MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A subscription that causes a push notification to fire whenever any change happens in the specified record zone.

**Notes:** Subclass of the CKSubscriptionMBS class.

31.44.2 Methods

31.44.3 Constructor(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a subscription object that monitors all records in the specified record zone.

**Notes:**

- zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.

Returns a subscription object initialized to track changes to the contents of the specified record zone.

The object returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.

See also:

- 31.44.4 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string)

31.44.4 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a subscription object that monitors the specified zone and has a custom name that you provide.

**Notes:**

- zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.
- subscriptionID: The unique name of the subscription object. This string must be unique for each subscription object in the container. This parameter must not be nil.

Returns a subscription object initialized to track changes to the contents of a record zone.
The CKRecordZoneSubscriptionMBS returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone. See also:

- 31.44.3 Constructor(zoneID as CKRecordZoneIDMBS)

### 31.44.5 copy as CKRecordZoneSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

### 31.44.6 Properties

#### 31.44.7 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The record type being monitored in a query-based subscription. (read-only)

**Notes:**

The value of this property applies only to query-based subscriptions and is set automatically by the CKRecordZoneSubscriptionMBS and CKRecordZoneSubscriptionMBS methods. For all other types of subscription objects, the value of this property is ignored and set to nil.

(Read and Write property)

#### 31.44.8 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Zone that the specified query subscription is scoped to.

**Notes:**

The value of this property applies both to query-based subscriptions and zone-based subscriptions. Specifying a record zone limits the search scope to the records in that zone. In the case of a zone-based subscription, the search encompasses all records in the zone. For a query-based subscription, the search encompasses only records of recordType in that zone.

For zone-based subscriptions, the value of this property is set automatically by the CKRecordZoneSubscriptionMBS or CKRecordZoneSubscriptionMBS methods. For all other subscription types, the default value is nil. To apply a zone to a query-based subscription, you must assign a value explicitly.

(Read only property)
31.45.  CLASS CKREFERENCEMBS

31.45  class CKReferenceMBS

31.45.1  class CKReferenceMBS

Function: A CKReference object creates a many-to-one relationship between records in your database.
Notes:
Each reference object stores information about the one record that is the target of the reference. You then
save the reference object in the fields of one or more records to create a link from those records to the target.
Both records must be located in the same zone of the same database.

see

31.45.2  Methods

31.45.3  Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

31.45.4  Constructor

Function: The private constructor.
See also:

- 31.45.5 Constructor(record as CKRecordMBS, action as Integer = 0) 5339
- 31.45.6 Constructor(recordID as CKRecordIDMBS, action as Integer = 0) 5340

31.45.5  Constructor(record as CKRecordMBS, action as Integer = 0)

Function: Initializes and returns a reference object that points to the specified record object.
Notes:
record: The target record of the reference.
action: The ownership options to put in place for the records. If you specify the deleteSelf option, the object
referred to by the recordID parameter becomes the owner of any objects that use this reference object. For
a list of possible values, see CKReferenceAction.

Returns an initialized reference object that points to the specified record, or nil if the reference cannot be initialized.

Use this method to initialize a reference to a local record object. The local record can be one that you just created or one that you fetched previously from the server.

When you create a reference object for use in a search predicate, the predicate ignores the value in the action parameter. Search predicates use only the ID of the record during their comparison.

See also:

- 31.45.4 Constructor
- 31.45.5 Constructor(record as CKRecordMBS, action as Integer = 0)

### 31.45.6 Constructor(recordID as CKRecordIDMBS, action as Integer = 0)

**Function:** Initializes and returns a reference object that points to the record with the specified ID.

**Notes:**

recordID: The ID of the target record. This method throws an exception if you specify nil for this parameter.

action: The ownership option to put in place between the target record and any records that incorporate this reference object. If you specify the deleteSelf option, the record referred to by the recordID parameter owns (or acts as the parent) of any objects that use this reference object. For a list of possible values, see CKReferenceActionMBS.

Returns an initialized reference object that points to the specified record, or nil if the reference cannot be initialized.

Use this method when you have only the ID of the record that is to become the target of a link. You might use this method if you saved only the ID of the record to a local data cache.

When you create a reference object for use in a search predicate, the predicate ignores the value in the action parameter. Search predicates use only the ID of the record during their comparison.

See also:

- 31.45.4 Constructor
- 31.45.5 Constructor(record as CKRecordMBS, action as Integer = 0)
31.45.7 copy as CKReferenceMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

31.45.8 Properties

31.45.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

31.45.10 recordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the referenced record. **Notes:** Use the ID in this property to fetch the record on the other end of the link. (Read only property)

31.45.11 referenceAction as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ownership behavior for the records. **Notes:** The value in this property determines what action, if any, to take when the target of the reference object that is, the object pointed to in the recordID property is deleted. When this property is set to deleteSelf, deleting the target object deletes any records that contain that reference in one of their fields. When this property is set to none, deleting the target object does not delete any additional objects. (Read only property)

31.45.12 Constants

31.45.13 ActionDeleteSelf = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the actions. **Notes:**
The delete action for referenced records.
Deleting a record also deletes any records containing CKReferenceMBS objects that point to that record. The deletion of the additional records may trigger a cascade deletion of more records. The deletions are asynchronous in the default zone and immediate in a custom zone.

31.45.14 ActionNone = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the actions.
**Notes:**

No action when a referenced record is deleted.
Deleting a parent record does not delete the children that refer to that parent. The CKReference object still contains the ID of the deleted record and is not updated automatically.
31.46. CLASS CKSERVERCHANGETOKENMBS

31.46. class CKServerChangeTokenMBS

**Function:** A CKServerChangeTokenMBS object is an opaque data object that identifies a specific version of a record.

**Notes:**
You do not create instances of this class yourself. When fetching records using a CKFetchRecordChangeOperation object, the server provides one of these objects along with the record changes. The next time you fetch the records, pass the previous token to the server. Passing the previous token tells the server what portions of the records to fetch and return to your app.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.46.2. Methods

31.46.3. Available as Boolean

**Function:** Whether this class is available.

**Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

31.46.4. Constructor

**Function:** The private constructor.

31.46.5. copy as CKServerChangeTokenMBS

**Function:** Creates a copy of this object.

31.46.6. IsEqual(Other as CKServerChangeTokenMBS) as boolean

**Function:** Checks if two objects are equal.
31.46.7 Properties

31.46.8 description as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description text.  
**Notes:** (Read only property)

31.46.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)
31.47. CLASS CKSHAREMBS

31.47 class CKShareMBS

31.47.1 class CKShareMBS

Function: A reference to a shared record.

Notes:
Available in macOS 10.12 and newer.
Subclass of the CKRecordMBS class.

31.47.2 Methods

31.47.3 addParticipant(participant as CKShareParticipantMBS)

Function: Adds a participant to this share.

Notes:
participant: The participant to be added to this share.

If a participant with a matching userIdentity already exists in this share, that existing participants properties are updated; no new participant is added.

To modify the list of participants, a share must have publicPermission set to CKShareParticipantPermission-None. You cannot mix and match private users and public users in the same share. Only certain participant types may be added via this API; see CKShareParticipantMBS.

31.47.4 Available as Boolean

Function: Whether this class is available.

Notes: Should be true for OS X 10.12 and newer in 64-bit application.

31.47.5 CKRecordTypeShare as String

Function: The type of record for a share.
CHAPTER 31. CLOUDKIT

31.47.6 CKShareThumbnailImageDataKey as String

Function: One of the predefined keys in the CKRecordTypeShare schema.
Notes:
They’re used by the out of process UI flow to send a share, and as part of the share acceptance flow. These
are optional.

Value is a data blob suitable to pass into NSImageMBS.imageWithData.

31.47.7 CKShareTitleKey as String

Function: One of the predefined keys in the CKRecordTypeShare schema.
Notes:
They’re used by the out of process UI flow to send a share, and as part of the share acceptance flow. These
are optional.

Value is a string. Example for a recipe sharing app: "Pot Roast"

31.47.8 CKShareTypeKey as String

Function: One of the predefined keys in the CKRecordTypeShare schema.
Notes:
They’re used by the out of process UI flow to send a share, and as part of the share acceptance flow. These
are optional.

Value is a string representing a UTI. Example for a recipe sharing app: "com.mycompany.recipe"

31.47.9 Constructor

Function: The constructor.
See also:

• 31.47.10 Constructor(RecordType as String)
31.47. **CLASS CKSHAREMBS**

- 31.47.10 Constructor(RecordType as String)

  **Function:** The constructor.
  See also:
  - 31.47.9 Constructor  
  - 31.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS)  
  - 31.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)  
  - 31.47.13 Constructor(rootRecord as CKRecordMBS)  
  - 31.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS)  

- 31.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS)

  **Function:** The constructor.
  See also:
  - 31.47.9 Constructor  
  - 31.47.10 Constructor(RecordType as String)  
  - 31.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)  
  - 31.47.13 Constructor(rootRecord as CKRecordMBS)  
  - 31.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS)  

- 31.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)

  **Function:** The constructor.
  See also:
  - 31.47.9 Constructor  
  - 31.47.10 Constructor(RecordType as String)
31.47.13 Constructor(rootRecord as CKRecordMBS)

Function: Initializes and returns a share object.
Notes: When saving a newly created CKShare, you must save the share and its rootRecord in the same CKModifyRecordsOperationMBS batch.
See also:
- 31.47.9 Constructor
- 31.47.10 Constructor(RecordType as String)
- 31.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS)
- 31.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)
- 31.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS)

31.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS)

Function: Initializes and returns a share object.
Notes:
rootRecord: The record being shared.
shareID: The CKRecordID associated with this share.

When saving a newly created CKShare, save the share and its rootRecord in the same CKModifyRecordsOperationMBS batch.
See also:
- 31.47.9 Constructor
- 31.47.10 Constructor(RecordType as String)
- 31.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS)
- 31.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)
- 31.47.13 Constructor(rootRecord as CKRecordMBS)
31.47.15  **participants as CKShareParticipantMBS()**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array containing metadata objects for all participants in this share. **Notes:** The participants array contains all participants on the share that the current user has permissions to see. At a minimum, this array includes the owner and the current user.

31.47.16  **removeParticipant(participant as CKShareParticipantMBS)**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a participant from the share. **Notes:**

participant: The participant to be removed from this share.

To modify the list of participants, a share must have publicPermission set to CKShareParticipantPermission-None. You cannot mix and match private users and public users in the same share. Only certain participant types may be added via this API; see CKShareParticipantMBS.

31.47.17  **Properties**

31.47.18  **currentUserParticipant as CKShareParticipantMBS**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current users metadata for this share. **Notes:**

This computed property accesses the participants property and returns the CKShareParticipant that is associated with the current user. (Read only property)

31.47.19  **owner as CKShareParticipantMBS**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The share owners metadata. **Notes:**

This computed property accesses the participants property and returns the CKShareParticipant that is associated with the owner of this share. (Read only property)
31.47.20 publicPermission as Integer

Function: Definition of permissions new users joining this share will have initially.
Notes:
Shares with publicPermission more permissive than CKShareParticipantPermissionNone are joinable by any user with access to the shares URL. If the value is set to CKShareParticipantPermissionReadWrite, then those users can also create and modify records in the share. By default, public permission is CKShareParticipantPermissionNone. Changing the public permission to CKShareParticipantPermissionNone results in all public participants being removed when the share is saved.
(Read and Write property)

31.47.21 URL as String

Function: A URL that can be used to invite participants to this share.
Notes:
This property is only available after a share record has been saved to the server. This URL is stable and is tied to the rootRecord. If you share a rootRecord, delete the share, and then re-share the same rootRecord via a newly created share, that newly created shares URL will be identical to the prior shares URL.
(Read only property)
31.48. CLASS CKSHAREMETADATAMBS

31.48  class CKShareMetadataMBS

31.48.1  class CKShareMetadataMBS

31.48.2  Methods

31.48.3  Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available. Notes: Should be true for OS X 10.12 and newer in 64-bit application.

31.48.4  Constructor

31.48.5  copy as CKShareMetadataMBS

31.48.6  Properties

31.48.7  containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The unique identifier for the container associated with this share. Notes: This read only property can be used to fetch the container associated with this share. (Read only property)
31.48.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

31.48.9 ownerIdentity as CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identity of the owner of the associated share.  
**Notes:** This read only property is used to access the owner of the share.  
(Read only property)

31.48.10 participantPermission as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Permissions associated with the user who retrieved the metadata for this share.  
**Notes:** This property reflects the permissions associated with the participant who invoked the CKFetchShareMetadataOperationMBS.  
(Read only property)

31.48.11 participantStatus as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The participation status of the user who retrieved the metadata for this share.  
**Notes:** This property reflects the status of the participant who invoked the CKFetchShareMetadataOperationMBS.  
See CKShareParticipantMBS for the statuses available.  
(Read only property)

31.48.12 participantType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of the user who retrieved the metadata for this share.  
**Notes:**
This property reflects the \texttt{participantType} of the participant who invoked the \texttt{CKFetchShareMetadataOperationMBS}. See \texttt{CKShareParticipantMBS} for the types available.

(Read only property)

31.48.13 \textbf{rootRecord as CKRecordMBS}

\textbf{Function}: The root record associated with this share.
\textbf{Notes}:
This read only property contains a reference to the root record associated with this share. This property can be nil if the \texttt{CKFetchShareMetadataOperationMBS} did not set \texttt{shouldFetchRootRecord} to true.
(Read only property)

31.48.14 \textbf{rootRecordID as CKRecordIDMBS}

\textbf{Function}: The unique identifier for the root record associated with this share.
\textbf{Notes}:
This property is populated even if \texttt{shouldFetchRootRecord} is set to false on the \texttt{CKFetchShareMetadataOperationMBS} and can be used to retrieve the \texttt{rootRecord} if the record was not retrieved with the metadata.
(Read only property)

31.48.15 \textbf{share as CKShareMBS}

\textbf{Function}: The associated share.
\textbf{Notes}:
This read only property contains a reference to the \texttt{CKShareMBS} that this \texttt{CKShareMetadataMBS} is associated with.
(Read only property)
31.49 class CKShareParticipantMBS

31.49.1 class CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A reference to a person who accepted a shared record.

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

31.49.2 Methods

31.49.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.

**Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

31.49.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.49.5 copy as CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

31.49.6 Properties

31.49.7 acceptanceStatus as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current state of the users acceptance of this share. (read-only)

**Notes:**
This property contains the current state of the participants acceptance of this share. For a list of possible values, see CKShareParticipantAcceptanceStatus* constants.
(Read only property)
31.49. CLASS CKSHAREPARTICIPANTMBS

31.49.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

31.49.9 permission as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The permission level that the user has for this share.  
**Notes:**  
This property controls the permissions that the participant has for this share. For a list of possible values, see CKShareParticipantPermission* constants.  
(Read and Write property)

31.49.10 type as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The participant type.  
**Notes:**  
The property controls the participant type for the share. For a list of possible values, see CKShareParticipantType* constants.  
(Read and Write property)

31.49.11 userIdentity as CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identity of the participant. (read-only)  
**Notes:**  
This property contains a reference to the user identity for the share participant.  
(Read only property)

31.49.12 Constants

31.49.13 CKShareParticipantAcceptanceStatusAccepted = 2  

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the status values of a participant.  
**Notes:** The participant has accepted the share request.
31.49.14  CKShareParticipantAcceptanceStatusPending = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the status values of a participant. **Notes:** The participant has not accepted the share request.

31.49.15  CKShareParticipantAcceptanceStatusRemoved = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the status values of a participant. **Notes:** The participant was removed from the share.

31.49.16  CKShareParticipantAcceptanceStatusUnknown = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the status values of a participant. **Notes:** The participants status is unknown.

31.49.17  CKShareParticipantPermissionNone = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the permissions granted constants for the participant. **Notes:** The participant does not have any permissions for this share.

31.49.18  CKShareParticipantPermissionReadOnly = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the permissions granted constants for the participant. **Notes:** The participant has read only permissions for this share.

31.49.19  CKShareParticipantPermissionReadWrite = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the permissions granted constants for the participant. **Notes:** The participant has full read and write permissions for this share.
31.49. **CLASS CKSHAREPARTICIPANTMBS**

### 31.49.20 CKShareParticipantPermissionUnknown = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the permissions granted constants for the participant.
**Notes:** The current status of the participant’s permissions is unknown.

### 31.49.21 CKShareParticipantTypeOwner = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the participant types.
**Notes:** The participant is the owner of the share. As owner, the user can add private users to the share.

### 31.49.22 CKShareParticipantTypePrivateUser = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the participant types.
**Notes:** The participant is a private user and can access the share.

### 31.49.23 CKShareParticipantTypePublicUser = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the participant types.
**Notes:** The participant is a public user. Public users are self-added when the participant accesses the shareURL. Owners cannot add public users.

### 31.49.24 CKShareParticipantTypeUnknown = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the participant types.
**Notes:** The type of the participant cannot be determined.
31.50 class CKSubscriptionMBS

31.50.1 class CKSubscriptionMBS

Function: Use a CKSubscription object to track changes occurring on the server.
Notes:
A subscription acts like a persistent query on the server that can track the creation, deletion, and modification of records. When changes occur, they trigger the delivery of push notifications so that your app can respond appropriately.

see

Available in 10.10 in 64-bit, but most is deprecated by Apple with 10.12.

31.50.2 Methods

31.50.3 Available as Boolean

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

31.50.4 Constructor

Function: The private constructor.
See also:

- 31.50.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer) 5360
- 31.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer) 5361
**31.50.5 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer)**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a query-based subscription that monitors records with the specified options. **Notes:**

- **recordType:** The string that identifies the type of records to track. You are responsible for naming your apps record types. This parameter must not be nil or an empty string.
- **predicate:** The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQueryMBS.
- **subscriptionOptions:** A bitmask of the configuration options for the subscription. You must specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription for searching records in the target database. The subscription monitors the specified type of records in all of the users record zones and generates push notifications when the search criteria are met.

- 31.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer)

**31.50.6 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer)**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a query-based subscription that monitors records with the specified options. **Notes:**

- **recordType:** The string that identifies the type of records to track. You are responsible for naming your apps record types. This parameter must not be nil or an empty string.
- **predicate:** The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQueryMBS.
- **subscriptionOptions:** A bitmask of the configuration options for the subscription. You must specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.
Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription for searching records in the target database. The subscription monitors the specified type of records in all of the users record zones and generates push notifications when the search criteria are met.

- 31.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer)

31.50.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer)

**Function:** Initializes and returns a subscription object that monitors the specified zone and has a custom name that you provide.

**Notes:**

- zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.
- subscriptionID: The unique name of the subscription object. This string must be unique for all other subscription objects in the container. This parameter must not be nil.
- subscriptionOptions: The configuration options for the subscription. You must specify 0 for this parameter. Zone subscriptions currently do not support any options.

Returns a subscription object initialized to track changes to the contents of a record zone.

The object returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.

- 31.50.6 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer)
- 31.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer)
31.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer)

**Function:** Initializes and returns a subscription object that monitors all records in the specified record zone.  
**Notes:**  
zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.  
subscriptionOptions: The configuration options for the subscription. You must specify 0 for this parameter. Zone subscriptions currently do not support any options.  

Returns a subscription object initialized to track changes to the contents of a record zone.  

The object returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.

- 31.50.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer)

31.50.9 copy as CKSubscriptionMBS

**Function:** Creates a copy of this object.  

31.50.10 Properties

31.50.11 Handle as Integer

**Function:** The internal object reference.  
**Notes:** (Read and Write property)
31.50.12 notificationInfo as CKNotificationInfoMBS

Function: The configuration data for push notifications sent by the subscription.

Notes:

If you want your subscriptions push notifications to alert the user to corresponding changes, assign a value to this property. The server uses the information in the CKNotificationInfoMBS object to determine the delivery options for notifications. For example, you can specify the alert text to display and the name of a special sound file to play. When a push notification involves a record, you can also specify which fields of the record to include in the push notifications payload data.

If you do not assign a value to this property, the server still sends push notifications to your app but those notifications do not cause the system to alert the user. The default value of this property is nil.

(Read only property)

31.50.13 predicate as NSPredicateMBS

Function: The matching criteria to apply to records.

Notes:

A query-based subscription uses its search predicate to identify potential matches for records. It combines the predicate information with the value in the subscriptionOptions property to determine the conditions under which to send a push notification to the app.

The search predicate defines the records that the subscription object monitors for changes. The value in this property is used only if the subscriptionTypeMBS property is set to CKSubscriptionTypeQuery; otherwise, it is ignored.

(Read only property)

31.50.14 recordType as String

Function: The record type being monitored in a query-based subscription.

Notes:

The value of this property applies only to query-based subscriptions and is set automatically by the constructors. For all other types of subscription objects, the value of this property is ignored and set to nil.

(Read only property)
31.50. **CLASS CKSUBSCRIPTIONMBS**

### 31.50.15 subscriptionID as String

**Function:** The unique identifier for the subscription.

**Notes:**
If you initialize the subscription object using the constructor, the default value of this property is set to the value provided by those methods. In all other cases, an ID based on a UUID is generated for you automatically.

(Read only property)

### 31.50.16 subscriptionOptions as Integer

**Function:** The options for triggering notifications.

**Notes:**
Set the value of this property at initialization time. When configuring a query-based subscription, you must specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

(Read only property)

### 31.50.17 subscriptionType as Integer

**Function:** The type of behavior provided by the subscription.

**Notes:**
The value of this property is set automatically at creation time. Use it to distinguish between query-based subscriptions and those that monitor specific types of data.

(Read only property)

### 31.50.18 zoneID as CKRecordZoneIDMBS

**Function:** The ID of the record zone to monitor.

**Notes:**
The value of this property applies both to query-based subscriptions and zone-based subscriptions. Specifying a record zone limits the search scope to the records in that zone. In the case of a zone-based subscription, the search encompasses all records in the zone. For a query-based subscription, the search encompasses only records of a specific type in that zone.
For zone-based subscriptions, the value of this property is set automatically by the constructor. For all other subscription types, the default value is nil. To apply a zone to a query-based subscriptions, you must assign a value explicitly.

(Read only property)

### 31.50.19 Constants

**31.50.20 OptionsFiresOnce = 8**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the configuration options for a subscription. **Notes:** An option for sending a push notification only one time. After sending the push notification, the server deletes the subscription object. This option applies only to query-based subscriptions.

### 31.50.21 OptionsFiresOnRecordCreation = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the configuration options for a subscription. **Notes:** An option for generating a push notification when a record that matches the search criteria in the predicate property is created. This option applies only to query-based subscriptions.

### 31.50.22 OptionsFiresOnRecordDeletion = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the configuration options for a subscription. **Notes:** An option for generating a push notification when a record that matched the search criteria in the predicate property was deleted. This option applies only to query-based subscriptions.

### 31.50.23 OptionsFiresOnRecordUpdate = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the configuration options for a subscription. **Notes:** An option for generating a push notification when changes are made to the fields of a record that cause the record to match the search criteria specified in the predicate property. This option applies only to query-based subscriptions.

### 31.50.24 TypeDatabase = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants that identify a subscriptions behavior. **Notes:** A constant indicating the subscription is a query-based subscription. This type of subscription
tracks the creation, modification, or deletion of a specific type of record.

31.50.25 TypeQuery = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the constants that identify a subscriptions behavior.
Notes: A constant indicating the subscription is a query-based subscription. This type of subscription tracks the creation, modification, or deletion of a specific type of record.

31.50.26 TypeRecordZone = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the constants that identify a subscriptions behavior.
Notes: A constant indicating the subscription is a zone-based subscription. The subscription tracks changes to records in a specific record zone.
31.51 class CKUserIdentityLookupInfoMBS

31.51.1 class CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An object that represents information you use to fetch users. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

31.51.2 Methods

31.51.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Should be true for OS X 10.12 and newer in 64-bit application.

31.51.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor. **Notes:** Please use the shared methods to constructor instances. This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

31.51.5 copy as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

31.51.6 lookupInfosWithEmailAddress(emailAddress as string) as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of user identity lookup objects configured with email addresses as the search criteria. **Notes:**
emails: An array of strings that represent the email addresses to use to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the email addresses that were passed in.
May return nil in case of error.

Once initialized, these objects can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentity objects for the user.

### 31.51.7 lookupInfosWithEmails(emailAddresses() as string) as CKUserIdentityLookupInfoMBS()

**Function:** Returns an array of user identity lookup objects configured with email addresses as the search criteria.
**Notes:**
emails: An array of strings that represent the email addresses to use to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the email addresses that were passed in.
May return nil in case of error.

Once initialized, these objects can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS objects for the user.

### 31.51.8 lookupInfosWithPhoneNumbers(phoneNumbers() as string) as CKUserIdentityLookupInfoMBS()

**Function:** Returns an array of user identity lookup objects configured with phone numbers as the search criteria.
**Notes:**
phoneNumbers: An array of strings that represent the phone numbers to use to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the phone numbers that were passed in.
May return nil in case of error.

Once initialized, these objects can be passed into a CKDiscoverUserIdsOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS objects for the user.

### 31.51.9 lookupInfosWithRecordIDs(userRecordIDs() as CKRecordIDMBS) as CKUserIdentityLookupInfoMBS()

**MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns an array of user identity lookup objects configured with phone numbers as the search criteria.

**Notes:**

- **userRecordIDs:** An array of CKRecordIDMBS objects that are used to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the CKRecordIDMBS objects that were passed in.

### 31.51.10 lookupInfosWithUserRecordID(userRecordID as CKRecordIDMBS) as CKUserIdentityLookupInfoMBS

**MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Initializes and returns a look up info object with the user record ID property configured.

**Notes:**

- **userRecordID:** The user record ID to use to look up the user.

Returns an user identity lookup object initialized to look up a user by the users record ID, or nil if the object cannot be initialized.

Once initialized, this object can be passed into CKDiscoverUserIdsOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS for the user.

### 31.51.11 lookupInfosWithPhoneNumber(phoneNumber as string) as CKUserIdentityLookupInfoMBS

**MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Initializes and returns a look up info object with the phone number property configured.

**Notes:**
31.51. CLASS CKUSERIDENTITYLOOKUPINFOMBS

phoneNumber: The phone number to use to look up the user.

Returns an user identity lookup object initialized to look up a user by the users phone number, or nil if the object cannot be initialized.

Once initialized, this object can be passed into a CKDiscoverUserIdentitieMBS, or a CKFetchSharePa-

ticipantsOperationMBS to retrieve the CKUserIdentityMBS for the user.

31.51.12 Properties

31.51.13 emailAddress as String

Function: The email address of the user whose information you want to retrieve.
Notes:
This property corresponds to a single email address associated with the user whose information you wish to look up.
(Read only property)

31.51.14 Handle as Integer

Notes: (Read and Write property)

31.51.15 phoneNumber as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The phone number of the user whose information you want to retrieve.
Notes:
This property corresponds to a single phone number associated with the user whose information you wish to look up.
(Read only property)
31.51.16 userRecordID as CKRecordIDMBS

**Function:** The ID of the user record.

**Notes:**

Use this value to retrieve the user record associated with the specified user. The user record does not contain any personal information about the user by default. Your app can add data to the user record but should not add any sensitive user data to it.

(Read only property)
31.52. **CLASS CKUSERIDENTITYMBS**

31.52. **class CKUserIdentityMBS**

31.52.1 **class CKUserIdentityMBS**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A reference to a user. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

31.52.2 **Methods**

31.52.3 **Available as Boolean**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Should be true for OS X 10.12 and newer in 64-bit application.

31.52.4 **Constructor**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.52.5 **copy as CKUserIdentityMBS**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

31.52.6 **Properties**

31.52.7 **description as String**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description text. **Notes:** (Read only property)
31.52.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

31.52.9 hasiCloudAccount as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether this user has an iCloud account. **Notes:** The value is true if this CKUserIdentity has an iCloud account associated with it; otherwise, false. (Read only property)

31.52.10 localizedDisplayName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The localized display name. **Notes:** (Read only property)

31.52.11 lookupInfo as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The information (phone number, email address, etc.) used to retrieve this user. **Notes:** The information that is passed into a CKDiscoverUserIdentitesOperationMBS or CKFetchShareParticipantsOperationMBS object to retrieve the user identity. (Read only property)

31.52.12 nameComponents as NSPersonNameComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the user associated with the specified user identity object. **Notes:** This property can be used to display the name of the user associated with this CKUserIdentity object. (Read only property)
31.52. CLASS CKUSERIDENTITYMBS

31.52.13 userRecordID as CKRecordIDMBS

Function: Unique identifier for this record.

Notes:
This property is the unique identifier associated with this CKUserIdentity.
(Read only property)
31.53 class NSPersonNameComponentsMBS

31.53.1 class NSPersonNameComponentsMBS

**Function:** An NSPersonNameComponents object encapsulates the components of a person’s name in an extendable, object-oriented manner. 
**Notes:** It is used to specify a person’s name by providing the components comprising a full name: given name, middle name, family name, prefix, suffix, nickname, and phonetic representation.

31.53.2 Methods

31.53.3 Available as Boolean

**Function:** Whether this class is available. 
**Notes:** Should be true for OS X 10.11 and newer.

31.53.4 Constructor

**Function:** The private constructor.

31.53.5 copy as CKQueryCursorMBS

**Function:** Creates a copy of this object.

31.53.6 Properties

31.53.7 familyName as String

**Function:** Name bestowed upon an individual to denote membership in a group or family. (for example, Appleseed). 
**Notes:** (Read and Write property)
31.53.8  givenName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Name bestowed upon an individual to differentiate them from other members of a group that share a family name (for example, Johnathan).
**Notes:** (Read and Write property)

31.53.9  Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
**Notes:** (Read and Write property)

31.53.10  middleName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Secondary name bestowed upon an individual to differentiate them from others that have the same given name (for example, Maple).
**Notes:** (Read and Write property)

31.53.11  namePrefix as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The portion of a names full form of address that precedes the name itself (for example, Dr., Mr., Ms.).
**Notes:** (Read and Write property)

31.53.12  nameSuffix as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The portion of a names full form of address that follows the name itself (for example, Esq., Jr., Ph.D.).
**Notes:** (Read and Write property)

31.53.13  nickname as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Name substituted for the purposes of familiarity (for example, "Johnny").
**Notes:** (Read and Write property)
31.53.14 phoneticRepresentation as NSPersonNameComponentsMBS

Function: The phonetic representation name components of the receiver.

Notes:

Each component of the receiver with a value should have a corresponding value for any value set for this property. nil by default.

(Read and Write property)
Chapter 32

Cocoa

32.1 control CocoaControlMBS

32.1.1 control CocoaControlMBS

Function: The control to embed NSViews into a REALbasic window.
Notes: Due the way Cocoa event handling works, the keydown event handler (and others) do not work with this control. To actually get an event, you’d have to use a subclass of CustomNSViewMBS and handle events there. In the CustomNSViewMBS you add the actual view you like to have. So all events not handled by this view, fall through to your CustomNSViewMBS.
On Carbon the RS framework intercepts events and calls keydown event.
Requires the window being composite for Carbon targets which is currently not available for modal windows in Real Studio.

32.1.2 Properties

32.1.3 Available as Boolean

Function: Whether this control can work.
Notes: Returns true on Mac OS X 10.5 (or newer) and false on any other OS.
(Read only property)
32.1.4 View as NSViewMBS

Function: The view used with this control.
Notes:
You define this view in the GetView event.
(Read only property)

32.1.5 WantsFocus as Boolean

Function: Whether this control wants to have focus.
Notes:
By default this is true.
(Read and Write property)

32.1.6 Events

32.1.7 EnableMenuItems

Function: The event where you can enable menu items.

32.1.8 GetView as NSViewMBS

Function: Asks your application which NSView should be used.
Example:
// an example on how to use this event:

Function GetView() As NSViewMBS
  dim n as NSTextViewMBS

  // create a textview:
  n=new NSTextViewMBS(0, 0, CocoaControlMBS1.Width, CocoaControlMBS1.Height)
  n.ContinuousSpellCheckingEnabled=true
  Return n
End Function

Notes:
Return a NSView setup as you like.
You may also want to keep a reference to the view you use for easier access.

32.1.9 MenuAction(HitItem as MenuItem) As Boolean

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.1.10 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes:
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.1.11 MouseDrag(x as Integer, y as Integer)

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.
32.1.12 MouseUp(x as Integer, y as Integer)

**Function:** The mouse button was released.
**Notes:** Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

32.1.13 ScaleFactorChanged(NewFactor as Double)

**Function:** The backing store scale factor has changed.
**Notes:** Please invalidate any cached bitmaps or other relevant state.
32.2. class ContainerControl

32.2.1 class ContainerControl

Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The container class in Xojo.

32.2.2 Methods

32.2.3 NSViewMBS as NSViewMBS

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSViewMBS object for the given container.

**Example:**

MsgBox ContainerControl1.NSViewMBS.className

**Notes:** This way you can manipulate Cocoa container controls directly.
32.3 class CustomNSToolbarItemMBS

32.3.1 class CustomNSToolbarItemMBS

Function: The class for a custom toolbar item.
Notes: Use this class if you need to fill events.
Subclass of the NSToolbarItemMBS class.

32.3.2 Methods

32.3.3 Constructor(itemIdentifier as string)

Function: The constructor.
Notes: itemIdentifier: The identifier for the receiver. itemIdentifier is never seen by users and should not be localized.
The identifier is used by the toolbar and its delegate to identify the kind of the toolbar item.

32.3.4 Destructor

Function: The destructor.

32.3.5 Events

32.3.6 Action

Function: The action event called when user clicks toolbar item.

32.3.7 allowsDuplicatesInToolbar as boolean

Function: Returns a Boolean value that indicates whether the receiver can be represented in the toolbar.
32.3. CLASS CUSTOMNSTOOLBARITEMMBS

at more than one position.

**Notes:**

You use this event to override the default behavior in a subclass. By default, if an item with the same identifier is already in the toolbar, dragging it in again will effectively move it to the new position.

If you leave this event empty (no code), you get the default behavior.

32.3.8 validate as boolean

**Function:** Validates a toolbar item.

**Notes:**

If this event is implemented and returns false, NSToolbar will disable theItem; returning true causes theItem to be enabled.

NSToolbar only calls this method for image items.

validate is called very frequently, so it must be efficient.

If you don’t have code in this event, the plugin will simply return enabled value.

This methods may not be called if you set Autovalidates to true.
32.4 class CustomNSToolbarMBS

32.4.1 class CustomNSToolbarMBS

Function: The toolbar class for the case you need to use the events.
Notes: Subclass of the NSToolbarMBS class.

32.4.2 Methods

32.4.3 Constructor(Identifier as string)

Function: One of the standard toolbar item identifiers.

32.4.4 Destructor

Function: The destructor.

32.4.5 Events

32.4.6 allowsSizeMode(mode as Integer, SuperAllows as boolean) as boolean

Function: Whether to allow the given size mode.
Example:

Function allowsSizeMode(mode as Integer, SuperAllows as boolean) As boolean
# if DebugBuild then
System.DebugLog CurrentMethodName+” ”+str(SuperAllows)
# endif

if mode = NSToolbarMBS.NSToolbarSizeModeSmall then
Return false
else
Return SuperAllows
end if

End Function
Notes:
If you have nothing in the event, the default behavior is to allow all.
You can return false for a mode to disable it. e.g. NSToolbarSizeModeSmall
SuperAllows parameter tells you if mode is enabled by default.

32.4.7 itemForItemIdentifier(identifier as string, willBeInsertedIntoToolbar as boolean) as NSToolbarItemMBS

Function: Sent to request a new toolbar item; returns a toolbar item of the identified kind for the specified toolbar.
Notes:
itemIdentifier: The identifier for the requested item.
willBeInsertedIntoToolbar: True if the item will be immediately inserted into the toolbar. If flag is false the toolbar item is being requested for display in the toolbar customization sheet and should always be enabled or provide some other canonical representation. If you ignore this parameter the same toolbar item will be used in the toolbar and in the customization sheet.
Return Value
The toolbar item for the specified toolbar and identifier. Return nil to indicate that the identified kind of toolbar item is not supported. When an item is requested again, you may return the same NSToolbarItem object returned earlier or a different instance.

Implement this method to create new toolbar item instances. This method is called lazily on behalf of a toolbar instance, which must be the sole owner of the toolbar item. A toolbar may ask again for a kind of toolbar item already supplied to it, in which case this method may return the same toolbar item it returned before or a different one. If your delegate services multiple toolbars, each attached to a different window, it is best to return a different item for each toolbaran NSToolbarItem object can only be in one toolbar at a time.

If the item is a custom view item, the NSView object must be fully formed when the item is returned. Do not assume that the returned item is going to be added as an active item in the toolbar, as it could be that it will be used only in the customization palette. (The customization palette makes a copy of the returned item.)

This event must be implemented if the associated toolbar is created programatically.

32.4.8 toolbarAllowedItemIdentifiers as string()

Function: Sent to discover the allowed item identifiers for a toolbar.
Notes:
An array of toolbar item identifiers for toolbar, specifying the contents and the order of the items in the configuration palette.

Every allowed item must be explicitly listed, even the standard ones. The identifiers returned should include all of those returned by toolbarDefaultItemIdentifiers.

This event must be implemented if the associated toolbar is created programatically.

32.4.9 toolbarDefaultItemIdentifiers as string()

Function: Sent to discover the default item identifiers for a toolbar.
Notes:
Return an array of toolbar item identifiers for toolbar, specifying the contents and the order of the items in the default toolbar configuration.

During initialization of toolbar, this method is called only if a toolbar configuration for the identifier of toolbar is not found in the user preferences. This method is called during initialization of the toolbar customization palette.

This event must be implemented if the associated toolbar is created programatically.

32.4.10 toolbarDidRemoveItem(item as NSToolbarItemMBS, notification as NSNotificationMBS)

Function: Sent just after an item has been removed from a toolbar.
Notes: This method allows you to remove information related to the item that may have been cached.

32.4.11 toolbarItemAction(item as NSToolbarItemMBS)

Function: The action event called when user clicks toolbar item.
Notes: Only for instances of CustomNSToolbarItemMBS, the plugin can forward the allowsDuplicatesIn-Toolbar event to the CustomNSToolbarMBS, so you can handle it in a central place for all toolbar items.
32.4. CLASS CUSTOMNSTOOLBARMBS

32.4.12 toolbarItemAllowsDuplicatesInToolbar(item as NSToolbarItemMBS) as boolean

Function: Returns a Boolean value that indicates whether the receiver can be represented in the toolbar at more than one position.
Notes:
You use this event to override the default behavior in a subclass.
By default, if an item with the same identifier is already in the toolbar, dragging it in again will effectively move it to the new position.

If you leave this event empty (no code), you get the default behavior.

Only for instances of CustomNSToolbarItemMBS, the plugin can forward the allowsDuplicatesInToolbar event to the CustomNSToolbarMBS, so you can handle it in a central place for all toolbar items.

32.4.13 toolbarItemValidate(item as NSToolbarItemMBS) as boolean

Function: Validates a toolbar item.
Notes:
If this event is implemented and returns false, NSToolbar will disable theItem; returning true causes theItem to be enabled.

NSToolbar only calls this method for image items.
validateis called very frequently, so it must be efficient.

If you don’t have code in this event, the plugin will simply return enabled value.
This methods may not be called if you set Autovalidates to true.

Only for instances of CustomNSToolbarItemMBS, the plugin can forward the allowsDuplicatesInToolbar event to the CustomNSToolbarMBS, so you can handle it in a central place for all toolbar items.

32.4.14 toolbarSelectableItemIdentifiers as string()

Function: Sent to discover the selectable item identifiers for a toolbar.
Notes:
Return an array of item identifiers that should indicate selection in the specified toolbar.
Toolbars that need to indicate item selection should return an array containing the identifiers of the selectable toolbar items.

If implemented, toolbar will display the currently selected item with a visual highlight. Clicking on an item whose identifier is selectable will automatically update the toolbar’s selected item identifier, when possible. Clicking an item whose identifier is not selectable will not update the toolbar’s selected item identifier.

32.4.15 toolbarWillAddItem(item as NSToolbarItemMBS, notification as NSNotificationMBS)

Function: Sent just before a new item is added to a toolbar.

Notes: If you need to cache a reference to a toolbar item or need to set up some initial state before a toolbar item is added, this is where to do it.
32.5.  MODULE DICTIONARYSERVICEMBS

32.5  module DictionaryServiceMBS

32.5.1  module DictionaryServiceMBS

Function: The Dictionary Services module.
Notes:
Dictionary Services provides functions that let you access dictionaries programmatically from within your application.

A dictionary is any look-up reference that is built using the Dictionary Development Kit. The contents of a dictionary can serve many purposes. The most typical use is to provide definitions for a single language, but you can create content for a thesaurus, bilingual dictionaries (such as English-Japanese), in-house glossaries, and professional dictionaries (such as legal, medical, and technical).

Available in Mac OS X v10.5 and later.

32.5.2  Methods

32.5.3  GetTermRangeInString(text as string, offset as Integer=0) as boolean

Function: Determines the range of the longest word or phrase with respect to an offset.
Notes:
text: Text that contains the word or phrase to look up.
offset: A character offset in the textString parameter.

Return Value

The range that specifies the location, around the specified offset, of the word or phrase, or the value -1. The range is stored in the RangePosition and RangeLength properties and the function returns true. On any error it returns false.

You can use this function to determine the range of text that contains a word or phrase. After you determine the range, you can pass the result to the functions TextDefinition and Show.

To see how this works, follow these steps:
In Mac OS X v10.5 or later, open Text Edit.
Type It is a foggy day in San Francisco, California.
Control-click Francisco (don’t select it). Then, choose ”Lookup in Dictionary”.

RAW_TEXT_END
Note that the Dictionary window appears with a definition of San Francisco. The function GetTermRangeInString automatically detected the range of the phrase San Francisco, using Francisco as the text string to search for and a character offset in this string. The function expanded the range until it found a possible match.

You can also point the cursor at the word Francisco and, without making a selection or clicking, type Command-Control-D. GetTermRangeInString detects the range.

The function GetTermRangeInString only returns the range. You must call TextDefinition to copy the definition and Show to display the definition in a Dictionary window.

Available in Mac OS X v10.5 and later.

### 32.5.4 RangeLength as Integer

**Function:** The length from the range.  
**Notes:**  
This value set by the GetTermRangeInString function.  
(Read and Write computed property)

### 32.5.5 RangePosition as Integer

**Function:** The position from the range.  
**Notes:**  
This value set by the GetTermRangeInString function.  
(Read and Write computed property)

### 32.5.6 Show(text as string, start as Integer = 0, length as Integer = 0, textOriginX as Double = 0, textOriginY as Double = 0) as boolean

**Function:** Displays dictionary search result in a dictionary window.  
**Notes:**  
text: Text that contains the word or phrase to look up.
start and length:
If you are using this function to show the results associated with text selected by the user, then provide
the selection range of the textString parameter. If you are using this function to show the results associ-
atied with calling the DCSGetTermRangeInString function, then provide the range returned by that function.

This function opens a window to display the definition of a word or phrase.

Available in Mac OS X v10.5 and later.

32.5.7 TextDefinition(text as string, position as Integer=0, length as Integer=0) as string

Function: Returns the definition associated with the provided text range.
Notes:

text: Text that contains the word or phrase to look up.

position and length: A range that specifies the location of the word or phrase in the textString parameter.
If text string exactly specifies the word or phrase that you want to look up, you can pass the range of the
text string. For example, for the word make, you would pass (0,4) to specify the range.

If the textString parameter contains the word or phrase, but does not specify it exactly, then pass the range
returned by the function GetTermRangeInString.

Return Value:
The definition of the word or phrase, as plain text. The returned text does not contain any elements that
are marked with a priority attribute whose value is 2.

This function returns the description of the first matching record found in the the active dictionaries. It
searches first in the default word definition dictionary which, in the English environment, is the Oxford
dictionary.

Available in Mac OS X v10.5 and later.
32.6 class NSAlertMBS

32.6.1 class NSAlertMBS

32.6.2 Methods

32.6.3 addButtonWithTitle(title as string) as Variant

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Customize the buttons in the alert panel. **Example:**

// make dialog
dim a as NSAlertMBS = NSAlertMBS.alertWithMessageText("Hello World", "First Button", "Second Button")

// add button
dim thirdButton as NSButtonMBS = a.addButtonWithTitle("Third Button")

// and show dialog
call a.runModal

**Notes:**

Buttons are added from right to left (for left to right languages).
Returns NSButtonMBS object.

32.6.4 alertWithError(error as NSErrorMBS) as NSAlertMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Given an NSError, create an NSAlert that can be used to present the error to the user. **Notes:** The error’s localized description, recovery suggestion, and recovery options will be used to set the alert’s message text, informative text, and button titles, respectively.
32.6. CLASS NSALERTMBS

32.6.5 alertWithMessageText(MessageText as string, defaultButton as string = "", alternateButton as string = "", otherButton as string = ",", informativeText as string = "") as NSAlertMBS

32.6.6 beginSheetModalForWindow(win as NSWindowMBS)

**Notes:**
If the alert has an alertStyle of NSCriticalAlertStyle, it will be shown as a "critical" sheet; it will otherwise be presented as a normal sheet.
Calls later SheetDidEnd event with the result.

Please keep a reference to the dialog object alive to avoid trouble.
e.g. store reference in parent window, global property or app property.
See also:

- 32.6.7 beginSheetModalForWindow(win as window)

32.6.7 beginSheetModalForWindow(win as window)

**Notes:**
If the alert has an alertStyle of NSCriticalAlertStyle, it will be shown as a "critical" sheet; it will otherwise be presented as a normal sheet.
Calls later SheetDidEnd event with the result.

Please keep a reference to the dialog object alive to avoid trouble.
e.g. store reference in parent window, global property or app property.
See also:

- 32.6.6 beginSheetModalForWindow(win as NSWindowMBS)

32.6.8 buttons as Variant()

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the buttons, where the rightmost button is at index 0.
Example:

```vbnet
dim a as NSAlertMBS = NSAlertMBS.alertWithMessageText("Hello World", "First Button", "Second Button")
dim buttons() as Variant = a.buttons

for each b as NSButtonMBS in buttons
    MsgBox b.title
next
```

Notes: Returns NSButtonMBS array.

### 32.6.9 close

**Notes:** The SheetDidEnd event will not run.

### 32.6.10 Constructor

**Notes:** Use properties to configure the dialog.

### 32.6.11 Destructor

### 32.6.12 layout

**Notes:** Can be used to indicate that the alert panel should do immediate layout, overriding the default behavior of laying out lazily just before showing panel. You should only call this method if you want to do your own custom layout after it returns. You should call this method only after you have finished with NSAlert customization, including setting message and informative text, and adding buttons and an accessory view if needed. You can make layout changes after this method returns, in particular to adjust the frame of an
accessory view. Note that the standard layout of the alert may change in the future, so layout customization should be done with caution.

### 32.6.13 `runModal` as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Run the alert as an application-modal panel and return the result.

### 32.6.14 Properties

#### 32.6.15 `accessoryView` as `NSViewMBS`

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The accessory view displayed in the alert panel. **Notes:** By default, the accessory view is positioned below the informative text and the suppression button (if any) and above the alert buttons, left-aligned with the informative text. If you want to customize the location of the accessory view, you must first call layout method. (Read and Write property)

#### 32.6.16 `alertStyle` as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The alert style. **Notes:** Value can be:

- `NSWarningAlertStyle` 0 Warning
- `NSInformationalAlertStyle` 1 Information
- `NSCriticalAlertStyle` 2 Critical Error

(Read and Write property)

#### 32.6.17 `helpAnchor` as String

32.6.18 icon as NSImageMBS

**Notes:**
By default uses the image named NSApplicationIcon. (Read and Write property)

32.6.19 informativeText as String

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The informative text.

**Notes:** (Read and Write property)

32.6.20 messageText as String

**Notes:** (Read and Write property)

32.6.21 showsHelp as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to show help button.

**Notes:**
True adds a help button to the alert panel. When the help button is pressed, the delegate is first consulted. If the event does not implement ShowHelp event or returns false, then NSHelpManager.openHelpAnchor is called with a nil book and the anchor specified by HelpAnchor, if any. An exception will be raised if the delegate returns false and there is no help anchor set. (Read and Write property)

32.6.22 ShowsSuppressionButton as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether or not the alert should contain a suppression checkbox.
Notes:
The default is false. This checkbox is typically used to give the user an option to not show this alert again. If shown, the suppression button will have a default localized title similar to "Do not show this message again". You can customize this title using alert.suppressionButton.Title. When the alert is dismissed, you can get the state of the suppression button, using [[ alert suppressionButton ] state ] and store the result in user defaults, for example. This setting can then be checked before showing the alert again. By default, the suppression button is positioned below the informative text, and above the accessory view (if any) and the alert buttons, and left-aligned with the informative text. However do not count on the placement of this button, since it might be moved if the alert panel user interface is changed in the future. If you need a checkbox for purposes other than suppression text, it is recommended you create your own using an accessory view.
(Read and Write property)

32.6.23 suppressionButton as Variant

Function: Returns a suppression button which may be customized, including the title and the initial state.
Example:

| // make dialog |
| dim a as NSAlertMBS = NSAlertMBS.alertWithMessageText("Hello World", "First Button", "Second Button") |
| // get button |
| dim suppressionButton as NSButtonMBS = a.suppressionButton |
| // change title |
| suppressionButton.title = "Hello World Button" |
| // want to show it |
| a.ShowsSuppressionButton = true |
| // and show dialog |
| call a.runModal |

Notes:
You can also use this method to get the state of the button after the alert is dismissed, which may be stored in user defaults and checked before showing the alert again. In order to show the suppression button in the alert panel, you must set ShowsSuppressionButton to true.
Returns NSButtonMBS object.
(Read only property)
32.6.24  TimedOut as Boolean

Function: Whether we got a timeout.
Notes:
This is set to true when a timeout occurred.
(Read only property)

32.6.25  timeOut as Double

Function: Timeout for the dialog.
Notes:
Set this to the number of seconds after which the dialog should close.
(Read and Write property)

32.6.26  window as Variant

Function: Returns the application-modal panel or the document-modal sheet corresponding to this alert.
Notes: (Read only property)

32.6.27  Events

32.6.28  SheetDidEnd(returnCode as Integer)

Function: The sheet did finish.

32.6.29  ShowHelp as boolean

Function: Show custom help.
Notes: See ShowHelp property.
32.6. CLASS NSALERTMBS

32.6.30 Constants

32.6.31 NSAlertFirstButtonReturn = 1000

MBS MacCocoa Plugin, Plugin Version: 14.2. Function: One of the button return codes. Notes: First (rightmost) button

32.6.32 NSAlertSecondButtonReturn = 1001

32.6.33 NSAlertThirdButtonReturn = 1002

32.6.34 NSCriticalAlertStyle = 2

32.6.35 NSInformationalAlertStyle = 1

32.6.36 NSWarningAlertStyle = 0

32.7 class NSAnimationContextMBS

32.7.1 class NSAnimationContextMBS

Function: The Cocoa class for the context of a NSAnimation.
Notes: Available in Mac OS X v10.5 and later.

32.7.2 Methods

32.7.3 beginGrouping

Function: Creates a new animation grouping.
Notes: Available in Mac OS X v10.5 and later.

32.7.4 Constructor

Function: Creates a new NSAnimationContextMBS object with the current animation context.
Notes: Available in Mac OS X v10.5 and later.

32.7.5 currentContext as NSAnimationContextMBS

Function: Returns the current animation context.
Notes: Available in Mac OS X v10.5 and later.

32.7.6 endGrouping

Function: Ends the current animation grouping.
Notes: Available in Mac OS X v10.5 and later.
32.7. CLASS NSANIMATIONCONTEXTMBS

32.7.7 Properties

32.7.8 Handle as Integer

Function: The internal reference to the NSAnimationContext object.
Notes: (Read and Write property)

32.7.9 duration as Double

Function: The duration used when animating object properties that support animation.
Example:
NSAnimationContextMBS.currentContext.duration = 0.5

Notes:
Any animations that occur as a result of setting the values of animatable properties in the current context will run for this duration.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)
32.8  class NSAnimationMBS

Function:  Objects of the NSAnimation class manage the timing and progress of animations in the user interface.
Notes:  
The class also lets you link together multiple animations so that when one animation ends another one starts. It does not provide any drawing support for animation and does not directly deal with views, targets, or actions.

NSAnimation objects have several characteristics, including duration, frame rate, and animation curve, which describes the relative speed of the animation over its course. You can set progress marks in an animation, each of which specifies a percentage of the animation completed; when an animation reaches a progress mark, it notifies its delegate and posts a notification to any observers. Animations execute in one of three blocking modes: blocking, non-blocking on the main thread, and non-blocking on a separate thread. The non-blocking modes permit the handling of user events while the animation is running.

32.8.2 Methods

32.8.3 clearStartAnimation

Function:  Clears linkage to another animation that causes the receiver to start.

32.8.4 clearStopAnimation

Function:  Clears linkage to another animation that causes the receiver to stop.

32.8.5 Constructor(duration as Double, animationCurve as Integer)

Function:  Initializes the object with the specified duration and animation-curve values.
Notes:  
duration: The number of seconds over which the animation occurs. Specifying a negative number raises an exception.
animationCurve: An NSAnimationCurve constant that describes the relative speed of the animation over...
its course; if it is zero, the default curve (NSAnimationEaseInOut) is used.

You can always later change the duration of an NSAnimation object by sending it a setDuration: message, even while the animation is running. See "Constants" for descriptions of the NSAnimationCurve constants.

32.8.6 currentValue as Double

32.8.7 Destructor

32.8.8 isAnimating as boolean

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value that indicates whether the receiver is currently animating. Notes: True if the receiver is animating, false otherwise.

32.8.9 startAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Starts the animation represented by the receiver. Notes: The receiver retains itself and is then autoreleased at the end of the animation or when it receives stopAnimation. If the blocking mode is NSAnimationBlocking, the method only returns after the animation has completed or the delegate sends it stopAnimation. If the receiver has a progress of 1.0, it starts again at 0.0.

32.8.10 stopAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Stops the animation represented by the receiver. Notes: The current progress of the receiver is not reset. When this method is sent to instances of NSViewAnimation (a subclass of NSAnimation) the receiver moves to the end frame location.
32.8.11 Properties

32.8.12 Handle as Integer

Function: The internal reference to the animation object.
Notes: (Read and Write property)

32.8.13 animationBlockingMode as Integer

Function: The blocking mode of the receiver.
Notes: A constant representing the blocking mode the animation is next scheduled to run under. See "NSAnimationBlockingMode" for valid values.
If the constant is NSAnimationNonblocking, the animation runs in the main thread in one of the standard run-loop modes or in a mode returned from runLoopModesForAnimating. If animationBlockingMode is NSAnimationNonblockingThreaded, a new thread is spawned to run the animation.
The default mode is NSAnimationBlocking, which means that the animation runs on the main thread in a custom run-loop mode that blocks user events. The new blocking mode takes effect the next time the receiver is started and has no effect on an animation underway.
(Read and Write computed property)

32.8.14 animationCurve as Integer

Function: The animation curve the receiver is running under.
Notes: The animation curve describes the relative frame rate over the course of the animation. See NSAnimation* constants.
(Read and Write computed property)

32.8.15 currentProgress as Double

Function: The current progress of the receiver.
Notes:
The current progress is a value between 0.0 and 1.0 that represents the percentage of the animation currently completed. (Read and Write computed property)

### 32.8.16 duration as Double

**Function:** The duration of the animation, in seconds.  
**Notes:** (Read and Write computed property)

### 32.8.17 frameRate as Double

**Function:** The frame rate of the animation.  
**Notes:**  
The frame rate is the number of updates per second. It is not guaranteed to be accurate because of differences between systems on the time needed to process a frame. (Read and Write computed property)

### 32.8.18 Events

### 32.8.19 CurrentProgressChanged(progress as Double)

**Function:** The event called whenever the current value changes.

### 32.8.20 Constants

### 32.8.21 NSAnimationBlocking=0

MBS MacFrameworks Plugin, Plugin Version: 10.0.  
**Function:** One of the constants to indicate the blocking mode of an NSAnimation object when it is running.  
**Notes:**  
Requests the animation to run in the main thread in a custom run-loop mode that blocks user input.  

This is the default.
32.8.22  **NSAnimationEaseIn=1**

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to describe the curve of an animation that is, the relative speed of an animation from start to finish.  
**Notes:** Describes an animation that slows down as it reaches the end.

32.8.23  **NSAnimationEaseInOut=0**

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to describe the curve of an animation that is, the relative speed of an animation from start to finish.  
**Notes:** Describes an S-curve in which the animation slowly speeds up and then slows down near the end of the animation. This constant is the default.

32.8.24  **NSAnimationEaseOut=2**

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to describe the curve of an animation that is, the relative speed of an animation from start to finish.  
**Notes:** Describes an animation that slowly speeds up from the start.

32.8.25  **NSAnimationLinear=3**

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to describe the curve of an animation that is, the relative speed of an animation from start to finish.  
**Notes:** Describes an animation in which there is no change in frame rate.

32.8.26  **NSAnimationNonblocking=1**

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to indicate the blocking mode of an NSAnimation object when it is running.  
**Notes:** Requests the animation to run in a standard or specified run-loop mode that allows user input.

32.8.27  **NSAnimationNonblockingThreaded=2**

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to indicate the blocking mode of an NSAnimation object when it is running.  
**Notes:**
Requests the animation to run in a separate thread that is spawned by the NSAnimation object.

The secondary thread has its own run loop.
32.9  class NSAppearanceMBS

32.9.1  class NSAppearanceMBS

Function: The appearance class.
Notes:

An NSAppearance object represents a file that specifies a standard or custom appearance that applies to a
subset of UI elements in an app. An app can contain multiple appearance files and because NSAppearance
conforms to NSCoding you can use Interface Builder to assign UI elements to an appearance.

Typically, you customize a window by using Xcode to create an appearance file that contains the views you
want to customize and the custom art that should be applied to them. Xcode transforms the files art content
into a runtime format that AppKit can draw when the specified views are displayed.

If the art for a specific view cant be found, AppKit searches for the art in the appearances of the views
ancestors. A nil appearance means that a view uses the default Aqua appearance; a non-nil appearance
means that the view uses an ancestors appearance.

When AppKit draws a control, it automatically sets the current appearance on the current thread to the
controls appearance. The current appearance can influence the actual drawing path and the return values
you get when you access system fonts and colors. The current appearance also affects the appearance of text
and images, such as the text and template images that can be displayed in a toolbar.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

32.9.2  Methods

32.9.3  appearance(item as Variant) as NSAppearanceMBS

Function: The appearance of the receiver, in an NSAppearance object.
Example:

dim v as NSViewMBS = PushButton1.NSViewMBS
dim a as NSAppearanceMBS = NSAppearanceMBS.appearance(v)

MsgBox a.name

Notes: The default value for this property is nil, which means that the receiver uses the appearance it
inherits from the nearest ancestor that has set an appearance. When you set appearance to a non-nil value,
the receiver and the views it contains use the specified appearance.
32.9.4 appearanceNamed(name as string) as NSAppearanceMBS

Function: Returns the NSAppearance object with the specified name.
Notes:
name: The name of a standard or custom appearance.
Returns a standard or custom appearance object.

When you specify a standard appearance name such as NSAppearanceNameAquathis method returns a built-in appearance. If you specify a custom appearance name, this method searches the main bundle for an appearance file that has the specified name.
Available in OS X v10.9 and later.
See also:
• 32.9.5 appearanceNamed(name as string, bundle as NSBundleMBS) as NSAppearanceMBS

32.9.5 appearanceNamed(name as string, bundle as NSBundleMBS) as NSAppearanceMBS

Function: Creates an NSAppearance object initialized to the specified appearance file in the specified bundle.
Notes:
name: The name of the appearance file to search for, without any path information.
bundle: The bundle in which to search for the appearance file. If bundle is nil, this method searches in the main bundle.

Returns an initialized appearance object, or nil if an error occurs.
Available in OS X v10.9 and later.
See also:
• 32.9.4 appearanceNamed(name as string) as NSAppearanceMBS

32.9.6 Available as boolean

32.9.7 Constructor

32.9.8 currentAppearance as NSAppearanceMBS

Example:
MsgBox NSAppearanceMBS.currentAppearance.name

Notes:
When a UI element draws on the screen, it automatically sets the appearance that it's using on the current thread.
Available in OS X v10.9 and later.

32.9.9 effectiveAppearance(item as Variant) as NSAppearanceMBS

MBS MacExtras Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The appearance that will be used when the receiver is drawn onscreen, in an NSAppearance object.
Notes:
The default value for this property is provided by the nearest ancestor of the receiver that has set an appearance.
You can use this property to ensure that an offscreen view sets the appropriate current appearance when it draws onscreen.
Available in OS X v10.9 and later.

32.9.10 NSAppearanceNameAqua as string

32.9.11  **NS AppearanceNameLightContent** as string

**Function:** The name of the standard appearance that can be used by controls in light content areas (not including window-frame areas).

32.9.12  **NS AppearanceNameVibrantDark** as string

**Function:** The name of the vibrant dark appearance.  
**Notes:**  
Available on Mac OS X 10.10 and newer.  
Should only be set on an NSVisualEffectView, or one of its container subviews.

32.9.13  **NS AppearanceNameVibrantLight** as string

**Function:** The name of the vibrant dark appearance.  
**Notes:**  
Available on Mac OS X 10.10 and newer.  
Should only be set on an NSVisualEffectView, or one of its container subviews.

32.9.14  **setAppearance(item as Variant, appearance as NSAppearanceMBS)**

**Function:** Sets the appearance of the receiver, in an NSAppearance object.  
**Notes:** The default value for this property is nil, which means that the receiver uses the appearance it inherits from the nearest ancestor that has set an appearance. When you set appearance to a non-nil value, the receiver and the views it contains use the specified appearance.

32.9.15  **setCurrentAppearance(appearance as NSAppearanceMBS = nil)**

**Function:** Sets the current appearance to the specified NSAppearance object.  
**Notes:**  
appearance: The NSAppearance object that should be used for the window or view, or nil to specify the default appearance.
When you set an appearance on a window, all views in that window including the window background and controls in both the frame and content areas use that appearance. By default, AppKit sets the current appearance for standard windows and views during window drawing, so you don’t need to use this method unless you want to change the current appearance of a specific window or view.

You can use this method to set the current appearance for an offscreen view to the appearance that will be used when the view is drawn. To do this, use the offscreen views effectiveAppearance for the appearance parameter.

Available in OS X v10.9 and later.

### 32.9.16 Properties

#### 32.9.17 allowsVibrancy as Boolean

**Function:** Query allowsVibrancy to see if the given appearance actually needs vibrant drawing.

**Notes:**

You may want to draw differently if the current appearance is vibrant.

(Read only property)

#### 32.9.18 Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)

#### 32.9.19 name as String

**Function:** The name of the appearance.

**Example:**

MsgBox NSApearanceMBS.currentAppearance.name

**Notes:** (Read only property)
32.10. class NSApplicationDelegateMBS

32.10.1 class NSApplicationDelegateMBS

Function: The class for an Cocoa application delegate.

Notes:
Please install in app Constructor. App.Open may be too late.

Using this class you can get application related events before (!) the app class gets it. And of course more events than just the ones the app class have.

Only for Cocoa desktop targets.

In general the plugin calls first the event. Depending on the result it may pass the event to the Real Studio application delegate. If you have no code in the plugin event, everything just passes through and you should not see a difference.

The plugin application delegate is installed with the Constructor and uninstalled in the Destructor.

The original delegate from Real Studio is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.

32.10.2 Events

32.10.3 applicationDidBecomeActive(Notification as NSNotificationMBS)

Function: Sent by the default notification center immediately after the application becomes active.

32.10.4 applicationDidChangeScreenParameters(Notification as NSNotificationMBS)

Function: Sent by the default notification center when the configuration of the displays attached to the computer is changed (either programmatically or when the user changes settings in the Displays control panel).
CHAPTER 32. COCOA

32.10.5 applicationDidDecodeRestorableState(coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event gives you the chance to restore your own state.

32.10.6 applicationDidFailToRegisterForRemoteNotificationsWithError(error as NSErrorMBS)

32.10.7 applicationDidFinishLaunching(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Sent by the default notification center after the application has been launched and initialized but before it has received its first event. Notes: Delegates can implement this method to perform further initialization. This method is called after the application’s main run loop has been started but before it has processed any events. If the application was launched by the user opening a file, the delegate’s applicationOpenFile method is called before this method. If you want to perform initialization before any files are opened, implement the applicationWillFinishLaunching method in your delegate, which is called before applicationOpenFile."

32.10.8 applicationDidHide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Sent by the default notification center immediately after the application is hidden.

32.10.9 applicationDidReceiveRemoteNotification(userInfo as Dictionary)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: A notification was received. Notes: The dictionary contains payload like this:
key "aps" contains another dictionary. This second dictionary contains keys like "alert", "badge" and "sound".

Available on Mac OS X 10.7 or newer.

### 32.10.10 applicationDidRegisterForRemoteNotificationsWithDeviceToken(deviceToken as memoryblock)

**Function:** Application registered for remote notifications.  
**Notes:**  
Tell your server the device token ID and use it in your push notifications.  
Distinguish between iOS and Mac versions of your app!

Available on Mac OS X 10.7 or newer.

### 32.10.11 applicationDidResignActive(Notification as NSNotificationMBS)

**Function:** Sent by the default notification center immediately after the application is deactivated.

### 32.10.12 applicationDidUnhide(Notification as NSNotificationMBS)

**Function:** Sent by the default notification center immediately after the application is made visible.

### 32.10.13 applicationDidUpdate(Notification as NSNotificationMBS)

**Function:** Sent by the default notification center immediately after the application object updates its windows.

### 32.10.14 applicationDockMenu as NSMenuMBS

**Function:** Allows the delegate to supply a dock menu for the application dynamically.  
**Notes:** Return the menu to display in the dock. Or nil for having no/default menu.
32.10.15  applicationOpenFile(filename as string) as boolean

Function: Tells the delegate to open a single file.
Notes:
filename: The path of the file to open.

Return yes if the file was successfully opened or false if it was not.

Sent directly by application to the delegate. The method should open the file filename, returning true if the file is successfully opened, and false otherwise. If the user started up the application by double-clicking a file, the delegate receives the applicationOpenFile message before receiving applicationDidFinishLaunching. (applicationWillFinishLaunching is sent before applicationOpenFile.)

If you return false, the plugin will pass the event to the default Real Studio runtime application delegate, so the OpenDocument event can fire.

32.10.16  applicationOpenFiles(filenames() as string) as boolean

Function: Tells the delegate to open multiple files.
Notes:
sender: The application object associated with the delegate.
filenames: An array of strings containing the names of the files to open.

Identical to applicationOpenFile except that the receiver opens multiple files corresponding to the file names in the filenames array. Delegates should invoke the replyToOpenOrPrint method upon success or failure, or when the user cancels the operation.

If you add code to this event, it is possible that OpenDocument event in Real Studio does not fire.

32.10.17  applicationOpenFileWithoutUI(filename as string) as boolean

Function: Tells the delegate to open a file programmatically.
Notes:
filename: The name of the file to open.
Return true if the file was successfully opened or false if it was not.

Sent directly by sender to the delegate to request that the file filename be opened as a linked file. The method should open the file without bringing up its application’s user interface; that is, work with the file is under programmatic control of sender, rather than under keyboard control of the user.

If you add code to this event, it is possible that OpenDocument event in Real Studio does not fire.

32.10.18  applicationOpenTempFile(filename as string) as boolean

Function: Tells the delegate to open a temporary file.
Notes:
filename: The name of the temporary file to open.

True if the file was successfully opened or false if it was not.

Sent directly by application to the delegate. The method should attempt to open the file filename, returning true if the file is successfully opened, and false otherwise.

By design, a file opened through this method is assumed to be temporary; it’s the application’s responsibility to remove the file at the appropriate time.

If you add code to this event, it is possible that OpenDocument event in Real Studio does not fire.

32.10.19  applicationOpenUntitledFile as boolean

Function: Tells the delegate to open an untitled file.
Notes:
Return true if the file was successfully opened or false if it was not.
Sent directly by application to the delegate to request that a new, untitled file be opened.

If you return false, the plugin will pass the event to the default Real Studio runtime application delegate.

If you add code to this event, it is possible that OpenDocument event in Real Studio does not fire.
32.10.20  applicationPrintFile(filename as string) as boolean

Function:  Sent when the user starts up the application on the command line with the -NSPrint option.

Notes:

filename:  The name of the file to print.

Returns true if the file was successfully printed or false if it was not.

This message is sent directly by application to the delegate. The application terminates (using the terminate method) after this method returns.

If at all possible, this method should print the file without displaying the user interface. For example, if you pass the -NSPrint option to the TextEdit application, TextEdit assumes you want to print the entire contents of the specified file. However, if the application opens more complex documents, you may want to display a panel that lets the user choose exactly what they want to print.

32.10.21  applicationPrintFiles(fileNames() as string, printSettings as dictionary, showPrintPanels as boolean) as boolean

Function:  Prints a group of files.

Notes:

fileNames:  An array of strings, each of which contains the name of a file to print.

printSettings:  A dictionary containing NSPrintInfo-compatible print job attributes.

showPrintPanels:  A Boolean that specifies whether the print panel should be displayed for each file printed. Print progress indicators will be presented even if this value is false.

Return a constant indicating whether printing was successful. For a list of possible values, see NSPrinting* constants.

Return NSPrintingReplyLater if the result of printing cannot be returned immediately, for example, if printing will cause the presentation of a sheet. If your method returns NSPrintingReplyLater it must always invoke the NSApplicationMBS method replyToOpenOrPrint when the entire print operation has been completed, successfully or not.
32.10.22 applicationShouldHandleReopen(hasVisibleWindows as boolean) as boolean

Function: Sent by the application to the delegate prior to default behavior to reopen (rapp) AppleEvents.
Notes:
flag: Indicates whether the NSApplication object found any visible windows in your application. You can use this value as an indication of whether the application would do anything if you return true.

Return true if you want the application to perform its normal tasks or false if you want the application to do nothing.

These events are sent whenever the Finder reactivates an already running application because someone double-clicked it again or used the dock to activate it.

By default the Application Kit will handle this event by checking whether there are any visible NSWindow (not NSPanel) objects, and, if there are none, it goes through the standard untitled document creation (the same as it does if application is launched without any document to open). For most document-based applications, an untitled document will be created.

The application delegate will also get a chance to respond to the normal untitled document delegate methods. If you implement this method in your application delegate, it will be called before any of the default behavior happens. If you return true, then NSApplication will proceed as normal. If you return false, then NSApplication will do nothing. So, you can either implement this method with a version that does nothing, and return false if you do not want anything to happen at all (not recommended), or you can implement this method, handle the event yourself in some custom way, and return false.

Miniaturized windows, windows in the Dock, are considered visible by this method, and cause flag to return true, despite the fact that miniaturized windows return false when sent an isVisible message.

Having no code in the event will tell the plugin to return true.

32.10.23 applicationShouldOpenUntitledFile as boolean

Function: Invoked immediately before opening an untitled file.
Notes:
Return true if the application should open a new untitled file or false if it should not.

Use this method to decide whether the application should open a new, untitled file. Note that applicationOpenUntitledFile is invoked if this method returns true.
If you return false here, the NewDocument event in Real Studio may not fire. Having no code in this event is the same as returning true.

32.10.24 applicationShouldTerminate as Integer

Function: Sent to notify the delegate that the application is about to terminate.
Notes:
One of the values defined in NSTerminate* constants indicating whether the application should terminate.

This method is called after the application’s Quit menu item has been selected, or after the terminate method has been called. Generally, you should return NSTerminateNow to allow the termination to complete, but you can cancel the termination process or delay it somewhat as needed. For example, you might delay termination to finish processing some critical data but then terminate the application as soon as you are done by calling the replyToApplicationShouldTerminate method.

32.10.25 applicationShouldTerminateAfterLastWindowClosed as boolean

Function: Invoked when the user closes the last window the application has open.
Notes:
Return false if the application should not be terminated when its last window is closed; otherwise, true to terminate the application.

The application sends this message to your delegate when the application’s last window is closed. It sends this message regardless of whether there are still panels open. (A panel in this case is defined as being an instance of NSPanel or one of its subclasses.)

If your implementation returns false, control returns to the main event loop and the application is not terminated. If you return true, your delegate’s applicationShouldTerminate method is subsequently invoked to confirm that the application should be terminated.

Having no code in this event is the same as returning false.
32.10.26  applicationWillBecomeActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application becomes active.

32.10.27  applicationWillEncodeRestorableState(coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Event called to give you chance to encode any additional state into the NSCoder.  **Notes:** If the restorable state managed by the delegate changes, you must call NSApplicationMBS.invalidateRestorableState so that it will be re-encoded.

32.10.28  applicationWillFinishLaunching(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application object is initialized.

32.10.29  applicationWillHide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application is hidden.

32.10.30  applicationWillPresentError(error as NSErrorMBS) as NSErrorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent to the delegate before the specified application presents an error message to the user.  **Notes:** error: The error object that is used to construct the error message. Your implementation of this method can return a new NSError object or the same one in this parameter.  

Return the error object to display.

You can implement this delegate method to customize the presentation of any error presented by your application, as long as no code in your application overrides either of the NSResponder methods presentError in a way that prevents errors from being passed down the responder chain to the application object.

Your implementation of this delegate method can examine error and, if its localized description or recovery
information is unhelpfully generic, return an error object with specific localized text that is more suitable for presentation in alert sheets and dialogs. If you do this, always use the domain and error code of the NSError object to distinguish between errors whose presentation you want to customize and those you do not. Don’t make decisions based on the localized description, recovery suggestion, or recovery options because parsing localized text is problematic. If you decide not to customize the error presentation, just return the passed-in error object.

If you have no code in this event or you return nil, the plugin passes the given error back to the Cocoa runtime.

### 32.10.31 applicationWillResignActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application is deactivated.

### 32.10.32 applicationWillTerminate(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application terminates.

### 32.10.33 applicationWillUnhide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately after the application is unhidden.

### 32.10.34 applicationWillUpdate(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application object updates its windows.

### 32.10.35 restoreWindowWithIdentifier(identifier as string, state as NSCoderMBS, byref resultWindow as Variant, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked to request that a window be restored. **Notes:**
If you plan to use this event, please initialize the NSApplicationDelegateMBS subclass in app.constructor.

identifier: The unique interface item identifier string that was previously associated with the window. Use this string to determine which window to create.
state: A coder object containing the window state information. This coder object contains the combined restorable state of the window, which can include the state of the window, its delegate, window controller, and document object. You can use this state to determine which window to create.

Pass back with the parameters:
The window that was created or nil if the window could not be created.
An error object if the window was not recognized or could not be created for whatever reason; otherwise, specify nil. In OS X 10.7, the error parameter is ignored.

Return true if the window was restored; otherwise false.

If the receiver knows how to restore the identified window, it should invoke the completion handler with the window, possibly creating it. It is acceptable to use a pre-existing window, though you should not pass the same window to more than one completion handler. If the receiver cannot restore the identified window (for example, the window referenced a document that has been deleted), it should invoke the completion handler with a nil window.

The receiver is application is passed the identifier of the window, which allows it to quickly check for known windows. For example, you might give your preferences window an identifier of "preferences" in the nib, and then check for that identifier in your implementation. The receiver is also passed the NSCoder instance containing the combined restorable state of the window, its delegate, the window controller, and any document. The receiver may decode information previously stored in the coder to determine what window to restore.

Available in OS X v10.7 and later.

The plugin implements this method for NSApplication and forwards the message to this event. If you return true, please set either error or resultWindow values. resultWindow must be an NSWindowMBS or a window object.

### 32.10.36 Constants

#### 32.10.37 NSPrintingCancelled = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constant values to reply to ApplicationPrintFiles event.
**Notes:** Printing was cancelled.
32.10.38 NSPrintingFailure = 3

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constant values to reply to ApplicationPrintFiles event.
**Notes:** Printing failed.

32.10.39 NSPrintingReplyLater = 2

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constant values to reply to ApplicationPrintFiles event.
**Notes:** The result of printing cannot be returned immediately, for example, if printing will cause the presentation of a sheet. If your method returns NSPrintingReplyLater it must always invoke replyToOpenOrPrint when the entire print operation has been completed, successfully or not.

32.10.40 NSPrintingSuccess = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constant values to reply to ApplicationPrintFiles event.
**Notes:** Printing was successful.

32.10.41 NSTerminateCancel = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants to answer application-ShouldTerminate event.
**Notes:** The application should not be terminated.

32.10.42 NSTerminateLater = 2

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants to answer application-ShouldTerminate event.
**Notes:** It may be OK to proceed with termination later. Returning this value causes Cocoa to run the run loop in the NSModalPanelRunLoopMode until your application subsequently calls replyToApplication-ShouldTerminate with the value true or false. This return value is for delegates that need to provide document modal alerts (sheets) in order to decide whether to quit.
32.10.43  **NSTerminateNow = 1**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants to answer application-ShouldTerminate event.  
**Notes:** It is OK to proceed with termination.
32.11 class NSApplicationMBS

32.11.1 class NSApplicationMBS

Function: The cocoa application class.
Example:

```vbnet
dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication

// set a custom picture

dim p as Picture = LogoMBS(500)
dim n as new NSImageMBS(p)
a.applicationIconImage = n

// restore
'a.applicationIconImage = nil
```

Notes:
The plugin only implements a small subset of what's available in Cocoa. If you miss something, please send us an email.

You can get an instance of this class using one of three ways:

- app.NSApplicationMBS function
- new NSApplicationMBS
- NSApplicationMBS.sharedInstance

32.11.2 Methods

32.11.3 activateIgnoringOtherApps(flag as boolean)

Function: Makes the receiver the active application.
Notes:
flag: If false, the application is activated only if no other application is currently active. If true, the application activates regardless.
The flag parameter is normally set to false. When the Finder launches an application, using a value of false for flag allows the application to become active if the user waits for it to launch, but the application remains unobtrusive if the user activates another application. Regardless of the setting of flag, there may be a time lag before the application activates; you should not assume the application will be active immediately after sending this message.

You rarely need to invoke this method. Under most circumstances, the Application Kit takes care of proper activation. However, you might find this method useful if you implement your own methods for inter-application communication.

You don’t need to send this message to make one of the application’s NSWindows key. When you send a makeKeyWindow message to an NSWindow object, you ensure that it is the key window when the application is active.

32.11.4 addWindowsItem(win as NSWindowMBS, title as string, isFilename as boolean)

Function: Adds an item to the Window menu for a given window.
Notes:

- win: The window being added to the menu. If this window object already exists in the Window menu, this method has no effect.
- Title: The string to display for the window’s menu item. How the string is interpreted is dependent on the value in the isFilename parameter.
- isFilename: If false, title appears literally in the menu; otherwise, title is assumed to be a converted pathname with the name of the file preceding the path (the way the NSWindow method setTitleWithRepresentedFilename shows a title)

You rarely need to invoke this method directly because Cocoa places an item in the Window menu automatically whenever you set the title of an NSWindow object.

32.11.5 arrangeInFront

Function: Arranges windows listed in the Window menu in front of all other windows.
Example:

```javascript
dim a as new NSApplicationMBS
a.arrangeInFront
```
Notes: Windows associated with the application but not listed in the Window menu are not ordered to the front.

32.11.6 cancelUserAttentionRequest(request as Integer)

Function: Cancels a previous user attention request.
Notes:
request: The request identifier returned by the requestUserAttention method.

A request is also canceled automatically by user activation of the application.

32.11.7 changeWindowsItem(win as NSWindowMBS, title as string, isFilename as boolean)

Function: Changes the item for a given window in the Window menu to a given string.
Notes:
win: The window whose title you want to change in the Window menu. If win is not in the Window menu, this method adds it.
title: The string to display for the window's menu item. How the string is interpreted is dependent on the value in the isFilename parameter.
isFilename: If false, title appears literally in the menu; otherwise, title is assumed to be a converted pathname with the name of the file preceding the path (the way the NSWindow method setTitleWithRepresentedFilename shows a title)

32.11.8 completeStateRestoration

Function: Completes the extended state restoration.
Notes:
This method informs the application that the extended state restoration is completed for the balancing.

If a window has some state that may take a long time to restore, such as a web page, you may use this method and methods to completeStateRestoration to extend the period of this crash protection beyond the default.

You call extendStateRestoration within your implementation of restoreWindowWithIdentifier. You would
then call completeStateRestoration some time after the window is fully restored. If the app crashes in the interim, then it may offer to discard restorable state on the next launch.

The extendStateRestoration and completeStateRestoration method act as a counter. Each call to extendStateRestoration increments the counter, and must be matched with a corresponding call to completeStateRestoration which decrements it. When the counter reaches zero, the app is considered to have been fully restored, and any further calls are silently ignored.

This method is thread safe.
Available in OS X v10.7 and later.

### 32.11.9 Constructor

**Function:** The constructor.  
**Example:**

```plaintext
dim n as new NSApplicationMBS

n.dockTile.badgeLabel = "Hello"
n.dockTile.showsApplicationBadge = true
```

**Notes:** Creates an object which points to the shared NSApplication instance.

### 32.11.10 deactivate

**Function:** Deactivates the receiver.  
**Example:**

```plaintext
dim a as new NSApplicationMBS

a.deactivate
```

**Notes:** Normally, you shouldn’t invoke this method the Application Kit is responsible for proper deactivation.
32.11.11 disableRelaunchOnLogin

Function: Disable relaunching this app on login, if the app was running at the time the user logged out.

Notes:

These methods increment and decrement a counter respectively; if the counter is 0 at the time the user logs out, then the app may be relaunched when the user logs back in. The counter is initially zero, so by default apps are relaunched.

If your app should not be relaunched because it launches via some other mechanism (e.g. launchd), then the recommended usage is to call disableRelaunchOnLogin once, and never pair it with an enable call.

If your app should not be relaunched because it triggers a restart (e.g. an installer), then the recommended usage is to call disableRelaunchOnLogin immediately before you attempt to trigger a restart, and enableRelaunchOnLogin immediately after. This is because the user may cancel restarting; if the user later restarts for another reason, then your app should be brought back.

These methods are thread safe.
Available on Mac OS X 10.7 or newer.

32.11.12 discardEventsMatchingMask(mask as Integer, beforeEvent as NSEventMBS)

Function: Removes all events matching the given mask and generated before the specified event.

Notes:

mask: Contains one or more flags indicating the types of events to discard. The constants section of the NSEvent class defines the constants you can add together to create this mask. The discussion section also lists some of the constants that are typically used.

lastEvent: A marker event that you use to indicate which events should be discarded. Events that occurred before this event are discarded but those that occurred after it are not.

Use this method to ignore any events that occurred before a specific event. For example, suppose your app has a tracking loop that you exit when the user releases the mouse button. You could use this method, specifying NSAnyEventMask as the mask argument and the ending mouse-up event as the lastEvent argument, to discard all events that occurred while you were tracking mouse movements in your loop. Passing the mouse-up event as lastEvent ensures that any events that might have occurred after the mouse-up event (that is, that appear in the queue after the mouse-up event) are not discarded.

Typically, you send this message to an NSWindow object, rather than to the app object. Discarding events for a window clears out all of the events for that window only, leaving events for other windows in place.
For the mask parameter, you can add together event type constants such as the following:

- NSLeftMouseDownMask
- NSLeftMouseUpMask
- NSRightMouseDownMask
- NSRightMouseUpMask
- NSMouseMovedMask
- NSLeftMouseDraggedMask
- NSRightMouseDraggedMask
- NSMouseEnteredMask
- NSMouseExitedMask
- NSKDownMask
- NSKUpMask
- NSFflagsChangedMask
- NSPeriodicMask
- NSCursorUpdateMask
- NSAnyEventMask

This method can also be called in subthreads. Events posted in subthreads bubble up in the main thread event queue.

32.11.13 enabledRemoteNotificationTypes as Integer

**Notes:** Available on Mac OS X 10.7 or newer.
32.11.14  enableRelaunchOnLogin

Function: Enable relaunching this app on login, if the app was running at the time the user logged out.

Notes:
These methods increment and decrement a counter respectively; if the counter is 0 at the time the user logs out, then the app may be relaunched when the user logs back in. The counter is initially zero, so by default apps are relaunched.

If your app should not be relaunched because it launches via some other mechanism (e.g. launchd), then the recommended usage is to call disableRelaunchOnLogin once, and never pair it with an enable call.

If your app should not be relaunched because it triggers a restart (e.g. an installer), then the recommended usage is to call disableRelaunchOnLogin immediately before you attempt to trigger a restart, and enableRelaunchOnLogin immediately after. This is because the user may cancel restarting; if the user later restarts for another reason, then your app should be brought back.

These methods are thread safe.
Available on Mac OS X 10.7 or newer.

32.11.15  extendStateRestoration

Function: Allows an application to extend its state restoration period.

Notes:
This method allows an application to extend the state restoration period beyond the usual. For example, the app crashes before state restoration is complete, then it may offer to discard restorable state on the next launch.

If a window has some state that may take a long time to restore, such as a web page, you may use this method and methods to completeStateRestoration to extend the period of this crash protection beyond the default.

You call extendStateRestoration within your implementation of restoreWindowWithIdentifier. You would then call completeStateRestoration some time after the window is fully restored. If the app crashes in the interim, then it may offer to discard restorable state on the next launch.

The extendStateRestoration and completeStateRestoration method act as a counter. Each call to extendStateRestoration increments the counter, and must be matched with a corresponding call to completeStateRestoration which decrements it. When the counter reaches zero, the app is considered to have been fully restored, and any further calls are silently ignored.
This method is thread safe.
Available in OS X v10.7 and later.

32.11.16 hide

**Function:** Hides all the receiver’s windows, and the next application in line is activated.
**Example:**

```
NSApplicationMBS.sharedApplication.hide
```

**Notes:** This method is usually invoked when the user chooses Hide in the application’s main menu. When this method begins, it posts an NSApplicationWillHideNotification to the default notification center. When it completes successfully, it posts an NSApplicationDidHideNotification.

32.11.17 hideOtherApplications

**Function:** Hides all applications, except the receiver.
**Example:**

```
NSApplicationMBS.sharedApplication.hideOtherApplications
```

32.11.18 invalidateRestorableState

**Function:** Invalidates the restorable state.
**Notes:** applicationWillEncodeRestorableState event will be called soon in your NSApplicationDelegateMBS subclass to get a new state encoded.

32.11.19 miniaturizeAll

**Function:** Miniaturizes all the receiver’s windows.
**Example:**
32.11.20 modalWindow as NSWindowMBS

Function: Returns the modal window that the receiver is displaying.
Example:

```csharp
// show title of current dialog
MsgBox NSApplicationMBS.sharedApplication.modalWindow.Title
```

Notes:
Returns the modal window being displayed or nil if no modal window is being displayed.

This method returns the current standalone modal window. It does not return sheets that are attached to other windows. If you need to retrieve a sheet window, use the attachedSheet method of NSWindow.

32.11.21 nextEventMatchingMask(mask as Integer, untilDate as date, mode as String, dequeueFlag as boolean) as NSEventMBS

Function: Returns the next event matching a given mask, or nil if no such event is found before a specified expiration date.
Example:

```csharp
Function MouseDown(X As Integer, Y As Integer) Handles MouseDown as Boolean
// in mousedown event

dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication

// check current event
dim e as NSEventMBS = a.currentEvent

// check next mouse up event
dim d as new date
d.Second = d.Second + 2 // maximum 2 seconds wait time

dim n as NSEventMBS = a.nextEventMatchingMask(NSEventMBS.NSLeftMouseUpMask, d, NSRunLoopMBS.NSDefaultRunLoopMode, false)

// e->mouseDown
```
32.11. CLASS NSAPPLICATIONMBS

// e->mouseUp, if already available

Break
End Function

Notes:

mask: Contains one or more flags indicating the types of events to return. The constants section of the
NSEvent class defines the constants you can add together to create this mask. The discardEventsMatching-
Mask method also lists several of these constants.
expiration: The expiration date for the current event request. Specifying nil for this parameter is equivalent
to returning a date object using the distantPast method.
mode: The run loop mode in which to run while looking for events. The mode you specify also determines
which timers and run-loop observers may fire while the app waits for the event.
flag: Specify true if you want the event removed from the queue.

Returns the event object whose type matches one of the event types specified by the mask parameter.

You can use this method to short circuit normal event dispatching and get your own events. For example,
you may want to do this in response to a mouse-down event in order to track the mouse while its button is
down. (In such an example, you would pass the appropriate event types for mouse-dragged and mouse-up
events to the mask parameter and specify the NSEventTrackingRunLoopMode run loop mode.) Events that
do not match one of the specified event types are left in the queue.
You can specify one of the run loop modes defined by AppKit or a custom run loop mode used specifically
by your app. AppKit defines the following run-loop modes:

- NSDefaultRunLoopMode
- NSEventTrackingRunLoopMode
- NSModalPanelRunLoopMode
- NSConnectionReplyMode

32.11.22 NSAppKitVersionNumber as Double

Function: This constant identifies the installed version of the Application Kit framework.
Example:

const NSAppKitVersionNumber10_0 = 577
const NSAppKitVersionNumber10_1 = 620
const NSAppKitVersionNumber10_2 = 663
const NSAppKitVersionNumber10_2_3 = 663.6
const NSAppKitVersionNumber10_3 = 743
const NSAppKitVersionNumber10_3_2 = 743.14
const NSAppKitVersionNumber10_3_3 = 743.2
const NSAppKitVersionNumber10_3_5 = 743.24
const NSAppKitVersionNumber10_3_7 = 743.33
const NSAppKitVersionNumber10_3_9 = 743.36
const NSAppKitVersionNumber10_4 = 824
const NSAppKitVersionNumber10_4_1 = 824.1
const NSAppKitVersionNumber10_4_3 = 824.23
const NSAppKitVersionNumber10_4_4 = 824.33
const NSAppKitVersionNumber10_4_7 = 824.41
const NSAppKitVersionNumber10_5 = 949
const NSAppKitVersionNumber10_5_2 = 949.27
const NSAppKitVersionNumber10_5_3 = 949.33
const NSAppKitVersionNumber10_6 = 1038
const NSAppKitVersionNumber10_7 = 1138
const NSAppKitVersionNumber10_7_2 = 1138.23

if NSApplicationMBS.NSAppKitVersionNumber >= NSAppKitVersionNumber10_5 then
    MsgBox "This is Mac OS X 10.5 or newer."
end if

Notes: See NSAppKitVersionNumber* constants.

32.11.23 NSApplicationDidBecomeActiveNotification as string

Function: One of the notification names.
Notes:
Posted immediately after the application becomes active.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

32.11.24 NSApplicationDidChangeScreenParametersNotification as string

Function: One of the notification names.
Notes:
Posted when the configuration of the displays attached to the computer is changed.
The configuration change can be made either programmatically or when the user changes settings in the Displays control panel. The notification object is sharedApplication. This notification does not contain a userInfo dictionary.
32.11. **CLASS NSAPPLICATIONMBS**

32.11.25 **NSApplicationDidFinishLaunchingNotification as string**

**Function:** One of the notification names.

**Notes:**

Posted at the end of the finishLaunching method to indicate that the application has completed launching and is ready to run.

The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

32.11.26 **NSApplicationDidFinishRestoringWindowsNotification as string**

**Function:** Posted when the application is finished restoring windows.

**Notes:**

The notification is posted when the application is finished restoring windows, that is, when all the completion handlers from restoreWindowWithIdentifier have been called. This is always posted after NSApplicationWillFinishLaunchingNotification, but may be posted before or after NSApplicationDidFinishLaunchingNotification, depending on whether clients copy the completion handlers and invoke them later. If there were no windows to restore, then this notification is still posted at the corresponding point in app launch (between NSApplicationWillFinishLaunchingNotification and NSApplicationDidFinishLaunchingNotification).

The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

Available in OS X v10.7 and later.

32.11.27 **NSApplicationDidHideNotification as string**

**Function:** One of the notification names.

**Notes:**

Posted at the end of the hide method to indicate that the application is now hidden.

The notification object is NSApp. This notification does not contain a userInfo dictionary.

32.11.28 **NSApplicationDidResignActiveNotification as string**

**Function:** One of the notification names.

**Notes:**

Posted immediately after the application gives up its active status to another application.

The notification object is NSApp. This notification does not contain a userInfo dictionary.
32.11.29 **NSApplicationDidUnhideNotification as string**

**Function:** One of the notification names.

**Notes:**
Posted at the end of the unhideWithoutActivation method to indicate that the application is now visible.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

32.11.30 **NSApplicationDidUpdateNotification as string**

**Function:** One of the notification names.

**Notes:**
Posted at the end of the updateWindows method to indicate that the application has finished updating its windows.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

32.11.31 **NSApplicationLaunchIsDefaultLaunchKey as string**

**Function:** One of the keys for the userinfo dictionary on didFinishLaunching.

**Notes:**
The following key is present in the userInfo of NSApplicationDidFinishLaunchingNotification or in the didFinishLaunching event. Its value is a number containing a bool. It will be false if the app was launched to open or print a file, to perform a Service, if the app had saved state that will be restored, or if the app launch was in some other sense not a "default" launch. Otherwise its value will be true.

Available on Mac OS X 10.7 or newer.

32.11.32 **NSApplicationLaunchRemoteNotificationKey as string**

**Function:** One of the keys for the userinfo dictionary on didFinishLaunching.

**Notes:**
User info keys for NSApplicationDidFinishLaunchingNotification.
Available on Mac OS X 10.7 or newer.
32.11.33 **NSApplicationLaunchUserNotificationKey** as string

**Function**: One of the user info keys for NSApplicationDidFinishLaunchingNotification.

**Example**:

```
Sub applicationDidFinishLaunching(Notification as NSNotificationMBS)
    dim userInfo as Dictionary = Notification.userInfo
    dim key as string = NSApplicationMBS.NSApplicationLaunchUserNotificationKey
    dim UserNotification as NSUserNotificationMBS = userInfo.Lookup(key, nil)
    if UserNotification <> nil then
        MsgBox UserNotification.identifier + ": " + UserNotification.informativeText
    end if
End Sub
```

**Notes**:

This key is present in the userInfo of NSApplicationDidFinishLaunchingNotification. It will be present if your application was launched because a user activated a notification in the Notification Center. Its value is an NSUserNotification object.

Available in Mac OS X 10.8.

32.11.34 **NSApplicationWillBecomeActiveNotification** as string

**Function**: One of the notification names.

**Notes**:

Posted immediately after the application becomes active.

The notification object is NSApp. This notification does not contain a userInfo dictionary.

32.11.35 **NSApplicationWillFinishLaunchingNotification** as string

**Function**: One of the notification names.

**Notes**:

Posted at the start of the finishLaunching method to indicate that the application has completed its initialization process and is about to finish launching.
CHAPTER 32. COCOA

The notification object is NSApp. This notification does not contain a userInfo dictionary.

32.11.36 NSApplicationWillHideNotification as string

Function: One of the notification names.
Notes:
Posted at the start of the hide method to indicate that the application is about to be hidden.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

32.11.37 NSApplicationWillResignActiveNotification as string

Function: One of the notification names.
Notes:
Posted immediately before the application gives up its active status to another application.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

32.11.38 NSApplicationWillTerminateNotification as string

Function: One of the notification names.
Notes:
Posted by the terminate method to indicate that the application will terminate.
Posted only if the delegate method applicationWillTerminate returns true. The notification object is
sharedApplication. This notification does not contain a userInfo dictionary.

32.11.39 NSApplicationWillUnhideNotification as string

Function: One of the notification names.
Notes:
Posted at the start of the unhideWithoutActivation method to indicate that the application is about to
become visible.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.
32.11.40 **NSApplicationWillUpdateNotification as string**

**Function:** One of the notification names.

**Notes:**

Posted at the start of the updateWindows method to indicate that the application is about to update its windows.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

32.11.41 **orderFrontCharacterPalette**

**Function:** Opens the character palette.

**Example:**

```dim a as new NSApplicationMBS
a.orderFrontCharacterPalette```

**Notes:**

Available in Mac OS X v10.3 and later.
This shows the special characters palette.

32.11.42 **orderFrontStandardAboutPanel**

**Function:** Displays a standard About window.

**Example:**

```dim a as new NSApplicationMBS
a.orderFrontStandardAboutPanel```

**Notes:** This method calls orderFrontStandardAboutPanelWithOptions with a nil argument. See orderFrontStandardAboutPanelWithOptions for a description of what’s displayed.
32.11.43 orderFrontStandardAboutPanelWithOptions(options as dictionary)

**Function:** Displays a standard About window with information from a given options dictionary.

**Example:**

```plaintext
dim a as new NSApplicationMBS

// this image has no mask, so you’ll see a white border
dim p as Picture = LogoMBS(500)
dim n as new NSImageMBS(p)
dim options as new Dictionary

// show window with default values
'a.orderFrontStandardAboutPanel

// we overwrite default values with new values
options.Value("Credits") = NSAttributedStringMBS.attributedStringWithString("Written by Christian Schmitz")
options.Value("ApplicationName") = "MyCoolApp"
options.Value("Version") = "1.2.3"
options.Value("Copyright") = " 2011 Monkeybread Software"
options.Value("ApplicationIcon") = n

a.orderFrontStandardAboutPanelWithOptions(options)
```

**Exception** ex as NSExceptionMBS
MsgBox ex.message

**Notes:**

options: A dictionary whose keys define the contents of the About window. See the discussion for a description of the available keys.

The following strings are keys that can occur in optionsDictionary:

32.11.44 OverlayApplicationIconImage(image as NSImageMBS)

**Function:** Overlays the image.

**Example:**

```plaintext
// draw a picture with a red dot on the top left

dim p as new Picture(512,512,32)
```
"""
"""
An NSAttributedStringMBS displayed in the info area of the panel. If not specified, this method then looks for a file named "Credits.html", "Credits.rtf", and "Credits.rtfd", in that order, in the bundle returned by the NSBundle class method mainBundle. The first file found is used. If none is found, the info area is left blank.

"ApplicationName" A string displayed as the application’s name. If not specified, this method then uses the value of CFBundleName (localizable). If neither is found, this method uses the process name.

"ApplicationIcon" A NSImageMBS object displayed as the application’s icon. If not specified, this method then looks for an image named "NSApplicationIcon", using NSImageMBS.imageNamed("NSApplicationIcon"). If neither is available, this method uses the generic application icon.

"Version" A string with the build version number of the application ("58.4"), displayed as "(v58.4)". If not specified, obtain from the CFBundleVersion key in infoDictionary; if not specified, leave blank (the "(v)" is not displayed).

"Copyright" A string with a line of copyright information. If not specified, this method then looks for the value of NSHumanReadableCopyright in the localized version infoDictionary. If neither is available, this method leaves the space blank.

"ApplicationVersion" A string with the application version ("Mac OS X", "3", "WebObjects 4.5", "AppleWorks 6","..."). If not specified, obtain from the CFBundleShortVersionString key in infoDictionary. If neither is available, the build version, if available, is printed alone, as "Version x.x".

dim g as Graphics = p.Graphics
g.ForeColor = & c FF0000
g.FillRect 0,0,128,128
g = p.mask.Graphics
g.ForeColor = & c FFFFFF
g.Fillrect 0,0,512,512
g.ForeColor = & c 000000
g.Filloval 0,0,128,128
Backdrop = p

// create nsimage
dim n as new NSImageMBS(p,p.mask)

// and overlay over original image
NSApplicationMBS.sharedApplication.OverlayApplicationIconImage n

Notes:

Same as setting applicationIconImage, but instead overlays the original image with the new image. This
way you can show custom badges. For normal text badges, use NSDockTileMBS class.

Pass image = nil to reset application dock icon.

Size of the image seems to be 128 Pixel by default, but could go up to 1024 in the future. Plugin scales up or down as needed for you.

### 32.11.45 postEvent(e as NSEventMBS, atStart as boolean)

MBS MacCocoa Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a given event to the receivers event queue. **Notes:**

* anEvent: The event object to post to the queue.
* flag: Specify true to add the event to the front of the queue; otherwise, specify false to add the event to the back of the queue.

This method can also be called in subthreads. Events posted in subthreads bubble up in the main thread event queue.

### 32.11.46 preventWindowOrdering

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Suppresses the usual window ordering in handling the most recent mouse-down event. **Notes:** This method is only useful for mouse-down events when you want to prevent the window that receives the event from being ordered to the front.

### 32.11.47 registerForRemoteNotificationTypes(type as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers for remote notifications. **Example:**

NSApplicationMBS.sharedApplication.registerForRemoteNotificationTypes NSApplicationMBS.NSRemoteNotificationTypeBadge

**Notes:**

Only applications distributed through the Mac App Store may use Push notifications.
32.11. CLASS NSAPPLICATIONMBS

Type can only be NSRemoteNotificationTypeBadge currently for Mac OS X 10.7.0.

Available on Mac OS X 10.7 or newer.

32.11.48 removeWindowsItem(win as NSWindowMBS)

Function: Removes the Window menu item for a given window.

Notes:

Win: The window whose menu item is to be removed.

This method doesn't prevent the item from being automatically added again. Use the excludedFromWindowsMenu method of NSWindow if you want the item to remain excluded from the Window menu.

32.11.49 replyToApplicationShouldTerminate(reply as boolean)

Function: Responds to NSTerminateLater once the application knows whether it can terminate.

Notes:

souldTerminate: Specify true if you want the application to terminate; otherwise, specify false.

If your application delegate returns NSTerminateLater from its applicationShouldTerminate event, your code must subsequently call this method to let the NSApplication object know whether it can actually terminate itself.

32.11.50 replyToOpenOrPrint(reply as Integer)

Function: Handles errors that might occur when the user attempts to open or print files.

Notes:

reply: The error that occurred. For a list of possible values, see "Constants."

Delegates should invoke this method if an error is encountered in the applicationOpenFiles or applicationPrintFiles delegate methods.
32.11.51  requestUserAttention(type as Integer) as Integer

Function: Starts a user attention request.
Example:

dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication

if not a.isActive then // only when we are in background
call a.requestUserAttention(a.NSInformationalRequest) // dock bounces
end if

Notes:

requestType: The severity of the request. Can be NSInformationalRequest or NSCriticalRequest.

Returns the identifier for the request. You can use this value to cancel the request later using the cancelUser-
AttentionRequest method.

Activating the application cancels the user attention request. A spoken notification will occur if spoken
notifications are enabled. Sending requestUserAttention to an application that is already active has no effect.

If the inactive application presents a modal panel, this method will be invoked with NSCriticalRequest au-
tomatically. The modal panel is not brought to the front for an inactive application.

32.11.52  runModalForWindow(win as NSWindowMBS) as Integer

Function: Starts a modal event loop for the specified window.
Notes:

win: The window to be displayed modally. If it is not already visible, the window is centered on the screen
using the value in its center method and made visible and key. If it is already visible, it is simply made key.

Returns an integer indicating the reason that this method returned.

This method runs a modal event loop for the specified window synchronously. It displays the specified win-
dow, makes it key, starts the run loop, and processes events for that window. (You do not need to show the
window yourself.) While the app is in that loop, it does not respond to any other events (including mouse,
keyboard, or window-close events) unless they are associated with the window. It also does not perform any
tasks (such as firing timers) that are not associated with the modal run loop. In other words, this method
consumes only enough CPU time to process events and dispatch them to the action methods associated with
You can exit the modal loop by calling the stopModal, stopModalWithCode, or abortModal methods from your modal window code. If you use the stopModalWithCode method to stop the modal event loop, this method returns the argument passed to stopModalWithCode. If you use stopModal instead, this method returns the constant NSModalResponseStop (-1000). If you use abortModal, this method returns the constant NSModalResponseAbort (-1001).

32.11.53 runPageLayout

**Function:** Displays the app’s page layout panel, an instance of NSPageLayout.  
**Example:**  
NSApplicationMBS.sharedApplication.runPageLayout

**Notes:** If the NSPageLayout instance does not exist, this method creates one. This method is typically invoked when the user chooses Page Setup from the application’s File menu.

32.11.54 sendEvent(theEvent as NSEventMBS)

**Function:** Dispatches an event to other objects.  
**Notes:**  
You rarely invoke sendEvent directly, although you might want to override this method to perform some action on every event. sendEvent messages are sent from the main event loop (the run method). sendEvent is the method that dispatches events to the appropriate respondersNSApp handles application events, the NSWindow object indicated in the event record handles window-related events, and mouse and key events are forwarded to the appropriate NSWindow object for further dispatching.

If you need to override sendEvent method, please call MBS support.

32.11.55 sharedApplication as NSApplicationMBS

**Function:** Returns the application instance, creating it if it doesn’t exist yet.  
**Notes:** The plugin makes sure that there is only one application object by returning the same object each time.
32.11.56  showHelp

Function: Shows help.
Example:
NSApplicationMBS.sharedApplication.showHelp

Notes: If your project is properly registered, and the necessary keys have been set in the property list, this method launches Help Viewer and displays the first page of your app's help book.

32.11.57  startDictation

Function: Starts dictation.
Example:
NSApplicationMBS.sharedApplication.startDictation

Notes: For Mac OS X 10.8.

32.11.58  stopDictation

Notes: For Mac OS X 10.8.

32.11.59  terminate

Function: Terminates the receiver.
Example:
NSApplicationMBS.sharedApplication.terminate

Notes:
This method is typically invoked when the user chooses Quit or Exit from the application’s menu.
When invoked, this method performs several steps to process the termination request. First, it asks the application’s document controller (if one exists) to save any unsaved changes in its documents. During this process, the document controller can cancel termination in response to input from the user. If the document controller does not cancel the operation, this method then calls the delegate’s applicationShouldTerminate method. If applicationShouldTerminate returns NSTerminateCancel, the termination process is aborted and control is handed back to the main event loop. If the method returns NSTerminateLater, the application runs its run loop in the NSModalPanelRunLoopMode mode until the replyToApplicationShouldTerminate method is called with the value true or false. If the applicationShouldTerminate method returns NSTerminateNow, this method posts a NSApplicationWillTerminateNotification notification to the default notification center.

Do not bother to put final cleanup code in your application’s main() functionit will never be executed. If cleanup is necessary, perform that cleanup in the delegate’s applicationWillTerminate method.

### 32.11.60 `unhide`

**Function:** Restores hidden windows to the screen and makes the receiver active.  
**Example:**  
NSApplicationMBS.sharedApplication.unhide

### 32.11.61 `unhideAllApplications`

**Function:** Unhides all applications, including the receiver.  
**Example:**  
NSApplicationMBS.sharedApplication.unhideAllApplications

**Notes:** This action causes each application to order its windows to the front, which could obscure the currently active window in the active application.

### 32.11.62 `unhideWithoutActivation`

**Function:** Restores hidden windows without activating their owner (the receiver).  
**Example:**
NSApplicationMBS.sharedApplication.unhideWithoutActivation

Notes: When this method begins, it posts an NSApplicationWillUnhideNotification to the default notification center. If it completes successfully, it posts an NSApplicationDidUnhideNotification.

32.11.63 unregisterForRemoteNotifications

Function: Unregisters for remote notifications. 
Example: 
NSApplicationMBS.sharedApplication.unregisterForRemoteNotifications

Notes: Available on Mac OS X 10.7 or newer.

32.11.64 updateWindows

Function: Sends an update message to each onscreen window. 
Notes: 
This method is invoked automatically in the main event loop after each event when running in NSDefaultRunLoopMode or NSModalRunLoopMode. This method is not invoked automatically when running in NSEventTrackingRunLoopMode. 
When this method begins, it posts an NSApplicationWillUpdateNotification to the default notification center. When it successfully completes, it posts an NSApplicationDidUpdateNotification.

32.11.65 updateWindowsItem(win as NSWindowMBS)

Function: Updates the Window menu item for a given window to reflect the edited status of that window. 
Notes: 
win: The window whose menu item is to be updated. 

You rarely need to invoke this method because it is invoked automatically when the edit status of an NSWindow object is set.
32.11. CLASS NSAPPLICATIONMBS

32.11.66 windows as NSWindowMBS()

Function: Returns an array containing the receiver’s window objects.
Example:

// show all window titles in message boxes
for each w as NSWindowMBS in NSApplicationMBS sharedApplication.windows
    MsgBox w.Title
next

Notes: Returns an array of NSWindow objects. This array includes both onscreen and offscreen windows.

32.11.67 windowWithWindowNumber(windowNumber as Integer) as NSWindowMBS

Function: Returns the window corresponding to the specified window number.
Example:

dim w as window = window1
w.Title = "This is our test window"

// get a window ID somewhere
dim WindowID as Integer = CGWindowMBS.GetWindowID(w)

// now find back the window
dim n as NSWindowMBS = NSApplicationMBS sharedApplication.windowWithWindowNumber(windowid)

MsgBox n.Title

Notes:

windowNumber: The unique window number associated with the desired NSWindow object.

Returns the desired window object or nil if the window could not be found.
32.11.68 Properties

32.11.69 activationPolicy as Integer

Function: The application’s activation policy.
Notes: Currently, NSApplicationActivationPolicyNone and NSApplicationActivationPolicyAccessory may be changed to NSApplicationActivationPolicyRegular, but other modifications are not supported.

Available in Mac OS X v10.6 and later.
(Read and Write property)

32.11.70 applicationIconImage as NSImageMBS

Function: The image used for the receiver’s icon.
Example:

```vbscript
dim pic as Picture = LogoMBS(500)
dim mask as new Picture(500, 500, 32)
dim g as Graphics = mask.Graphics

g.ForeColor = & c FFFFFF
g.FillRect 0,0,g.Width, g.Height
g.ForeColor = & c 000000
g.FillOval 0,0,g.Width, g.Height

dim n as new NSImageMBS(pic,mask)

NSApplicationMBS.sharedApplication.applicationIconImage = n
```

Notes:
An image containing the application’s icon.

This property can set the icon in the dock application tile. This method scales the image as necessary so that it fits in the dock tile. You can use this method to change your application icon while running. To restore your application’s original icon, you pass nil to this method.
(Read and Write property)
32.11. CLASS NSAPPLICATIONMBS

32.11.71 currentEvent as NSEventMBS

**Function:** Returns the current event, the last event the receiver retrieved from the event queue.
**Notes:**
The last event object retrieved by the application.

NSApp receives events and forwards them to the affected NSWindow objects, which then distribute them
to the objects in its view hierarchy.

Only for Cocoa applications.
(Read only property)

32.11.72 currentSystemPresentationOptions as Integer

**Function:** Returns the set of application presentation options that are currently in effect for the system.
**Example:**
```
dim a as new NSApplicationMBS
MsgBox "currentSystemPresentationOptions: " + str(a.currentSystemPresentationOptions)
```

**Notes:**
The presentation options. See NSApplicationPresentation* constants and combine them using a C bitwise
OR operator.

These are the presentation options that have been put into effect by the currently active application.
(Read only property)

32.11.73 dockTile as NSDockTileMBS

**Function:** Returns the application’s Dock tile.
**Example:**
```
dim a as new NSApplicationMBS
a.dockTile.badgeLabel = "Hello"
```
32.11.74 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSApplication object.

**Notes:** (Read and Write property)

32.11.75 helpMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The help menu used by the application.

**Notes:**

If helpMenu is nil, the system will append the help to an appropriate menu and will not return a reference to that menu when this method is called.

Available in Mac OS X v10.6 and later.

If helpMenu is a non-nil menu it is set as the Help menu, and Spotlight for Help will be installed in it. If helpMenu is nil, AppKit will install Spotlight for Help into a menu of its choosing, and that menu is not returned from helpMenu.

If you wish to completely suppress Spotlight for Help, you can set a menu that does not appear in the menu bar.

NSApplication retains its Help menu and releases it when a different menu is set. (Read and Write property)

32.11.76 isActive as Boolean

**Function:** Returns a Boolean value indicating whether this is the active application.

**Example:**
32.11.  CLASS NSAPPLICATIONMBS

    dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication
    MsgBox "isActive:" + str(a.isActive)

Notes:
True if this is the active application; false otherwise.
(Read only property)

32.11.77  isFullKeyboardAccessEnabled as Boolean

Function: Returns that status of Full Keyboard Access set in the Keyboard preference pane.
Example:
    dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication
    MsgBox "isFullKeyboardAccessEnabled:" + str(a.isFullKeyboardAccessEnabled)

Notes:
True if Full Keyboard Access is enabled, otherwise false.
You may use this status to implement your own key loop or to implement in-control tabbing behavior similar to NSTableView.

Available in Mac OS X v10.6 and later.
(Read only property)

32.11.78  isHidden as Boolean

Function: Returns a Boolean value indicating whether the receiver is hidden.
Example:
    MsgBox str(NSApplicationMBS.sharedApplication.isHidden)

Notes:
True if the receiver is hidden, false otherwise.
(Read only property)
32.11.79  isRunning as Boolean

Function: Returns a Boolean value indicating whether the main event loop is running.
Example:
ErrMsg str(NSApplicationMBS.sharedApplication.isRunning)

Notes:
True if the main event loop is running; false otherwise.
False means the stop: method was invoked.
Should always be true for a Real Studio application.
(Read only property)

32.11.80  keyWindow as NSWindowMBS

Function: Returns the window that currently receives keyboard events.
Example:
// title of front window
ErrMsg NSApplicationMBS.sharedApplication.keyWindow.Title

Notes:
The window object currently receiving keyboard events or nil if there is no key window.
This method might return nil if the application hasn’t finished loading yet or if the receiver is not active.
Does return nil in Carbon applications.
(Read only property)

32.11.81  mainMenu as NSMenuMBS

Function: The menu object representing the application’s menu bar.
Example:
// shows titles of the menus in a Cocoa app
dim m as NSMenuMBS = NSApplicationMBS.sharedApplication.mainMenu
if m<>nil then
    dim c as Integer = m.numberOfItems-1
    for i as Integer = 0 to c
        MsgBox m.Item(i).Title
    next
end if

Notes:
Returns nil on a Carbon application.
(Read and Write property)

32.11.82 mainWindow as NSWindowMBS

Function: Returns the main window.
Example:
// shows title in Cocoa, but not in Carbon
MsgBox NSApplicationMBS.sharedInstance().mainWindow.Title

Notes:
The application’s main window or nil if there is no main window.
This method might return nil if the application hasn’t finished loading, if the receiver is not active, or if the
application is hidden.
(Read only property)

32.11.83 presentationOptions as Integer

Function: The presentation options that should be in effect for the system when this application is active.
Example:
dim a as new NSApplicationMBS
// hide dock
a.presentationOptions = NSApplicationMBS.NSApplicationPresentationAutoHideDock
Notes:
Available in Mac OS X v10.6 and later.

Only certain combinations of "NSApplicationPresentationOptions" flags are supported. When given an invalid combination of option flags this method raises an exception NSInvalidArgumentException exception.

See NSApplicationPresentation* constants.
(Read and Write property)

32.11.84 servicesProvider as NSServiceProviderMBS

Function: Registers or queries the service provider.
Notes:
The service provider is an object that performs all services the application provides to other applications. When another application requests a service from the receiver, it sends the service request to aProvider. Service requests can arrive immediately after the service provider is set, so invoke this method only when your application is ready to receive requests.

Please keep an object reference around so the object is not going out of scope too early!
(Read and Write property)

32.11.85 userInterfaceLayoutDirection as Integer

Function: The layout direction of the user interface.
Notes:
This property contains the general user interface layout flow directions. For a list of possible values, see NSUserInterfaceLayoutDirection.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.6 and later.
(Read only property)
32.11. CLASS NSAPPLICATIONMBS

32.11.86 windowsMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The window menu or nil if such a menu does not exist or has not yet been created. Notes: (Read and Write property)

32.11.87 Constants

32.11.88 NSApplicationActivationPolicyAccessory = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the activation policy constants. Notes: The application does not appear in the Dock and does not have a menu bar, but it may be activated programmatically or by clicking on one of its windows. This corresponds to value of the LSUIElement key in the application's Info.plist being 1. Available in Mac OS X v10.6 and later.

32.11.89 NSApplicationActivationPolicyProhibited = 2

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the activation policy constants. Notes: The application does not appear in the Dock and may not create windows or be activated. This corresponds to the value of the LSBackgroundOnly key in the application’s Info.plist being 1. This is also the default for unbundled executables that do not have Info.plist. Available in Mac OS X v10.6 and later.

32.11.90 NSApplicationActivationPolicyRegular = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the activation policy constants. Notes: The application is an ordinary app that appears in the Dock and may have a user interface. This is the default for bundled apps, unless overridden in the Info.plist. Available in Mac OS X v10.6 and later.

32.11.91 NSApplicationPresentationAutoHideDock = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the control constants for presentationOptions and currentSystemPresentationOptions functions.
Example:

dim a as new NSApplicationMBS

// hide dock
a.presentationOptions = NSApplicationMBS.NSApplicationPresentationAutoHideDock

32.11.92  NSApplicationPresentationAutoHideMenuBar = 4

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

32.11.93  NSApplicationPresentationAutoHideToolbar = 2048

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

**Notes:**
Fullscreen window toolbar is detached from window and hides/shows with autoHidden menuBar. May be used only when both NSApplicationPresentationFullScreen and NSApplicationPresentationAutoHideMenuBar are also set

Available on Mac OS X 10.7 or newer.

32.11.94  NSApplicationPresentationDefault = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

32.11.95  NSApplicationPresentationDisableAppleMenu = 16

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.
32.11. **CLASS NSAPPLICATIONMBS**

32.11.96 **NSApplicationPresentationDisableForceQuit = 64**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

32.11.97 **NSApplicationPresentationDisableHideApplication = 256**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

32.11.98 **NSApplicationPresentationDisableMenuBarTransparency = 512**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

32.11.99 **NSApplicationPresentationDisableProcessSwitching = 32**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

32.11.100 **NSApplicationPresentationDisableSessionTermination = 128**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

32.11.101 **NSApplicationPresentationFullScreen = 1024**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

**Notes:**
Application is in fullscreen mode.
Available on Mac OS X 10.7 or newer.
32.11.102  NSApplicationPresentationHideDock = 2

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

32.11.103  NSApplicationPresentationHideMenuBar = 8

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

32.11.104  NSCriticalRequest = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants for the level of severity of a user attention request.

**Notes:**

The user attention request is a critical request.
The dock icon will bounce until either the application becomes active or the request is canceled.
32.11. CLASS NSAPPLICATIONMBS

32.11.105 NSInformationalRequest = 10

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants for the level of severity of a user attention request.

**Notes:**
The user attention request is an informational request. The dock icon will bounce for one second. The request, though, remains active until either the application becomes active or the request is canceled.

32.11.106 NSRemoteNotificationTypeAlert = 4

MBS MacCocoa Plugin, Plugin Version: 12.3. **Function:** One of the notification type constants.

**Notes:** Available in Mac OS X 10.8.

32.11.107 NSRemoteNotificationTypeBadge = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the notification type constants.

32.11.108 NSRemoteNotificationTypeNone = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the notification type constants.

32.11.109 NSRemoteNotificationTypeSound = 2

MBS MacCocoa Plugin, Plugin Version: 12.3. **Function:** One of the notification type constants.

**Notes:** Available in Mac OS X 10.8.
32.12 class NSAttributedStringMBS

32.12.1 class NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to represent a string in the Cocoa world with attached attributes.

**Example:**

```vba
dim a as new NSAttributedStringMBS
if a.initWithHTML("<B>Hello</B>") then
    MsgBox a.htmlString
end if
```

32.12.2 Methods

32.12.3 AsCFAttributedString as Variant

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new CFAttributedStringMBS object pointing to same attributed string.

**Example:**

```vba
// make NS version
dim n as new NSAttributedStringMBS
if n.initWithString("Hello World") then
    // convert
    dim c as CFAttributedStringMBS = n.AsCFAttributedString
    // and check content
    MsgBox c.String
end if
```

**Notes:** For passing to functions which need a CFAttributedStringMBS.

32.12.4 attributeAtIndex(name as string, location as UInt64) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.

**Notes:**
name: The name of an attribute.
location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
effectiveRange: Optional. If the named attribute exists at index, upon return aRange contains a range over which the named attribute’s value applies. If the named attribute does not exist at index, upon return aRange contains the range over which the attribute does not exist.
The range isn’t necessarily the maximum range covered by attributeName, and its extent is implementation-dependent. If you need the maximum range, use the other variant of this method.

Returns the value for the attribute named attributeName of the character at index index, or nil if there is no such attribute.
Raises an NSRangeException if index lies beyond the end of the receiver’s characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

• 32.12.5 attributeAtIndex(name as string, location as UInt64, inRange as NSRangeMBS) as Variant

32.12.5 attributeAtIndex(name as string, location as UInt64, inRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the value for the attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.

Notes:

name: The name of an attribute.
location: The index at which to test for attributeName.
longestEffectiveRange: Optional. If the named attribute exists at index, upon return aRange contains the full range over which the value of the named attribute is the same as that at index, clipped to rangeLimit. If the named attribute does not exist at index, upon return aRange contains the full range over which the attribute does not exist, clipped to rangeLimit.
inRange: The range over which to search for continuous presence of attributeName. This value must not exceed the bounds of the receiver.

Returns the value for the attribute named attributeName of the character at index, or nil if there is no such attribute.

 Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver’s characters.

If you don’t need the longest effective range, it’s far more efficient to use the other variant method to retrieve the attribute value.
For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

See also:

- 32.12.4 attributeAtIndex(name as string, location as UInt64) as Variant

32.12.6 attributeAtIndex2(name as string, location as UInt64, byref effectiveRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.

**Notes:**

name: The name of an attribute.
location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
effectiveRange: Optional. If the named attribute exists at index, upon return aRange contains a range over which the named attribute’s value applies. If the named attribute does not exist at index, upon return aRange contains the range over which the attribute does not exist.
The range isn’t necessarily the maximum range covered by attributeName, and its extent is implementation-dependent. If you need the maximum range, use the other variant of this method.

Returns the value for the attribute named attributeName of the character at index index, or nil if there is no such attribute.
Raises an NSRangeException if index lies beyond the end of the receiver’s characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

---

**32.12.8 **attributedStringWithAttachment(attachment as NSTextAttachmentMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an attributed string with an attachment.

**Example:**

```
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"

dim a as new NSTextAttachmentMBS(f)
dim s as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(a)
```

**Notes:** This is a convenience method for creating an attributed string containing an attachment using NSAttachmentCharacter as the base character.
32.12.9 `attributedStringWithAttributedString` (text as NSAttributedStringMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Initializes string with content of the given attributed string.

32.12.10 `attributedStringWithDocFormat` (data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Initializes string with content of given DOC file data. **Notes**: `documentAttributes`: Optional dictionary to receive the attributes. See also:

- 32.12.11 `attributedStringWithDocFormat` (data as memoryblock, byref `DocumentAttributes` as dictionary) as NSAttributedStringMBS

32.12.11 `attributedStringWithDocFormat` (data as memoryblock, byref `DocumentAttributes` as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Initializes string with content of given DOC file data. **Notes**: `documentAttributes`: Optional dictionary to receive the attributes. See also:

- 32.12.10 `attributedStringWithDocFormat` (data as memoryblock) as NSAttributedStringMBS

32.12.12 `attributedStringWithHTML` (data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Initializes string with content of given HTML file data. **Notes**: `documentAttributes`: Optional dictionary to receive the attributes. See also:

- 32.12.13 `attributedStringWithHTML` (data as memoryblock, BaseURL as string) as NSAttributedStringMBS
- 32.12.14 `attributedStringWithHTML` (data as memoryblock, BaseURL as string, byref `DocumentAttributes` as dictionary) as NSAttributedStringMBS
- 32.12.15 `attributedStringWithHTML` (data as memoryblock, byref `DocumentAttributes` as dictionary) as NSAttributedStringMBS
32.12.13 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the object with html code from a given url. **Notes:** documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.12 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS
- 32.12.14 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS
- 32.12.15 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

32.12.14 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the object with html code from a given url. **Notes:** documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.12 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS
- 32.12.13 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS
- 32.12.15 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

32.12.15 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given HTML file data. **Notes:** documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.12 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS
- 32.12.13 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS
- 32.12.14 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS
32.12.16  **attributedStringWithHTMLOld(data as string) as NSAttributedStringMBS**

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given HTML file data. **Notes:** With plugin version 9.4 the attributedStringWithHTML method uses the system function to parse html. The old plugin function is available with the name attributedStringWithHTMLOld.

32.12.17  **attributedStringWithPath(file as folderitem) as NSAttributedStringMBS**

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file. **Example:**

```swift
// load rtfd file into textarea
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
    t.textStorage.setAttributedString(n)
```

**Notes:** documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.18 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5470
- 32.12.19 attributedStringWithPath(path as string) as NSAttributedStringMBS 5471
- 32.12.20 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5471

32.12.18  **attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS**

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file. **Notes:** documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.17 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 5470
- 32.12.19 attributedStringWithPath(path as string) as NSAttributedStringMBS 5471
- 32.12.20 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5471
32.12. CLASS NSATTRIBUTEDSTRINGMBS

32.12.19 attributedStringWithPath(path as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes string with content of file at the given path string. Notes: documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.17 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS
- 32.12.18 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS
- 32.12.20 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

32.12.20 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes string with content of file at the given path string. Notes: documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.17 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS
- 32.12.18 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS
- 32.12.19 attributedStringWithPath(path as string) as NSAttributedStringMBS

32.12.21 attributedStringWithRTF(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes string with content of given RTF file data. Notes: documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.22 attributedStringWithRTF(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

32.12.22 attributedStringWithRTF(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

32.12.23 attributedStringWithRTFD(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTFD file data. **Notes:** documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.21 attributedStringWithRTF(data as memoryblock) as NSAttributedStringMBS

32.12.24 attributedStringWithRTFD(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTFD file data. **Notes:** documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.23 attributedStringWithRTFD(data as memoryblock) as NSAttributedStringMBS

32.12.25 attributedStringWithString(text as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given plain text. **Example:**

```plaintext
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy
m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSMakeRange(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

**Notes:** documentAttributes: Optional dictionary to receive the attributes. See also:
32.12. CLASS NSAttributedStringMBS

- 32.12.26 attributedStringWithString(text as string, withAttributes as dictionary) as NSAttributedStringMBS

32.12.26 attributedStringWithString(text as string, withAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Initializes string with content of given plain text. **Notes**: documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.25 attributedStringWithString(text as string) as NSAttributedStringMBS

32.12.27 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Initializes string with content of file at the given file. **Notes**: documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.28 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS
- 32.12.29 attributedStringWithURL(url as string) as NSAttributedStringMBS
- 32.12.30 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

32.12.28 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Initializes string with content of file at the given file. **Notes**: documentAttributes: Optional dictionary to receive the attributes. See also:

- 32.12.27 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS
- 32.12.29 attributedStringWithURL(url as string) as NSAttributedStringMBS
- 32.12.30 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS
32.12.29 attributedStringWithURL(url as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given url.
**Notes:** documentAttributes: Optional dictionary to receive the attributes.
See also:
- 32.12.27 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS
- 32.12.28 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS
- 32.12.30 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

32.12.30 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given url.
**Notes:** documentAttributes: Optional dictionary to receive the attributes.
See also:
- 32.12.27 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS
- 32.12.28 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS
- 32.12.29 attributedStringWithURL(url as string) as NSAttributedStringMBS

32.12.31 attributedSubstringFromRange(range as NSRangeMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSAttributedString object consisting of the characters and attributes within a given range in the receiver.
**Notes:**
Range: The range from which to create a new attributed string. aRange must lie within the bounds of the receiver.

Returns an NSAttributedString object consisting of the characters and attributes within aRange in the receiver.

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver’s characters. This method treats the length of the string as a valid range value that returns an empty string.
32.12. **CLASS NSATTRIBUTEDSTRINGMBS**

### 32.12.32 attributesAtIndex(location as UInt64) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the attributes for the character at a given index.

**Notes:**

*location:* The index for which to return attributes. This value must lie within the bounds of the receiver.

*Range:* Optional. Upon return, the range over which the attributes and values are the same as those at index. This range isn’t necessarily the maximum range covered, and its extent is implementation-dependent. If you need the maximum range, use other variant of this method.

Returns the attributes for the character at index.

Raises an NSRangeException if index lies beyond the end of the receiver’s characters.

See also:

- 32.12.33 attributesAtIndex(location as UInt64, inRange as NSRangeMBS) as dictionary

### 32.12.33 attributesAtIndex(location as UInt64, inRange as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.

**Notes:**

*location:* The index for which to return attributes. This value must not exceed the bounds of the receiver.

*range:* Optional. Upon return contains the maximum range over which the attributes and values are the same as those at index, clipped to range Limit.

*inRange:* The range over which to search for continuous presence of the attributes at index. This value must not exceed the bounds of the receiver.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver’s characters.

If you don’t need the range information, it’s far more efficient to use the other variant of this method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

See also:

- 32.12.32 attributesAtIndex(location as UInt64) as dictionary
32.12.34 **attributesAtIndex2** (location as UInt64, byref range as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the attributes for the character at a given index.

**Notes:**
- location: The index for which to return attributes. This value must lie within the bounds of the receiver.
- Range: Optional. Upon return, the range over which the attributes and values are the same as those at index. This range isn’t necessarily the maximum range covered, and its extent is implementation-dependent. If you need the maximum range, use other variant of this method.

Returns the attributes for the character at index.

Raises an NSRangeException if index lies beyond the end of the receiver’s characters.

See also:
- 32.12.35 attributesAtIndex2 (location as UInt64, byref range as NSRangeMBS, inRange as NSRangeMBS) as dictionary

32.12.35 **attributesAtIndex2** (location as UInt64, byref range as NSRangeMBS, inRange as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.

**Notes:**
- location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
- range: Optional. Upon return contains the maximum range over which the attributes and values are the same as those at index, clipped to range Limit.
- inRange: The range over which to search for continuous presence of the attributes at index. This value must not exceed the bounds of the receiver.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver’s characters.

If you don’t need the range information, it’s far more efficient to use the other variant of this method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

See also:
- 32.12.34 attributesAtIndex2 (location as UInt64, byref range as NSRangeMBS) as dictionary
32.12. CLASS NSATTRIBUTEDSTRINGMBS

32.12.36 copy as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the attributed string.

32.12.37 CopyToClipboard as Boolean

MBS MacBase Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies styled text to clipboard.

32.12.38 dataFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil, byref error as NSErrorMBS) as memoryblock

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an data object that contains a text stream corresponding to the characters and attributes within the given range.  
**Notes:**  
offset and length: The range.  
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute.  
error: An in-out variable containing an encountered error, if any.

Returns the data for the attributed string, or nil if failure. When nil, error encapsulates the error information.  
Raises an NSRangeException if any part of range lies beyond the end of the receivers characters.

32.12.39 docFormatFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates DOC data from the whole string.  
**Notes:**  
Same as docFormatFromRange(0,length)  
Returns nil on failure.  
documentAttributes can optionally be a dictionary with document attributes like author or title.  
See also:

- 32.12.40 docFormatFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock
CHAPTER 32. COCOA

32.12.40  docFormatFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates DOC data from the current string range. **Notes:** Returns nil on failure. documentAttributes can optionally be a dictionary with document attributes like author or title. See also:

- 32.12.39  docFormatFromRange(documentAttributes as dictionary = nil) as MemoryBlock

32.12.41  fileWrapperFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil, byref Error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSFileWrapper object that contains a text stream corresponding to the characters and attributes within the given range. **Example:**

```plaintext
// get styled text from htmlviewer
dim w as WebViewMBS = HTMLViewer1.WebViewMBS
dim f as WebFrameMBS = w.mainFrame
dim v as WebFrameViewMBS = f.frameView
dim d as WebDocumentViewMBS = v.documentView
dim n as NSAttributedStringMBS = d.attributedString
// package it
dim da as new Dictionary
da.Value(n.NSDocumentTypeDocumentAttribute) = n.NSRTFDTextDocumentType
dim e as NSErrorMBS
dim fw as NSFileWrapperMBS = n.fileWrapperFromRange(0, n.Length, da, e)
if e <> nil then
    MsgBox e.localizedDescription
    Return
end if

// write to disk
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
if fw.writeFile(file, e) then
    MsgBox "OK"
else
    MsgBox e.localizedDescription
```

Notes:

offset and length: The range.
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute.
error: An in-out variable containing an encountered error, if any.

Returns a file wrapper for the appropriate document type, or nil if failure. When nil, error encapsulates the error information.

Raises an NSRangeException if any part of range lies beyond the end of the receivers characters.

32.12.42 FromClipboard as NSAttributedStringMBS

32.12.43 GeneratePDF(PrintOptions as Variant = nil) as MemoryBlock

Example:

// read file
dim fi as FolderItem = SpecialFolder.Desktop.Child("test.docx")

dim d as new Dictionary
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(fi, d)

// write pdf
dim p as MemoryBlock = n.GeneratePDF(nil)

dim fo as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim bo as BinaryStream = BinaryStream.Create(fo)
bo.Write p

Notes: PrintOptions is optional NSPrintInfoMBS object for print settings like margin.
32.12.44  htmlString as string

MBS MacBase Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A self made function to return the text content as html string preserving the style information.

**Example:**

```dim s as NSAttributedStringMBS
s=new NSAttributedStringMBS
if s.initwithhtml("<b>Hello</b>") then
    MsgBox s.htmlstring // shows "<b>Hello</b>
    MsgBox s.text // shows "Hello"
end if```

**Notes:**
Does not always work well, but can help.
(Apple has no official function for this)

32.12.45  initWithAttributedString(text as NSAttributedStringMBS) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of the given attributed string.

**Notes:** Returns true on success.

32.12.46  initWithDocFormat(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given DOC file data.

**Notes:**
Returns true on success.

documentAttributes: Optional dictionary to receive the attributes.

See also:

- 32.12.47 initWithDocFormat(data as memoryblock, byref documentAttributes as dictionary) as boolean
32.12. **CLASS NSATTRIBUTEDSTRINGMBS**

32.12.47 **initWithDocFormat**(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given DOC file data.  
**Notes:**  
Returns true on success.  
documentAttributes: Optional dictionary to receive the attributes.  
See also:
- 32.12.46 **initWithDocFormat**(data as MemoryBlock) as boolean

32.12.48 **initWithHTML**(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given HTML file data.  
**Example:**
```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("<b>test</b>") then
    MsgBox n.text
else
    MsgBox "failed"
end if

dim attribText as new NSAttributedStringMBS
dim text as string = "<P>Hello </P>"

If attribText.initWithHTML(text) Then
    MsgBox attribText.text
End If
```

**Notes:**
- documentAttributes: Optional dictionary to receive the attributes.  
- Returns true on success.
- With plugin version 9.4 this uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.
- On Mac OS X 10.6 the text encoding expected is ISO Latin 1 as far as I see.

### 32.12.57 initWithRTF(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTF file data. **Notes:**

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 32.12.58 initWithRTF(data as memoryblock, byref documentAttributes as dictionary) as boolean

### 32.12.58 initWithRTF(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTF file data. **Notes:**

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 32.12.57 initWithRTF(data as MemoryBlock) as boolean

### 32.12.59 initWithRTFD(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTFD file data. **Notes:**
documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 32.12.60 initWithRTFD(data as memoryblock, byref documentAttributes as dictionary) as boolean

32.12.60 initWithRTFD(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTFD file data.
**Notes:**
documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 32.12.59 initWithRTFD(data as MemoryBlock) as boolean

32.12.61 initWithString(text as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given plain text.
**Example:**

```plaintext
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if ninitWithHTML("test") then
    MsgBox n.text
else
    MsgBox "failed"
end if
```

**Notes:**
documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 32.12.62 initWithString(text as string, withAttributes as Dictionary) as boolean
32.12. CLASS NSATTRIBUTEDSTRINGMBS

32.12.62 initWithString(text as string, withAttributes as Dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given plain text. **Example:**

```vba
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("test") then
    MsgBox n.text
else
    MsgBox "failed"
end if
```

**Notes:**

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 32.12.61 initWithString(text as string) as boolean

32.12.63 initWithURL(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file. **Example:**

```vba
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithURL(SpecialFolder.Desktop.Child("testfile")) then
    MsgBox n.text
else
    MsgBox "failed"
end if
```

**Notes:**

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 32.12.64 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean
- 32.12.65 initWithURL(url as string) as boolean
32.12.64 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file.

**Example:**

```plaintext
dim n as NSAttributedStringMBS
dim documentAttributes as dictionary
n=new NSAttributedStringMBS
if n.initWithURL(SpecialFolder.Desktop.Child("testfile"), documentAttributes) then
    MsgBox n.text
else
    MsgBox "failed"
end if
```

**Notes:**

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 32.12.63 initWithURL(file as folderitem) as boolean
- 32.12.65 initWithURL(url as string) as boolean
- 32.12.66 initWithURL(url as string, byref documentAttributes as dictionary) as boolean

32.12.65 initWithURL(url as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given url.

**Notes:**

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 32.12.63 initWithURL(file as folderitem) as boolean
- 32.12.65 initWithURL(url as string) as boolean
- 32.12.66 initWithURL(url as string, byref documentAttributes as dictionary) as boolean
32.12. CLASS NSATTRIBUTEDSTRINGMBS

32.12.66 initWithURL(url as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given url.

**Notes:**

documentAttributes: Optional dictionary to receive the attributes.

Returns true on success.

See also:

- 32.12.63 initWithURL(file as folderitem) as boolean
- 32.12.64 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean
- 32.12.65 initWithURL(url as string) as boolean

32.12.67 isEqualToAttributedString(other as NSAttributedStringMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares both strings.

**Example:**

```vba
dim n as NSAttributedStringMBS
dim m as NSAttributedStringMBS

n=new NSAttributedStringMBS
if n.initWithString("test") then
    MsgBox n.text
else
    MsgBox "failed"
end if

m=new NSAttributedStringMBS
if m.initWithString("test") then
    MsgBox n.text
else
    MsgBox "failed"
end if

if m isEqualToAttributedString(n) then
    MsgBox "Ok"
else
    MsgBox "failed"
end if

m=new NSAttributedStringMBS
if m.initWithString("test2") then
```

```
MsgBox n.text
else
MsgBox "failed"
end if

if m.isEqualToAttributedString(n) then
MsgBox "failed"
else
MsgBox "Ok"
end if

Notes: Returns true if they are equal in content.

32.12.68 itemNumberInTextList(list as NSTextListMBS, location as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the index of the item at the given location within the list.
Notes:
list: The text list.
location: The location of the item.

Returns the index within the list.

32.12.69 lineRangeForRange(range as NSRangeMBS) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the range of characters representing the line or lines containing a given range.
Notes:
Range: A range within the receiver. The value must not exceed the bounds of the receiver.

The range of characters representing the line or lines containing aRange, including the line termination characters.

32.12.70 mutableCopy as NS MutableAttributedStringMBS

Example:

```plaintext
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

### 32.12.71 NSAttributedStringAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.  
**Notes:**  
NSTextAttachment  
Default nil, no attachment

### 32.12.72 NSAttributedStringAuthorDocumentAttribute as string

**Example:**

```plaintext
// get some attributed text:
dim t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
dim dic as new Dictionary
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"

// get rtf
dim rtf as string = t.RTFFromRange(dic)

// write to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```
Notes:

string containing author name.
Available in Mac OS X v10.4 and later.

32.12.73  **NSBackgroundColorAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

NSColor
Default nil, no background

32.12.74  **NSBackgroundColorDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

NSColor, representing the document-wide page background color.
Mac OS X v10.3 and earlier string constant is "BackgroundColor". For applications linked on versions prior to Mac OS X v10.5, HTML import sets the NSBackgroundColorDocumentAttribute to NSColorMBS.whiteColor in cases in which the HTML does not specify a background color. For applications linked on Mac OS X v10.5 and later, no NSBackgroundColorDocumentAttribute is set in these cases.
Available in Mac OS X v10.4 and later.

32.12.75  **NSBaselineOffsetAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

Number containing floating point value, as points offset from baseline
Default 0.0

32.12.76  **NSBaseURLDocumentOption as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
32.12. CLASS NSATTRIBUTEDSTRINGMBS

Notes:
For HTML documents; NSURL containing base URL. Previous string constant was @"BaseUrl"
Available in Mac OS X v10.4 and later.

32.12.77 NSBottomMarginDocumentAttribute as string

Example:

```vbnet
// get some attributed text:
dim t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
dim dic as new Dictionary
dic.Value(t.NSBottomMarginDocumentAttribute) = 20
dic.Value(t.NSLeftMarginDocumentAttribute) = 20
dic.Value(t.NSRightMarginDocumentAttribute) = 20
dic.Value(t.NSTopMarginDocumentAttribute) = 20
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"

// get rtf
dim rtf as string = t.RTFFromRange(dic)

// write to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```

Notes:
Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "BottomMargin".
Available in Mac OS X v10.4 and later.

32.12.78 NSCategoryDocumentAttribute as string

Notes:
string containing the document’s category.
CHAPTER 32. COCOA

Available in Mac OS X v10.6 and later.

32.12.79  NSCharacterEncodingDocumentAttribute as string

Notes:
Number, containing an int specifying the stringEncoding for the file; for reading and writing plain text files and writing HTML; default for plain text is the default encoding; default for HTML is UTF-8. Mac OS X v10.3 and earlier string constant is "CharacterEncoding".
Available in Mac OS X v10.4 and later.

32.12.80  NSCharacterEncodingDocumentOption as string

Notes:
For plain text documents; Number containing the unsigned int stringEncoding to override any encoding specified in an HTML document. Previous string constant was @"CharacterEncoding".
Available in Mac OS X v10.4 and later.

32.12.81  NSCharacterShapeAttributeName as string

Notes:
An integer value. The value is interpreted as Apple Type Services kCharacterShapeType selector + 1. The default value is 0 (disable). 1 is kTraditionalCharactersSelector, and so on. Refer to <ATS/SFNGLayoutTypes.h> and "Font Features" in ATSUI Programming Guide for additional information.
Available in Mac OS X v10.0 and later.

32.12.82  NSCocoaVersionDocumentAttribute as string

Notes:
Number, containing a float. For RTF files only, stores the version of Cocoa with which the file was created.
32.12. **CLASS NSATTRIBUTEDSTRING**

Absence of this value indicates RTF file not created by Cocoa or its predecessors. Values less than 100 are preMac OS X; 100 is Mac OS X v10.0 or v10.1; 102 is Mac OS X v10.2 and 10.3; values greater than 102 correspond to values of NSAppKitVersionNumber on Mac OS X v10.4 and later. Mac OS X v10.3 and earlier string constant is "CocoaRTFVersion". Available in Mac OS X v10.4 and later.

32.12.83 **NSCommentDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

string containing document comments. Available in Mac OS X v10.4 and later.

32.12.84 **NSCompanyDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

string containing company or organization name. Available in Mac OS X v10.4 and later.

32.12.85 **NSConvertedDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

Number, containing an int. Indicates whether the file was converted by a filter service. If missing or 0, the file was originally in the format specified by document type. If negative, the file was originally in the format specified by document type, but the conversion to NSAttributedString may have been lossy. If 1 or more, it was converted to this type by a filter service. Mac OS X v10.3 and earlier string constant is @"Converted". Available in Mac OS X v10.4 and later.

32.12.86 **NSCopyrightDocumentAttribute as string**

32.12.87 **NSCreationTimeDocumentAttribute as string**

**Notes:**  
NSDate containing the creation date of the document; note that this is not the file system creation date of the file, but of the document.  
Available in Mac OS X v10.4 and later.

32.12.88 **NSCursorAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.  
**Notes:**  
NSCursor Default as returned by the NSCursor method IBeamCursor  
Available in Mac OS X v10.3 and later.

32.12.89 **NSDefaultAttributesDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the document attributes.  
**Notes:**  
NSDictionary containing attributes to be applied to plain files. Used by reader methods. This key in options can specify the default attributes applied to the entire document contents. The document attributes can contain this key indicating the actual attributes used.  
Available on Mac OS X 10.11.

32.12.90 **NSDefaultAttributesDocumentOption as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.  
**Notes:**
For plain text documents; Dictionary containing attributes to be applied to plain files. Previous string constant was @"DefaultAttributes". Available in Mac OS X v10.4 and later.

**32.12.91 NSDefaultTabIntervalDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**
Number containing a float. Represents the document-wide default tab stop interval. Mac OS X v10.3 and earlier string constant is "DefaultTabInterval". Available in Mac OS X v10.4 and later.

**32.12.92 NSDocFormatTextDocumentType as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary. **Notes:** Microsoft Word document.

**32.12.93 NSDocumentTypeDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**
How the document was interpreted; one of the values in "Document Types." Mac OS X v10.3 and earlier string constant is "DocumentType". Available in Mac OS X v10.4 and later.

**32.12.94 NSDocumentTypeDocumentOption as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**
One of the document types described in "Document Types," indicating a document type to be forced when loading the document. Previous string constant was @"DocumentType". Available in Mac OS X v10.4 and later.
32.12.95 **NSEditorDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

string containing name of person who last edited the document. Available in Mac OS X v10.4 and later.

32.12.96 **NSExcludedElementsDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString related to HTML generation. **Notes:**

An Array object containing string objects, representing HTML elements not to be used in generated HTML. Available in Mac OS X v10.4 and later.

NSExcludedElementsDocumentAttribute allows control over the tags used. The recognized values in the NSExcludedElementsDocumentAttribute array are (case-insensitive) HTML tags, plus DOCTYPE (representing a doctype declaration) and XML (representing an XML declaration). By default, if this attribute is not present, the excluded elements will be those deprecated in HTML 4 (APPLET, BASEFONT, CENTER, DIR, FONT, ISINDEX, MENU, S, STRIKE, and U) plus XML. If XML is on the list, HTML forms are used; if XML is not on the list, XHTML forms are used where there is a distinction.

32.12.97 **NSExpansionAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

Number containing floating point value, as log of expansion factor to be applied to glyphs
Default 0.0, no expansion
Available in Mac OS X v10.3 and later.

32.12.98 **NSFileTypeDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

string indicating which document type was used to interpret the document, specified as a UTI; for reading, this is available along with NSDocumentTypeDocumentAttribute, but for writing the two are mutually ex-
32.12.99  **NSFileTypeDocumentOption as string**

**Notes:**

string indicating a document type to be forced when loading the document, specified as a UTI string; mutually exclusive with NSDocumentTypeDocumentOption.

Available in Mac OS X v10.6 and later.

32.12.100  **NSFontAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the attribute names for NSAttributedString.

**Example:**

MsgBox NSAttributedStringMBS.NSFontAttributeName

Dim NSGraphics as New NSGraphicsMBS()
Dim NSFont as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 11.0)
Dim NSAttributes as New Dictionary

NSAttributes.value(NSAttributedStringMBS.NSFontAttributeName) = nsfont

Dim stringWidth as Double = NSGraphics.sizeWithAttributes("Hello World", NSAttributes).Width
MsgBox("StringWidth from NSGraphicsMBS: " + Str(stringWidth))

**Notes:**

NSFont
Default Helvetica 12-point

32.12.101  **NSForegroundColorAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the attribute names for NSAttributedString.

**Notes:**

NSColor
5500

CHAPTER 32. COCOA

Default blackColor
Available in Mac OS X v10.0 and later.

32.12.102 NSGlyphInfoAttributeName as string

Notes:
The name of an NSGlyphInfo object.
NSLayoutManager assigns the glyph specified by this glyph info to the entire attribute range, provided that its contents match the specified base string, and that the specified glyph is available in the font specified by NSFontAttributeName.
Available in Mac OS X v10.2 and later.
32.12. CLASS NSATTRIBUTEDSTRINGMBS

32.12.103 NSHTMLTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary. **Notes:** Hypertext Markup Language (HTML) document.

32.12.104 NSHyphenationFactorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**
Number, containing a float; 0 = off, 1 = full hyphenation.
Mac OS X v10.3 and earlier string constant is "HyphenationFactor".
Available in Mac OS X v10.4 and later.

32.12.105 NSKernAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**
Number containing floating point value, as points by which to modify default kerning
Default nil, use default kerning specified in font file; 0.0, kerning off; non-zero, points by which to modify
default kerning
Available in Mac OS X v10.0 and later.

32.12.106 NSKeywordsDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**
Array of string, containing keywords.
Available in Mac OS X v10.4 and later.

32.12.107 NSLeftMarginDocumentAttribute as string

Notes:
Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "LeftMargin".
Available in Mac OS X v10.4 and later.

32.12.108 **NSLigatureAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**
Number containing integer
Default 1, standard ligatures; 0, no ligatures; 2, all ligatures.

32.12.109 **NSLinkAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**
NSURL (preferred) or string
Default nil, no link
Available in Mac OS X v10.0 and later.

32.12.110 **NSMacSimpleTextDocumentType as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary. **Notes:** Macintosh SimpleText document.

32.12.111 **NSManagerDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**
string containing the name of the author's manager.
Available in Mac OS X v10.6 and later.
32.12. CLASS NSAttributedStringMBS

32.12.112 NSMarkedClauseSegmentAttributeName as string

Notes:
Number containing an integer, as an index in marked text indicating clause segments
Available in Mac OS X v10.5 and later.

32.12.113 NSModificationTimeDocumentAttribute as string

Notes:
NSDate containing the modification date of the document contents.
Available in Mac OS X v10.4 and later.

32.12.114 NSObliquenessAttributeName as string

Notes:
Number containing floating point value, as skew to be applied to glyphs
Default 0.0, no skew
Available in Mac OS X v10.3 and later.

32.12.115 NSOfficeOpenXMLTextDocumentType as string

Notes:
ECMA Office Open XML text document format.
Available in Mac OS X v10.5 and later.
32.12.116 NSOpenDocumentTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.  
**Notes:**  
OASIS Open Document text document format.  
Available in Mac OS X v10.5 and later.

32.12.117 NSPaperSizeDocumentAttribute as string

**Notes:**  
NSString, containing NSSize.  
Mac OS X v10.3 and earlier string constant is "PaperSize".  
Available in Mac OS X v10.4 and later.

32.12.118 NSParagraphStyleAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.  
**Example:**  
```swift  
// change line spacing in a Label

dim n as NSTextFieldMBS = Label1.NSTextFieldMBS  
dim a as NSAttributedStringMBS = n.attributedStringValue

dim p as NSParagraphStyleMBS = a.attributeAtIndex(a.NSParagraphStyleAttributeName, 0)  
dim m as NSParagraphStyleMBS = p.mutableCopy  
m.setLineSpacing 5

dim s as NSAttributedStringMBS = a.mutableCopy  
s.addAttribute(a.NSParagraphStyleAttributeName, m, new NSRangeMBS(0, s.length))

n.attributedStringValue = s
```

**Notes:**  
NSParagraphStyle  
Default as returned by the NSParagraphStyle method defaultParagraphStyle
32.12.119  **NSPlainTextDocumentType** as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary. **Notes:** Plain text document.

32.12.120  **NSPrefixSpacesDocumentAttribute** as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString related to HTML generation. **Notes:**
An Number containing an integer (default 0) representing the number of spaces per level by which to indent certain nested HTML elements. Available in Mac OS X v10.4 and later.

NSPrefixSpacesDocumentAttribute allows some control over formatting.

32.12.121  **NSReadOnlyDocumentAttribute** as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**
Number, containing int. If missing or 0 or negative, not read only; 1 or more, read only.
Note that this has nothing to do with the file system protection on the file, but instead can affect how the file should be displayed to the user. 
Mac OS X v10.3 and earlier string constant is "ReadOnly". Available in Mac OS X v10.4 and later.

32.12.122  **NSRightMarginDocumentAttribute** as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**
Number, containing a float, in points. Mac OS X v10.3 and earlier string constant is "RightMargin".
Available in Mac OS X v10.4 and later.

### 32.12.123 NSRTFDTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary. **Notes:** Rich text format with attachments document.

### 32.12.124 NSRTFTTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary. **Notes:** Rich text format document.

### 32.12.125 NSShadowAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

NSShadow
Default nil, no shadow.
Available in Mac OS X v10.3 and later.

### 32.12.126 NSSpellingStateAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

An integer value. Defaults to 0, indicating no grammar or spelling error. See "NSSpellingStateAttributeName Flags" for possible values.
This key is available in Mac OS X v10.2 and later, but its interpretation changed in Mac OS X v10.5. Previously, any non-zero value caused the spelling indicator to be displayed. For Mac OS X v10.5 and later, the (integer) value is treated as being composed of the spelling and grammar flags.
Available in Mac OS X v10.5 and later.
32.12. CLASS NSAttributedStringMBS

32.12.127 NSStrikethroughColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: One of the attribute names for NSAttributedString. **Notes**: NSColor
Default nil, same as foreground color
Available in Mac OS X v10.3 and later.

32.12.128 NSStrikethroughStyleAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: One of the attribute names for NSAttributedString. **Example**:

```// underline selected text in TextArea1```
```dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim s as NSTextStorageMBS = t.textStorage```
```const NSUnderlineStyleSingle = 1```
```dim d as Dictionary = t.selectedTextAttributes```
```d.Value(NSAttributedStringMBS.NSStrikethroughStyleAttributeName) = NSUnderlineStyleSingle```
```t.selectedTextAttributes = d```

**Notes**: Number containing integer
Default 0, no strikethrough. See "Underlining Patterns", "Underlining Styles", and "Underline Masks" in Apple Documentation for mask values.
Available in Mac OS X v10.3 and later.

32.12.129 NSStrokeColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: One of the attribute names for NSAttributedString. **Notes**: NSColor
Default nil, same as foreground color
Available in Mac OS X v10.3 and later.
CHAPTER 32. COCOA

32.12.130  **NSStrokeWidthAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

Number containing floating point value, as percent of font point size
Default 0, no stroke; positive, stroke alone; negative, stroke and fill (a typical value for outlined text would be 3.0)
Available in Mac OS X v10.3 and later.

32.12.131  **NSSubjectDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

string containing subject of document.
Available in Mac OS X v10.4 and later.

32.12.132  **NSSuperscriptAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

Number containing integer
Default 0

32.12.133  **NSTextAlternativesAttributeName as string**

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names. **Notes:**

An NSTextAlternatives object. Used primarily as a temporary attribute, with primaryString equal to the substring for the range to which it is attached, and alternativeStrings representing alternatives for that string that may be presented to the user.
Available on OS X 10.8 and newer.
32.12.134 NSTextEffectAttributeName as string

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names. **Notes:** NSString, default nil: no text effect

32.12.135 NSTextEffectLetterpressStyle as string

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the text effect names. **Notes:** Available on Mac OS X 10.10 or newer.

32.12.136 NSTextEncodingNameDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString related to HTML generation. **Notes:**

An string object containing the name, IANA or otherwise, of a text encoding to be used; mutually exclusive with NSCharacterEncodingDocumentAttribute. Available in Mac OS X v10.4 and later.

Either NSCharacterEncodingDocumentAttribute or NSTextEncodingNameDocumentAttribute may be used to control the encoding used for generated HTML; character entities are used for characters not representable in the specified encoding.

32.12.137 NSTextEncodingNameDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

String containing the name, IANA or otherwise, of a text encoding to override any encoding specified in an HTML document. Mutually exclusive with @"CharacterEncoding". Previous string constant was @"TextEncodingName". Available in Mac OS X v10.4 and later.
CHAPTER 32. COCOA

32.12.138 NSTextLayoutSectionOrientation as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants used as by the NSLayoutOrientationSectionsAttribute. Notes: An Number containing an NSTextLayoutOrientation value. The default value is NSTextLayoutOrientationHorizontal. Available in Mac OS X v10.7 and later.

32.12.139 NSTextLayoutSectionRange as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants used as by the NSLayoutOrientationSectionsAttribute. Notes: An NSValue containing an NSRange representing a character range. The default value is a range covering the entire string. Available in Mac OS X v10.7 and later.

32.12.140 NSTextLayoutSectionsAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the attribute names for NSAttributedString. Notes: An Array containing dictionaries. Each dictionary describes a layout orientation section. The dictionary can have two attributes: NSTextLayoutSectionOrientation and NSTextLayoutSectionRange. When there is a gap between sections, it’s assumed to have NSTextLayoutOrientationHorizontal. Available in Mac OS X v10.7 and later.

32.12.141 NSTextSizeMultiplierDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the attribute names for NSAttributedString. Notes: Specifies a scale factor for font sizes. Number containing float, default 1.0; for HTML only, corresponding to WebView’s textSizeMultiplier. There is no textual equivalent for Mac OS X v10.3. Available in Mac OS X v10.4 and later.
32.12.142 NSTimeoutDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

Number containing float. Time in seconds to wait for a document to finish loading. Previous string constant was @"Timeout".
Available in Mac OS X v10.4 and later.

32.12.143 NSTitleDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

String containing document title.
Available in Mac OS X v10.4 and later.

32.12.144 NSToolTipAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

String
Default nil, no tooltip
Available in Mac OS X v10.3 and later.

32.12.145 NSTopMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "TopMargin".
Available in Mac OS X v10.4 and later.
32.12.146  **NSUnderlineColorAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. 

**Notes:**

NSColor
Default nil, same as foreground color  
Available in Mac OS X v10.3 and later.

32.12.147  **NSUnderlineStyleAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. 

**Notes:**

Number containing integer  
Default 0, no underline. See "Underlining Patterns", "Underlining Styles", and "Underline Masks" in Apple Documentation for mask values.

32.12.148  **NSVerticalGlyphFormAttributeName as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. 

**Notes:**

An Number containing an integer value, 0 means horizontal text and 1 indicates vertical text. If no value specified, it’s interpreted to determine the setting based on higher-level vertical orientation settings such as NSTextLayoutOrientation . The behavior for any other value is undefined.  
Available in Mac OS X v10.7 and later.

32.12.149  **NSViewModeDocumentAttribute as string**

**Notes:**

NSValue, containing an int; 0 = normal; 1 = page layout (use value of "PaperSize").  
Mac OS X v10.3 and earlier string constant is "ViewMode".  
Available in Mac OS X v10.4 and later.
32.12.150  **NSViewSizeDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

NSValue, containing NSSize. Mac OS X v10.3 and earlier string constant is "ViewSize". Available in Mac OS X v10.4 and later.

32.12.151  **NSViewZoomDocumentAttribute as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString. **Notes:**

Mac OS X v10.3 and earlier string constant is "ViewZoom". NSValue, containing a float; 100 = 100% zoom. Available in Mac OS X v10.4 and later.

32.12.152  **NSWebArchiveTextDocumentType as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary. **Notes:** Web Kit WebArchive document.

32.12.153  **NSWebPreferencesDocumentOption as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString. **Notes:**

WebPreferences; for HTML only, specifies a WebPreferences object. If not present, a default set of preferences is used. Previous string constant was @"WebPreferences". Available in Mac OS X v10.4 and later.

32.12.154  **NSWebResourceLoadDelegateDocumentOption as string**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

WebResourceLoadDelegateMBS; for HTML only, specifies an object to serve as the web resource loading delegate.
If not present, a default delegate is used that permits the loading of subsidiary resources but does not respond to authentication challenges. Previous string constant was @"WebResourceLoadDelegate".
Available in Mac OS X v10.4 and later.

32.12.155 NSWordMLTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
**Notes:** Microsoft Word XML (WordML schema) document.

32.12.156 NSWritingDirectionAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
**Example:**

```swift
const NSWritingDirectionNatural = -1 // Determines direction using the Unicode Bidi Algorithm rules P2 and P3
const NSWritingDirectionLeftToRight = 0 // Left to right writing direction
const NSWritingDirectionRightToLeft = 1 // Right to left writing direction

const NSTextWritingDirectionEmbedding = 0
const NSTextWritingDirectionOverride = 2

dim t as NSTextStorageMBS = TextArea1.NSTextViewMBS.textStorage
// get hello in arabic
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("")
dim m asNSMutableAttributedStringMBS = a.mutableCopy

// now set attributes for right to left
m.addAttribute t.NSWritingDirectionAttributeName, array(NSWritingDirectionRightToLeft+NSTextWritingDirectionOverride), new NSRangeMBS(0,m.Length)

// and add to textarea
t.appendAttributedString m
```

**Notes:**
An Array of Numbers.
This provides a means to override the default bidi algorithm, equivalent to the use of bidi control characters LRE, RLE, LRO, or RLO paired with PDF, as a higher-level attribute. This is the NSAttributedString equivalent of HTML’s dir attribute and/or BDO element. The array represents nested embeddings or overrides, in order from outermost to innermost. The values of the Numbers should be 0, 1, 2, or 3, for LRE, RLE, LRO, or RLO respectively; these should be regarded as NSWritingDirectionLeftToRight or NSWritingDirectionRightToLeft plus NSTextWritingDirectionEmbedding or NSTextWritingDirectionOverride.
Available in Mac OS X v10.6 and later.

32.12.157  **paragraphRangeForRange**(range as NSRangeMBS) as NSRangeMBS

**Function:** Returns the range of characters representing the paragraph or paragraphs containing a given range.  
**Notes:**
Range: A range within the receiver. The range must not exceed the bounds of the receiver.

The range of characters representing the paragraph or paragraphs containing range, including the paragraph termination characters.

A paragraph is any segment of text delimited by a carriage return (U+000D), newline (U+000A), or paragraph separator (U+2029).

32.12.158  **rangeOfTextList**(list as NSTextListMBS, location as Integer) as NSRangeMBS

**Function:** Returns the range of the given text list that contains the given location.  
**Notes:**
list: The text list.  
location: The location in the text list.

Returns the range of the given text list containing the location.

32.12.159  **rtf** as MemoryBlock

**Function:** Returns the content of this attributed string as a RTF string.  
**Example:**
CHAPTER 32. COCOA

```
dim s as NSAttributedStringMBS
s=new NSAttributedStringMBS
if s.initWithString("Hello") then
    MsgBox s.RTF
end if
```

// shows this text:
// { \rtf1\ansi\ansicpg1252\cocoartf949
// { \fonttbl\f0{\swiss\fcharset0 Helvetica; }
// { \colortbl: \red255\green255\blue255; }
// \pard\tx560\tx1120\tx1680\tx2240\tx2800\tx3360\tx3920\tx4480\tx5040\tx5600\tx6160\tx6720\qf1\ql\qnatural\pardirnatural
// \f0\fs24 \cf0 Hello }

**Notes:** Same as RTFFromRange(0,length)

### 32.12.160 RTFDFileWrapperFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSFileWrapper object that contains an RTFD document corresponding to the characters and attributes within the given range.

**Notes:**
- offset and length: The range.
- documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute. If there are no document-level attributes, dict can be nil.

Returns a file wrapper containing the RTFD data.

The file wrapper also includes the document-level attributes in docAttributes, as explained in RTF Files and Attributed Strings.

Raises an NSRangeException if any part of aRange lies beyond the end of the receivers characters.

You can save the file wrapper using the NSFileWrapper method writeToFile.
32.12. CLASS NSATTRIBUTEDSTRINGMBS

32.12.161 RTFDFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates RTFD data from the current string range.

**Notes:**
- Returns nil on failure.
- Same as RTFDFromRange(0,length)
- documentAttributes can optionally be a dictionary with document attributes like author or title.

See also:

- 32.12.162 RTFDFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

32.12.162 RTFDFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates RTFD data from the current string range.

**Notes:**
- Returns nil on failure.
- documentAttributes can optionally be a dictionary with document attributes like author or title.

See also:

- 32.12.161 RTFDFromRange(documentAttributes as dictionary = nil) as MemoryBlock

32.12.163 RTFFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates RTF data from whole string.

**Notes:**
- Returns nil on failure.
- Same as RTFFromRange(0,length)
- documentAttributes can optionally be a dictionary with document attributes like author or title.

See also:

- 32.12.164 RTFFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock
**32.12.164** R**TFFromRange**(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates RTF data from the current string range.

**Example:**

```plaintext
// get some attributed text:
dim t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
dim dic as new Dictionary
dic.Value(t.NSBottomMarginDocumentAttribute) = 20
dic.Value(t.NSLeftMarginDocumentAttribute) = 20
dic.Value(t.NSRightMarginDocumentAttribute) = 20
dic.Value(t.NSTopMarginDocumentAttribute) = 20
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"

// get rtf
dim rtf as string = t.RTFFromRange(dic)

// write to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```

**Notes:**

Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- **32.12.163** R**TFFromRange**(documentAttributes as dictionary = nil) as MemoryBlock

**32.12.165** **Properties**

**32.12.166** containsAttachments as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this attributed string has attachments.

**Notes:** (Read only property)
32.12.5  CLASS NSAttributedStringMBS

32.12.167  Handle as Integer

**Notes:**
Must not be nil to have the object being valid.
(Read and Write property)

32.12.168  length as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Length of text in characters.

**Example:**

```plaintext
dim n as NSAttributedStringMBS

n=new NSAttributedStringMBS
if n.initWithString("test") then
    MsgBox str(n.length) // shows 4
else
    MsgBox "failed"
end if
```

**Notes:** (Read only property)

32.12.169  Range as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates range for whole text.

**Notes:** (Read only property)

32.12.170  text as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plain text.

**Notes:** (Read only property)
32.12.171 Constants

32.12.172 NSSpellingStateGrammarFlag = 1

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the constants for spelling state. **Notes:** Flag for grammar issues.

32.12.173 NSSpellingStateSpellingFlag = 0

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the constants for spelling state. **Notes:** Flag for spelling issues.

32.12.174 NSUnderlineByWord = & h8000

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw the line only underneath or through words, not whitespace.

32.12.175 NSUnderlinePatternDash = & h0200

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw a line of dashes.

32.12.176 NSUnderlinePatternDashDot = & h0300

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw a line of alternating dashes and dots.

32.12.177 NSUnderlinePatternDashDotDot = & h0400

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw a line of alternating dashes and two dots.
32.12.178  **NSUnderlinePatternDot** = &h0100

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants.  
**Notes:** Draw a line of dots.

32.12.179  **NSUnderlinePatternSolid** = 0

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants.  
**Notes:** Draw a solid line.

32.12.180  **NSUnderlineStyleDouble** = 9

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants.  
**Notes:** Draw a double line.

32.12.181  **NSUnderlineStyleNone** = 0

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants.  
**Notes:** Do not draw a line.

32.12.182  **NSUnderlineStyleSingle** = 1

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants.  
**Example:**

```plaintext
// underline selected text in TextArea1

dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim s as NSTextStorageMBS = t.textStorage

dim d as Dictionary = t.selectedTextAttributes
d.Value(NSAttributedStringMBS.NSStrikethroughStyleAttributeName) = s.NSUnderlineStyleSingle
t.selectedTextAttributes = d
```

**Notes:** Draw a single line.
32.12.183  **NSUnderlineStyleThick = 2**

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants.  
**Notes:** Draw a thick line.

32.12.184  **NSWritingDirectionEmbedding = 0**

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the writing direction constants.  
**Notes:** Text is embedded in text with another writing direction. For example, an English quotation in the middle of an Arabic sentence could be marked as being embedded left-to-right text.

32.12.185  **NSWritingDirectionOverride = 1**

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the writing direction constants.  
**Notes:** Enables character types with inherent directionality to be overridden when required for special cases, such as for part numbers made of mixed English, digits, and Hebrew letters to be written from right to left.
32.13. CLASS NSAutoreleasePoolMBS

32.13 class NSAutoreleasePoolMBS

32.13.1 class NSAutoreleasePoolMBS

MBS Main Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for memory management in Cocoa.

**Example:**

```plaintext
dim pool as NSAutoreleasePoolMBS

sub MyThread.Run
    pool=new NSAutoreleasePoolMBS
    // do work
end sub
```

**Notes:** If you use threads, you need to create a NSAutoreleasePoolMBS on the start to have correct Cocoa memory manager.

32.13.2 Methods

32.13.3 Constructor

MBS Main Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new Autorelease Pool.

**Example:**

```plaintext
// Cleanup memory for Cocoa objects

Sub Action()  // in Timer
  static LastPool as NSAutoreleasePoolMBS = nil
  static CurrentPool as NSAutoreleasePoolMBS = nil

  LastPool = CurrentPool
  CurrentPool = new NSAutoreleasePoolMBS
End Sub
```

**Notes:** The example code above is not needed in REALbasic 2009r4 and above as the runtime does it automatically for you.
32.13.4 Properties

32.13.5 Handle as Integer

MBS Main Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the internally used NSAutoreleasePool object. **Notes:** (Read and Write property)
32.14.1 **NSLogMBS(message as string)**

MBS Main Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes a message to the Console.app on Mac OS X.

**Example:**

```vbnet
Sub Log(message as string)
    if TargetMacOS then
        NSLogMBS message
    else
        System.DebugLog message
    end if
End Sub
```

**Notes:** As with Mac OS X 10.8 the system.debugLog method does not write to Console.app. So use this function.

32.14.2 **NSStringArraySortMBS(texts() as string, options as Integer) as string()**

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sorts array of string with options.

**Example:**

```vbnet
// constants for the function:
const NSCaseInsensitiveSearch = 1
const NSLiteralSearch = 2
const NSBackwardsSearch = 4
const NSAnchoredSearch = 8
const NSNumericSearch = 64
const NSDiacriticInsensitiveSearch = 128
const NSWidthInsensitiveSearch = 256
const NSForcedOrderingSearch = 512
const NSOrderedAscending = -1
const NSOrderedSame = 0
const NSOrderedDescending = 1

// test array

dim a() as string = array("Test 1", "Test 2", "Test 12")
```
// sort with Cocoa sorting
dim r() as string = NSStringArraySortMBS(a, NSDiacriticInsensitiveSearch +
NSWidthInsensitiveSearch +
NSCaseInsensitiveSearch +
NSNumericSearch)

// sort with xojo
a.sort

// show result
MsgBox "Cocoa: " + Join(r, " ")+EndOfLine+
"Xojo: " + Join(a, " ")

Notes: This function allows you to use NSStringCompareMBS for array sorting.

32.14.3 NSStringCompareMBS(s as string, t as string, options as Integer) as Integer

MBS Main Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Compares two things using the Cocoa string functions.
Example:

// constants for the function:
const NSCaseInsensitiveSearch = 1
const NSLiteralSearch = 2
const NSBackwardsSearch = 4
const NSAnchoredSearch = 8
const NSNumericSearch = 64
const NSDiacriticInsensitiveSearch = 128
const NSWidthInsensitiveSearch = 256
const NSForcedOrderingSearch = 512
const NSOrderedAscending = -1
const NSOrderedSame = 0
const NSOrderedDescending = 1

if NSStringCompareMBS("Hello","hello", NSCaseInsensitiveSearch)=0 then
msgbox "equal (correct)"
else
msgbox "not equal"
end if

if NSStringCompareMBS("Hello","hello", 0)=0 then
msgbox "equal"
else
msgbox "not equal (correct)"
end if

if NSStringCompareMBS("Hello","Hell", NSDiacriticInsensitiveSearch)=0 then
msgbox "equal (correct)"
else
msgbox "not equal"
end if

Notes:

Following constants can be used for the compare:

- **NSCaseInsensitiveSearch** 1  Case Insensitive
- **NSLiteralSearch** 2  Exact character-by-character equivalence
- **NSBackwardsSearch** 4  Search from end of source string
- **NSAnchoredSearch** 8  Search is limited to start (or end, if NSBackwardsSearch) of source string
- **NSNumericSearch** 64  Added in 10.2: Numbers within strings are compared using numeric value, that is, Foo2.txt < Foo7.txt < Foo25.txt; only applies to compare methods, not find
- **NSDiacriticInsensitiveSearch** 128  If specified, ignores diacritics (o-umlaut = o)
- **NSWidthInsensitiveSearch** 256  If specified, ignores width differences ('a' = UFF41)
- **NSForcedOrderingSearch** 512  If specified, comparisons are forced to return either NSOrderedAscending or NSOrderedDescending if the strings are equivalent but not strictly equal, for stability when sorting (e.g. "aaa" > "AAA" with NSCaseInsensitiveSearch specified)

The constants NSDiacriticInsensitiveSearch, NSWidthInsensitiveSearch and NSForcedOrderingSearch are only for Mac OS X 10.5 and newer versions.

Returns value constants:

- **NSOrderedAscending** -1
- **NSOrderedSame** 0
- **NSOrderedDescending** 1

32.14.4  **NSMakePointMBS(x as Double, y as Double) as NSPointMBS**

MBS Main Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**  Creates a NSPoint object based on coordinates.
32.14.5  **NSMakeRangeMBS(location as UInt32, length as UInt32) as NSRangeMBS**

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new range with the given values.

32.14.6  **NSMakeRectMBS(x as Double, y as Double, w as Double, h as Double) as NSRectMBS**

MBS Main Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSRect object based on coordinates and size.

32.14.7  **NSMakeSizeMBS(w as Double, h as Double) as NSSizeMBS**

MBS Main Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSSize object based on a size.

32.14.8  **CenterResizeAddWindowMBS(win as window)**

MBS MacExtras Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds a window to the list of center resizing windows. **Notes:** Please call in open event of window.

32.14.9  **CenterResizeInstallMBS**

MBS MacExtras Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Installs the center resize function. **Notes:** The plugin can provide for Xojo and Real Studio the center based window resizing. Call this method early in app.open to prepare everything.

Then register windows with CenterResizeAddWindowMBS in window open event and unregister with CenterResizeRemoveWindowMBS in window close event. This works for all windows you register.
32.15. **CLASS NSBUNDLEMBS**

### 32.14.10 CenterResizeRemoveWindowMBS(win as window)

MBS MacExtras Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Removes a window from the list of center resizing windows. **Notes:** Please call in Close event of window.

### 32.15 class NSBundleMBS

#### 32.15.1 class NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSBundle object represents a location in the file system that groups code and resources that can be used in a program. **Example:**

```vbnet
MsgBox NSBundleMBS.mainBundle.bundlePath
```

**Notes:**

NSBundle objects locate program resources, dynamically load and unload executable code, and assist in localization. You build a bundle in Xcode using one of these project types: Application, Framework, plug-ins. Although bundle structures vary depending on the target platform and the type of bundle you are building, the NSBundle class hides this underlying structure in most (but not all) cases. Many of the methods you use to load resources from a bundle automatically locate the appropriate starting directory and look for resources in known places.

#### 32.15.2 Methods

##### 32.15.3 allBundles as NSBundleMBS()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of all the application’s non-framework bundles. **Example:**

```vbnet
dim a(-1) as NSBundleMBS = NSBundleMBS.allBundles
dim lines(-1) as string
for each n as NSBundleMBS in a
    lines.Append n.bundlePath
next
MsgBox Join(lines,EndOfLine)
```
Notes: The returned array includes the main bundle and all bundles that have been dynamically created but doesn’t contain any bundles that represent frameworks.

32.15.4 allFrameworks as NSBundleMBS()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of all of the application’s bundles that represent frameworks.

**Example:**

```vbscript
dim a(-1) as NSBundleMBS = NSBundleMBS.allFrameworks
dim lines(-1) as string

for each n as NSBundleMBS in a
    lines.Append n.bundlePath
next

MsgBox Join(lines,EndOfLine)
```

**Notes:**

Returns an array of all of the application’s bundles that represent frameworks. Only frameworks with one or more Objective-C classes in them are included.

The returned array includes frameworks that are linked into an application when the application is built and bundles for frameworks that have been dynamically created.

32.15.5 builtInPlugInsFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver’s subdirectory containing plug-ins.

**Example:**

```vbscript
MsgBox NSBundleMBS.mainBundle.builtInPlugInsFolder.DisplayName
```

**Notes:** This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.
32.15.6 **builtInPlugInsPath as string**

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver’s subdirectory containing plug-ins.  
**Example:**

MsgBox NSBundleMBS.mainBundle.builtInPlugInsPath

**Notes:** This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

32.15.7 **bundleFolder as folderitem**

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver’s bundle directory.  
**Example:**

MsgBox NSBundleMBS.mainBundle.bundleFolder.DisplayName

32.15.8 **bundleIdentifier as string**

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s bundle identifier.  
**Example:**

```dim n as NSBundleMBS = NSBundleMBS.mainBundle
MsgBox n.bundleIdentifier```

**Notes:** Returns the receiver’s bundle identifier, which is defined by the CFBundleIdentifier key in the bundle’s information property list.

32.15.9 **bundlePath as string**

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver’s bundle directory.  
**Example:**

MsgBox NSBundleMBS.mainBundle.bundlePath
32.15.10  bundleWithIdentifier(identifier as string) as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the previously created NSBundle instance that has the specified bundle identifier.

Example:

// create with path
dim x as NSBundleMBS = NSBundleMBS.bundleWithIdentifier(SpecialFolder.Applications.Child("iTunes.app"))
MsgBox x.bundlePath

// once the bundle is known it will be in the allBundles array and be found with bundleWithIdentifier:
dim n as NSBundleMBS = NSBundleMBS.bundleWithIdentifier("com.apple.iTunes")
MsgBox n.bundlePath

Notes:
The previously created NSBundle instance that has the bundle identifier identifier. Returns nil if the requested bundle is not found.

This method is typically used by frameworks and plug-ins to locate their own bundle at runtime. This method may be somewhat more efficient than trying to locate the bundle using the bundleForClass method.

32.15.11  bundleWithPath(path as folderitem) as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns an NSBundle object that corresponds to the specified directory.

Example:

// create with path
dim x as NSBundleMBS = NSBundleMBS.bundleWithPath(SpecialFolder.Applications.Child("iTunes.app"))
MsgBox x.bundlePath

Notes:
Returns the NSBundle object that corresponds to fullPath, or nil if fullPath does not identify an accessible bundle directory.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object.

See also:
32.15. **CLASS NSBUNDLEMBS**

- 32.15.12 `bundleWithPath(path as string) as NSBundleMBS` 5533

### 32.15.12 `bundleWithPath(path as string) as NSBundleMBS`

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an `NSBundle` object that corresponds to the specified directory.

**Example:**

```vbnet
// create with path
dim x as NSBundleMBS = NSBundleMBS.bundleWithPath(“/Applications/iTunes.app”)
MsgBox x.bundlePath
```

**Notes:**

Returns the `NSBundle` object that corresponds to `fullPath`, or nil if `fullPath` does not identify an accessible bundle directory.

This method allocates and initializes the returned object if there is no existing `NSBundle` associated with `fullPath`, in which case it returns the existing object.

See also:

- 32.15.11 `bundleWithPath(path as folderitem) as NSBundleMBS` 5532

### 32.15.13 Constructor(path as folderitem)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an `NSBundle` object that corresponds to the specified directory.

**Example:**

```vbnet
dim n as new NSBundleMBS(SpecialFolder.Applications.Child(“iTunes.app”))
dim d as Dictionary = n.infoDictionary
MsgBox d.Value(“CFBundleName”)
```

**Notes:**

Creates the `NSBundle` object that corresponds to `fullPath`, or fails if `fullPath` does not identify an accessible bundle directory. On failure the handle property is 0.

This method allocates and initializes the returned object if there is no existing `NSBundle` associated with `fullPath`, in which case it returns the existing object.

See also:

- 32.15.14 `Constructor(path as string)` 5534
32.15.14 Constructor(path as string)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBundle object that corresponds to the specified directory. 

**Example:**
```
dim n as new NSBundleMBS("/Applications/iTunes.app")
dim d as Dictionary = n.infoDictionary
MsgBox d.Value("CFBundleName")
```

**Notes:**
Creates the NSBundle object that corresponds to fullPath, or fails if fullPath does not identify an accessible bundle directory. On failure the handle property is 0.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object. 

See also:
- 32.15.13 Constructor(path as folderitem)

32.15.15 developmentLocalization as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the localization used to create the bundle. 

**Example:**
```
MsgBox NSBundleMBS.mainBundle.developmentLocalization
```

**Notes:** The returned localization corresponds to the value in the CFBundleDevelopmentRegion key of the bundle’s property list (Info.plist).

32.15.16 executableArchitectures as Integer()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of numbers indicating the architecture types supported by the bundle’s executable. 

**Example:**
```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.app")
dim b as new NSBundleMBS(f)

dim lines(-1) as string
```
for each e as Integer in b.executableArchitectures
    dim s as string
    Select case e
        case NSBundleMBS.NSBundleExecutableArchitectureI386
            s = "i386"
        case NSBundleMBS.NSBundleExecutableArchitecturePPC
            s = "PPC"
        case NSBundleMBS.NSBundleExecutableArchitecturePPC64
            s = "PPC 64-bit"
        case NSBundleMBS.NSBundleExecutableArchitectureX86_64
            s = "x86 64-bit"
        case 12
            s = "iPhone"
        else
            s = Str(e)
    end Select
    lines.Append hex(e) + ": " + s
next

MsgBox Join(lines, EndOfLine)

Notes: This method scans the bundle’s Mach-O executable and returns all of the architecture types it finds. Because they are taken directly from the executable, the returned values may not always correspond to one of the well-known CPU types defined in "Mach-O Architecture."

32.15.17 executableFile as folderitem

Example:
MsgBox NSBundleMBS.mainBundle.executableFile.AbsolutePath

32.15.18 executablePath as string

Example:
MsgBox NSBundleMBS.mainBundle.executablePath
32.15.19  infoDictionary as dictionary

Example:

```vba
dim n as new NSBundleMBS(SpecialFolder.Applications.Child("iTunes.app"))
dim d as Dictionary = n.infoDictionary

dim lines(-1) as string

for each key as Variant in d.keys
    dim value as Variant = d.Value(key)
    
    // special handle folderitems
    if value isa FolderItem then
        dim f as FolderItem = value
    value = f.Name
    end if

    lines.Append key.StringValue + " ->" + value.StringValue
next

MsgBox Join(lines,EndOfLine)
```

Notes: Returns a dictionary, constructed from the bundle’s Info.plist file, that contains information about the receiver. If the bundle does not contain an Info.plist file, a valid dictionary is returned but this dictionary contains only private keys that are used internally by the NSBundle class. The NSBundle class may add extra keys to this dictionary for its own use.

32.15.20  isLoaded as boolean

Example:

```vba
MsgBox str(NSBundleMBS.mainBundle.isLoaded) // mainbundle is always loaded
```

Notes: Returns true if the bundle’s code is currently loaded, otherwise false.
32.15.21 load as boolean

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Dynamically loads the bundle’s executable code into a running program, if the code has not already been loaded.

**Notes:**
Returns true if the method successfully loads the bundle’s code or if the code has already been loaded, otherwise false.

You can use this method to load the code associated with a dynamically loaded bundle, such as a plug-in or framework. Prior to Mac OS X version 10.5, a bundle would attempt to load its code if it had any only once. Once loaded, you could not unload that code. In Mac OS X version 10.5 and later, you can unload a bundle’s executable code using the unload method.

You don’t need to load a bundle’s executable code to search the bundle’s resources.

---

32.15.22 localizations as string()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a list of all the localizations contained within the receiver’s bundle.

**Example:**
MsgBox join(NSBundleMBS.mainBundle.localizations,EndOfLine)

**Notes:** Return an array, containing strings, that specifies all the localizations contained within the receiver’s bundle.

---

32.15.23 localizedInfoDictionary as dictionary

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary with the keys from the bundle’s localized property list.

**Example:**
dim n as new NSBundleMBS(SpecialFolder.Applications.Child("iTunes.app"))
dim d as Dictionary = n.localizedInfoDictionary
dim lines(-1) as string
for each key as Variant in d.keys
dim value as Variant = d.Value(key)
// special handle folderitems
if value isa FolderItem then
dim f as FolderItem = value
value = f.Name
end if

lines.Append key.StringValue + " ->" + value.StringValue
next

MsgBox Join(lines, EndOfLine)

**Notes:**

Returns a dictionary with the keys from the bundle’s localized property list (InfoPlist.strings).

This method uses the preferred localization for the current user when determining which resources to return. If the preferred localization is not available, this method chooses the most appropriate localization found in the bundle.

### 32.15.24 localizedStringForKey(key as string, value as string="", tableName as string="") as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns a localized version of the string designated by the specified key and residing in the specified table.

**Notes:**

- **key:** The key for a string in the table identified by tableName.
- **value:** The value to return if key is "" or if a localized string for key can’t be found in the table.
- **tableName:** The receiver’s string table to search. If tableName is an empty string, the method attempts to use the table in Localizable.strings.

Returns a localized version of the string designated by key in table tableName. If value is nil or an empty string, and a localized string is not found in the table, returns key. If key and value are both nil, returns the empty string.

For more details about string localization and the specification of a .strings file, see "Working With Localized Strings."

Using the user default NSShowNonLocalizedStrings, you can alter the behavior of localizedStringForKey to log a message when the method can’t find a localized string. If you set this default to true (in the global domain or in the application’s domain), then when the method can’t find a localized string in the table, it logs a message to the console and capitalizes key before returning it.

The following example cycles through a static array of keys when a button is clicked, gets the value for each key from a strings table named Buttons.strings, and sets the button title with the returned value:
### 32.15.25 mainBundle as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSBundle object that corresponds to the directory where the current application executable is located.

**Example:**

MsgBox NSBundleMBS.mainBundle.bundlePath

**Notes:**

Returns the NSBundle object that corresponds to the directory where the application executable is located, or nil if a bundle object could not be created.

This method allocates and initializes a bundle object if one doesn’t already exist. The new object corresponds to the directory where the application executable is located. Be sure to check the return value to make sure you have a valid bundle. This method may return a valid bundle object even for unbundled applications. In general, the main bundle corresponds to an application file package or application wrapper: a directory that bears the name of the application and is marked by a ”.app” extension.

### 32.15.26 pathForResource(name as string, extension as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname for the resource identified by the specified name and file extension.

**Notes:**

name: The name of the resource file.

extension: If extension is an empty string, the extension is assumed not to exist and the file URL is the first
file encountered that exactly matches name.

Returns the full pathname for the resource file or nil if the file could not be located.

The method first looks for a matching resource file in the non-localized resource directory of the specified bundle. (In Mac OS X, this directory is typically called Resources but in iPhone OS, it is the main bundle directory.) If a matching resource file is not found, it then looks in the top level of any available language-specific ".lproj" directories. (The search order for the language-specific directories corresponds to the user’s preferences.) It does not recurse through other subdirectories at any of these locations. For more details see Bundles and Localization.

The following code fragment gets the path to a plist within the bundle, and loads it into a dictionary.

See also:

- 32.15.28 pathForResource(name as string, extension as string, subpath as string) as folderitem
- 32.15.29 pathForResource(name as string, extension as string, subpath as string, localizationName as string) as folderitem

32.15.28 pathForResource(name as string, extension as string, subpath as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the full pathname for the resource identified by the specified name and file extension and located in the specified bundle subdirectory.

**Notes:**

name: The name of the resource file.

extension: If extension is an empty string, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches name.

subpath: The name of the bundle subdirectory.

Returns the full pathname for the resource file or nil if the file could not be located.

If subpath is "", this method searches the top-level nonlocalized resource directory and the top-level of any language-specific directories. (In Mac OS X, the top-level nonlocalized resource directory is typically called Resources but in iPhone OS, it is the main bundle directory.) For example, suppose you have a Mac OS X application with a modern bundle and you specify "Documentation" for the subpath parameter. This method would first look in the Contents/Resources/Documentation directory of the bundle, followed by the Documentation subdirectories of each language-specific .lproj directory. (The search order for the language-specific directories corresponds to the user’s preferences.) This method does not recurse through any other subdirectories at any of these locations. For more details see Bundles and Localization.

- 32.15.27 pathForResource(name as string, extension as string) as folderitem
32.15. **CLASS NSBUNDLEMBS**

- 32.15.29 `pathForResource(name as string, extension as string, subpath as string, localizationName as string) as folderitem`

### 32.15.29 `pathForResource(name as string, extension as string, subpath as string, localizationName as string) as folderitem`

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the full pathname for the resource identified by the specified name and file extension, located in the specified bundle subdirectory, and limited to global resources and those associated with the specified localization.

**Notes:**

- `name`: The name of the resource file.
- `extension`: If extension is an empty string, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches `name`.
- `subpath`: The name of the bundle subdirectory to search.
- `localizationName`: The name of the localization. This parameter should correspond to the name of one of the bundle’s language-specific resource directories without the .lproj extension.

Returns the full pathname for the resource file or nil if the file could not be located.

This method is equivalent to `pathForResource ofType`, except that only nonlocalized resources and those in the language-specific .lproj directory specified by `localizationName` are searched.

There should typically be little reason to use this method—see Getting the Current Language and Locale.

**See also:**

- 32.15.27 `pathForResource(name as string, extension as string) as folderitem`
- 32.15.28 `pathForResource(name as string, extension as string, subpath as string) as folderitem`

### 32.15.30 `pathForSoundResource(name as string) as folderitem`

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the location of the specified sound resource file.

**Notes:**

- `name`: The name of the sound resource file, without any pathname information. Including a filename extension is optional.

Returns the folderItem of the resource file or nil if the file was not found.

Sound resources are those files in the bundle that are recognized by the NSSound class. The types of sound files can be determined by calling the `soundUnfilteredFileTypes` method of NSSound.
32.15.31 preferredLocalizations as string()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings indicating the actual localizations contained in the receiver’s bundle. **Notes:** An array of strings, each of which identifies the a localization in the receiver’s bundle. The localizations in the array are not returned in any particular order.

32.15.32 privateFrameworksFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver’s subdirectory containing frameworks. **Notes:** This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

32.15.33 privateFrameworksPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver’s subdirectory containing frameworks. **Notes:** This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

32.15.34 resourceFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiving bundle’s subdirectory containing resources.

32.15.35 resourcePath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiving bundle’s subdirectory containing resources.

32.15.36 sharedFrameworksFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver’s subdirectory containing shared frameworks.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

32.15.37 sharedFrameworksPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver’s subdirectory containing shared frameworks. **Notes:** This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

32.15.38 sharedSupportFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's subdirectory containing shared support files. **Notes:** This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

32.15.39 sharedSupportPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver’s subdirectory containing shared support files. **Notes:** This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

32.15.40 unload as boolean

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unloads the code associated with the receiver. **Notes:**

Returns true if the bundle was successfully unloaded or was not already loaded; otherwise, false if the bundle could not be unloaded.

This method attempts to unload a bundle's executable code using the underlying dynamic loader (typically dyld). You may use this method to unload plug-in and framework bundles when you no longer need the code they contain. You should use this method to unload bundles that were loaded using the methods of the NSBundle class only. Do not use this method to unload bundles that were originally loaded using the bundle-manipulation functions in Core Foundation.

It is the responsibility of the caller to ensure that no in-memory objects or data structures refer to the code.
being unloaded. For example, if you have an object whose class is defined in a bundle, you must release that object prior to unloading the bundle. Similarly, your code should not attempt to access any symbols defined in an unloaded bundle.

Prior to Mac OS X version 10.5, code could not be unloaded once loaded, and this method would always return false. In Mac OS X version 10.5 and later, you can unload a bundle’s executable code using this method.

Available in Mac OS X v10.5 and later.

32.15.41 Properties

32.15.42 Handle as Integer

Example:
MsgBox hex(NSBundleMBS.mainBundle.Handle)

Notes: (Read and Write property)

32.15.43 Constants

32.15.44 NSBundleExecutableArchitectureI386 = 7

MBS MacBase Plugin, Plugin Version: 9.8. Function: One of the constants describe the CPU types that a bundle’s executable code may support.
Notes:
Specifies the 32-bit Intel architecture.
Available in Mac OS X v10.5 and later.

32.15.45 NSBundleExecutableArchitecturePPC = & h12

MBS MacBase Plugin, Plugin Version: 9.8. Function: One of the constants describe the CPU types that a bundle’s executable code may support.
Notes:
Specifies the 32-bit PowerPC architecture.
Available in Mac OS X v10.5 and later.
32.15.46  **NSBundleExecutableArchitecturePPC64 = & h01000012**

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** One of the constants describe the CPU types that a bundle's executable code may support.

**Notes:**
Specifies the 64-bit PowerPC architecture.
Available in Mac OS X v10.5 and later.

32.15.47  **NSBundleExecutableArchitectureX86_64 = & h01000007**

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** One of the constants describe the CPU types that a bundle's executable code may support.

**Notes:**
Specifies the 64-bit Intel architecture.
Available in Mac OS X v10.5 and later.
32.16 class NSCalendarMBS

32.16.1 class NSCalendarMBS

Notes:
see also https://developer.apple.com/library/mac/# documentation/Cocoa/Reference/Foundation/Classes/NSCalendar_Class/Reference/NSCalendar.html

32.16.2 Methods

32.16.3 autoupdatingCurrentCalendar as NSCalendarMBS

Notes:
Settings you get from this calendar do change as the user’s settings change (contrast with currentCalendar).

Note that if you cache values based on the calendar or related information those caches will of course not be automatically updated by the updating of the calendar object.

Available in Mac OS X v10.5 and later.

32.16.4 calendarIdentifier as string

32.16.5 Constructor

See also:

• 32.16.6 Constructor(identifier as string)
32.16. CLASS NSCALENDARMBS

32.16.6 Constructor(identifier as string)

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly-allocated NSCalendar object for the calendar specified by a given identifier. See also:

- 32.16.5 Constructor

32.16.7 copy as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a copy of the calendar object.

32.16.8 currentCalendar as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the logical calendar for the current user. **Notes:** The returned calendar is formed from the settings for the current user’s chosen system locale overlaid with any custom settings the user has specified in System Preferences. Settings you get from this calendar do not change as System Preferences are changed, so that your operations are consistent (contrast with autoupdatingCurrentCalendar).

32.16.9 description as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description for this timezone.

32.16.10 Print

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the calendar to debug output. **Notes:** This may help for debugging and you see output in console app.
32.16.11 Properties

32.16.12 Handle as Integer

**Notes:** (Read and Write property)

32.16.13 firstWeekday as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The index of the first weekday.  
**Notes:** (Read and Write computed property)

32.16.14 locale as NSLocaleMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The locale.  
**Notes:** (Read and Write computed property)

32.16.15 minimumDaysInFirstWeek as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum number of days in the first week.  
**Notes:** (Read and Write computed property)

32.16.16 timeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time zone.  
**Notes:** (Read and Write computed property)
32.17. CLASS NSCHARACTERSETMBS

32.17 class NSCharacterSetMBS

32.17.1 class NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

An NSCharacterSet object represents a set of Unicode-compliant characters.

**Example:**

```java
// get the Symbol font
dim n as NSFontMBS = NSFontMBS.fontWithName("Symbol",10)

// what characters are defined for this font?
dim c as NSCharacterSetMBS = n.coveredCharacterSet

// display a string with all the characters
MsgBox c.StringValue
```

**Notes:**

NSString and NSScanner objects use NSCharacterSet objects to group characters together for searching operations, so that they can find any of a particular set of characters during a search. The cluster’s two public classes, NSCharacterSet and NSMunableCharacterSet, declare the programmatic interface for static and dynamic character sets, respectively.

The objects you create using these classes are referred to as character set objects (and when no confusion will result, merely as character sets). Because of the nature of class clusters, character set objects aren’t actual instances of the NSCharacterSet or NSMunableCharacterSet classes but of one of their private sub-classes. Although a character set object’s class is private, its interface is public, as declared by these abstract superclasses, NSCharacterSet and NSMunableCharacterSet. The character set classes adopt the NSCopying and NSMunableCopying protocols, making it convenient to convert a character set of one type to the other.

The NSCharacterSet class declares the programmatic interface for an object that manages a set of Unicode characters (see the NSString class cluster specification for information on Unicode). NSCharacterSet’s principal primitive method, characterIsMember:, provides the basis for all other instance methods in its interface. A subclass of NSCharacterSet needs only to implement this method, plus mutableCopyWithZone:, for proper behavior. For optimal performance, a subclass should also override bitmapRepresentation, which otherwise works by invoking characterIsMember: for every possible Unicode value.

NSCharacterSet is "toll-free bridged" with its Cocoa Foundation counterpart, CFCharacterSet Reference. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an NSCharacterSet * parameter, you can pass a CFCharacterSetRef, and in a function where you see a CFCharacterSetRef parameter, you can pass an NSCharacterSet instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging.
The mutable subclass of NSCharacterSet is NSMutableCharacterSet.

### 32.17.2 Methods

#### 32.17.3 alphanumericCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the categories Letters, Marks, and Numbers.

**Example:**

```dim n as NSCharacterSetMBS = NSCharacterSetMBS.alphanumericCharacterSet
MsgBox left(n,200) // show only first 200 chars```

**Notes:** Informally, this set is the set of all characters used as basic units of alphabets, syllabaries, ideographs, and digits.

#### 32.17.4 bitmapRepresentation as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a memoryblock object encoding the receiver in binary format.

**Notes:**

This format is suitable for saving to a file or otherwise transmitting or archiving.

A raw bitmap representation of a character set is a byte array of $2^{16}$ bits (that is, 8192 bytes). The value of the bit at position $n$ represents the presence in the character set of the character with decimal Unicode value $n$.

#### 32.17.5 capitalizedLetterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Titlecase Letters.

**Example:**

```dim n as NSCharacterSetMBS = NSCharacterSetMBS.capitalizedLetterCharacterSet
MsgBox n```
32.17. CLASS NSCHARACTERSETMBS

32.17.6 characterIsMember(Character as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether a given character is in the receiver.
**Example:**
```
// get the Symbol font
dim n as NSFontMBS = NSFontMBS.fontWithName("Arial",10)

// what characters are defined for this font?
dim c as NSCharacterSetMBS = n.coveredCharacterSet

// is letter A part of this font?
MsgBox "A included: " + str(c.characterIsMember(asc("A")))
```

32.17.7 characterSetWithBitmapRepresentation(data as MemoryBlock) as NSCharac
terSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing characters determined by a given bitmap representation.
**Notes:**
This method is useful for creating a character set object with data from a file or other external data source.

A raw bitmap representation of a character set is a byte array of $2^{16}$ bits (that is, 8192 bytes). The value of the bit at position $n$ represents the presence in the character set of the character with decimal Unicode value $n$.

32.17.8 characterSetWithCharactersInString(aString as string) as NSCharac
terSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in a given string.
**Example:**
```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.characterSetWithCharactersInString("Hello World")
MsgBox n
```

**Notes:** A character set containing the characters in aString. Returns an empty character set if aString is empty.
32.17.9  **characterSetWithContentsOfFile(aString as string) as NSStringCharacterSet**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a character set read from the bitmap representation stored in the file a given path.

**Notes:**
To read a bitmap representation from any file, use the NSData method `dataWithContentsOfFile` and pass the result to `characterSetWithBitmapRepresentation`.

This method doesn’t use filenames to check for the uniqueness of the character sets it creates. To prevent duplication of character sets in memory, cache them and make them available through an API that checks whether the requested set has already been loaded.

See also:
- 32.17.10 `characterSetWithContentsOfFile(file as folderitem) as NSStringCharacterSet`

32.17.10  **characterSetWithContentsOfFile(file as folderitem) as NSStringCharacterSet**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a character set read from the bitmap representation stored in the file a given path.

**Notes:**
To read a bitmap representation from any file, use the NSData method `dataWithContentsOfFile` and pass the result to `characterSetWithBitmapRepresentation`.

This method doesn’t use filenames to check for the uniqueness of the character sets it creates. To prevent duplication of character sets in memory, cache them and make them available through an API that checks whether the requested set has already been loaded.

See also:
- 32.17.9 `characterSetWithContentsOfFile(aString as string) as NSStringCharacterSet`

32.17.11  **characterSetInRange(r as NSRangeMBS) as NSStringCharacterSet**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a character set containing characters with Unicode values in a given range.

**Example:**
```plaintext
dim r as NSRangeMBS = NSMakeRangeMBS(asc(“a”),26) // all small letters
dim n as NSStringCharacterSetMBS = NSStringCharacterSetMBS.characterSetInRange(r)
MsgBox n
```
32.17. CLASS NSCharacterSetMBS

Notes:

r: A range of Unicode values.

r.location is the value of the first character to return; aRange.location + r.length-1 is the value of the last.

Returns a character set containing characters whose Unicode values are given by aRange. If aRange.length is 0, returns an empty character set.

This code excerpt creates a character set object containing the lowercase English alphabetic characters:

32.17.12 componentsSeparatedByCharactersInSet(s as string) as String()

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** Returns an array containing substrings from the receiver that have been divided by characters in a given set.
**Notes:**

self: A character set containing the characters to use to split the receiver. Must not be nil.
s: The text to process.

Returns an array of string containing substrings from the receiver that have been divided by characters in separator.

The substrings in the array appear in the order they did in the receiver. Adjacent occurrences of the separator characters produce empty strings in the result. Similarly, if the string begins or ends with separator characters, the first or last substring, respectively, is empty.

32.17.13 Constructor

**Function:** The constructor to create an empty character set.

32.17.14 controlCharacterSet as NSCharacterSetMBS

**Function:** Returns a character set containing the characters in the categories of Control or Format Characters.
**Notes:** These characters are specifically the Unicode values U+0000 to U+001F and U+007F to U+009F.
32.17.15  copy as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the character set.

32.17.16  decimalDigitCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Decimal Numbers.  
**Example:**

```plaintext
dim n as NSCharacterSetMBS = NSCharacterSetMBS.decimalDigitCharacterSet
MsgBox n
```

**Notes:** Informally, this set is the set of all characters used to represent the decimal values 0 through 9. These characters include, for example, the decimal digits of the Indic scripts and Arabic.

32.17.17  decomposableCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing all individual Unicode characters that can also be represented as composed character sequences.  
**Notes:**

Returns a character set containing all individual Unicode characters that can also be represented as composed character sequences (such as for letters with accents), by the definition of "standard decomposition" in version 3.2 of the Unicode character encoding standard.

These characters include compatibility characters as well as pre-composed characters.

Note: This character set doesn’t currently include the Hangul characters defined in version 2.0 of the Unicode standard.

32.17.18  hasMemberInPlane(thePlane as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver has at least one member in a given character plane.  
**Notes:** This method makes it easier to find the plane containing the members of the current character set.
32.17. **CLASS NSCHARACTERSETMBS**

The Basic Multilingual Plane is plane 0.

---

**32.17.19 illegalCharacterSet as NSCharacterSetMBS**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing values in the category of Non-Characters or that have not yet been defined in version 3.2 of the Unicode standard.

---

**32.17.20 invertedSet as NSCharacterSetMBS**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing only characters that don’t exist in the receiver. **Notes:** Inverting an immutable character set is much more efficient than inverting a mutable character set.

---

**32.17.21 isSupersetOfSet(theOtherSet as NSCharacterSetMBS) as boolean**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is a superset of another given character set. **Notes:** Returns true if the receiver is a superset of theOtherSet, otherwise false. Available in Mac OS X v10.2 and later.

---

**32.17.22 letterCharacterSet as NSCharacterSetMBS**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the categories Letters and Marks. **Example:**

```plaintext
dim n as NSCharacterSetMBS = NSCharacterSetMBS.letterCharacterSet
MsgBox n
```

**Notes:** Informally, this set is the set of all characters used as letters of alphabets and ideographs.
CHAPTER 32. COCOA

32.17.23 longCharacterIsMember(theLongChar as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether a given long character is a member of the receiver. **Notes:**

Returns true if theLongChar is in the receiver, otherwise false. This method supports the specification of 32-bit characters. Available in Mac OS X v10.2 and later.

32.17.24 lowercaseLetterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Lowercase Letters. **Example:**

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.lowercaseLetterCharacterSet
MsgBox n
```

**Notes:** Informally, this set is the set of all characters used as lowercase letters in alphabets that make case distinctions.

32.17.25 mutableCopy as NSMutableCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a mutable copy of the character set.

32.17.26 newlineCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the newline characters. **Example:**

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.newLineCharacterSet
MsgBox n
```

**Notes:**

A character set containing the newline characters (U+000A, U+000D, U+0085). Available in Mac OS X v10.5 and later.
32.17.27 nonBaseCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a character set containing the characters in the category of Marks.

**Example:**
```vbscript
dim n as NSCharacterSetMBS = NSCharacterSetMBS.nonBaseCharacterSet
MsgBox n
```

**Notes:** This set is also defined as all legal Unicode characters with a non-spacing priority greater than 0. Informally, this set is the set of all characters used as modifiers of base characters.

32.17.28 Operator_Convert as string

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a string containing all characters in this set.

**Example:**
```vbscript
dim r as NSRangeMBS = NSMakeRangeMBS(asc(“a”),26) // all small letters
dim n as NSCharacterSetMBS = NSCharacterSetMBS.characterSetWithRange(r)
MsgBox n
```

**Notes:** This way you can use a character set directly with functions expecting a string like msgbox.

32.17.29 punctuationCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a character set containing the characters in the category of Punctuation.

**Example:**
```vbscript
dim n as NSCharacterSetMBS = NSCharacterSetMBS.punctuationCharacterSet
MsgBox n
```

**Notes:** Informally, this set is the set of all non-whitespace characters used to separate linguistic units in scripts, such as periods, dashes, parentheses, and so on.
32.17.30  rangeOfCharacterFromSet(s as string, options as Integer = 0, searchRange as NSRangeMBS = nil) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Finds and returns the range in the receiver of the first character from a given character set found in a given range with given options. **Notes:**

- `self`: A character set. This value must not be nil.
- `s`: The text to process:
- `options`: A mask specifying search options. The following options may be specified by combining them with bitwise OR operator: `NSAnchoredSearch (8), NSBackwardsSearch (4)`.
- `searchRange`: Optional, the range in which to search. The range must not exceed the bounds of the receiver.

Raises a NSException if search range is invalid.

Returns the range in the receiver of the first character found from set within search range. Returns a range of `{ NSNotFound, 0 }` if none of the characters in aSet are found.

Because pre-composed characters in set can match composed character sequences in the receiver, the length of the returned range can be greater than 1. For example, if you search for "" in the string "strudel", the returned range is `{ 3,2 }`.

**Special Considerations**

This method detects all invalid ranges (including those with negative lengths). For applications linked against OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

32.17.31  stringByTrimmingCharactersInSet(s as string) as String

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new string made by removing from both ends of the receiver characters contained in a given character set. **Notes:**

Returns a new string made by removing from both ends of the receiver characters contained in set. If the receiver is composed entirely of characters from set, the empty string is returned.

Use whitespaceCharacterSet or whitespaceAndNewlineCharacterSet to remove whitespace around strings.
32.17. **CLASS NSCharacterSetMBS**

### 32.17.32 StringValue as string

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing all characters in this set.  
**Example:**

```vbnet
// get the Symbol font
dim n as NSFontMBS = NSFontMBS.fontWithName("Symbol",10)

// what characters are defined for this font?
dim c as NSCharacterSetMBS = n.coveredCharacterSet

// display a string with all the characters
MsgBox c.StringValue
```

### 32.17.33 symbolCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Symbols.  
**Example:**

```vbnet
dim n as NSCharacterSetMBS = NSCharacterSetMBS.symbolCharacterSet
MsgBox n
```

**Notes:**  
These characters include, for example, the dollar sign ($ ) and the plus (+) sign. Available in Mac OS X v10.3 and later.

### 32.17.34 uppercaseLetterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the categories of Uppercase Letters and Titlecase Letters.  
**Example:**

```vbnet
dim n as NSCharacterSetMBS = NSCharacterSetMBS.uppercaseLetterCharacterSet
MsgBox n
```

**Notes:** Informally, this set is the set of all characters used as uppercase letters in alphabets that make case distinctions.
32.17.35 whitespaceAndNewlineCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing only the whitespace characters space (U+0020) and tab (U+0009) and the newline and nextline characters (U+000A U+000D, U+0085).

**Example:**

```vbnet
dim n as NSCharacterSetMBS = NSCharacterSetMBS.whitespaceAndNewlineCharacterSet
MsgBox n
```

32.17.36 whitespaceCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing only the in-line whitespace characters space (U+0020) and tab (U+0009).

**Example:**

```vbnet
dim n as NSCharacterSetMBS = NSCharacterSetMBS.whitespaceCharacterSet
MsgBox n
```

**Notes:** This set doesn’t contain the newline or carriage return characters.

32.17.37 Properties

32.17.38 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.

**Notes:** (Read and Write property)

32.17.39 Constants

32.17.40 NSOpenStepUnicodeReservedBase=& hF400

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** A constant to specify lower bound for a Unicode character range reserved for Apple’s corporate use.

**Notes:** Specifies lower bound for a Unicode character range reserved for Apple’s corporate use (the range is 0xF4000xF8FF).
32.18  class NSCoderMBS

32.18.1  class NSCoderMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plugin class for NSCoder.

**Example:**

```plaintext
// make archiver
dim a as new NSKeyedArchiverMBS

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data
dim m as MemoryBlock = a.archiverData

// start unarchiver
dim u as new NSKeyedUnarchiverMBS(m)

// query and display a value
dim s as string = u.decodeString("Greeting")
MsgBox s
```

**Notes:**

The NSCoder abstract class declares the interface used by concrete subclasses to transfer objects and other Objective-C data items between memory and some other format. This capability provides the basis for archiving (where objects and data items are stored on disk) and distribution (where objects and data items are copied between different processes or threads). The concrete subclasses provided by Foundation for these purposes are NSArchiver, NSUnarchiver, NSKeyedArchiver, NSKeyedUnarchiver, and NSPortCoder. Concrete subclasses of NSCoder are referred to in general as coder classes, and instances of these classes as coder objects (or simply coders). A coder object that can only encode values is referred to as an encoder object, and one that can only decode values as a decoder object.

 NSCoder operates on objects, scalars, C arrays, structures, and strings, and on pointers to these types. It does not handle types whose implementation varies across platforms, such as union, void *, function pointers, and long chains of pointers. A coder object stores object type information along with the data, so an object decoded from a stream of bytes is normally of the same class as the object that was originally encoded into the stream. An object can change its class when encoded, however; this is described in Archives and Serializations Programming Guide.
For details of how to create a subclass of NSCoder, see "Subclassing NSCoder" in Archives and Serializations Programming Guide.

The plugin implements this class because it is needed to encode and decode the window state. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

32.18.2 Methods

32.18.3 allowsKeyedCoding as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value that indicates whether the receiver supports keyed coding of objects. Notes: The default implementation returns false. Concrete subclasses that support keyed coding, such as NSKeyedArchiver, need to override this method to return true.

32.18.4 Constructor

32.18.5 containsValueForKey(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value that indicates whether an encoded value is available for a string.

32.18.6 decodeBool(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Decodes and returns a boolean value that was previously encoded with encodeBool and associated with the string key.

32.18.7 decodeBytes(key as string) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Decodes a buffer of data whose types are unspecified.
32.18.8  decodeCFOBJECTMBS(key as string) as Variant

**Notes:**
This is a special convenience methods to decode CF* classes which are bridged to Cocoa objects. Like CFDictionary, CFURL, CFData, CFString, CFNumber, CFArray and a few others.

32.18.9  decodeDictionary(key as string) as Dictionary

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a dictionary.

32.18.10  decodeDouble(key as string) as Double

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes and returns a double value that was previously encoded with either encodeFloat or encodeDouble and associated with the string key.

32.18.11  decodeFloat(key as string) as single

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes and returns a float value that was previously encoded with encodeFloat or encodeDouble and associated with the string key.

32.18.12  decodeInt32(key as string) as Int32

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes and returns a 32-bit integer value that was previously encoded with encodeInt, encodeInteger, encodeInt32, or encodeInt64 and associated with the string key.

**Notes:** If the encoded integer does not fit into a 32-bit integer, the method raises an NSRangeException.

32.18.13  decodeInt64(key as string) as Int64

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes and returns a 64-bit integer value that was previously encoded with encodeInt, encodeInteger,
encodeInt32, or encodeInt64 and associated with the string key.

### 32.18.14 decodeNSURLFile(key as string) as folderitem

### 32.18.15 decodeNSURLString(key as string) as String

### 32.18.16 decodePoint(key as string) as CGPointMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a point object.

### 32.18.17 decodeRect(key as string) as CGRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a rectangle.

### 32.18.18 decodeSize(key as string) as CGSizeMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a size object.

### 32.18.19 decodeString(key as string) as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a string.
### 32.18.20 encodeBool(value as boolean, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes value and associates it with the string key.

### 32.18.21 encodeBytes(value as MemoryBlock, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a buffer of data whose types are unspecified.

### 32.18.22 encodeCFOBJECTMBS(value as Variant, key as string)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a CFOBJECT.

**Notes:**
This is a special convenience method to encode CF* classes which are bridged to Cocoa objects. Like CFDictionary, CFURL, CFData, CFString, CFNumber, CFArray and a few others.

### 32.18.23 encodeDictionary(value as Dictionary, key as string)

**Notes:**
Not all objects can be inside the dictionary. Cocoa objects, string, booleans and numbers are okay.

### 32.18.24 encodeDouble(value as Double, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes value and associates it with the string key.

### 32.18.25 encodeFloat(value as single, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes value and associates it with the string key.
32.18.26  encodeInt32(value as Int32, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes the 32-bit integer value and associates it with the string key.

32.18.27  encodeInt64(value as Int64, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes the 64-bit integer value and associates it with the string key.

32.18.28  encodeNSURLFile(value as folderitem, key as string)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a folderitem as NSURL.

32.18.29  encodeNSURLString(value as String, key as string)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a string with URL as NSURL object.

32.18.30  encodePoint(value as NSPointMBS, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a point object.

32.18.31  encodeRect(value as NSRectMBS, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a rectangle.

32.18.32  encodeSize(value as NSSizeMBS, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a size object.
### 32.18.33 `encodeString(value as string, key as string)`

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a string.

### 32.18.34 `systemVersion as Integer`

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** During encoding, this method should return the system version currently in effect. **Notes:**

During decoding, this method should return the version that was in effect when the data was encoded.

By default, this method returns the current system version, which is appropriate for encoding but not for decoding. Subclasses that implement decoding must override this method to return the system version of the data being decoded.

### 32.18.35 Properties

#### 32.18.36 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference for this object. **Notes:** (Read and Write property)
32.19 class NSCursorMBS

32.19.1 class NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Instances of the NSCursor class manage the appearance of the cursor.

**Example:**

```vba
Dim im As NSImageMBS
Dim p As Picture
Dim m As Picture
Dim theCursor As NSCursorMBS
Dim test As Boolean

// create a blue ball picture
p = NewPicture(16,16,32)
p.Graphics.ForeColor = & c0000FF
p.Graphics.FillRect 0,0,16,16

m = NewPicture(16,16,32)
m.Graphics.ForeColor = & c000000
m.Graphics.Filloval 0,0,16,16

// Create a new NSImage
im=New NSImageMBS(p,m)

// Create a cursor from the NSImage
theCursor=New NSCursorMBS(im, 10, 10)

Title = Str(theCursor.Handle)

// Make this the active cursor
theCursor.set

// display picture
p.Mask.Graphics.DrawPicture m,0,0
Backdrop = p

// so you see it for a second before RB resets the cursor
DelayMBS 1.0
```

**Notes:**

In Cocoa, you can change the currently displayed cursor based on the position of the mouse over one of your views. You might use this technique to provide visual feedback about what actions the user can take with the mouse. For example, you might display one of the resize cursors whenever the mouse moves over
a portion of your view that acts as a custom resizing handle. To set this up, you associate a cursor object with one or more cursor rectangles in the view.

Cursor rectangles are a specialized type of tracking rectangles, which are used to monitor the mouse location in a view. Views implement cursor rectangles using tracking rectangles but provide methods for setting and refreshing cursor rectangles that are distinct from the generic tracking rectangle interface. For information on how to set up cursor rectangles, see "Handling Tracking-Rectangle and Cursor-Update Events in Views".

### 32.19.2 Methods

#### 32.19.3 `arrowCursor` as `NSCursorMBS`

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default cursor, the arrow cursor.  
**Example:**

```plaintext
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.arrowCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

**Notes:** The default cursor, a slanted arrow with its hot spot at the tip. The arrow cursor is the one you’re used to seeing over buttons, scrollers, and many other objects in the window system.

#### 32.19.4 `closedHandCursor` as `NSCursorMBS`

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the closed-hand system cursor.  
**Example:**

```plaintext
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.closedHandCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```
32.19.5  **Constructor(image as NSImageMBS, foregroundColorHint as NSColorMBS, backgroundColorHint as NSColorMBS, HotSpotX as Double, HotSpotY as Double)**

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the cursor with the specified image and hot spot.
See also:

- 32.19.6 Constructor(image as NSImageMBS, HotSpotX as Double, HotSpotY as Double)

32.19.6  **Constructor(image as NSImageMBS, HotSpotX as Double, HotSpotY as Double)**

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the cursor with the specified image and hot spot.
See also:

- 32.19.5 Constructor(image as NSImageMBS, foregroundColorHint as NSColorMBS, backgroundColorHint as NSColorMBS, HotSpotX as Double, HotSpotY as Double)

32.19.7  **contextualMenuCursor as NSCursorMBS**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the contextual menu system cursor.
**Example:**

```cpp
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.contextualMenuCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

**Notes:** Available in Mac OS X v10.6 and later.

32.19.8  **crosshairCursor as NSCursorMBS**

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the cross-hair system cursor.
**Example:**

```cpp
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.crosshairCursor
dim i as NSImageMBS = c.image
```
32.19. **CLASS NSCURSORMBS**

window1.Backdrop=i.CopyPictureWithMask

**Notes:** This cursor is used for situations when precise location is required (where the lines cross is the hot spot).

### 32.19.9 currentCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the application’s current cursor.

**Example:**

```vbnet
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.currentCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

**Notes:** The top cursor on the application’s cursor stack. This cursor may not be the visible cursor on the screen if a different application is currently active.

### 32.19.10 currentSystemCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current system cursor.

**Example:**

```vbnet
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.currentSystemCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

**Notes:**
Returns a cursor whose image and hot spot match those of the currently-displayed cursor on the system. This method returns the current system cursor regardless of which application set the cursor, and whether Cocoa or Carbon APIs were used to set it. This method replaces the now deprecated QDGetCursorData function. Available in Mac OS X v10.6 and later.
32.19.11  disappearingItemCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor indicating that the current operation will result in a disappearing item. **Example:**

```vbnet
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.disappearingItemCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

**Notes:**
The system cursor that indicates that the current operation will result in a disappearing item (for example, when dragging an item from the dock or a toolbar).

Available in Mac OS X v10.3 and later.

32.19.12  dragCopyCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor indicating that the current operation will result in a copy action. **Example:**

```vbnet
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.dragCopyCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

**Notes:** Available in Mac OS X v10.6 and later.

32.19.13  dragLinkCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor indicating that the current operation will result in a link action. **Example:**

```vbnet
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.dragLinkCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```
Notes: Available in Mac OS X v10.6 and later.

32.19.14 hide

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes the current cursor invisible.

**Notes:**
If another cursor becomes current, that cursor will be invisible, too. It will remain invisible until you invoke the unhide method.

hide overrides setHiddenUntilMouseMoves.

32.19.15 hotSpotX as Double

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the position of the cursor’s hot spot.

**Example:**

```csharp
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.arrowCursor

MsgBox str(c.hotSpotX) + "/" + str(c.hotSpotY)
```

**Notes:**
The point describing the position of the hot spot, specified according to the cursor’s flipped coordinate system.

For a more complete explanation, see the class description.

Note that an NSCursor object is immutable: you cannot change its hot spot after it’s created. Instead, use the Constructor to create a new cursor with the new settings.

32.19.16 hotSpotY as Double

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the position of the cursor’s hot spot.
Example:

```vbs
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.arrowCursor
MsgBox str(c.hotSpotX)+"/"+str(c.hotSpotY)
```

Notes:
The point describing the position of the hot spot, specified according to the cursor’s flipped coordinate system.

For a more complete explanation, see the class description.

Note that an NSCursor object is immutable: you cannot change its hot spot after it’s created. Instead, use the Constructor to create a new cursor with the new settings.

### 32.19.17 IBeamCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor that looks like a capital I with a tiny crossbeam at its middle.

**Example:**

```vbs
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.IBeamCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

**Notes:** The I-beam cursor. This is the cursor that you’re used to seeing over editable or selectable text. The I-beam cursor’s default hot spot is where the crossbeam intersects the I.

### 32.19.18 IBeamCursorForVerticalLayout as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor that looks like a capital I with a tiny crossbeam at its middle.

**Example:**

```vbs
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.IBeamCursorForVerticalLayout
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```
Notes: Available in Mac OS X 10.7.

### 32.19.19 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s image.

**Example:**
```plaintext
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.arrowCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: The cursor image or nil if none exists

Note that an NSCursor object is immutable: you cannot change its image after it’s created. Instead, use the constructor to create a new cursor with the new settings.

### 32.19.20 isSetOnMouseEntered as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver becomes current on receiving a mouseEntered message.

**Notes:**

True if the receiver will become current when it receives a mouseEntered message; otherwise, false.

To receive such a message, the receiver must first be assigned a cursor rectangle. This assignment can be made using the NSView method addCursorRect. For a more complete explanation, see the class description.

### 32.19.21 isSetOnMouseExited as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver becomes current when it receives a mouse-Exited message.

**Notes:**
True if the receiver becomes current when it receives a mouseExited: message; otherwise, false.

To receive such a message, the receiver must first be assigned a cursor rectangle. This assignment can be made using the NSView method addCursorRect. For a more complete explanation, see the class description.

### 32.19.22 mouseEntered(e as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Automatically sent to the receiver when the cursor enters a cursor rectangle owned by the receiver. **Notes:**

If used after setOnMouseEntered has been called with an argument of true, mouseEntered can make the receiver the current cursor.

In your programs, you won’t invoke mouseEntered explicitly. It’s only included in the class interface so you can override it.

For a more complete explanation, see "Handling Tracking-Rectangle and Cursor-Update Events in Views" and the NSView method addTrackingRect.

### 32.19.23 mouseExited(e as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Automatically sent to the receiver when the cursor exits a cursor rectangle owned by the receiver. **Notes:**

Like mouseEntered, this message is part of the class interface only so you can override it.

For a more complete explanation, see "Handling Tracking-Rectangle and Cursor-Update Events in Views" and the NSView method addTrackingRect.

### 32.19.24 openHandCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the open-hand system cursor. **Example:**

```cpp
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.openHandCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```
Notes: Available in Mac OS X v10.3 and later.

32.19.25 operationNotAllowedCursor as NSCursorMBS

Notes: This cursor indicates that the operation that is being attempted, perhaps dragging to an item that can't accept the drag type, is being denied.
Available in Mac OS X v10.6 and later.

32.19.26 pointingHandCursor as NSCursorMBS

Example:
```javascript
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.pointingHandCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```
Notes: The pointing-hand cursor. The tip of the pointing finger is the hot spot.

32.19.27 pop

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Pops the current cursor off the top of the stack.
Notes: The new object on the top of the stack becomes the current cursor. If the current cursor is the only cursor on the stack, this method does nothing.
See also:
- 32.19.28 pop
32.19.28 pop

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends a pop message to the receiver's class.

See also:
- 32.19.27 pop

32.19.29 push

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Puts the receiver on top of the cursor stack and makes it the current cursor.

32.19.30 resizeDownCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-down system cursor.

**Example:**

```plaintext
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeDownCursor
dim i as NSImageMBS = c.image
window1Backdrop = i.CopyPictureWithMask
```

**Notes:**

The resize-down cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

32.19.31 resizeLeftCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-left system cursor.

**Example:**

```plaintext
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeLeftCursor
dim i as NSImageMBS = c.image
window1Backdrop = i.CopyPictureWithMask
```
Notes:
The resize-left cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

32.19.32  resizeLeftRightCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-left-and-right system cursor.

**Example:**

```vbnet
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeLeftRightCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:
The resize-left-and-right cursor. This cursor is used when moving or resizing an object and the object can be moved left or right.

Available in Mac OS X v10.3 and later.

32.19.33  resizeRightCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-right system cursor.

**Example:**

```vbnet
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeRightCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:
The resize-right cursor. This cursor is used when moving or resizing an object to indicate that the user can
move only in the indicated direction.

Available in Mac OS X v10.3 and later.

### 32.19.34 resizeUpCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-up system cursor.  
**Example:**

```plaintext
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeUpCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

**Notes:**
The resize-up cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

### 32.19.35 resizeUpDownCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-up-and-down system cursor.  
**Example:**

```plaintext
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeUpDownCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

**Notes:**
The resize-up-and-down cursor. This cursor is used when moving or resizing an object and the object can be moved up or down.

Available in Mac OS X v10.3 and later.
32.19.36  ringCursorWithDiameter(diameter as Double) as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a ring cursor with the given size.
Example:

// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.ringCursorWithDiameter(20)
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask

32.19.37  set

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Makes the receiver the current cursor.
Notes: If your application is not the front application, the system will ignore this set message!

32.19.38  setHiddenUntilMouseMoves(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Sets whether the cursor is hidden until the mouse moves.
Notes:
value: True to hide the cursor until one of the following occurs:
The mouse moves.
You invoke the method again, with flag set to false.

Do not try to counter this method by invoking unhide. The results are undefined.

32.19.39  setOnMouseEntered(flag as boolean)

Notes:
True if the receiver accepts future mouseEntered event messages; otherwise it ignores them.

Accepting mouseEntered event messages allows the cursor to be made the current cursor when the cursor enters a view’s cursor rectangle.
32.19.40 setOnMouseExited(flag as boolean)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** Sets whether the receiver accepts mouseExited events.

**Notes:**
flag: True if the receiver accepts future mouseExited: event messages; otherwise it ignores them.

Accepting mouseExited event messages allows the cursor to be made the current cursor when the cursor exits a view’s cursor rectangle.

32.19.41 unhide

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** Negates an earlier call to hide by showing the current cursor.

32.19.42 Properties

32.19.43 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** The internal used NSCursor reference.

**Notes:** (Read and Write property)
32.20 class NSDateComponentsMBS

32.20.1 class NSDateComponentsMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSDateComponents encapsulates the components of a date in an extendable, object-oriented manner. **Notes:** It is used to specify a date by providing the temporal components that make up a date and time: hour, minutes, seconds, day, month, year, and so on. It can also be used to specify a duration of time, for example, 5 hours and 16 minutes. An NSDateComponents object is not required to define all the component fields. When a new instance of NSDateComponents is created the date components are set to NSUndefinedDateComponent.

32.20.2 Methods

32.20.3 Constructor

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates new date components object.

32.20.4 copy as NSDateComponentsMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a copy of the date component object.

32.20.5 date as date

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The date. **Notes:** Available in Mac OS X v10.7 and later.

32.20.6 description as string

32.20.7  NSUndefinedDateComponent as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This constant specifies that an NSDateComponents component is undefined.

32.20.8  Print

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the date components to debug output.  
**Notes:** This may help for debugging and you see output in console app.

32.20.9  Properties

32.20.10 Handle as Integer

**Notes:** (Read and Write property)

32.20.11 calendar as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The calendar.  
**Notes:** (Read and Write computed property)

32.20.12 day as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of day units.  
**Notes:** (Read and Write computed property)

32.20.13 era as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of era units.  
**Notes:** (Read and Write computed property)
32.20.14  hour as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of hour units.  
**Notes:** (Read and Write computed property)

32.20.15  isLeapMonth as Boolean

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether it is leap month.  
**Notes:**  
Available on Mac OS X 10.8.  
(Read and Write computed property)

32.20.16  minute as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of minute units.  
**Notes:** (Read and Write computed property)

32.20.17  month as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of month units.  
**Notes:** (Read and Write computed property)

32.20.18  quarter as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of quarters.  
**Notes:** (Read and Write computed property)

32.20.19  second as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of second units.
32.20.20  timeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time zone.  
**Notes:** (Read and Write computed property)

32.20.21  week as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of week units.  
**Notes:** (Read and Write computed property)

32.20.22  weekday as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of weekday units.  
**Notes:**  
Weekday units are the numbers 1 through n, where n is the number of days in the week. For example, in the Gregorian calendar, n is 7 and Sunday is represented by 1.  
(Read and Write computed property)

32.20.23  weekdayOrdinal as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ordinal number of weekday units.  
**Notes:**  
Weekday ordinal units represent the position of the weekday within the next larger calendar unit, such as the month. For example, 2 is the weekday ordinal unit for the second Friday of the month.  
(Read and Write computed property)

32.20.24  weekOfMonth as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The week of the month.
32.20. **CLASS NSDATECOMPONENTSMBS**

**Notes:** (Read and Write computed property)

---

### 32.20.25 **weekOfYear as Integer**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The week of the year.  
**Notes:** (Read and Write computed property)

---

### 32.20.26 **year as Integer**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of year unit.  
**Notes:** (Read and Write computed property)

---

### 32.20.27 **yearForWeekOfYear as Integer**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The year for the week of the year.  
**Notes:** (Read and Write computed property)
32.21 class NSDirectoryEnumeratorMBS

32.21.1 class NSDirectoryEnumeratorMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSDirectoryEnumerator object enumerates the contents of a directory, returning the pathnames of all files and directories contained within that directory.

**Example:**

```vbs
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as string = d.nextObject
while len(f)>0
List.AddRow f
f=d.nextObject
wend
```

**Notes:**

These pathnames are relative to the directory.

An enumeration is recursive, including the files of all subdirectories, and crosses device boundaries. An enumeration does not resolve symbolic links, or attempt to traverse symbolic links that point to directories. Subclass of theNSEnumeratorMBS class.

32.21.2 Methods

32.21.3 Constructor(folder as folderitem)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSDirectoryEnumerator object that enumerates the contents of the directory at a given path.

**Example:**

```vbs
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
MsgBox d.nextObject // shows "\DS_Store% or some other file name
```

**Notes:**

An NSDirectoryEnumerator object that enumerates the contents of the directory at path. If path is a filename, the method returns an enumerator object that enumerates no filesthe first call to
nextObject will return nil.

Because the enumeration is deep that is, it lists the contents of all subdirectories this enumerator object is useful for performing actions that involve large file-system subtrees. This method does not resolve symbolic links encountered in the traversal process, nor does it recurse through them if they point to a directory. See also:

- 32.21.4 Constructor(path as string)

### 32.21.4 Constructor(path as string)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an NSDirectoryEnumerator object that enumerates the contents of the directory at a given path.

**Example:**

```vbscript
dim d as new NSDirectoryEnumeratorMBS("/Applications")
dim f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name

// if this is a folder, we skip the sub folders
d.skipDescendents

f=d.nextFile
wend
```

**Notes:**

An NSDirectoryEnumerator object that enumerates the contents of the directory at path.

If path is a filename, the method returns an enumerator object that enumerates no files the first call to nextObject will return nil.

Because the enumeration is deep that is, it lists the contents of all subdirectories this enumerator object is useful for performing actions that involve large file-system subtrees. This method does not resolve symbolic links encountered in the traversal process, nor does it recurse through them if they point to a directory. See also:

- 32.21.3 Constructor(folder as folderitem)
32.21.5 Destructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor for this class.

32.21.6 directoryAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an Dictionary object that contains the attributes of the directory at which enumeration started.

32.21.7 fileAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an object that contains the attributes of the most recently returned file or subdirectory (as referenced by the pathname).

**Example:**

```vba
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as FolderItem = d.nextFile

while f<>Nil
    List.AddRow f.Name
    dim di as Dictionary = d.fileAttributes
    dim size as int64 = di.Value(d.NSFileSize)
    List.AddRow f.Name+” (”+str(size)+” Bytes)”

    f=d.nextFile
wend
```

32.21.8 level as Integer

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of levels deep the current object is in the directory hierarchy being enumerated.

**Example:**

```vba
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as FolderItem = d.nextFile
```
while f<>Nil
List.AddRow f.Name+” ”+str(d.level)

f=d.nextFile
wend

Notes: Available in Mac OS X v10.6 and later.

32.21.9 nextFile as folderitem

Example:

dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as string = d.nextObject

while len(f)>0
List.AddRow f

f=d.nextObject
wend

Notes:
The next folderitem from the collection being enumerated, or nil when all objects have been enumerated.

Same as nextObject, but returns a folderitem.

32.21.10 NSFileAppendOnly as string

Notes: The key in a file attribute dictionary whose value indicates whether the file is read-only.

32.21.11 NSFileBusy as string

Notes: The key in a file attribute dictionary whose value indicates whether the file is busy.

32.21.12 NSFileCreationDate as string

Notes: The key in a file attribute dictionary whose value indicates the file’s creation date.

32.21.13 NSFileDeviceIdentifier as string

Notes: The key in a file attribute dictionary whose value indicates the identifier for the device on which the file resides.

32.21.14 NSFileExtensionHidden as string

Notes: The key in a file attribute dictionary whose value indicates whether the file’s extension is hidden.

32.21.15 NSFileGroupOwnerAccountID as string

Notes: The key in a file attribute dictionary whose value indicates the file’s group ID.

32.21.16 NSFileGroupOwnerAccountName as string

Notes: The key in a file attribute dictionary whose value indicates the group name of the file’s owner.
32.21.17  **NSFileHFSCreatorCode as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file attribute dictionary whose value indicates the file’s HFS creator code.

32.21.18  **NSFileHFSTypeCode as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file attribute dictionary whose value indicates the file’s HFS type code.

32.21.19  **NSFileImmutable as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file attribute dictionary whose value indicates whether the file is mutable.

32.21.20  **NSFileModificationDate as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file attribute dictionary whose value indicates the file’s last modified date.

32.21.21  **NSFileOwnerAccountID as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file attribute dictionary whose value indicates the file’s owner’s account ID.

32.21.22  **NSFileOwnerAccountName as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file attribute dictionary whose value indicates the name of the file’s owner.
### 32.21.23 NSFilePosixPermissions as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries. **Notes:** The key in a file attribute dictionary whose value indicates the file's Posix permissions.

### 32.21.24 NSFileReferenceCount as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries. **Notes:** The key in a file attribute dictionary whose value indicates the file's reference count.

### 32.21.25 NSFileSize as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries. **Example:**

```vba
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name

dim di as Dictionary = d.fileAttributes
dim size as int64 = di.Value(d.NSFileSize)
List.AddRow f.Name+" ("+str(size)+" Bytes)"

f=d.nextFile
wend
```

**Notes:** The key in a file attribute dictionary whose value indicates the file's size in bytes.

### 32.21.26 NSFileSystemFileNumber as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries. **Notes:** The key in a file attribute dictionary whose value indicates the file's filesystem file number.
32.21.27 NSFileSystemFreeNodes as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file system attribute dictionary whose value indicates the number of free nodes in the file system.

32.21.28 NSFileSystemFreeSize as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file system attribute dictionary whose value indicates the amount of free space on the file system.

32.21.29 NSFileSystemNodes as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file system attribute dictionary whose value indicates the number of free nodes in the file system.

32.21.30 NSFileSystemNumber as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file system attribute dictionary whose value indicates the filesystem number of the file system.

32.21.31 NSFileSystemSize as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.  
**Notes:** The key in a file system attribute dictionary whose value indicates the size of the file system.

32.21.32 NSFileType as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file’s type.

32.21.33 **NSFileTypeBlockSpecial as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
**Notes:** Block special file

32.21.34 **NSFileTypeCharacterSpecial as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
**Notes:** Character special file

32.21.35 **NSFileTypeDirectory as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
**Notes:** Directory

32.21.36 **NSFileTypeRegular as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
**Notes:** Regular file

32.21.37 **NSFileTypeSocket as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
**Notes:** Socket

32.21.38 **NSFileTypeSymbolicLink as string**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
32.21.39 NSFileTypeUnknown as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
**Notes:** Unknown

32.21.40 Path as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path used in the constructor.

32.21.41 skipDescendents

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Causes the receiver to skip recursion into the most recently obtained subdirectory.
32.22 class NSDockTileMBS

32.22.1 class NSDockTileMBS

**Function:** The cocoa class to customize the dock tile.

**Notes:**

The NSDockTile class lets you customize the visual representation for your application’s miniaturized windows and application icon as they appear in the Dock. You do not create Dock tile objects explicitly in your application. Instead, you retrieve the Dock tile for an existing window or for the application by calling that object’s dockTile method.

Typically, you do not subclass the NSDockTile class. Instead, you use the methods of the class to make the following customizations:

- Badge the tile with a custom string.
- Remove or show the application icon badge.
- Draw the tile content yourself.

If you decide to draw the tile content yourself, you must provide a custom content view to handle the drawing.

**Application Dock Tiles**

An application Dock tile defaults to display the application’s applicationIconImage.

The application Dock tile never shows a smaller application icon badge.

Whether using the default or custom view, the application Dock tile may be badged with a short custom string.

**Window Dock Tiles**

A window Dock tile defaults to display a miniaturized version of the windows contents with a badge derived from the application Dock icon, including any customized application Dock icon. The default window Dock tile image may not be badged with a custom string.

A window Dock tile can use a custom view to draw the Dock icon. If a custom view is used, no application badge will be added, but the text label will be overlaid on top of the icon.
Available in Mac OS X v10.5 and later.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

### 32.22.2 Methods

### 32.22.3 Constructor

**Function:** The private constructor.

### 32.22.4 display

**Function:** Redraws the dock tile’s content.
**Notes:**
If a custom content view is provided, Cocoa calls the drawRect method of that view (and its subviews) to draw the tile's content.

You can call this method to force the redrawing of the dock tile contents. You might do this if the contents of the underlying application or window change in a way that would require a refreshing of the tile. Some types of system activity, such as resizing the dock, may trigger automatic redrars of the tile. In most cases, however, your application is responsible for triggering redrars.

Cocoa does not automatically redraw the contents of your dock tile. Instead, your application must explicitly send display messages to the dock tile object whenever the contents of your view change and need to be redrawn.

### 32.22.5 owner as Variant

**Function:** Returns the object represented by the dock tile.
**Example:**

```vba
dim d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile
if d<>nil then
dim t as Introspection.TypeInfo = Introspection.GetType(d.owner)
MsgBox t.FullName // shows NSApplicationMBS
end if
```
Notes: The object represented by the dock tile. This is either the NSApplicationMBS object or one of your application’s NSWindowMBS objects.

32.22.6 size as NSSizeMBS

Function: Returns the size of the tile.
Example:

dim d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
    MsgBox str(d.size.Width)+” x ”+str(d.size.Height)
    // 128 x 128 in Mac OS X 10.5 and 10.6
end if

Notes: The size returned by this method corresponds to the size of the backing store in the dock, which may be bigger than the actual tile displayed on the screen.

32.22.7 Properties

32.22.8 Handle as Integer

Function: The internal reference to the docktile object.
Notes: (Read and Write property)

32.22.9 badgeLabel as string

Function: The tile’s current badge label.
Example:

dim d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
    // this works in Carbon and Cocoa applications :-)
d.badgeLabel = "Hello"
d.showsApplicationBadge = true
end if

Notes:
The localized string to be displayed in the tile’s badging area. This string may be empty.
(Read and Write computed property)

32.22.10 contentView as NSViewMBS

Function: The view used to draw the dock tile contents.
Notes:
The view you specify should be height and width resizable.

Cocoa does not automatically redraw the contents of your dock tile. Instead, your application must explicitly
send display messages to the dock tile object whenever the contents of your view change and need to be
redrawn. Your dock tile view is responsible for drawing the entire contents of the dock tile. Your view does
not need to draw the application or custom string badges.
(Read and Write computed property)

32.22.11 showsApplicationBadge as boolean

Function: Whether the tile should be badged with the application’s icon.
Example:

dim d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
    // this works in Carbon and Cocoa applications :-) 

d.badgeLabel = "Hello"
d.showsApplicationBadge = true
end if

Notes:
Miniaturized windows include the application badge by default to convey the associated application to the
user. In Mac OS X v10.5 and later, application tiles do not support the application badge. A miniaturized
window with a custom view does not draw the application badge.

The application icon is positioned automatically in the tile by the NSDockTile object. (Read and Write computed property)
32.23.  class NSEnumeratorMBS

32.23.1  class NSEnumeratorMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: NSEnumerator is an abstract class, instances of whose subclasses enumerate collections of other objects, such as arrays and dictionaries.

Example:

```vbs
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
MsgBox d.nextObject
```

Notes:
You send nextObject repeatedly to a newly created NSEnumerator object to have it return the next object in the original collection. When the collection is exhausted, nil is returned. You cannot "reset" an enumerator after it has exhausted its collection. To enumerate a collection again, you need a new enumerator.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

32.23.2  Methods

32.23.3  allObjects as Variant()

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns an array of objects the receiver has yet to enumerate.

Example:

```vbs
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)

dim a(-1) as Variant = d.allObjects
dim lines(-1) as string

for each v as Variant in a
lines.Append v
next

MsgBox Join(lines, EndOfLine) // shows all stuff on desktop
```

Notes:
Put another way, the array returned by this method does not contain objects that have already been enumerated with previous nextObject messages.
Invoking this method exhausts the enumerator’s collection so that subsequent invocations of nextObject
32.23.4 Constructor

32.23.5 nextObject as Variant

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the next object from the collection being enumerated.

**Example:**

```
Dim d As New NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
MsgBox d.nextObject  // shows "DS_Store" or some other file name
```

**Notes:** The next object from the collection being enumerated, or nil when all objects have been enumerated.

32.23.6 Properties

32.23.7 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSEnumerator object.

**Notes:** (Read and Write property)
32.24. class NSErrorMBS

32.24.1. class NSErrorMBS

MBS Main Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for error information in the Cocoa World.

32.24.2. Methods

32.24.3. Constructor(Handle as Integer)

MBS Main Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor for a handle value of NSError.

**Notes:**
Retains reference number and destructor later releases it.
Handle must be a NSError reference number and should not be zero.

32.24.4. Properties

32.24.5. code as Integer

MBS Main Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This is a domain specific error code.

**Notes:** (Read only property)

32.24.6. description as string

MBS Main Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the description for this object.

**Notes:** (Read only property)

32.24.7. domain as string

MBS Main Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The error domain.

**Notes:**
Domains are described by names that are arbitrary strings used to differentiate groups of codes; for custom domain using reverse-DNS naming will help avoid conflicts.  
(Read only property)

### 32.24.8 Handle as Integer

**Function:** The internal used handle for the NSError reference.  
**Notes:** (Read and Write property)

### 32.24.9 localizedDescription as string

**Function:** The localized error description.  
**Example:**

```vba
dim f as FolderItem=SpecialFolder.Desktop.Child("test.mov")
dim q as new QTKitMovieMBS(f)
dim e as NSErrorMBS

f=SpecialFolder.Desktop.Child("test2.aif")
MsgBox str(q.Handle)

if q.exportToFile(f,"AIFF","soun","") then
    MsgBox "ok"
else
    MsgBox "Fail"
end if

if e<>Nil then
    MsgBox e.localizedDescription
end if
```

**Notes:**  
The primary user-presentable message for the error. This method can be overridden by subclasses wishing to present better error strings. By default this looks for NSLocalizedDescriptionKey in the user info. If not present, it manufactures a string from the domain and code. Also, for some of the built-in domains it knows about, it might try to fetch an error string by calling a domain-specific function. In the absence of a custom error string, the manufactured one might not be suitable for presentation to the user, but can be used in logs or debugging.
32.24.10  `localizedFailureReason as string`

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing the localized explanation of the reason for the error.

**Notes:**
A string containing the localized explanation of the reason for the error. By default this method returns the object in the user info dictionary for the key `NSLocalizedFailureReasonErrorKey`.
This method can be overridden by subclasses to present customized error strings.
Available in Mac OS X v10.4 and later.
(Read only property)

32.24.11  `localizedRecoverySuggestion as string`

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing the localized recovery suggestion for the error.

**Notes:**
Returns a string containing the localized recovery suggestion for the error. By default this method returns the object in the user info dictionary for the key `NSLocalizedRecoverySuggestionErrorKey`. If the user info dictionary doesn’t contain a value for `NSLocalizedRecoverySuggestionErrorKey`, nil is returned.

The returned string is suitable for displaying as the secondary message in an alert panel.

This method can be overridden by subclasses to present customized recovery suggestion strings.

Available in Mac OS X v10.4 and later.
(Read only property)

32.24.12  `userInfo as dictionary`

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s user info dictionary.

**Notes:**
The receiver’s user info dictionary, or nil if the user info dictionary has not been set.
(Read only property)
32.25 class NSEventMBS

32.25.1 class NSEventMBS

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for an user event. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

32.25.2 Methods

32.25.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

32.25.4 doubleClickInterval as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the time, in seconds, in which a second mouse click must occur in order to be considered a double click. **Notes:** This is a system setting, overriding this method will have no effect. Available in Mac OS X v10.6 and later.

32.25.5 eventWithCGEvent(CGEventRef as Integer) as NSEventMBS

MBS MacBase Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an event object that is based on a Core Graphics type of event. **Notes:** The returned object retains the CGEventRef object (cgEvent) until it (the Xojo and Objective-C object) is freed then releases the CGEventRef object. If no Cocoa event corresponds to the CGEventRef object, this method returns nil.

32.25.6 isMouseCoalescingEnabled as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether mouse-movement event coalescing is enabled.
32.25. CLASS NSEVENTMBS

Notes: Available in Mac OS X v10.5 and later.

32.25.7 keyRepeatDelay as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the length of time a key must be held down in order to generate the first key repeat event.
Notes:
This is a system setting, overriding this method will have no effect.
Available in Mac OS X v10.6 and later.

32.25.8 keyRepeatInterval as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the length between subsequent key repeat events being posted.
Notes:
This is a system setting, overriding this method will have no effect.
Available in Mac OS X v10.6 and later.

32.25.9 modifierFlagsGlobal as UInt32

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the currently pressed modifier flags.
Notes:
This returns the state of devices combined with synthesized events at the moment, independent of which
events have been delivered via the event stream.
Available in Mac OS X v10.6 and later.

32.25.10 mouseLocation as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Reports the current mouse position in screen coordinates.
Notes:
This method is similar to the NSWindow method mouseLocationOutsideOfEventStream. It returns the
location regardless of the current event or pending events. The difference between these methods is that
mouseLocationOutsideOfEventStream returns a point in the receiving window’s coordinates and mouseLo-
cation returns the same information in screen coordinates.
32.25.11 pressedMouseButtons as UInt32

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the indices of the currently depressed mouse buttons.

**Notes:**
The indices of the currently depressed mouse buttons.

A return value of \(1 << 0\) corresponds to left the mouse, \(1 << 1\) corresponds to the right mouse, \(1 << n\), \(n >= 2\) to other mouse buttons.

This returns the state of devices combined with synthesized events at the moment, independent of which events have been delivered via the event stream, so this method is not suitable for tracking.

Available in Mac OS X v10.6 and later.

32.25.12 setMouseCoalescingEnabled(Value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether mouse-movement event coalescing is enabled.

**Notes:**
This method affects mouse-moved, mouse-dragged, and tablet events. Mouse-movement event coalescing is enabled by default.

Available in Mac OS X v10.5 and later.

32.25.13 Properties

32.25.14 absoluteX as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports the absolute x coordinate of a pointing device on its tablet at full tablet resolution.

**Notes:**
For the coordinate to be valid, the receiver should represent an event generated by a tablet pointing device (otherwise 0 is returned). This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint. Use this value if you want to scale from tablet
location to screen location yourself; otherwise use the class method mouseLocation or the instance method locationInWindow.

Available in Mac OS X v10.4 and later.
(Read only property)

### 32.25.15 absoluteY as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports the absolute y coordinate of a pointing device on its tablet at full tablet resolution.

**Notes:**
For the coordinate to be valid, the receiver should represent an event generated by a tablet pointing device (otherwise 0 is returned). This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint. Use this value if you want to scale from tablet location to screen location yourself; otherwise use the class method mouseLocation or the instance method locationInWindow.

Available in Mac OS X v10.4 and later.
(Read only property)

### 32.25.16 absoluteZ as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports the absolute z coordinate of pointing device on its tablet at full tablet resolution.

**Notes:**
For the coordinate to be valid, the receiver should represent an event generated by a tablet pointing device (otherwise 0 is returned). The z coordinate does not represent pressure. It registers the depth coordinate returned by some tablet devices with wheels; if the device is something other than these, 0 is returned. This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint.

Available in Mac OS X v10.4 and later.
(Read only property)

### 32.25.17 associatedEventsMask as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The event mask describing the various events that you may also get during this event sequence.

**Notes:**
This message is valid for Mouse events. Useful for determining if the input device issuing this mouse event can also simultaneously issue NSEventGetTypePressure events.
(Read only property)

### 32.25.18 buttonMask as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a bit mask identifying the buttons pressed when the tablet event represented by the receiver was generated.

**Notes:**
Use one or more of the button-mask constants described in Constants to determine which buttons of the pointing device are pressed. This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint.

Available in Mac OS X v10.4 and later.

Constants to use:

- NSPenTipMask = 1 The pen tip is activated.
- NSPenLowerSideMask = 2 The button on the lower side of the device is activated.
- NSPenUpperSideMask = 4 The button on the upper side of the device is activated.

(Read only property)

### 32.25.19 buttonNumber as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the button number for the mouse button that generated an NSOtherMouse... event.

**Notes:**
This method is intended for use with the NSOtherMouseDown, NSOtherMouseUp, and NSOtherMouse-Dragged events, but will return values for NSLeftMouse... and NSRightMouse... events also.

(Read only property)

### 32.25.20 capabilityMask as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a mask whose set bits indicate the capabilities of the tablet device that generated the event
32.25. CLASS NSEVENTMBS

represented by the receiver.

Notes:

These bits are vendor-defined. This method is valid only for mouse events with a subtype of NSTabletProximityEventSubtype and for events of type NSTabletProximity.

Available in Mac OS X v10.4 and later.

(Read only property)

32.25.21 CGEventRef as Integer

MBS MacBase Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Core Graphics event object corresponding to this event.

Notes:

The CGEventRef opaque type returned. If no CGEventRef object corresponding to the NSEvent object can be created, this method returns 0.

(Read only property)

32.25.22 characters as string

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the characters associated with the receiving key-up or key-down event.

Notes:

These characters are derived from a keyboard mapping that associates various key combinations with Unicode characters. Raises an NSInternalInconsistencyException if sent to any other kind of event object.

This method returns an empty string for dead keys, such as Option-e. However, for a key combination such as Option-Shift-e this method returns the standard accent ("'").

(Read only property)

32.25.23 charactersIgnoringModifiers as string

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the characters generated by the receiving key event as if no modifier key (except for Shift) applies.

Notes:

Raises an NSInternalInconsistencyException if sent to a nonkey event.

This method returns the non-modifier key character pressed for dead keys, such as Option-e. For example, Option-e (no shift key) returns an "e" for this method, whereas the characters method returns an empty
This method is useful for determining "basic" key values in a hardware-independent manner, enabling such features as keyboard equivalents defined in terms of modifier keys plus character keys. For example, to determine if the user typed Alt-S, you don’t have to know whether Alt-S generates a German double ess, an integral sign, or a section symbol. You simply examine the string returned by this method along with the event’s modifier flags, checking for “s” and NSAlternateKeyMask.

(Read only property)

### 32.25.24 clickCount as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of mouse clicks associated with the receiver, which represents a mouse-down or mouse-up event.

**Notes:**
Raises an NSInternalInconsistencyException if sent to a nonmouse event.

Returns 0 for a mouse-up event if a time threshold has passed since the corresponding mouse-down event. This is because if this time threshold passes before the mouse button is released, it is no longer considered a mouse click, but a mouse-down event followed by a mouse-up event.

The return value of this method is meaningless for events other than mouse-down or mouse-up events.

(Read only property)

### 32.25.25 data1 as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns additional data associated with the receiver.

**Notes:**
The value returned by this method is dependent on the event type, and is defined by the originator of the event. Raises an NSInternalInconsistencyException if sent to an event not of type NSAppKitDefined, NSSystemDefined, NSApplicationDefined, or NSPeriodic.

NSPeriodic events don’t use this attribute.

(Read only property)
32.25. CLASS NSEVENTMBS

32.25.26  data2 as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns additional data associated with the receiver.

**Notes:**

The value returned by this method is dependent on the event type, and is defined by the originator of the event. Raises an NSInternalInconsistencyException if sent to an event not of type NSAppKitDefined, NSSystemDefined, NSApplicationDefined, or NSPeriodic.

NSPeriodic events don’t use this attribute.

(Read only property)

32.25.27  deltaX as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the x-coordinate change for a scroll wheel, mouse-move, or mouse-drag event.

**Notes:** (Read only property)

32.25.28  deltaY as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the y-coordinate change for a scroll wheel, mouse-move, or mouse-drag event.

**Notes:**

The behavior of this method may seem counter-intuitive: as the mouse moves up the screen, the value is negative; and as it moves down the screen, the value is positive. The reason for this behavior is that NSEvent computes this delta value in device space, which is flipped, but both the screen and the window’s base coordinate system are not flipped.

(Read only property)

32.25.29  deltaZ as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the z-coordinate change for a scroll wheel, mouse-move, or mouse-drag event.

**Notes:** (Read only property)
32.25.30  description as string

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the description for this object.
Notes: (Read only property)

32.25.31  deviceID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a special identifier that is used to match tablet-pointer events with the tablet-proximity event represented by the receiver.
Notes:
All tablet-pointer events generated in the period between the device entering and leaving tablet proximity have the same device ID. This message is valid only for mouse events with subtype NSTabletPointEventSubtype or NSTabletProximityEventSubtype, and for NSTabletPoint and NSTabletProximity events. Available in Mac OS X v10.4 and later.
(Read only property)

32.25.32  eventNumber as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the counter value of the latest mouse or tracking-rectangle event object; every system-generated mouse and tracking-rectangle event increments this counter.
Notes:
Raises an NSInternalInconsistencyException if sent to any other type of event object.
(Read only property)

32.25.33  Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The handle to the internal used NSEvent class.
Notes: (Read and Write property)

32.25.34  hasPreciseScrollingDeltas as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns whether there are precise scrolling deltas available.
Notes:
Returns true if precise scrolling deltas are available; false otherwise.

This method is valid for NSScrollWheel events. A generic scroll wheel issues rather coarse scroll deltas. Some mice and trackpads provide much more precise delta. This method determines how the values of the scrollingDeltaX and scrollingDeltaY should be interpreted.
Available in OS X v10.7 and later.
(Read only property)

**32.25.35 isARepeat as boolean**

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns true if the receiving key event is a repeat caused by the user holding the key down, false if the key event is new.
**Notes:**
Raises an NSInternalInconsistencyException if sent to an NSFlagsChanged event or other nonkey event.
(Read only property)

**32.25.36 isDirectionInvertedFromDevice as boolean**

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns whether the user has changed the device inversion.
**Notes:**
This method valid for NSEventScrollWheel and NSEventTypeSwipe events. The user may choose to change the scrolling behavior such that it feels like they are moving the content instead of the scroll bar.

To accomplish this, deltaX and deltaY and scrollingDeltaX and scrollingDeltaY values are automatically inverted for NSEventScrollWheel events according to the user’s preferences.

The direction of fluid swipes matches the direction of scrolling and as such for NSEventTypeSwipe events gestureAmount is inverted. However, for some uses of NSEventScrollWheel and NSEventTypeSwipe events, the behavior should not respect the user preference. This method allows you to determine when the event has been inverted and compensate by multiplying -1 if needed.

Available in OS X v10.7 and later.
(Read only property)
32.25.37 \textbf{isEnteringProximity as boolean}

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Returns true to indicate that a pointing device is entering the proximity of its tablet and false when it is leaving it.

\textbf{Notes:}
This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTablet-Proximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

32.25.38 \textbf{keyCode as Integer}

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Returns the virtual key code for the keyboard key associated with the receiving key event.

\textbf{Notes:}
The virtual key code. The returned value is hardware-independent. The value returned is the same as the value returned in the kEventParamKeyCode when using Carbon Events.

Raises an NSInternalInconsistencyException if sent to a non-key event.
(Read only property)

32.25.39 \textbf{locationInWindow as NSPointMBS}

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Returns the receiver's location in the base coordinate system of the associated window.

\textbf{Notes:}
For nonmouse events the return value of this method is undefined.

With NSMouseMoved and possibly other events, the receiver can have a nil window (that is, window returns nil). In this case, locationInWindow returns the event location in screen coordinates.
(Read only property)

32.25.40 \textbf{magnification as Double}

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Returns the change in magnification.

\textbf{Notes:}
The change in magnification that should be added to the current scaling of an item to achieve the new scale factor. This message is valid for events of type NSEventMagnifyType. Available in Mac OS X v10.6 and later. (Read only property)

32.25.41  modifierFlags as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns an integer bit field indicating the modifier keys in effect for the receiver. Notes: You can examine individual flag settings using the C bitwise AND operator with the predefined key masks. The lower 16 bits of the modifier flags are reserved for device-dependent bits. (Read only property)

32.25.42  pointingDeviceID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the index of the pointing device currently in proximity with the tablet. Notes: This index is significant for multimode (or Dual Tracking) tablets that support multiple concurrent pointing devices; the index is incremented for each pointing device that comes into proximity. Otherwise, zero is always returned. The receiver of this message should be a mouse event object with subtype NSTabletProximityEventSubtype or an event of type NSTabletProximity. Available in Mac OS X v10.4 and later. (Read only property)

32.25.43  pointingDeviceSerialNumber as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the vendor-assigned serial number of a pointing device of a certain type. Notes: Devices of different types, such as a puck and a pen, may have the same serial number. The receiver of this message should be a mouse event object with subtype NSTabletProximityEventSubtype or an event of type NSTabletProximity. Available in Mac OS X v10.4 and later. (Read only property)
32.25.44  pointingDeviceType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns a NSPointingDeviceType constant indicating the kind of pointing device associated with the receiver.  
**Notes:**  
For example, the device could be a pen, eraser, or cursor pointing device. This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events. See "Constants" for descriptions of valid NSPointingDeviceType constants.  

Available in Mac OS X v10.4 and later.  
(Read only property)

32.25.45  pressure as Double

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns a value from 0.0 through 1.0 indicating the pressure applied to the input device (used for appropriate devices).  
**Notes:**  
For devices that aren’t pressure-sensitive, the value is either 0.0 or 1.0. Raises an NSInternalInconsistencyException if sent to a nonmouse event.  

For tablet pointing devices that are in proximity, the pressure value is 0.0 if they are not actually touching the tablet. As the device is pressed into the tablet, the value is increased.  
(Read only property)

32.25.46  rotation as Double

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns the rotation in degrees of the tablet pointing device associated with the receiver.  
**Notes:**  
Many devices do not support rotation, in which case the returned value is 0.0. This method is valid only for mouse events with subtype NSTabletPointEventSubtype and for NSTabletPoint events.  

Available in Mac OS X v10.4 and later.  
(Read only property)
32.25. CLASS NSEVENTMBS

32.25.47 scrollingDeltaX as Double

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scroll wheel horizontal delta.

**Notes:**
This is the preferred method for accessing NSScrollWheel delta values. When hasPreciseScrollingDeltas returns false, your application may which to modify this value.

Available in OS X v10.7 and later.
(Read only property)

32.25.48 scrollingDeltaY as Double

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scroll wheel vertical delta.

**Notes:**
This is the preferred method for accessing NSScrollWheel delta values. When hasPreciseScrollingDeltas returns false, multiply the value returned by this method by the line or row height. Otherwise scroll by the returned amount.

Available in OS X v10.7 and later.
(Read only property)

32.25.49 stage as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The stage of pressure events.

**Notes:**
This message is valid for NSEventTypePressure events.
Pressure gesture events go through multiple stages.
(Read only property)

32.25.50 stageTransition as Double

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The stage transition for pressure events.

**Notes:**
This message is valid for NSEventTypePressure events. Positive stageTransition describes approaching the
next stage of the pressure gesture. Negative stageTransition describes approaching release of the current stage.
(Read only property)

### 32.25.51 subtype as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the subtype of the receiving event object.

**Notes:**

Raises an NSInternalInconsistencyException if sent to an event not of type NSAppKitDefined, NSSystemDefined, NSApplicationDefined, or NSPeriodic.

NSPeriodic events don’t use this attribute.

This method is also valid for mouse events on Mac OS X v10.4 and later. See the predefined mouse and tablet subtypes.
(Read only property)

### 32.25.52 systemTabletID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the index of the tablet device connected to the system.

**Notes:**

If multiple tablets are connected to the system, the system-tablet ID is incremented for each subsequent one. If there is only one tablet device, its system-tablet ID is zero. The receiver of this message should be a mouse event object with subtype NSTabletProximityEventSubtype or an event of type NSTabletProximity.

Available in Mac OS X v10.4 and later.
(Read only property)

### 32.25.53 tabletID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the USB model identifier of the tablet device associated with the receiver.

**Notes:**

This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTablet-Proximity events.
Available in Mac OS X v10.4 and later.
32.25.54  **tangentialPressure as Double**

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Reports the tangential pressure on the device that generated the event represented by the receiver.  
**Notes:**
The value returned can range from -1.0 to 1.0.  Tangential pressure is also known as barrel pressure.  Only some pointing devices support tangential pressure.  This method is valid for mouse events with subtype NSTabletPointEventSubtype and for NSTabletPoint events.

Available in Mac OS X v10.4 and later.  
(Read only property)

32.25.55  **tilt as NSPointMBS**

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Reports the scaled tilt values of the pointing device that generated the event represented by the receiver.  
**Notes:**
The value returned can range from -1.0 to 1.0 for both axes.  An x-coordinate value that is negative indicates a tilt to the left and a positive value indicates a tilt to the right; a y-coordinate value that is negative indicates a tilt to the top and a positive value indicates a tilt to the bottom.  If the device is perfectly perpendicular to the table surface, the values are 0.0 for both axes.  This method is valid for mouse events with subtype NSTabletPointEventSubtype and for NSTabletPoint events.

Available in Mac OS X v10.4 and later.  
(Read only property)

32.25.56  **timestamp as Double**

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns the time the receiver occurred in seconds since system startup.  
**Notes:** (Read only property)
32.25.57 trackingNumber as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the identifier of a mouse-tracking event.

**Notes:**
This method returns either an NSTrackingArea object or a NSTrackingRectTag constant depending on whether the event was generated from an NSTrackingArea object or a call to addTrackingRect:owner:userData:assumeInside:. Valid mouse-tracking methods are of types NSMouseEntered, NSMouseExited, and NSCursorUpdate. This method raises an NSInternalInconsistencyException if sent to any other type of event.

The NSTrackingArea class is new with Mac OS X version 10.5
(Read only property)

32.25.58 type as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of the receiving event.

**Notes:**
The type must be one of the following:

- NSLeftMouseDown
- NSLeftMouseUp
- NSRightMouseDown
- NSRightMouseUp
- NSOtherMouseDown
- NSOtherMouseUp
- NSMouseMoved
- NSLeftMouseDragged
- NSRightMouseDragged
- NSOtherMouseDragged
- NSMouseEntered
- NSMouseExited
- NSWKeyDown
- NSWKeyUp
- NSFlagsChanged
- NSAppKitDefined
- NSSystemDefined
- NSAApplicationDefined
- NSPeriodic
- NSCursorUpdate
- NSScrollWheel
(Read only property)
32.25.59 uniqueID as UInt64

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the unique identifier of the pointing device that generated the event represented by the receiver.

**Notes:**
Also known as tool ID, this is a unique number recorded in the chip inside every pointing device. The unique ID makes it possible to assign a specific pointing device to a specific tablet. You can also use it to "sign" documents or to restrict access to document layers to a specific pointing device. This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events. Available in Mac OS X v10.4 and later.
(Read only property)

32.25.60 vendorID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the vendor identifier of the tablet associated with the receiver.

**Notes:**
The tablet is typically a USB device. This method is valid only for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events. Available in Mac OS X v10.4 and later.
(Read only property)

32.25.61 vendorPointingDeviceType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a coded bit field whose set bits indicate the type of pointing device (within a vendor selection) associated with the receiver.

**Notes:**
See the vendor documentation for an interpretation of significant bits. This method is valid only for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events. Available in Mac OS X v10.4 and later.
(Read only property)

32.25.62 window as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window object associated with the receiver.
Notes:
A periodic event, however, has no window; in this case the return value is undefined.
(Read only property)

### 32.25.63 windowNumber as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the identifier for the window device associated with the receiver.

Notes:
A periodic event, however, has no window; in this case the return value is undefined.
(Read only property)

### 32.25.64 Constants

#### 32.25.65 NSAlphaShiftKeyMask = &h10000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.

Notes: Set if Caps Lock key is pressed.

#### 32.25.66 NSAlternateKeyMask = &h80000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.

Notes: Set if Option or Alternate key is pressed.

#### 32.25.67 NSAnyEventMask = &hFFFFFFFF

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.

Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

#### 32.25.68 NSAppKitDefined=13

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.
32.25.69  **NSAppKitDefinedMask = & h2000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.70  **NSApplicationActivatedEventType = 1**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.  
**Notes:** The application has been activated.

32.25.71  **NSApplicationDeactivatedEventType = 2**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.  
**Notes:** The application has been deactivated.

32.25.72  **NSApplicationDefined=15**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.73  **NSApplicationDefinedMask = & h8000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.74  **NSAWTEventType = 16**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.  
**Notes:** An event type used to support Java applications.
32.25.75  **NSBeginFunctionKey = & hF72A**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** Begin key. Not on most Macintosh keyboards.

32.25.76  **NSBreakFunctionKey = & hF732**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** Break key. Not on most Macintosh keyboards.

32.25.77  **NSClearDisplayFunctionKey = & hF73A**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** Clear Display key. Not on most Macintosh keyboards.

32.25.78  **NSClearLineFunctionKey = & hF739**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** Clear/Num Lock key.

32.25.79  **NSCommandKeyMask = & h100000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
**Notes:** Set if Command key is pressed.

32.25.80  **NSControlKeyMask = & h40000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
**Notes:** Set if Control key is pressed.
32.25. **CLASS NSEVENTMBS**

32.25.81 **NSCursorPointingDevice=2**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants represent pointing-device types for NSTabletProximity events or mouse events with subtype NSTabletProximityEventSubtype.  
**Notes:**  
The `pointingDeviceType` method returns one of these constants.  
Represents a cursor (or puck-like) pointing device.  
Available in Mac OS X v10.4 and later.

32.25.82 **NSCursorUpdate=17**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.83 **NSCursorUpdateMask = & h20000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:** Pass them to the `NSCell` method `sendActionOn` to specify when an `NSCell` should send its action message.

32.25.84 **NSDeleteCharFunctionKey = & hF73E**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Delete Character key. Not on most Macintosh keyboards.

32.25.85 **NSDeleteFunctionKey = & hF728**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Forward Delete key.

32.25.86 **NSDeleteLineFunctionKey = & hF73C**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Delete Line key. Not on most Macintosh keyboards.
32.25.87 NSDeviceIndependentModifierFlagsMask = & hffff0000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** The mask for all device independent modifier flags.  
**Notes:**  
Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.

Available in Mac OS X v10.4 and later.

32.25.88 NSDownArrowFunctionKey = & hF701

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Down Arrow key.

32.25.89 NSEndFunctionKey = & hF72B

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** End key.

32.25.90 NSEraserPointingDevice=3

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants represent pointing-device types for NSTabletProximity events or mouse events with subtype NSTabletProximityEventSubtype.  
**Notes:**  
The pointingDeviceType method returns one of these constants.  
Represents the eraser end of a stylus-like pointing device.  
Available in Mac OS X v10.4 and later.

32.25.91 NSEventMaskBeginGesture = & h80000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:**  
Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.  
Available in Mac OS X v10.6 and later.
32.25.92  **NSEventMaskEndGesture = & h100000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:**

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.

32.25.93  **NSEventMaskGesture = & h20000000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:**

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.

32.25.94  **NSEventMaskMagnify = & h40000000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:**

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.

32.25.95  **NSEventMaskRotate = & h40000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:**

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.

32.25.96  **NSEventMaskSwipe = & h80000000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:**

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.
32.25.97(NSEventTypeBeginGesture=19)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for events.

**Notes:**
An event that represents a gesture beginning.
Available in Mac OS X v10.6 and later.

32.25.98(NSEventTypeEndGesture=20)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for events.

**Notes:**
An event that represents some type of gesture such as NSEventTypeMagnify, NSEventTypeSwipe, NSEventTypeRotate, NSEventTypeBeginGesture, or NSEventTypeEndGesture.
Available in Mac OS X v10.6 and later.

32.25.99(NSEventTypeGesture=29)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the event types.

**Notes:**
An event that represents some type of gesture such as NSEventTypeMagnify, NSEventTypeSwipe, NSEventTypeRotate, NSEventTypeBeginGesture, or NSEventTypeEndGesture.
Available in Mac OS X v10.6 and later.

32.25.100(NSEventTypeMagnify=30)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the event types.

**Notes:**
An event representing a pinch open or pinch close gesture.
Available in Mac OS X v10.6 and later.

32.25.101(NSEventTypePressure = 34)

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the event types.

**Notes:** A force touch pressure event.
32.25.102 **NSEventTypeQuickLook = 33**

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the event types.  
**Notes:** The quicklook event.

32.25.103 **NSEventTypeRotate=18**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the event types.  
**Notes:**  
An event representing a rotation gesture.  
Available in Mac OS X v10.6 and later.

32.25.104 **NSEventTypeSmartMagnify = 32**

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the event types.  
**Notes:** The smart magnify event.
32.25.105 NSEventTypeSwipe=31

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the event types.
**Notes:**
An event representing a swipe gesture.
Available in Mac OS X v10.6 and later.

32.25.106 NSExecuteFunctionKey = & hF742

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** Execute key. Not on most Macintosh keyboards.

32.25.107 NSF10FunctionKey = & hF70D

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F10 key.

32.25.108 NSF11FunctionKey = & hF70E

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F11 key.

32.25.109 NSF12FunctionKey = & hF70F

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F12 key.

32.25.110 NSF13FunctionKey = & hF710

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F13 key.
32.25. CLASS NSEVENTMBS

32.25.111 NSF14FunctionKey = & hF711

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. 
**Notes:** F14 key.

32.25.112 NSF15FunctionKey = & hF712

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. 
**Notes:** F15 key.

32.25.113 NSF16FunctionKey = & hF713

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. 
**Notes:** F16 key.

32.25.114 NSF17FunctionKey = & hF714

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. 
**Notes:** F17 key.

32.25.115 NSF18FunctionKey = & hF715

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. 
**Notes:** F18 key.

32.25.116 NSF19FunctionKey = & hF716

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. 
**Notes:** F19 key.
32.25.117  NSF1FunctionKey = & hF704

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F1 key.

32.25.118  NSF20FunctionKey = & hF717

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F20 key.

32.25.119  NSF21FunctionKey = & hF718

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F21 key. Not on most Macintosh keyboards.

32.25.120  NSF22FunctionKey = & hF719

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F22 key. Not on most Macintosh keyboards.

32.25.121  NSF23FunctionKey = & hF71A

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F23 key. Not on most Macintosh keyboards.

32.25.122  NSF24FunctionKey = & hF71B

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
**Notes:** F24 key. Not on most Macintosh keyboards.
32.25.123 NSF25FunctionKey = & hF71C

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F25 key. Not on most Macintosh keyboards.

32.25.124 NSF26FunctionKey = & hF71D

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F26 key. Not on most Macintosh keyboards.

32.25.125 NSF27FunctionKey = & hF71E

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F27 key. Not on most Macintosh keyboards.

32.25.126 NSF28FunctionKey = & hF71F

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F28 key. Not on most Macintosh keyboards.

32.25.127 NSF29FunctionKey = & hF720

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F29 key. Not on most Macintosh keyboards.

32.25.128 NSF2FunctionKey = & hF705

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F2 key.
32.25.129 NSF30FunctionKey = & hF721

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F30 key. Not on most Macintosh keyboards.

32.25.130 NSF31FunctionKey = & hF722

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F31 key. Not on most Macintosh keyboards.

32.25.131 NSF32FunctionKey = & hF723

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F32 key. Not on most Macintosh keyboards.

32.25.132 NSF33FunctionKey = & hF724

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F33 key. Not on most Macintosh keyboards.

32.25.133 NSF34FunctionKey = & hF725

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F34 key. Not on most Macintosh keyboards.

32.25.134 NSF35FunctionKey = & hF726

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F35 key. Not on most Macintosh keyboards.
32.25.135 NSF3FunctionKey = \& hF706

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: F3 key.

32.25.136 NSF4FunctionKey = \& hF707

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: F4 key.

32.25.137 NSF5FunctionKey = \& hF708

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: F5 key.

32.25.138 NSF6FunctionKey = \& hF709

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: F6 key.

32.25.139 NSF7FunctionKey = \& hF70A

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: F7 key.

32.25.140 NSF8FunctionKey = \& hF70B

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: F8 key.
32.25.141  **NSF9FunctionKey = \& hF70C**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** F9 key.

32.25.142  **NSFindFunctionKey = \& hF745**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Find key. Not on most Macintosh keyboards.

32.25.143  **NSFlagsChanged=12**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.144  **NSFlagsChangedMask = \& h1000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.145  **NSFunctionKeyMask = \& h800000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.  
**Notes:** Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).

32.25.146  **NSHelpFunctionKey = \& hF746**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Help key.
32.25.147  **NSHelpKeyMask = & h400000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function**: One of the constants representing device-independent bits found in event modifier flags.  
**Notes**: Set if the Help key is pressed.

32.25.148  **NSHomeFunctionKey = & hF729**

MBS MacBase Plugin, Plugin Version: 9.6. **Function**: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes**: Home key.

32.25.149  **NSInsertCharFunctionKey = & hF73D**

MBS MacBase Plugin, Plugin Version: 9.6. **Function**: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes**: Insert Character key. Not on most Macintosh keyboards.

32.25.150  **NSInsertFunctionKey = & hF727**

MBS MacBase Plugin, Plugin Version: 9.6. **Function**: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes**: Insert key. Not on most Macintosh keyboards.

32.25.151  **NSInsertLineFunctionKey = & hF73B**

MBS MacBase Plugin, Plugin Version: 9.6. **Function**: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes**: Insert Line key. Not on most Macintosh keyboards.

32.25.152  **NSKeyDown=10**

MBS MacBase Plugin, Plugin Version: 7.7. **Function**: One of the event types.
32.25.153 NSKeyDownMask = & h400

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.154 NSKeyUp=11

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.155 NSKeyUpMask = & h800

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.156 NSLeftArrowFunctionKey = & hF702

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Left Arrow key.

32.25.157 NSLeftMouseDown=1

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.158 NSLeftMouseDownMask = 2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.159 NSLeftMouseDragged=6

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.
32.25.160  NSLeftMouseDownDraggedMask = 64

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.161  NSLeftMouseUp = 2

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.162  NSLeftMouseDownUpMask = 4

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.163  NSMenuFunctionKey = & hF735

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Menu key. Not on most Macintosh keyboards.

32.25.164  NSModeSwitchFunctionKey = & hF747

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Mode Switch key. Not on most Macintosh keyboards.

32.25.165  NSMouseEntered = 8

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.166  NSMouseEnteredMask = & h100

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action
CHAPTER 32. COCOA

message.

**32.25.167 NSMouseEventSubtype = 0**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing mouse-event subtypes for mouse and tablet events (accessed with the subtype method).

**Notes:**
Indicates a purely mouse event.
Available in Mac OS X v10.4 and later.

**32.25.168 NSMouseExited=9**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

**32.25.169 NSMouseExitedMask = & h200**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

**32.25.170 NSMouseMoved=5**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

**32.25.171 NSMouseMovedMask = 32**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

**32.25.172 NSNextFunctionKey = & hF740**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
32.25. CLASS NSEVENTMBS

Notes: Next key. Not on most Macintosh keyboards.

32.25.173  **NSNumericPadKeyMask = & h200000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags. 
**Notes:** Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrowFunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).

32.25.174  **NSOtherMouseDown=25**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.175  **NSOtherMouseDownMask = & h2000000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. 
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.176  **NSOtherMouseDragged=27**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.177  **NSOtherMouseDraggedMask = & h8000000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. 
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.178  **NSOtherMouseUp=26**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.
**32.25.179**  \( \text{NSOtherMouseUpMask} = \& \text{h}4000000 \)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

**32.25.180**  \( \text{NSPageDownFunctionKey} = \& \text{h}F72D \)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Page Down key.

**32.25.181**  \( \text{NSPageUpFunctionKey} = \& \text{h}F72C \)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Page Up key.

**32.25.182**  \( \text{NSPauseFunctionKey} = \& \text{h}F730 \)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Pause key. Not on most Macintosh keyboards.

**32.25.183**  \( \text{NSPenLowerSideMask}=2 \)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

**32.25.184**  \( \text{NSPenPointingDevice}=1 \)

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants represent pointing-device types for NSTabletProximity events or mouse events with subtype NSTabletProximityEventSubtype.  
**Notes:**  
The pointingDeviceType method returns one of these constants.  
Represents the tip end of a stylus-like pointing device.
Available in Mac OS X v10.4 and later.

**32.25.185  NSPenTipMask=1**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

**32.25.186  NSPenUpperSideMask=4**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

**32.25.187  NSPeriodic=16**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

**32.25.188  NSPeriodicMask = & h10000**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

**32.25.189  NSPowerOffEventType = 1**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** This constant denotes that the user is turning off the computer. **Notes:** Specifies that the user is turning off the computer.

**32.25.190  NSPrevFunctionKey = & hF73F**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Previous key. Not on most Macintosh keyboards.
32.25.191  **NSPrintFunctionKey = & hF738**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Print key. Not on most Macintosh keyboards.

32.25.192  **NSPrintScreenFunctionKey = & hF72E**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Print Screen key. Not on most Macintosh keyboards.

32.25.193  **NSRedoFunctionKey = & hF744**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Redo key. Not on most Macintosh keyboards.

32.25.194  **NSResetFunctionKey = & hF733**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Reset key. Not on most Macintosh keyboards.

32.25.195  **NSRightArrowFunctionKey = & hF703**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Right Arrow key.

32.25.196  **NSRightMouseDown=3**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.
32.25.197  **NSRightMouseDownMask = 8**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.198  **NSRightMouseDragged=7**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.199  **NSRightMouseDraggedMask = 128**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.200  **NSRightMouseUp=4**

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.201  **NSRightMouseUpMask = 16**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.  
**Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.202  **NSScreenChangedEventType = 8**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.  
**Notes:** An NSWindow has changed screens.

32.25.203  **NSScrollLockFunctionKey = &HF72F**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: Scroll Lock key. Not on most Macintosh keyboards.

32.25.204  NSScrollWheel=22

MBS MacBase Plugin, Plugin Version: 7.7. Function: One of the event types.

32.25.205  NSScrollWheelMask = & h400000

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.206  NSSelectFunctionKey = & hF741

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: Select key. Not on most Macintosh keyboards.

32.25.207  NSShiftKeyMask = & h20000

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing device-independent bits found in event modifier flags.
Notes: Set if Shift key is pressed.

32.25.208  NSStopFunctionKey = & hF734

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: Stop key. Not on most Macintosh keyboards.

32.25.209  NSSysReqFunctionKey = & hF731

MBS MacBase Plugin, Plugin Version: 9.6. Function: One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard.
Notes: System Request key. Not on most Macintosh keyboards.
32.25. CLASS NSEVENTMBS

32.25.210 NSSystemDefined=14

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.211 NSSystemDefinedMask = & h4000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

32.25.212 NSSystemFunctionKey = & hF737

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** System key. Not on most Macintosh keyboards.

32.25.213 NSTabletPoint=23

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.214 NSTabletPointEventSubtype = 1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing mouse-event subtypes for mouse and tablet events (accessed with the subtype method). **Notes:** Indicates a tablet-pointer event; see description of NSTabletPoint. Available in Mac OS X v10.4 and later.

32.25.215 NSTabletPointMask = & h800000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.
32.25.216 NSTabletProximity = 24

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

32.25.217 NSTabletProximityEventSubtype = 2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing mouse-event subtypes for mouse and tablet events (accessed with the subtype method). **Notes:** Indicates a tablet-proximity event; see description of NSTabletProximity. Available in Mac OS X v10.4 and later.

32.25.218 NSTabletProximityMask = &h1000000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events. **Notes:** Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.4 and later.

32.25.219 NSTouchEventSubtype = 3

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing mouse-event subtypes for mouse and tablet events (accessed with the subtype method). **Notes:** Indicates a touch event subtype. Available in Mac OS X v10.6 and later.

32.25.220 NSUndoFunctionKey = &hF743

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF7000xF8FF) that are reserved for function keys on the keyboard. **Notes:** Undo key. Not on most Macintosh keyboards.
32.25. CLASS NSEVENTMBS

32.25.221 NSUnknownPointingDevice=0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants represent pointing-device types for NSTabletProximity events or mouse events with subtype NSTabletProximityEventSubtype.  
**Notes:**
The pointingDeviceType method returns one of these constants.  
Represents an unknown type of pointing device.  
Available in Mac OS X v10.4 and later.

32.25.222 NSUpArrowFunctionKey = & hF700

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** Up Arrow key.

32.25.223 NSUserFunctionKey = & hF736

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700xF8FF) that are reserved for function keys on the keyboard.  
**Notes:** User key. Not on most Macintosh keyboards.

32.25.224 NSWindowExposedEventType = 0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.  
**Notes:** A non-retained NSWindow has been exposed.

32.25.225 NSWindowMovedEventType = 4

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.  
**Notes:** An NSWindow has moved.
32.26 class NSEventMonitorMBS

32.26.1 class NSEventMonitorMBS

Function: The class for watching events in Cocoa.
Notes: For Mac OS X 10.5 compatibility, please use CarbonMonitorEventsMBS class.

32.26.2 Methods

32.26.3 addGlobalMonitorForEventsMatchingMask(mask as UInt64) as boolean

Function: Installs an event monitor that receives copies of events posted to other applications.
Notes:
mask: An event mask specifying which events you wish to monitor. See NSEventMBS constants for possible values.

Events are delivered asynchronously to your app and you can only observe the event; you cannot modify or otherwise prevent the event from being delivered to its original target application.

Key-related events may only be monitored if accessibility is enabled or if your application is trusted for accessibility access (see AXIsProcessTrusted).

Note that your handler will not be called for events that are sent to your own application.

Special Considerations
In OS X v 10.6, event monitors are only able to monitor the following event types:

NSScrollWheel
NSTabletPoint
NSTabletProximity
NSKeyDown (Key repeats are determined by sending the event an isARepeat message.)

Available in OS X v10.6 and later.

### 32.26.4  `addLocalMonitorForEventsMatchingMask(mask as UInt64) as boolean`

**Function:** Installs an event monitor that receives copies of events posted to this application before they are dispatched.
**Notes:**

- mask: An event mask specifying which events you wish to monitor. See NSEventMBS constants for possible values.

Calls the LocalEvent event. You can return the event unmodified, create and return a new NSEventMBS object, or return nil to stop the dispatching of the event.

Your handler will not be called for events that are consumed by nested event-tracking loops such as control tracking, menu tracking, or window dragging; only events that are dispatched through the applications sendEvent method will be passed to your handler.

Note: The monitor Block is called for all future events that match mask.

**Special Considerations**

In OS X v 10.6, event monitors are only able to monitor the following event types:

- NSFlagsChanged
- NSLeftMouseDown
- NSLeftMouseDragged
- NSLeftMouseUp
- NSRightMouseUp
- NSOtherMouseUp
- NSRightMouseDragged
- NSOtherMouseDragged
- NSOtherMouseDown
- NSOtherMouseDragged
- NSScrollWheel
- NSTabletPoint
- NSTabletProximity
- NSRightMouseDown
NSKeyDown (Key repeats are determined by sending the event an isARepeat message.)

Available in OS X v10.6 and later.

### 32.26.5 Available as boolean

**Function:** Whether event monitoring is available.
**Notes:** Returns true on Mac OS X 10.6 and newer.

### 32.26.6 Constructor

**Function:** The constructor.
**Notes:** Initializes the object.

### 32.26.7 Destructor

**Function:** The destructor.
**Notes:** Remove all event monitors you added.

### 32.26.8 Properties

#### 32.26.9 Count as Integer

**Function:** Returns number of event monitors you added.
**Notes:** (Read only property)

### 32.26.10 Events

#### 32.26.11 GlobalEvent(e as NSEventMBS)

**Function:** This event is called for global system events.
**Notes:**
32.26. CLASS NSEVENTMONITORMBS

It is passed the event to monitor. You are unable to change the event, merely observe it.

Events are delivered asynchronously to your app and you can only observe the event; you cannot modify or otherwise prevent the event from being delivered to its original target application.

32.26.12 LocalEvent(e as NSEventMBS) as NSEventMBS

**Function:** This event is called for local application events.

**Notes:** You can return the event unmodified, create and return a new NSEventMBS object, or return nil to stop the dispatching of the event.
32.27  class NSExceptionHandlerMBS

32.27.1  class NSExceptionHandlerMBS

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class for a global handler to catch unhandled cocoa exceptions.

**Notes:**
Previous plugin versions tried to show a dialog to inform you. Now you can intercept that.
If code is in this event, we do not show the dialog from the plugin.

32.27.2  Methods

32.27.3  Disable

MBS Main Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Disables the global exception handler.

32.27.4  Enable

MBS Main Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Enables the global exception handler.

**Notes:** By default the MBS Plugin automatically enables it when you use Cocoa classes.

32.27.5  Events

32.27.6  CaughtException(e as NSExceptionMBS, IsMainThread as boolean)

MBS Main Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
An exception was caught.

**Notes:** If IsMainThread is true, you can show a dialog/window. But if it’s false, you may be in trouble on
a worker thread and showing a dialog can cause more trouble.
32.28  class NSExceptionMBS

32.28.1  class NSExceptionMBS

MBS Main Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function:
The Cocoa exception class.

Example:

dim m1 as new NSMenuMBS
dim m2 as new NSMenuMBS
dim n as new NSMenuItemMBS

n.CreateMenuItem

m1.addItem n
m2.addItem n  // raises an exception as a menuitem can’t be in two menus.

Exception e as NSExceptionMBS
MsgBox e.Message

// e.reason: "Item to be inserted into menu already is in another menu"
// e.name: "NSInternalInconsistencyException"
// e.message: "A Cocoa NSInternalInconsistencyException was not handled: Item to be inserted into menu
already is in another menu"

Notes:
The plugin installs exception handling code. If you use the NSExceptionMBS class somewhere in your code,
the NSException plugin part will be included and a NSExceptionMBS object will be
Subclass of the RuntimeException class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

32.28.2  Methods

32.28.3  callStackSymbols as string()

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function:
Returns an array containing the current call symbols.

Notes:
This method returns an array of strings describing the call stack backtrace at the moment the exception was
first raised. The format of each string is non-negotiable and is determined by the backtrace symbols API.
(like BacktraceMBS function)
32.28.4 Constructor

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

32.28.5 RaiseException(name as string, reason as string, userInfo as dictionary)

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Raises an exception.
**Notes:** The plugin does not catch it right away here, so this is a way to pass back an exception to the Cocoa frameworks.

32.28.6 Properties

32.28.7 Name as string

MBS Main Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the exception. (Its type)
**Notes:** (Read only property)

32.28.8 Reason as string

MBS Main Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reason the exception was raised.
**Notes:** (Read only property)

32.28.9 UserInfo as Dictionary

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Dictionary object containing application-specific data pertaining to the receiver.
**Notes:** Returns nil if no application-specific data exists. As an example, if a method’s return value caused the exception to be raised, the return value might be available to the exception handler through this method.
(Read only property)
32.28.10 Constants

32.28.11 **NSDestinationInvalidException = ”NSDestinationInvalidException”**

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.12 **NSGenericException = ”NSGenericException”**

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.13 **NSInternalInconsistencyException = ”NSInternalInconsistencyException”**

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.14 **NSInvalidArgumentException = ”NSInvalidArgumentException”**

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.15 **NSInvalidReceivePortException = ”NSInvalidReceivePortException”**

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.16 **NSInvalidSendPortException = ”NSInvalidSendPortException”**

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.17 **NSMallocException = ”NSMallocException”**

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.
32.28.18  **NSObjectInaccessibleException = ”NSObjectInaccessibleException”**
MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.19  **NSObjectNotAvailableException = ”NSObjectNotAvailableException”**
MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.20  **NSPortReceiveException = ”NSPortReceiveException”**
MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.21  **NSPortSendException = ”NSPortSendException”**
MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.22  **NSPortTimeoutException = ”NSPortTimeoutException”**
MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

32.28.23  **NSRangeException = ”NSRangeException”**
MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.
class NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The NSFileWrapper class provides access to the attributes and contents of file-system nodes.

Example:

// insert a file to textview
Public Sub InsertFile(textview as NSTextViewMBS, f as FolderItem)
    // read to file
    Dim b As BinaryStream = BinaryStream.Open(f)
    Dim s As String = b.Read(b.Length)

    // build wrapper
    Dim fileWrapper As NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(s)
    fileWrapper.preferredFilename = f.name

    // make attachment
    Dim fileAttachment As NSTextAttachmentMBS = fileWrapper
    Dim attributedString As NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(fileAttachment)

    // add to a NSTextViewMBS
    textview.insertText attributedString

End Sub

Notes:

A file-system node is a file, directory, or symbolic link. Instances of this class are known as file wrappers.

File wrappers represent a file-system node as an object that can be displayed as an image (and possibly edited in place), saved to the file system, or transmitted to another application.

There are three types of file wrappers:

- Regular-file file wrapper: Represents a regular file.
- Directory file wrapper: Represents a directory.
- Symbolic-link file wrapper: Represents a symbolic link.

A file wrapper has these attributes:
• Filename. Name of the file-system node the file wrapper represents.

• File-system attributes. See NSFileManager Class Reference for information on the contents of the attributes dictionary.

• Regular-file contents. Applicable only to regular-file file wrappers.

• File wrappers. Applicable only to directory file wrappers.

• Destination node. Applicable only to symbolic-link file wrappers.

32.29.2 Methods

32.29.3 addFileWrapper(child as NSFileWrapperMBS) as String

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Adds a child file wrapper to the receiver, which must be a directory file wrapper.

Notes:

child: File wrapper to add to the directory.

Returns Dictionary key used to store fileWrapper in the directorys list of file wrappers. The dictionary key is a unique filename, which is the same as the passed-in file wrapper’s preferred filename unless that name is already in use as a key in the directorys dictionary of children. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

Use this method to add an existing file wrapper as a child of a directory file wrapper. If the file wrapper does not have a preferred filename, set the preferredFilename property to give it one before calling addFileWrapper. To create a new file wrapper and add it to a directory, use the addRegularFileWithContents method.

Special Considerations
This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.
This method raises NSInvalidArgumentException if the child file wrapper doesn't have a preferred name.

32.29.4 addRegularFileWithContents(Data as MemoryBlock, preferredFilename as string) as String

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a regular-file file wrapper with the given contents and adds it to the receiver, which must be a directory file wrapper.

Notes:
32.29. **CLASS NSFILEWRAPPERMBS**

data: Contents for the new regular-file file wrapper.
filename: Preferred filename for the new regular-file file wrapper.

Returns Dictionary key used to store the new file wrapper in the directory’s list of file wrappers. The dictionary key is a unique filename, which is the same as the passed-in file wrapper’s preferred filename unless that name is already in use as a key in the directory’s dictionary of children. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

This is a convenience method. The default implementation allocates a new file wrapper, initializes it with initRegularFileWithContents, set its preferredFilename property, adds it to the directory with addFileWrapper, and returns what addFileWrapper returned.

This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper. This method raises NSInvalidArgumentException if you pass nil or an empty value for filename.

Available in OS X v10.0 and later.

### 32.29.5 Constructor

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

### 32.29.6 initDirectoryWithFileWrappers(childrenByPreferredName as Dictionary) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver as a directory file wrapper, with a given file-wrapper list. **Notes:**

childrenByPreferredName: Key-value dictionary of file wrappers with which to initialize the receiver. The dictionary must contain entries whose values are the file wrappers that are to become children and whose keys are filenames. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

Returns initialized file wrapper for fileWrappers.

After initialization, the file wrapper is not associated with a file-system node until you save it using write-ToURL:options:originalContentsURL:

The receiver is initialized with open permissions: anyone can read, write, or modify the directory on disk.
CHAPTER 32. COCOA

If any file wrapper in the directory doesn't have a preferred filename, its preferred name is automatically set to its corresponding key in the childrenByPreferredName dictionary.

### 32.29.7 initRegularFileWithContents(data as MemoryBlock) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver as a regular-file file wrapper.

**Example:**

```lisp
Dim content as MemoryBlock = "Hello World"
Dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"
```

**Notes:**

After initialization, the file wrapper is not associated with a file-system node until you save it using writeToURL.
The file wrapper is initialized with open permissions: anyone can write to or read the file wrapper.

### 32.29.8 initWithFile(File as folderItem, Options as Integer, byref error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the folderitem.

**Example:**

```lisp
Dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
Dim e as NSErrorMBS
Dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
If e <> nil Then
    MsgBox e.localizedDescription
Else
    Dim dic as Dictionary = f.fileAttributes
    Break // read dic in debugger
End If
```

**Notes:**

Nothing to note for this function.
32.29. **CLASS NSFILEWRAPPERMBS**

File: FolderItem of the file-system node the file wrapper is to represent.

options: Option flags for reading the node located at folderItem. Can be NSFileWrapperReadingImmediate
and/or NSFileWrapperReadingWithoutMapping.

Error: If an error occurs, upon return contains an NSErrorMBS object that describes the problem.

Returns File wrapper for the file-system node at folderItem. May be a directory, file, or symbolic link,
depending on what is located at the folderItem. Returns nil if reading is not successful.

If folderItem is a directory, this method recursively creates file wrappers for each node within that directory.
Use the fileWrappers property to get the file wrappers of the nodes contained by the directory.

Available in OS X v10.6 and later.

---

32.29.9 **initWithSerializedRepresentation(data as MemoryBlock) as NSFileWrapperMBS**

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Initializes the receiver as a regular-file file wrapper from given serialized data.

**Example:**

```swift
// get a wrapper
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
dim data as MemoryBlock = f.serializedRepresentation

// later restore it
dim other as NSFileWrapperMBS = NSFileWrapperMBS.initWithSerializedRepresentation(data)
MsgBox other.preferredFilename
```

**Notes:**

serializedRepresentation: Serialized representation of a file wrapper in the format used for the NSFileCon-
tentsPasteboardType pasteboard type. Data of this format is returned by such methods as serializedRepresen-
tation and RTFDInRange (in NSAttributedString).

Returns regular-file file wrapper initialized from serializedRepresentation.
The file wrapper is not associated with a file-system node until you save it using writeToURL.
32.29.10 initWithURL(URL as string, Options as Integer, byref error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the URL.

**Notes:**
- url: URL of the file-system node the file wrapper is to represent.
- options: Option flags for reading the node located at url. Can be NSFileWrapperReadingImmediate and/or NSFileWrapperReadingWithoutMapping.
- Error: If an error occurs, upon return contains an NSErrorMBS object that describes the problem.

Returns File wrapper for the file-system node at url. May be a directory, file, or symbolic link, depending on what is located at the URL. Returns nil if reading is not successful.

If url is a directory, this method recursively creates file wrappers for each node within that directory. Use the fileWrappers property to get the file wrappers of the nodes contained by the directory.

Available in OS X v10.6 and later.

32.29.11 keyForFileWrapper(child as NSFileWrapperMBS) as String

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the dictionary key used by a directory to identify a given file wrapper.

**Notes:**
- child: The child file wrapper for which you want the key.

Returns Dictionary key used to store the file wrapper in the directory’s list of file wrappers. The dictionary key is a unique filename, which may not be the same as the passed-in file wrapper’s preferred filename if more than one file wrapper in the directory’s dictionary of children has the same preferred filename. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure. Returns nil if the file wrapper specified in child is not a child of the directory.

**Special Considerations**
This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.
32.29.12 matchesContentsOfFile(File as Folderitem) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the contents of a file wrapper matches a directory, regular file, or symbolic link on disk.

**Notes:**

file: Folderitem of the file-system node with which to compare the file wrapper.

Returns true when the contents of the file wrapper match the contents of url, false otherwise.

The contents of files are not compared; matching of regular files is based on file modification dates. For a directory, children are compared against the files in the directory, recursively.

Because children of directory file wrappers are not read immediately by the initWithURL:options:error: method unless the NSFileWrapperReadingImmediate reading option is used, even a newly-created directory file wrapper might not have the same contents as the directory on disk. You can use this method to determine whether the file wrapper’s contents in memory need to be updated.

If the file wrapper needs updating, use the readFromURL:options:error: method with the NSFileWrapper-ReadingImmediate reading option.

This table describes which attributes of the file wrapper and file-system node are compared to determine whether the file wrapper matches the node on disk:

<table>
<thead>
<tr>
<th>File-wrapper type</th>
<th>Comparison determinants</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regular file</td>
<td>Modification date and access permissions.</td>
</tr>
<tr>
<td>Directory</td>
<td>Children (recursive).</td>
</tr>
<tr>
<td>Symbolic link</td>
<td>Destination pathname.</td>
</tr>
</tbody>
</table>

Available in OS X v10.6 and later.

32.29.13 matchesContentsOfURL(URL as String) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the contents of a file wrapper matches a directory, regular file, or symbolic link on disk.

**Notes:**

url: URL of the file-system node with which to compare the file wrapper.
Returns true when the contents of the file wrapper match the contents of url, false otherwise.

The contents of files are not compared; matching of regular files is based on file modification dates. For a directory, children are compared against the files in the directory, recursively.

Because children of directory file wrappers are not read immediately by the initWithURL:options:error: method unless the NSFileWrapperReadingImmediate reading option is used, even a newly-created directory file wrapper might not have the same contents as the directory on disk. You can use this method to determine whether the file wrapper’s contents in memory need to be updated.

If the file wrapper needs updating, use the readFromURL:options:error: method with the NSFileWrapper-ReadingImmediate reading option.

This table describes which attributes of the file wrapper and file-system node are compared to determine whether the file wrapper matches the node on disk:

<table>
<thead>
<tr>
<th>File-wrapper type</th>
<th>Comparison determinants</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regular file</td>
<td>Modification date and access permissions.</td>
</tr>
<tr>
<td>Directory</td>
<td>Children (recursive).</td>
</tr>
<tr>
<td>Symbolic link</td>
<td>Destination pathname.</td>
</tr>
</tbody>
</table>

Available in OS X v10.6 and later.

32.29.14 readFromFile(File as Folderitem, Options as Integer = 0, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Recursively rereads the entire contents of a file wrapper from the specified location on disk.
Notes:
File: Folderitem of the file-system node corresponding to the file wrapper.
options: Option flags for reading the node located at url.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if successful. If not successful, returns false after setting outError to an NSErrorMBS object that describes the reason why the file wrapper could not be reread.

When reading a directory, children are added and removed as necessary to match the file system.
Available in OS X v10.6 and later.
32.29.15 readFromURL(URL as String, Options as Integer = 0, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Recursively rereads the entire contents of a file wrapper from the specified location on disk. **Notes:**

- **url:** URL of the file-system node corresponding to the file wrapper.
- **options:** Option flags for reading the node located at url.
- **Error:** If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if successful. If not successful, returns false after setting outError to an NSErrorMBS object that describes the reason why the file wrapper could not be reread.

When reading a directory, children are added and removed as necessary to match the file system. Available in OS X v10.6 and later.

32.29.16 removeFileWrapper(child as NSFileWrapperMBS)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a child file wrapper from the receiver, which must be a directory file wrapper. **Notes:** This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.

32.29.17 writeToFile(File as FolderItem, Options as Integer = 0, originalContentsURL as FolderItem = nil, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Recursively writes the entire contents of a file wrapper to a given file-system URL. **Example:**

```javascript
// get styled text from htmlviewer
dim w as WebViewMBS = HTMLViewer1.WebViewMBS
dim f as WebFrameMBS = w.mainFrame
dim v as WebFrameViewMBS = f.frameView
dim d as WebDocumentViewMBS = v.documentView
dim n as NSAttributedStringMBS = d.attributedString

// package it
dim da as new Dictionary
da.Value(n.NSDocumentTypeDocumentAttribute) = n.NSRTFDTextDocumentType

dim e as NSErrorMBS
```
dim fw as NSFileWrapperMBS = n.fileWrapperFromRange(0, n.Length, da, e)
if e <> nil then
    MsgBox e.localizedDescription
    Return
end if

// write to disk
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtffd")
if fw.writeToFile(file, e) then
    MsgBox "OK"
else
    MsgBox e.localizedDescription
end if

Notes:
File: FolderItem of the file-system node to which the file wrappers contents are written.
options: Option flags for writing to the node located at url.
originalContentsURL: The location of a previous revision of the contents being written. The default implementation of this method attempts to avoid unnecessary I/O by writing hard links to regular files instead of actually writing out their contents when the contents have not changed. The child file wrappers must return accurate values when its filename property is accessed for this to work. Use the NSFileWrapperWritingWithNameUpdating writing option to increase the likelihood of that. Specify nil for this parameter if there is no earlier version of the contents or if you want to ensure that all the contents are written to files.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true when the write operation is successful. If not successful, returns false after setting outError to an NSError object that describes the reason why the file wrappers contents could not be written.

Available in OS X v10.6 and later.

32.29.18 writeToFile(URL as String, Options as Integer = 0, originalContentsURL as String = "", byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Recursively writes the entire contents of a file wrapper to a given file-system URL.
Notes:
url: URL of the file-system node to which the file wrappers contents are written.
options: Option flags for writing to the node located at url.
originalContentsURL: The location of a previous revision of the contents being written. The default implementation of this method attempts to avoid unnecessary I/O by writing hard links to regular files instead of actually writing out their contents when the contents have not changed. The child file wrappers must return accurate values when its filename property is accessed for this to work. Use the NSFileWrapperWritingWithNameUpdating writing option to increase the likelihood of that. Specify nil for this parameter if there is no earlier version of the contents or if you want to ensure that all the contents are written to files.
ingWithNameUpdating writing option to increase the likelihood of that. Specify nil for this parameter if there is no earlier version of the contents or if you want to ensure that all the contents are written to files.

Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true when the write operation is successful. If not successful, returns false after setting outError to an NSError object that describes the reason why the file wrappers contents could not be written.

Available in OS X v10.6 and later.

### 32.29.19 Properties

#### 32.29.20 Directory as Boolean

**MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:** This property contains a boolean value indicating whether the file wrapper is a directory file wrapper. (read-only)

**Notes:**

This property will contain true when the file wrapper is a directory file wrapper, otherwise it contains false. Invocations of readFromURL may change the value of this property, if the type of the file on disk has changed. (Read only property)

#### 32.29.21 fileAttributes as Dictionary

**MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:** A dictionary of file attributes.

**Example:**

```plaintext
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
if e <> nil then
    MsgBox e.localizedDescription
else
    dim dic as Dictionary = f.fileAttributes
    Break // read dic in debugger
end if
```

**Notes:**

The file attributes dictionary is the same format as that returned by attributesOfItemAtPath (see NSFile-
32.29.22 filename as String

Example:

```vba
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"
```

Notes:

This property contains the file wrappers filename, or nil when the file wrapper has no corresponding file-system node.

The filename is used for record-keeping purposes only and is set automatically when the file wrapper is created from the file system using initWithURL and when its saved to the file system using writeToURL (although this method allows you to request that the filename not be updated).

The filename is usually the same as the preferred filename, but might instead be a name derived from the preferred filename. You can use this method to get the name of a child that’s just been read. Don’t use this method to get the name of a child that’s about to be written, because the name might be about to change; send keyForFileWrapper to the parent instead.

(Read and Write property)

32.29.23 fileWrappers as Dictionary

Notes:

The dictionary contains entries whose values are the file wrappers and whose keys are the unique filenames that have been assigned to each one. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

This property may contain nil if the user modifies the directory after you call readFromURL or initWithURL but before NSFileWrapper has read the contents of the directory. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
This property raises NSInternalInconsistencyException if the file wrapper object is not a directory file wrapper.
(Read only property)

### 32.29.24 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.

**Notes:**

Must not be 0 to have the object being valid.
(Read and Write property)

### 32.29.25 icon as NSImageMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An image that can be used to represent the file wrapper to the user.

**Example:**

```vbnet
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
dim img as NSImageMBS = f.icon
dim pic as Picture = img.CopyPictureWithMask
window1Backdrop = pic
```

**Notes:**

An application does not have to use this icon; for example, a file viewer typically looks up icons automatically based on file extensions, and so wouldn't need this one. Similarly, if a file wrapper represents an image file, an application can display the image directly rather than a file icon.

This method may return nil if the file wrapper is a child created when its parent was read from the file system, and the child was modified before it was read. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.

Because the NSImage object that's returned might be shared by many NSFileWrapper objects, you must not mutate it. If you need to mutate the returned object, make a copy first and mutate the copy instead.
(Read and Write property)
32.29.26  preferredFilename as String

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The preferred filename for the file wrapper object.

**Example:**

```vba
// get a wrapper
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
dim data as MemoryBlock = f.serializedRepresentation

// later restore it
dim other as NSFileWrapperMBS = NSFileWrapperMBS.initWithSerializedRepresentation(data)
MsgBox other.preferredFilename
```

**Notes:**

This name is normally used as the dictionary key when a child file wrapper is added to a directory file wrapper. However, if another file wrapper with the same preferred name already exists in the directory file wrapper when this object is added, the filename assigned as the dictionary key may differ from the preferred filename.

When you change the preferred filename, the default implementation of this property causes the existing parent directory file wrappers to remove and re-add the child to accommodate the change. Preferred filenames of children are not preserved when you write a file wrapper to disk and then later instantiate another file wrapper by reading the file from disk. If you need to preserve the user-visible names of attachments, you have to store the names yourself.

(Read and Write property)

32.29.27  RegularFile as Boolean

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This property contains a boolean value that indicates whether the file wrapper object is a regular-file. (read-only)

**Notes:**

This property contains true when the file wrapper object is a regular-file wrapper, otherwise it contains false. Invocations of readFromURL may change the value of this property if the type of the file on disk has changed.

(Read only property)
32.29. CLASS NSFILEWRAPPERMBS

32.29.28 regularFileContents as MemoryBlock

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The contents of the file-system node associated with a regular-file file wrapper. (read-only)

Notes:
This property may contain nil if the user modifies the file after you call readFromURL or initWithURL but before NSFileWrapper has read the contents of the file. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
This property raises NSInternalInconsistencyException if the file wrapper object is not a regular-file file wrapper.
(Read only property)

32.29.29 serializedRepresentation as MemoryBlock

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The contents of the file wrapper as an opaque collection of data. (read-only)

Example:
```
// get a wrapper
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
dim data as MemoryBlock = f.serializedRepresentation

// later restore it
dim other as NSFileWrapperMBS = NSFileWrapperMBS.initWithSerializedRepresentation(data)
MsgBox other.preferredFilename
```

Notes:
This property contains an MemoryBlock in the format used by the pasteboard type NSFileContentsPboardType. This MemoryBlock is also suitable for passing to initWithSerializedRepresentation.
This property may contain nil if the user modifies the contents of the file-system node after you call readFromURL or initWithURL/File but before NSFileWrapper has read the contents of the file. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
(Read only property)

32.29.30 SymbolicLink as Boolean

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A boolean that indicates whether the file wrapper object is a symbolic-link file wrapper. (read-only)
Notes:
This property contains true when the file wrapper object is a symbolic-link file wrapper, false otherwise.
Invocations of readFromURL may change the value contained by this property, if the type of the file on disk has changed.
(Read only property)

32.29.31 symbolicLinkDestinationURL as String

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The URL referenced by the file wrapper object, which must be a symbolic-link file wrapper. (read-only)
Notes:
This property may contain nil if the user modifies the symbolic link after you call readFromURL or initWithURL but before NSFileWrapper has read the contents of the link. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
This property raises NSInternalInconsistencyException if the file wrapper object is not a symbolic-link file wrapper.
(Read only property)

32.29.32 Constants

32.29.33 NSFileWrapperReadingImmediate = 1

MBS MacBase Plugin, Plugin Version: 15.0. Function: One of the reading options.
Notes:
If reading with this option succeeds, then subsequent uses of fileWrappers, regularFileContents, symbolicLinkDestinationURL, and serializedRepresentation sent to the file wrapper and all its child file wrappers will fail and return nil only if an actual error occurs (for example, the volume has disappeared or the file server is unreachable)not as a result of the user moving or deleting files.

For performance reasons, NSFileWrapper may not read the contents of some file packages immediately even when this option is chosen. For example, because the contents of bundles (not all file packages are bundles) are immutable to the user, NSFileWrapper may read the children of such a directory lazily.

You can use this option to take a snapshot of a file or folder for writing later. For example, an application like TextEdit can use this option when creating new file wrappers to represent attachments that the user creates by copying and pasting or dragging and dropping from the Finder to a TextEdit document. Don’t use this option when reading a document file package, because that would cause unnecessarily bad performance. For example, an application wouldn’t use this option when creating file wrappers to represent attachments as it’s opening a document stored in a file package.
### 32.29.34 NSFileWrapperReadingWithoutMapping = 2

**MBS MacBase Plugin, Plugin Version: 15.0.** **Function:** One of the reading options.  
**Notes:**  
Whether file mapping for regular file wrappers is disallowed.

You can use this option to keep NSFileWrapper from memory-mapping files. This is useful if you want to make sure your application doesn’t hold files open (mapped files are open files), therefore preventing the user from ejecting DVDs, unmounting disk partitions, or unmounting disk images. In OS X v10.6 and later, NSFileWrapper memory-maps files that are on internal drives only. It never memory-maps files on external drives or network volumes, regardless of whether this option is used.

Available in OS X v10.6 and later.

### 32.29.35 NSFileWrapperWritingAtomic = 1

**MBS MacBase Plugin, Plugin Version: 15.0.** **Function:** One of the writing options.  
**Notes:**  
Whether writing is done atomically.

You can use this option to ensure that, when overwriting a file package, the overwriting either completely succeeds or completely fails, with no possibility of leaving the file package in an inconsistent state. Because this option causes additional I/O, you shouldn’t use it unnecessarily. For example, don’t use this option in an override of:  

```swift
- [NSDocument writeToURL]
```

, because NSDocument safe-saving is already done atomically.

Available in OS X v10.6 and later.

### 32.29.36 NSFileWrapperWritingWithNameUpdating = 2

**MBS MacBase Plugin, Plugin Version: 15.0.** **Function:** One of the writing options.  
**Notes:**  
Whether descendant file wrappers filename properties are set if the writing succeeds.

This option is necessary when your application passes a URL in the originalContentsURL parameter to the writeToURL method. Without using this option (and reusing child file wrappers properly), subsequent
invocations of writeToURL would not be able to reliably create hard links in a new file package, because the record of names in the old file package would be out of date.

Available in OS X v10.6 and later.
32.30. CLASS NSFONTDESCRIPTORMBS

32.30 class NSFontDescriptorMBS

32.30.1 class NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for a font descriptor.

**Notes:**

NSFontDescriptor objects provide a mechanism to describe a font with a dictionary of attributes. This font descriptor can be used later to create or modify an NSFont object. Mac OS X v10.4 and later provides a font matching capability, so that you can partially describe a font by creating a font descriptor with, for example, just a family name. You can then find all the available fonts on the system with a matching family name using matchingFontDescriptorsWithMandatoryKeys.

There are several ways to create a new NSFontDescriptor object. You can use the Constructor, fontDescriptorWithFontAttributes or fontDescriptorWithName, to create a font descriptor based on either your custom attributes dictionary or on a specific font’s name and size. Alternatively you can use one of the fontDescriptor instance methods (such as fontDescriptorWithFace) to create a modified version of an existing descriptor. The latter methods are useful if you have an existing descriptor and simply want to change one aspect.

All attributes in the attributes dictionary are optional.

32.30.2 Methods

32.30.3 Constructor(AttributesDic as Dictionary)

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a new font descriptor with the specified attributes.

**Notes:** attributes: The attributes for the new font descriptor. If nil, the font descriptor’s attribute dictionary will be empty.

32.30.4 copy as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the object.
32.30.5  fontAttributes as Dictionary

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s dictionary of attributes.

32.30.6  fontDescriptorByAddingAttributes(AttributesDic as Dictionary) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor that is the same as the receiver but with the specified attributes taking precedence over the existing ones.

32.30.7  fontDescriptorWithFace(newFace as string) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor that is the same as the receiver but with the specified face. **Notes:**

newFace: The new font face.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

32.30.8  fontDescriptorWithFamily(newFamily as string) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor whose attributes are the same as the receiver but from the specified family. **Notes:**

newFamily: The new font family.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.
32.30.9  fontDescriptorWithFontAttributes(AttributesDic as Dictionary) as NSFontDescriptorMBS

Notes:

attributes: The attributes for the font descriptor. If nil, the font descriptor’s dictionary will be empty.

Returns the new font descriptor.

32.30.10  fontDescriptorWithMatrix(matrix as Variant) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: Returns a new font descriptor that is the same as the receiver but with the specified matrix.

Notes:

matrix: The new font matrix. Must be a NSAffineTransformMBS object.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

32.30.11  fontDescriptorWithName(fontName as string, matrix as Variant) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: Returns a font descriptor with the NSFontNameAttribute and NSFontMatrixAttribute dictionary attributes set to the given values.

Notes:

fontName: The value for NSFontNameAttribute.
matrix: The value for NSFontMatrixAttribute. Must be a NSAffineTransformMBS object or nil!

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.
See also:

- 32.30.12 fontDescriptorWithName(fontName as string, size as Double) as NSFontDescriptorMBS
32.30.12  **fontDescriptorWithName(fontName as string, size as Double) as NSFontDescriptorMBS**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font descriptor with the NSFontNameAttribute and NSFontSizeAttribute dictionary attributes set to the given values.

**Notes:**
- **fontName:** The value for NSFontNameAttribute.
- **size:** The value for NSFontSizeAttribute.

Returns the new font descriptor.

Available in Mac OS X v10.3 and later.

See also:

- 32.30.11 fontDescriptorWithName(fontName as string, matrix as Variant) as NSFontDescriptorMBS

5683

32.30.13  **fontDescriptorWithSize(newPointSize as Double) as NSFontDescriptorMBS**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor that is the same as the receiver but with the specified point size.

**Notes:**
- **newPointSize:** The new point size.

Returns the new font descriptor.

Available in Mac OS X v10.4 and later.

32.30.14  **fontDescriptorWithSymbolicTraits(SymbolicTraits as Integer) as NSFontDescriptorMBS**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor that is the same as the receiver but with the specified symbolic traits taking precedence over the existing ones.

**Example:**

```swift
// get a bold font
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(13)
dim f as NSFontDescriptorMBS = n.fontDescriptor
dim w as Integer = f.symbolicTraits

// find similar font without bold
```
f = f.fontDescriptorWithSymbolicTraits(BitwiseAnd(w, Bitwise.OnesComplement(f.NSFontBoldTrait)))

// now check it
dim d as Dictionary = f.fontAttributes
w = f.symbolicTraits

if BitwiseAnd(w, f.NSFontBoldTrait) <> 0 then
    MsgBox "bold"
else
    MsgBox "not bold"
end if

Notes:
symbolicTraits: The new symbolic traits.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

32.30.15 matchingFontDescriptorsWithMandatoryKeys as NSFontDescriptorMBS()

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns all the fonts available on the system whose specified attributes match those of the receiver. Notes: mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptors.

For example, suppose there are two versions of a given font installed that differ in the number of glyphs covered (the new version has more glyphs). If you explicitly specify NSFontNameAttribute as the only mandatory key, then a font descriptor that specifies a font name and character set by default matches both versions, since the character set attribute is not used for matching. If you specify that font name and character set keys are mandatory, the returned array contains only the font that matches both keys.

Available in Mac OS X v10.4 and later.
See also:
- 32.30.16 matchingFontDescriptorsWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS()
32.30.16 matchingFontDescriptorsWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS()

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns all the fonts available on the system whose specified attributes match those of the receiver. **Notes:**

mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptors.

For example, suppose there are two versions of a given font installed that differ in the number of glyphs covered (the new version has more glyphs). If you explicitly specify NSFontNameAttribute as the only mandatory key, then a font descriptor that specifies a font name and character set by default matches both versions, since the character set attribute is not used for matching. If you specify that font name and character set keys are mandatory, the returned array contains only the font that matches both keys.

Available in Mac OS X v10.4 and later. See also:

- 32.30.15 matchingFontDescriptorsWithMandatoryKeys as NSFontDescriptorMBS() 5685

32.30.17 matchingFontDescriptorWithMandatoryKeys as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a normalized font descriptor whose specified attributes match those of the receiver. **Notes:**

mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptor. The returned font descriptor is the first element returned from matchingFontDescriptorsWithMandatoryKeys. See also:

- 32.30.18 matchingFontDescriptorWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS 5686

32.30.18 matchingFontDescriptorWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a normalized font descriptor whose specified attributes match those of the receiver. **Notes:**
mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptor.
The returned font descriptor is the first element returned from matchingFontDescriptorsWithMandatoryKeys.
See also:

- 32.30.17 matchingFontDescriptorWithMandatoryKeys as NSFontDescriptorMBS

32.30.19  matrix as Variant

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current transform matrix of the receiver.
**Notes:** Must be a NSAffineTransformMBS object or nil!

32.30.20  NSFontCascadeListAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
**Notes:**
An array with sub-descriptors.
The default value is the system default cascading list for user’s locale.
Available in Mac OS X v10.4 and later.

32.30.21  NSFontCharacterSetAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
**Notes:**
An NSCharacterSetMBS instance that represents the set of Unicode characters covered by the font.
The default value is supplied by the font.
Available in Mac OS X v10.4 and later.

32.30.22  NSFontColorAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
**Notes:**
An optional memory block that specifies the font color.
(Deprecated. Use NSForegroundColorAttributeName instead.)
Available in Mac OS X v10.3 and later.
Deprecated in Mac OS X v10.4.

### 32.30.23 NSFontFaceAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys. **Notes:** An optional string that specifies the font face.

### 32.30.24 NSFontFamilyAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys. **Notes:** An optional string that specifies the font family.

### 32.30.25 NSFontFeatureSelectorIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for font descriptor attributes. **Notes:**
A number specifying a font feature selector such as common ligature off, traditional character shape, and so on. See "Font Features" in ATSUI Programming Guide for predefined feature selectors. Available in Mac OS X v10.5 and later.

### 32.30.26 NSFontFeatureTypeIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for font descriptor attributes. **Notes:**
A number specifying a font feature type such as ligature, character shape, and so on. See "Font Features" in ATSUI Programming Guide for predefined feature types. Available in Mac OS X v10.5 and later.
32.30. CLASS NSFONTDESCRIPTORMBS

32.30.27 NSFontFixedAdvanceAttribute as string

Notes: A number containing a float value that overrides the glyph advancement specified by the font. The default value is 0.0.

32.30.28 NSFontMatrixAttribute as string

Notes: An NSAffineTransformMBS instance that specifies the font’s transformation matrix. The default value is the identity matrix. Available in Mac OS X v10.4 and later.

32.30.29 NSFontNameAttribute as string

Notes: An optional string that specifies the font name.

32.30.30 NSFontSizeAttribute as string

Notes: An optional string, containing a float value, that specifies the font size.

32.30.31 NSFontSlantTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the keys to retrieve information about a font descriptor from its trait dictionary.
Notes: The relative slant angle value as a number. The valid value range is from -1.0 to 1.0. The value of 0.0 corresponds to 0 degree clockwise rotation from the vertical and 1.0 corresponds to 30 degrees clockwise rotation.
CHAPTER 32. COCOA

Available in Mac OS X v10.4 and later.

32.30.32 **NSFontSymbolicTrait as string**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its trait dictionary. **Notes:**
The symbolic traits value as a number. Available in Mac OS X v10.4 and later.

32.30.33 **NSFontTraitsAttribute as string**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys. **Notes:**
A Dictionary instance instance fully describing font traits. The default value is supplied by the font. See "Font traits dictionary keys" for dictionary keys. Available in Mac OS X v10.4 and later.

32.30.34 **NSFontVariationAttribute as string**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys. **Notes:**
A dictionary instance that describes the font’s variation axis. The default value is supplied by the font. See "Font variation axis dictionary keys" for dictionary keys. Available in Mac OS X v10.4 and later.

32.30.35 **NSFontVariationAxisDefaultValueKey as string**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary. **Notes:**
The default axis value as a number. Available in Mac OS X v10.4 and later.
32.30. **CLASS NSFONTDESCRIPTORMBS**

32.30.36 **NSFontVariationAxisIdentifierKey as string**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary. **Notes:**
The axis identifier value as a number.
Available in Mac OS X v10.4 and later.

32.30.37 **NSFontVariationAxisMaximumValueKey as string**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary. **Notes:**
The maximum axis value as a number.
Available in Mac OS X v10.4 and later.

32.30.38 **NSFontVariationAxisMinimumValueKey as string**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary. **Notes:**
The minimum axis value as a number.
Available in Mac OS X v10.4 and later.

32.30.39 **NSFontVariationAxisNameKey as string**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary. **Notes:**
The localized variation axis name.
Available in Mac OS X v10.4 and later.

32.30.40 **NSFontVisibleNameAttribute as string**

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes: An optional string that specifies the font’s visible name.

### 32.30.41 NSFontWeightTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its trait dictionary. **Notes:**

The normalized weight value as a number. The valid value range is from -1.0 to 1.0. The value of 0.0 corresponds to the regular or medium font weight. Available in Mac OS X v10.4 and later.

### 32.30.42 NSFontWidthTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its trait dictionary. **Notes:**

The relative inter-glyph spacing value as a number. The valid value range is from -1.0 to 1.0. The value of 0.0 corresponds to the regular glyph spacing. Available in Mac OS X v10.4 and later.

### 32.30.43 pointSize as Double

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the point size of the receiver. **Example:**

```dim f as NSFontMBS = NSFontMBS.fontWithName("Arial", 12)
dim d as NSFontDescriptorMBS = f.fontDescriptor
MsgBox str(d.pointSize)```

### 32.30.44 postscriptName as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the PostScript name of the receiver. **Example:**

```dim f as NSFontMBS = NSFontMBS.fontWithName("Arial", 12)
dim d as NSFontDescriptorMBS = f.fontDescriptor```
32.30. **CLASS NSFONTDESCRIPTORMBS**

MsgBox d.postscriptName

### 32.30.45 `symbolicTraits as Integer`

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a bit mask that describes the traits of the receiver.

**Example:**

```vba
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(13)
dim f as NSFontDescriptorMBS = n.fontDescriptor
dim w as Integer = f.symbolicTraits

if BitwiseAnd(w, f.NSFontBoldTrait) <> 0 then
    MsgBox "bold"
else
    MsgBox "not bold"
end if
```

**Notes:**

Typeface information is specified by the lower 16 bits of system trait value.

The font family class constants classify certain stylistic qualities of the font. These values correspond closely to the font class values in the OpenType OS/2 table. The class values are bundled in the upper four bits of the NSFontSymbolicTraits and can be accessed via NSFontFamilyClassMask. For more information about the specific meaning of each identifier, refer to the OpenType specification.

### 32.30.46 `variantForKey(key as string) as Variant`

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font attribute specified by the given key.

### 32.30.47 Properties

### 32.30.48 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference.
CHAPTER 32. COCOA

Notes: (Read and Write property)

32.30.49 Constants

32.30.50 NSFontBoldTrait = 2

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits. **Notes:**
The font’s typestyle is boldface.
Available in Mac OS X v10.4 and later.

32.30.51 NSFontClarendonSerifsClass = & h40000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants. **Notes:**
The font’s style is a variation of the Oldstyle Serifs and the Transitional Serifs.
Available in Mac OS X v10.4 and later.

32.30.52 NSFontCondensedTrait = 64

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits. **Notes:**
The font’s typestyle is condensed. Expanded and condensed traits are mutually exclusive.
Available in Mac OS X v10.4 and later.

32.30.53 NSFontExpandedTrait = 32

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits. **Notes:**
The font’s typestyle is expanded. Expanded and condensed traits are mutually exclusive.
Available in Mac OS X v10.4 and later.
32.30.54 **NSFontFamilyClassMask = &hF0000000**

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** The font family class mask used to access NSFontFamilyClass values.

**Notes:**
Available in Mac OS X v10.4 and later.
This constant is used to access NSFontFamilyClass values in the upper four bits of NSFontSymbolicTraits.

32.30.55 **NSFontFreeformSerifsClass = &h70000000**

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.

**Notes:**
The font’s style includes serifs, but it expresses a design freedom that does not generally fit within the other serif design classifications.
Available in Mac OS X v10.4 and later.

32.30.56 **NSFontItalicTrait = 1**

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits.

**Notes:**
The font’s typestyle is italic.
Available in Mac OS X v10.4 and later.

32.30.57 **NSFontModernSerifsClass = &h30000000**

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.

**Notes:**
The font’s style is based on the Latin printing style of the 20th century.
Available in Mac OS X v10.4 and later.

32.30.58 **NSFontMonoSpaceTrait = 1024**

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits.

**Notes:**
The font uses fixed-pitch glyphs if available. The font may have multiple glyph advances (many CJK glyphs contain two spaces).
32.30.59  NSFontOldStyleSerifsClass = & h10000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.  
**Notes:** The font’s style is based on the Latin printing style of the 15th to 17th century.  
Available in Mac OS X v10.4 and later.

32.30.60  NSFontOrnamentalsClass = & h90000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.  
**Notes:** The font’s style includes highly decorated or stylized character shapes such as those typically used in headlines.  
Available in Mac OS X v10.4 and later.

32.30.61  NSFontSansSerifClass = & h80000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.  
**Notes:** The font’s style includes most basic letter forms (excluding Scripts and Ornamentals) that do not have serifs on the strokes.  
Available in Mac OS X v10.4 and later.

32.30.62  NSFontScriptsClass = & hA0000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.  
**Notes:** The font’s style is among those typefaces designed to simulate handwriting.  
Available in Mac OS X v10.4 and later.
32.30. **CLASS NSFONTDESCRIPTORMBS**

### 32.30.63 NSFontSlabSerifsClass = & h50000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants. **Notes:**
The font’s style is characterized by serifs with a square transition between the strokes and the serifs (no brackets).
Available in Mac OS X v10.4 and later.

### 32.30.64 NSFontSymbolicClass = & hC0000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants. **Notes:**
The font’s style is generally design independent, making it suitable for special characters (icons, dingbats, technical symbols, and so on) that may be used equally well with any font.
Available in Mac OS X v10.4 and later.

### 32.30.65 NSFontTransitionalSerifsClass = & h20000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants. **Notes:**
The font’s style is based on the Latin printing style of the 18th to 19th century.
Available in Mac OS X v10.4 and later.

### 32.30.66 NSFontUIOptimizedTrait = 4096

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits. **Notes:**
The font synthesizes appropriate attributes for user interface rendering, such as control titles, if necessary.
Available in Mac OS X v10.4 and later.

### 32.30.67 NSFontUnknownClass = 0

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants. **Notes:**
The font has no design classification.
Available in Mac OS X v10.4 and later.
32.30.68  \texttt{NSFontVerticalTrait = 2048}

MBS MacBase Plugin, Plugin Version: 12.1. \textbf{Function:} One of the typeface constants for symbolic traits.  
\textbf{Notes:}  
The font uses vertical glyph variants and metrics.  
Available in Mac OS X v10.4 and later.
32.31 class NSFontManagerMBS

### 32.31.1 class NSFontManagerMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSFontManager is the center of activity for the font conversion system.

**Example:**

```vbnet
// pick some font
dim n1 as NSFontMBS = nsfontmbs.fontWithName("Book Antiqua bold", 12)
dim fm as new NSFontManagerMBS

// remove all font traits
dim n2 as NSFontMBS = fm.convertFontToNotHaveTrait(n1, fm.traitsOfFont(n1))

// show name of base font
MsgBox n2.fontName
```

**Notes:**

It records the currently selected font, updates the Font panel and Font menu to reflect the selected font, initiates font changes, and converts fonts in response to requests from text-bearing objects. In a more prosaic role, NSFontManager can be queried for the fonts available to the application and for the particular attributes of a font, such as whether it’s condensed or extended.

As of Mac OS X version 10.3, font collections are managed by NSFontManager.

### 32.31.2 Methods

#### 32.31.3 addCollection(collectionName as String, Options as Integer = 0) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a specified font collection to the font manager with a given set of options.

**Notes:**

collectionName: The collection to add.
Options: Pass NSFontCollectionApplicationOnlyMask to make the collection available only to the application.
Return true if the font collection was successfully added; otherwise, false.
32.31.4  addFontDescriptorsToCollection(descriptors() as NSFontDescriptorMBS, collectionName as String)

**Function:** Adds an array of font descriptors to the specified font collection.
**Example:**

```plaintext
dim fontManager as NSFontManagerMBS = NSFontManagerMBS.sharedFontManager

dim collectionNames() as string = fontManager.collectionNames
dim collectionName as string = collectionNames(collectionNames.Ubound) // get last one

dim fonts() as NSFontDescriptorMBS = fontManager.fontDescriptorsInCollection(collectionName)

// add Helvetica to this collection

dim font as NSFontMBS = NSFontMBS.fontWithName(“Helvetica”, 12)
dim fontDescriptor as NSFontDescriptorMBS = font.fontDescriptor

fontManager.addFontDescriptorsToCollection(array(fontDescriptor), collectionName)

dim fonts2() as NSFontDescriptorMBS = fontManager.fontDescriptorsInCollection(collectionName)

// fonts2 should have one more entry than fonts

Break
```

**Notes:**
- **descriptors:** The font descriptors to add.
- **collectionName:** The font collection to which descriptors are added.

32.31.5  availableFontFamilies as string()

**Function:** Returns the names of the font families available in the system.
**Example:**

```plaintext
dim n as new NSFontManagerMBS

dim names() as string = n.availableFontFamilies

MsgBox Join(names,EndOfLine)
```

**Notes:** These fonts are in various system font directories.
32.31. **CLASS NSFONTMANAGERMBS**

32.31.6 **availableFontNamesMatchingFontDescriptor(descriptor as NSFontDescriptorMBS) as String()**

MBS MacCocoa Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Returns the names of the fonts that match the attributes in the given font descriptor.

32.31.7 **availableFontNamesWithTraits(traits as Integer) as string()**

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Returns the names of the fonts available in the system whose traits are described exactly by the given font trait mask (not the NSFont objects themselves).

**Example:**
```pascal
  dim n as new NSFontManagerMBS
  dim names() as string = n.availableFontNamesWithTraits(n.NSBoldFontMask)

  MsgBox str(UBound(names)+1)+” fonts: ”+Join(names,”, ”)
```

**Notes:**
- **traits**: The font traits for which to return font names. You specify the desired traits by combining the font trait mask values described in Constants using the bitwiseor operator.

- Returns the names of the corresponding fonts.

- These fonts are in various system font directories.

  - If fontTraitMask is 0, this method returns all fonts that are neither italic nor bold. This result is the same one you’d get if fontTraitMask were NSUnitalicFontMask | NSUnboldFontMask.

32.31.8 **availableFonts as string()**

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Returns the names of the fonts available in the system (not the NSFont objects themselves).

**Example:**
```pascal
  dim n as new NSFontManagerMBS
  dim names() as string = n.availableFonts

  MsgBox Join(names,EndOfLine)
```
CHAPTER 32. COCOA

Notes: These fonts are in various system font directories.

32.31.9 availableMembersOfFontFamily(FontFamily as string) as Variant()

Function: Returns an array with one entry for each available member of a font family.
Example:

dim n as new NSFontManagerMBS
dim members() as Variant = n.availableMembersOfFontFamily(”Times”)

for each m as Variant in members
    dim member() as Variant = m
    MsgBox ”Postscript name: ”+member(0)+EndOfLine+”Suffix: ”+member(1)+EndOfLine+”Font weight: ”+member(2)+EndOfLine+”Font trait: ”+member(3)
next

Notes:

family: The name of a font family, like one that availableFontFamilies returns.

Returns the available members of family.

Each entry of the returned variant array is another variant array with four members, as follows:

0. The PostScript font name, as a string.
1. The part of the font name used in the font panel that’s not the font name, as a string. This value is not localized for example, ”Roman”, ”Italic”, or ”Bold”.
2. The font’s weight, as a double.
3. The font’s traits, as a double.

The members of the family are arranged in the font panel order (narrowest to widest, lightest to boldest, plain to italic).
32.31.10  collectionNames as string()

**Function:** Returns the names of the currently loaded font collections.  
**Example:**

```vba
dim n as new NSFontManagerMBS
dim names() as string = n.collectionNames
MsgBox Join(names, EndOfLine)
```

**Notes:** The names of the current font collections.

32.31.11  Constructor

**Function:** Initializes the object with the shared instance of the font manager for the application, creating it if necessary.

32.31.12  convertAttributes(dic as dictionary) as dictionary

**Function:** Converts attributes in response to an object initiating an attribute change, typically the Font panel or Font menu.

32.31.13  convertFont(font as NSFontMBS) as NSFontMBS

**Function:** Converts the given font according to the object that initiated a font change, typically the Font panel or Font menu.

32.31.14  convertFontToFace(font as NSFontMBS, face as string) as NSFontMBS

**Function:** Returns a font whose traits are as similar as possible to those of the given font except for the typeface, which is changed to the given typeface.  
**Example:**
dim fontManager as new NSFontManagerMBS
// you have a font
dim font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)

// change font face
font = fontManager.convertFontToFace(font, "Helvetica-BoldOblique")

MsgBox font.fontName // shows Helvetica-BoldOblique

Notes:
Font: The font whose traits are matched.
face: The new typeface; a fully specified family-face name, such as Helvetica-BoldOblique or Times-Roman.

Returns a font with matching traits and the given typeface, or aFont if it can’t be converted.

This method attempts to match the weight and posture of aFont as closely as possible. Italic is mapped to Oblique, for example. Weights are mapped based on an approximate numeric scale of 0 to 15.

32.31.15 convertFontToFamily(font as NSFontMBS, family as string) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a font whose traits are as similar as possible to those of the given font except for the font family, which is changed to the given family.

Example:

dim fontManager as new NSFontManagerMBS
// you have a font
dim font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)

// change font family
font = fontManager.convertFontToFamily(font, "Arial")

MsgBox font.fontName // shows ArialMT

Notes:
Font: The font whose traits are matched.
family: The new font family; a generic font name, such as Helvetica or Times.

Returns a font with matching traits and the given family, or aFont if it can’t be converted.
This method attempts to match the weight and posture of aFont as closely as possible. Italic is mapped to Oblique, for example. Weights are mapped based on an approximate numeric scale of 0 to 15.

32.31.16  `convertFontToHaveTrait(font as NSFontMBS, trait as Integer) as NSFontMBS`

**Function:** Returns a font whose traits are the same as those of the given font, except that the traits are changed to include the single specified trait.

**Example:**
```vbs
dim n as new NSFontManagerMBS
dim f as NSFontMBS = NSFontMBS.fontWithName("Times", 12.0)
dim g as NSFontMBS = n.convertFontToHaveTrait(f, n.NSBoldFontMask)
MsgBox g.fontName // Times-Bold
```

**Notes:**
- Font: The font whose traits are matched.
- Trait: The new trait; may be any one of the traits described in Constants. Using NSUnboldFontMask or NSUnitalicFontMask removes the bold or italic trait, respectively.

Returns a font with matching traits including the given trait, or font if it can’t be converted. Using NSUnboldFontMask or NSUnitalicFontMask removes the bold or italic trait, respectively.

32.31.17  `convertFontToNotHaveTrait(font as NSFontMBS, trait as Integer) as NSFontMBS`

**Function:** Returns an NSFont object with the same traits as the given font, except for the traits in the given font trait mask, which are removed.

**Example:**
```vbs
dim n as new NSFontManagerMBS
dim f as NSFontMBS = NSFontMBS.fontWithName("Times-Bold", 12.0)
dim g as NSFontMBS = n.convertFontToHaveTrait(f, n.NSUnBoldFontMask)
MsgBox g.fontName // Times-Roman
```
Notes:
Font: The font whose traits are matched.
trait: The mask for the traits to remove, created using the bitwiseOr operator to combine the traits described in Constants. Using NSUnboldFontMask or NSUnitalicFontMask removes the bold or italic trait, respectively.
Returns a font with matching traits minus the given traits, or font if it can’t be converted.

32.31.18 convertFontToSize(font as NSFontMBS, size as Double) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns an NSFont object whose traits are the same as those of the given font, except for the size, which is changed to the given size.
Example:

dim fontManager as new NSFontManagerMBS
	// you have a font
dim font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)

	// change font size
font = fontManager.convertFontToSize(font, 20)

MsgBox str(font.pointSize)

Notes:
Font: The font whose traits are matched.
size: The new font size.

Returns a font with matching traits except in the new size, or aFont if it can’t be converted.

32.31.19 convertFontTraits(traits as Integer) as Integer

Notes:
traits: The current font traits.

Returns the new traits mask value to be used by convertFont:.

This method is intended to be invoked to query the font traits while the action message (usually changeFont:)
32.31. **CLASS NSFONTMANAGERMBS**

is being invoked when the current font action is either NSAddTraitFontAction or NSRemoveTraitFontAction.

Available in Mac OS X v10.5 and later.

### 32.31.20 `convertWeightOfFont(font as NSFontMBS, up as boolean) as NSFontMBS`

**Function:** Returns an NSFont object whose weight is greater or lesser than that of the given font, if possible.

**Example:**

```
dim n as new NSFontManagerMBS
dim f as NSFontMBS = NSFontMBS.fontWithName("Times", 12.0)
dim g as NSFontMBS = n.convertWeightOfFont(f, true)
```

MsgBox g.fontName // Times-Bold

**Notes:**

- **up:** If true, a heavier font is returned; if it’s false, a lighter font is returned.
- **Font:** The font whose weight is increased or decreased.

Returns a font with matching traits except for the new weight, or font if it can’t be converted.

### 32.31.21 `fontDescriptorsInCollection(collectionName as String) as NSFontDescriptorMBS()`

**Function:** Returns an array of the font descriptors in the collection specified by the given collection name.

**Example:**

```
dim fontManager as NSFontManagerMBS = NSFontManagerMBS.sharedFontManager
dim collectionNames() as string = fontManager.collectionNames
dim collectionName as string = collectionNames(collectionNames.Ubound) // get last one
dim fonts() as NSFontDescriptorMBS = fontManager.fontDescriptorsInCollection(collectionName)
```

Break
32.31.22  fontHasTraits(fontName as string, Traits as Integer) as boolean

**Function:** Indicates whether the given font has all the specified traits.

**Example:**

```
    dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)
    dim m as new NSFontManagerMBS

    dim isBold as Boolean = m.fontHasTraits(n.fontName, m.NSBoldFontMask)
    dim isItalic as Boolean = m.fontHasTraits(n.fontName, m.NSItalicFontMask)

    MsgBox "is bold: " + str(isBold) + _
    EndOfLine + "is italic: " + str(isItalic)
```

**Notes:**

- **typeface:** The name of the font.
- **fontTraitMask:** The font traits to test, specified by combining the font trait mask values described in Constants using the bitwiseOR operation.

Returns true if the font named typeface has all the traits specified in fontTraitMask; false if it doesn’t.

Using NSUnboldFontMask returns true if the font is not bold, false otherwise. Using NSUnitalicFontMask returns true if the font is not italic, false otherwise.

32.31.23  isMultiple as boolean

**Function:** Indicates whether the last font selection recorded has multiple fonts.

**Notes:** Returns true if the last font selection recorded has multiple fonts; false if it’s a single font.

32.31.24  orderFrontFontPanel

**Function:** This action method opens the Font panel by sending it an orderFront message, creating the Font panel if necessary.
32.31.25 orderFrontStylesPanel

32.31.26 removeCollection(collectionName as String) as Boolean

32.31.27 removeFontDescriptorFromCollection(descriptor as NSFontDescriptorMBS, collectionName as String)

32.31.28 selectedFont as NSFontMBS

32.31.29 setSelectedAttributes(dic as dictionary, isMultiple as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Informs the paragraph and character formatting panels when text in a selection has changed attributes. Notes: dic: The new attributes. isMultiple: If true, informs the panel that multiple fonts or attributes are enclosed within the selection. This method is used primarily by NSTextView. Available in Mac OS X v10.3 and later.
32.31.30  setSelectedFont(font as NSFontMBS, isMultiple as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Records the given font as the currently selected font and updates the Font panel to reflect this.

Notes:

font: The font to set as selected.
isMultiple: If true, the Font panel indicates that more than one font is contained in the selection; if false, it does not.

An object that manipulates fonts should invoke this method whenever it becomes first responder and whenever its selection changes. It shouldn’t invoke this method in the process of handling a changeFont message, as this causes the font manager to lose the information necessary to effect the change. After all fonts have been converted, the font manager itself records the new selected font.

32.31.31  sharedFontManager as NSFontManagerMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the shared instance of the font manager for the application, creating it if necessary.

32.31.32  traitsOfFont(font as NSFontMBS) as Integer

Example:

```dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)
dim m as new NSFontManagerMBS

// shows 2 which is m.NSBoldFontMask
MsgBox str(m.traitsOfFont(n))```

Notes:

Font: The font whose traits are returned.
Returns the font traits, returned as a mask created by combining values listed in Constants with the bitwise OR operation.
32.31.33  weightOfFont(font as NSFontMBS) as Integer

**Function:** Returns a rough numeric measure the weight of the given font.  
**Example:**

```vbnet
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)  
dim m as new NSFontManagerMBS  
MsgBox str(m.weightOfFont(n))
```

**Notes:**

Font: The font whose weight is returned.

A rough numeric measure the weight of the given font, where 0 indicates the lightest possible weight, 5 indicates a normal or book weight, and 9 or more indicates a bold or heavier weight.

32.31.34  Properties

32.31.35  Handle as Integer

**Function:** The internal object reference.  
**Notes:** (Read and Write property)

32.31.36  Enabled as boolean

**Function:** Whether the font conversion system’s user interface items (the Font panel and Font menu items) are enabled.  
**Notes:**

True if the font conversion system’s user interface items (the Font panel and Font menu items) are enabled; false if they’re not.  
(Read and Write computed property)
32.31.37 Constants

32.31.38 NSAddTraitFontAction = 2

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
**Notes:** Converts the font to have an additional trait using convertFontToHaveTrait.

32.31.39 NSBoldFontMask = 2

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
**Notes:** A mask that specifies a bold font.

32.31.40 NSCompressedFontMask = & h00000200

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
**Notes:** A mask that specifies a compressed font.

32.31.41 NSCondensedFontMask = & h00000400

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
**Notes:** A mask that specifies a condensed font.

32.31.42 NSExpandedFontMask = & h00000200

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
**Notes:** A mask that specifies an expanded font.

32.31.43 NSFixedPitchFontMask = & h00000400

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
32.31. CLASS NSFONTMANAGERMBS

Notes: A mask that specifies a fixed pitch font.

32.31.44 NSFontCollectionApplicationOnlyMask = 1

Notes: makes the collection available only to the application. This option is not yet implemented.

32.31.45 NSHeavierFontAction = 5

Notes: Converts the font to a heavier weight using convertWeightofFont.

32.31.46 NSItalicFontMask = 1

Notes: A mask that specifies an italic font.

32.31.47 NSLighterFontAction = 6

Notes: Converts the font to a lighter weight using convertWeightofFont.

32.31.48 NSNarrowFontMask = & h00000010

Notes: A mask that specifies a narrow font.

32.31.49 NSNoFontChangeAction = 0

Notes: No action; the font is returned unchanged.

32.31.50 NSNonStandardCharacterSetFontMask = 8

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
**Notes:** A mask that specifies a font that uses a non-standard character set.

32.31.51 NSPosterFontMask = & h00000100

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
**Notes:** A mask that specifies a poster-style font.

32.31.52 NSRemoveTraitFontAction = 7

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
**Notes:** Converts the font to remove a trait using convertFonttoNotHaveTrait.

32.31.53 NSSizeDownFontAction = 4

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
**Notes:** Converts the font to a smaller size using convertFonttoSize.

32.31.54 NSSizeUpFontAction = 3

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
**Notes:** Converts the font to a larger size using convertFonttoSize.

32.31.55 NSSmallCapsFontMask = & h00000080

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
32.31. **CLASS NSFONTMANAGERMBS**

Notes: A mask that specifies a small-caps font.

### 32.31.56 NSUnboldFontMask = 4

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.

Notes: A mask that specifies a font that is not bold.

### 32.31.57 NSUnitalicFontMask = & h01000000

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.

Notes: A mask that specifies a font that is not italic.

### 32.31.58 NSViaPanelFontAction = 1

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.

Notes: Converts the font according to the NSFontPanel method panelConvertFont.
32.32 class NSFontMBS

32.32.1 class NSFontMBS

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a font in the Cocoa world. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

32.32.2 Methods

32.32.3 advancementForGlyph(aGlyph as Integer) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the nominal spacing for the given glyph—the distance the current point moves after showing the glyph, taking into account the receiver’s size. **Notes:** This spacing is given according to the glyph’s movement direction, which is either strictly horizontal or strictly vertical.

32.32.4 boldSystemFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Aqua system font used for standard interface items that are rendered in boldface type in the specified size. **Example:**

```python
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)
```

```plaintext
MsgBox n.description
// shows: "LucidaGrande-Bold 12.00 pt. P [ ] (0x1c082c0) fobj=0x1c09d30, spc=3.96"
```

**Notes:** If fontSize is 0 or negative, returns the boldface system font at the default size.

32.32.5 boundingRectForGlyph(aGlyph as Integer) asNSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bounding rectangle for the specified glyph, scaled to the receiver’s size. **Notes:** Japanese fonts encoded with the scheme "EUC12-NJE-CFEncoding" do not have individual metrics or bounding boxes available for the glyphs above 127. For those glyphs, this method returns the bounding
rectangle for the font instead.

### 32.32.6 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

### 32.32.7 `controlContentFontOfSize(size as Double) as NSFontMBS`

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for the content of controls in the specified size.  
**Example:**

```vbs
dim n as NSFontMBS = NSFontMBS.controlContentFontOfSize(12)
MsgBox n.description
```

**Notes:** For example, in a table, the user’s input uses the control content font, and the table’s header uses another font. If `fontSize` is 0 or negative, returns the control content font at the default size.

### 32.32.8 file as folderitem

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the folderitem for this font.  
**Notes:** One file may give several font faces.

### 32.32.9 `fontDescriptor as NSFontDescriptorMBS`

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s font descriptor.  
**Notes:**  
A font descriptor object that describes the receiver.

The font descriptor contains a mutable dictionary of optional attributes for creating an NSFont object. See documentation on NSFontDescriptor for more information.
32.32.10  fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, font-Size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font object for the specified font descriptor and font size.

**Notes:**

- fontDescriptor: A font descriptor object.
- fontSize: The size in points to which the font is scaled.

Returns a font object for the specified descriptor and size.

In most cases, you can simply use fontWithName to create standard scaled fonts.

Available in Mac OS X v10.4 and later.

See also:

- 32.32.11 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, TextTransform as Variant) as NSFontMBS

32.32.11  fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, Text-Transform as Variant) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font object for the specified font descriptor and text transform.

**Notes:**

- fontDescriptor: The font descriptor object describing the font to return.
- textTransform: An affine transformation applied to the font. Must be a NSAffineTransformMBS object or nil!

Returns a font object for the specified name and transform.

In most cases, you can simply use fontWithName to create standard scaled fonts. If textTransform is non-nil, it has precedence over NSFontMatrixAttribute in fontDescriptor.

Available in Mac OS X v10.4 and later.

See also:

- 32.32.10 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, font-size as Double) as NS-FontMBS
32.32. CLASS NSFONTMBS

32.32.12  fontWeightName(fontName as string, fontSize as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a font object for the specified font name and font size.

**Example:**

```vba
dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)
```

MsgBox n.description
// shows: "Monaco 12.00 pt. P [ ] (0x1805020) fobj=0x168114b0, spc=7.20"

**Notes:**
The fontName is a fully specified family-face name, such as Helvetica-BoldOblique or Times-Roman. The fontSize is equivalent to using a font matrix of [ fontSize 0 0 fontSize 0 0 ] . If you use a fontSize of 0.0, this method uses the default User Font size.

Fonts created with this method automatically flip themselves in flipped views. This method is the preferred means for creating fonts.

32.32.13  glyphWithName(name as string) as UInt32

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the named encoded glyph, or 1 if the receiver contains no such glyph.

**Notes:**
Returns 1 if the glyph named glyphName isn’t encoded.
Glyph names in fonts do not always accurately identify the glyph. If possible, look up the appropriate glyph on your own.

32.32.14  labelFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Aqua font used for standard interface labels in the specified size.

**Example:**

```vba
dim n as NSFontMBS = NSFontMBS.labelFontOfSize(12)
```

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1829350) fobj=0x18293f0, spc=3.80"
Notes: If fontSize is 0 or negative, returns the label font with the default size.

### 32.32.15 labelFontSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the size of the standard label font.

**Example:**

```vbscript
MsgBox str(NSFontMBS.labelFontSize) // shows 10
```

### 32.32.16 menuBarFontSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for menu bar items, in the specified size.

**Example:**

```vbscript
dim n as NSFontMBS = NSFontMBS.menuBarFontSize(12)
MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x17e00c00) fobj=0x17e00ca0, spc=3.80"
```

**Notes:**
If fontSize is 0 or negative, returns the menu bar font with the default size.
Available in Mac OS X v10.3 and later.

### 32.32.17 menuFontSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for menu items, in the specified size.

**Example:**

```vbscript
dim n as NSFontMBS = NSFontMBS.menuFontSize(12)
MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1da6d80) fobj=0x1da6e20, spc=3.80"
```

**Notes:** If fontSize is 0 or negative, returns the menu items font with the default size.
32.32. CLASS NSFONTMBS

32.32.18 messageFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for standard interface items, such as button labels, menu items, and so on, in the specified size.

**Example:**

```vbscript
dim n as NSFontMBS = NSFontMBS.messageFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1c11520) fobj=0x1c11790, spc=3.80"
```

**Notes:** If fontSize is 0 or negative, returns this font at the default size. This method is equivalent to `systemFontOfSize()`.

32.32.19 paletteFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for palette window title bars, in the specified size.

**Example:**

```vbscript
dim n as NSFontMBS = NSFontMBS.paletteFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x18800c00) fobj=0x18800ca0, spc=3.80"
```

**Notes:** If fontSize is 0 or negative, returns the palette title font at the default size.

32.32.20 screenFontWithRenderingMode(renderingMode as Integer) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a bitmapped screen font, when sent to a font object representing a scalable PostScript font, with the specified rendering mode, matching the receiver in typeface and matrix (or size), or nil if such a font can’t be found.

**Notes:**
For valid rendering modes, see `NSFontRenderingMode`.
Screen fonts are for direct use with the window server only. Never use them with Application Kit objects, such as in `setFont:` methods. Internally, the Application Kit automatically uses the corresponding screen font for a font object as long as the view is not rotated or scaled.
Available in Mac OS X v10.4 and later.
32.32.21 **setUserFixedPitchFont(font as NSFontMBS)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the font used by default for documents and other text under the user’s control, when that font should be fixed-pitch, to the specified font.
**Notes:** Specifying font as nil causes the default to be removed from the application domain.

32.32.22 **setUserFont(font as NSFontMBS)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the font used by default for documents and other text under the user’s control to the specified font.
**Notes:** Specifying font as nil causes the default to be removed from the application domain.

32.32.23 **smallSystemFontSize as Double**

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the size of the standard small system font.
**Example:**

```plaintext
MsgBox str(NSFontMBS.smallSystemFontSize) // shows 11
```

32.32.24 **systemFontSize(size as Double) as NSFontMBS**

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Aqua system font used for standard interface items, such as button labels, menu items, and so on, in the specified size.
**Example:**

```plaintext
dim n as NSFontMBS = NSFontMBS.systemFontSize(12)
MsgBox n.description // shows: "LucidaGrande 12.00 pt. P [ ] (0x17e009d0) fobj=0x17e00ca0, spc=3.80"
```

**Notes:** If fontSize is 0 or negative, returns the system font at the default size.
**32.32. CLASS NSFONTMBS**

**32.32.25 systemFontSize as Double**

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the size of the standard system font.

**Example:**

MsgBox str(NSFontMBS.systemFontSize) // shows 13

**32.32.26 systemFontSizeForControlSize(controlSize as Integer) as Double**

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the font size used for the specified control size.

**Example:**

MsgBox str(NSFontMBS.systemFontSizeForControlSize(0)) // 13
MsgBox str(NSFontMBS.systemFontSizeForControlSize(1)) // 11

**Notes:**
If controlSize does not correspond to a valid NSControlSize, returns the size of the standard system font.
Available in Mac OS X v10.3 and later.

**32.32.27 titleBarFontSize(size as Double) as NSFontMBS**

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the font used for window title bars, in the specified size.

**Example:**

```vbnet
dim n as NSFontMBS = NSFontMBS.titleBarFontSize(12)
```

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1a31b20) fobj=0x1a31bc0, spc=3.80"

**Notes:** If fontSize is 0 or negative, returns the title bar font at the default size. This method is equivalent to boldSystemFontSize.
32.32.28  **toolTipsFontOFSize(size as Double) as NSFontMBS**

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for tool tips labels, in the specified size.

**Example:**

```vbnet
dim n as NSFontMBS = NSFontMBS.toolTipsFontOFSize(12)
MsgBox n.description
```

// shows: "LucidaGrande 12.00 pt. P [ ] (0x1828db0) fobj=0x1828e50, spc=3.80"

**Notes:** If fontSize is 0 or negative, returns the tool tips font at the default size.

32.32.29  **userFixedPitchFontOFSize(size as Double) as NSFontMBS**

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used by default for documents and other text under the user’s control (that is, text whose font the user can normally change), when that font should be fixed-pitch, in the specified size.

**Example:**

```vbnet
dim n as NSFontMBS = NSFontMBS.userFixedPitchFontOFSize(12)
MsgBox n.description
```

// shows: "Monaco 12.00 pt. P [ ] (0x1ad13a0) fobj=0x1ac2bd0, spc=7.20"

**Notes:**

If fontSize is 0 or negative, returns the fixed-pitch font at the default size.

The system does not guarantee that all the glyphs in a fixed-pitch font are the same width. For example, certain Japanese fonts are dual-pitch, and other fonts may have nonspacing marks that can affect the display of other glyphs.

32.32.30  **userFontOFSize(size as Double) as NSFontMBS**

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used by default for documents and other text under the user’s control (that is, text whose font the user can normally change), in the specified size.

**Example:**
32.32. CLASS NSFONTMBS

```vbnet
dim n as NSFontMBS = NSFontMBS.userFontSize(12)

MsgBox n.description
// shows: "Helvetica 12.00 pt. P [ ] (0x19019b0) fobj=0x181fd00, spc=3.33"
```

**Notes:** If fontSize is 0 or negative, returns the user font at the default size.

### 32.32.31 Properties

#### 32.32.32 ascender as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the top y-coordinate, offset from the baseline, of the receiver’s longest ascender. **Notes:** (Read only property)

#### 32.32.33 boundingRectForFont as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s bounding rectangle, scaled to the font’s size. **Notes:** The bounding rectangle is the union of the bounding rectangles of every glyph in the font. (Read only property)

#### 32.32.34 capHeight as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s cap height. **Notes:** (Read only property)

#### 32.32.35 coveredCharacterSet as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSCharacterSet object containing all of the nominal characters renderable by the receiver, which is all of the entries mapped in the receiver’s cmap’ table. **Example:**

```vbnet
// get the Symbol font
dim n as NSFontMBS = NSFontMBS.fontWithName("Symbol",10)
```
// what characters are defined for this font?
dim c as NSCharacterSetMBS = n.coveredCharacterSet

// display a string with all the characters
MsgBox c.StringValue

Notes:
Value is a NSCharacterSetMBS object. Returned as Variant to reduce plugin dependencies.
The number of glyphs supported by a given font is often larger than the number of characters contained in
the character set returned by this method.
(Read only property)

32.32.36 descender as Double
MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the bottom y coordinate, offset from the baseline, of the receiver’s longest descender.
Notes:
Thus, if the longest descender extends 2 points below the baseline, descender will return 2.
(Read only property)

32.32.37 description as string
MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The description of the font.
Example:
dim n as NSFontMBS = NSFontMBS.systemFontOfSize(12)
MsgBox n.description

Notes: (Read only property)

32.32.38 displayName as string
MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The (localized) display name of the font.
Example:
32.32. **CLASS NSFONTMBS**

```vbnet
dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)
MsgBox n.displayName // shows "Monaco"
```

**Notes:** (Read only property)

### 32.32.39 familyName as string

**MBS MacBase Plugin, Plugin Version:** 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The family name of the font.
**Example:**
```vbnet
dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)
MsgBox n.familyName // shows "Monaco"
```

**Notes:** (Read only property)

### 32.32.40 fontName as string

**MBS MacBase Plugin, Plugin Version:** 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The name of the font.
**Example:**
```vbnet
dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)
MsgBox n.fontName // shows "Monaco"
```

**Notes:** (Read only property)

### 32.32.41 Handle as Integer

**MBS MacBase Plugin, Plugin Version:** 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal reference to the NSFont object.
**Notes:** (Read and Write property)
32.32.42 isFixedPitch as boolean

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether all glyphs in the receiver have the same advancement.  
**Notes:**
Returns true if all glyphs in the receiver have the same advancement; false if any advancements differ.

Some Japanese fonts encoded with the scheme "EUC12-NJE-CFEncoding” return that they have the same advancement, but actually encode glyphs with one of two advancements, for historical compatibility. You may need to handle such fonts specially for some applications.  
(Read only property)

32.32.43 italicAngle as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s italic angle, the amount that the font is slanted in degrees counterclockwise from the vertical, as read from its AFM file.  
**Notes:**
Because the slant is measured counterclockwise, English italic fonts typically return a negative value.  
(Read only property)

32.32.44 leading as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s leading.  
**Notes:**
Available in Mac OS X v10.4 and later.  
(Read only property)

32.32.45 maximumAdvancement as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the greatest advancement of any of the receiver’s glyphs.  
**Notes:**
This advancement is always either strictly horizontal or strictly vertical.  
(Read only property)
CLASS NSFONTMBS

32.32.46 mostCompatibleStringEncoding as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string encoding that works best with the receiver, where there are the fewest possible unmatched characters in the string encoding and glyphs in the font.

**Notes:**

You can use NSStrings dataUsingEncoding method to convert the string to this encoding.

If this method returns NSASCIIStringEncoding, it could not determine the correct encoding and assumed that the font can render only ASCII characters.

This method works heuristically using well-known font encodings, so for nonstandard encodings it may not in fact return the optimal string encoding.

(Read only property)

32.32.47 numberOfGlyphs as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of glyphs in the receiver.

**Example:**

```dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)
MsgBox str(n.numberOfLines) // 1678```

**Notes:**

Glyphs are numbered starting at 0.

(Read only property)

32.32.48 pointSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s point size, or the effective vertical point size for a font with a nonstandard matrix.

**Notes:** (Read only property)

32.32.49 printerFont as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scalable PostScript font corresponding to itself.

**Notes:**

When sent to a font object representing a scalable PostScript font, returns self. When sent to a font object
representing a bitmapped screen font, returns its corresponding scalable PostScript font. (Read only property)

### 32.32.50 `renderingMode` as Integer

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rendering mode of the receiver.  
**Notes:**  
Available in Mac OS X v10.4 and later. (Read only property)

### 32.32.51 `screenFont` as `NSFontMBS`

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmapped screen font corresponding to itself.  
**Notes:**  
When sent to a font object representing a scalable PostScript font, returns a bitmapped screen font matching the receiver in typeface and matrix (or size), or nil if such a font can’t be found. When sent to a font object representing a bitmapped screen font, returns nil.  
Screen fonts are for direct use with the window server only. Never use them with Application Kit objects, such as in `setFont:` methods. Internally, the Application Kit automatically uses the corresponding screen font for a font object as long as the view is not rotated or scaled. (Read only property)

### 32.32.52 `textTransform` as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current transformation matrix for the receiver.  
**Notes:**  
Available in Mac OS X v10.4 and later.  
Returns `NSAffineTransformMBS`. Returned as Variant to reduce plugin dependencies. (Read only property)
32.32. CLASS NSFONTMBS

32.32.53 underlinePosition as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the baseline offset that should be used when drawing underlines with the receiver, as determined by the font’s AFM file. **Notes:** This value is usually negative, which must be considered when drawing in a flipped coordinate system. (Read only property)

32.32.54 underlineThickness as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the thickness that should be used when drawing underlines with the receiver, as determined by the font’s AFM file. **Notes:** (Read only property)

32.32.55 xHeight as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the x-height of the font. **Notes:** (Read only property)

32.32.56 Constants

32.32.57 NSControlGlyph=& hFFFFFF

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants define reserved glyph codes. **Notes:** NSGlyphGenerator generates NSControlGlyph for all characters in the Unicode General Category C* and U200B (ZERO WIDTH SPACE).

32.32.58 NSFontAntialiasedIntegerAdvancementsRenderingMode=3

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the font rendering mode. **Notes:** Specifies antialiased, integer advancements rendering mode. Available in Mac OS X v10.4 and later.
32.32.59  **NSFontAntialiasedRenderingMode=1**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the font rendering mode.

**Notes:**

Specifies antialiased, floating-point advancements rendering mode (synonymous with printerFont).
Available in Mac OS X v10.4 and later.

32.32.60  **NSFontDefaultRenderingMode=0**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the font rendering mode.

**Notes:**

Determines the actual mode based on the user preference settings.
Available in Mac OS X v10.4 and later.

32.32.61  **NSFontIntegerAdvancementsRenderingMode=2**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the font rendering mode.

**Notes:**

Specifies integer advancements rendering mode.
Available in Mac OS X v10.4 and later.

32.32.62  **NSNativeShortGlyphPacking=5**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** A constant for glyph packing.

**Notes:**

The native format for Mac OS X.

Cocoa stores all text data as Unicode. The text system converts Unicode into glyph IDs and places them in 1-, 2-, or 4-byte storage depending on the context. To render text, you must convert the storage into a format the text engine understands. The following constants describe the glyph packing schemes the text rendering engine can use. They are used to extract glyphs from a font for making a multibyte (or single-byte) array of glyphs for passing to an interpreter, such as the window server, which expects a big-endian multibyte stream (that is, "packed glyphs") instead of a pure NSGlyph stream. They’re used by glyphPacking. With Quartz, the engine always expects the format to be in 2-byte short array, so NSNativeShortGlyphPacking is the only format currently in use.
MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants define reserved glyph codes. **Notes:** A null glyph.
### 32.33 class NSFontPanelMBS

#### 32.33.1 class NSFontPanelMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSFontPanel class implements the Font panel user interface object that displays a list of available fonts, letting the user preview them and change the font used to display text. 

**Example:**

NSFontPanelMBS.sharedFontPanel.Show

**Notes:**

The actual changes are made through conversion messages sent to the shared NSFontManager instance. There’s only one Font panel for each application. 

Subclass of the NSPanelMBS class.

#### 32.33.2 Methods

#### 32.33.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Constructor.

#### 32.33.4 convertAttributes(old as dictionary) as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts attributes in response to an object initiating an attribute change, typically the Font panel. 

**Notes:** Call this function only in the changeAttributes event.

#### 32.33.5 convertFont(oldFont as NSFontMBS) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the given font according to the object that initiated a font change, typically the Font panel. 

**Notes:** Call this function only in the ChangeFont event.
32.33. CLASS NSFONTPANELMBS

32.33.6 Destructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

32.33.7 panelConvertFont(font as NSFontMBS) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the specified font using the settings in the receiver, with the aid of the shared NSFontManager if necessary. **Notes:** Font: The font to be converted. Returns the converted font, or aFont itself if it can't be converted.

For example, if aFont is Helvetica Oblique 12.0 point and the user has selected the Times font family (and nothing else) in the Font panel, the font returned is Times Italic 12.0 point.

32.33.8 reloadDefaultFontFamilies

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Triggers a reload to the default state, so that the delegate is called. **Notes:** This reloading provides the delegate opportunity to scrutinize the default list of fonts to be displayed in the panel.

32.33.9 setPanelFont(font as NSFontMBS, isMultiple as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the selected font in the receiver to the specified font. **Notes:** Font: The font to be selected. flag: If false, selects the specified font; otherwise selects no font and displays a message in the preview area indicating that multiple fonts are selected.

You normally don't use this method directly; instead, you send setSelectedFont to the shared NSFontManager, which in turn invokes this method.
32.33.10  sharedFontPanel as NSFontPanelMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the single NSFontPanel instance for the application, creating it if necessary. **Example:**

NSFontPanelMBS.sharedFontPanel.Show

32.33.11  sharedFontPanelExists as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the shared Font panel has been created, false if it hasn’t.

32.33.12  worksWhenModal as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver allows fonts to be changed in modal windows and panels.

32.33.13  Properties

32.33.14  accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The accessory view. **Notes:**

Establishes the specified view as the receiver’s accessory view, allowing you to add custom controls to your application’s Font panel without having to create a subclass.

(Read and Write computed property)

32.33.15  Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver’s Set button is enabled. **Notes:**

The receiver continues to reflect the font of the selection for cooperating text objects regardless of this setting.

(Read and Write computed property)
32.33.16 Events

32.33.17 changeAttributes

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called whenever attributes in the font panel changed. **Notes:** Use convertAttributes to know what changed.

32.33.18 changeFont

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called whenever the font in the font panel changed. **Notes:** Use ConvertFont to know what changed.

32.33.19 validModesForFontPanel as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the mode mask corresponding to the expected font panel mode. **Notes:** The mode masks are defined in constants. By default the plugin returns NSFontPanelAllModesMask.

32.33.20 Constants

32.33.21 NSFontPanelAllEffectsModeMask = & hFFF00

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel. **Notes:** Display all the effects user interface items.

32.33.22 NSFontPanelAllModesMask = & hFFFFFFFF

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel. **Notes:** Display all the available adornments.
32.33.23  \text{NSFontPanelCollectionModeMask} = 4

MBS MacCocoa Plugin, Plugin Version: 12.5. \textbf{Function}: One of the constants to define what is available in NSFontPanel. 
\textbf{Notes}: Display the font collections column.

32.33.24  \text{NSFontPanelDocumentColorEffectModeMask} = 2048

MBS MacCocoa Plugin, Plugin Version: 12.5. \textbf{Function}: One of the constants to define what is available in NSFontPanel. 
\textbf{Notes}: Display the document color button.

32.33.25  \text{NSFontPanelFaceModeMask} = 1

MBS MacCocoa Plugin, Plugin Version: 12.5. \textbf{Function}: One of the constants to define what is available in NSFontPanel. 
\textbf{Notes}: Display the typeface column.

32.33.26  \text{NSFontPanelShadowEffectModeMask} = 4096

MBS MacCocoa Plugin, Plugin Version: 12.5. \textbf{Function}: One of the constants to define what is available in NSFontPanel. 
\textbf{Notes}: Display the shadow effects button.

32.33.27  \text{NSFontPanelSizeModeMask} = 2

MBS MacCocoa Plugin, Plugin Version: 12.5. \textbf{Function}: One of the constants to define what is available in NSFontPanel. 
\textbf{Notes}: Display the font size column.

32.33.28  \text{NSFontPanelStandardModesMask} = \& \text{hFFFF}

MBS MacCocoa Plugin, Plugin Version: 12.5. \textbf{Function}: One of the constants to define what is available in NSFontPanel. 
\textbf{Notes}: Display the standard default font panel that is, including the collections, typeface, and size columns.
32.33. CLASS NSFONTPANELMBS

32.33.29 NSFontPanelStrikethroughEffectModeMask = 512

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
**Notes:** Display the strike-through popup menu.

32.33.30 NSFontPanelTextColorEffectModeMask = 1024

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
**Notes:** Display the text color button.

32.33.31 NSFontPanelUnderlineEffectModeMask = 256

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
**Notes:** Display the underline popup menu.
class NSHelpManagerMBS

32.34.1 class NSHelpManagerMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSHelpManager class provides an approach to displaying online help. **Notes:** An application contains one NSHelpManager object.

32.34.2 Methods

32.34.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSHelpManagerMBS object in Real Studio which points to the shared NSHelpManager object.

32.34.4 eventWindow as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the event window. **Notes:** Can be nil in future Mac OS X versions.

32.34.5 findString(query as string, book as string)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs a search for the specified string in the specified book. **Notes:**

query: String to search for.
book: Localized help book to search. When "", all installed help books are searched.

32.34.6 helpWindow as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the help window. **Notes:**

Can be nil in future Mac OS X versions.
Maybe be useful to reposition help window.
32.34.7  **isContextHelpModeActive as boolean**

**Function:** Indicates whether context-sensitive help mode is active.

**Notes:**
Returns true when the application is in context-sensitive help mode, false otherwise.

In context-sensitive help mode, when a user clicks a user interface item, help for that item is displayed in a small window just below the cursor.

32.34.8  **NSContextHelpModeDidActivateNotification as string**

**Function:** One of the notification names to be used with NSNotificationObserverMBS class.

**Notes:**
Posted when the application enters context-sensitive help mode. This typically happens when the user holds down the Help key.
The notification object is the help manager. This notification does not contain a userInfo dictionary.

32.34.9  **NSContextHelpModeDidDeactivateNotification as string**

**Function:** One of the notification names to be used with NSNotificationObserverMBS class.

**Notes:**
Posted when the application exits context-sensitive help mode. This happens when the user clicks the mouse button while the cursor is anywhere on the screen after displaying a context-sensitive help topic.
The notification object is the help manager. This notification does not contain a userInfo dictionary.

32.34.10  **openHelpAnchor(anchor as string, book as string)**

**Function:** Finds and displays the text at the given anchor location in the given book.

**Notes:**
anchor: Location of the desired text.
book: Help book containing the anchor. When "", all installed help books are searched.
32.34.11 registerBooksInBundle(bundle as NSBundleMBS) as boolean

**Function:** Registers one or more help books in the given bundle.  
**Notes:**  
bundle: The bundle for additional help books. Books in the main bundle are automatically registered.  

Returns true if registration is successful, false if if the bundle doesn’t contain any help books or if registration fails.  

You use registerBooksInBundle to register help books in, for example, a plug-in bundle. The Info.plist in the bundle should contain a help book directory path, which specifies one or more folders containing help books.  

The main bundle is automatically registered by openHelpAnchor and findString.  

32.34.12 setContextHelpModeActive(active as boolean)

**Function:** Specifies whether context-sensitive help mode is active.  
**Notes:**  
active: True turns on context-sensitive help, false turns it off.  

You never send this message directly; instead, the NSApplication method activateContextHelpMode activates context-sensitive help mode, and the first mouse click after displaying the context-sensitive help window deactivates it.  

When the application enters context-sensitive help mode, the help manager posts an NSContextHelpMode-DidActivateNotification to the default notification center. When the application returns to normal operation, the help manager posts an NSContextHelpModeDidDeactivateNotification.  

32.34.13 shadowWindow as NSWindowMBS

**Function:** The internal reference to the shadow window.  
**Notes:** Can be nil in future Mac OS X versions.
32.34.14 Properties

32.34.15 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference to the NSHelpManager object. **Notes:** (Read and Write property)
32.35 class NSIndexSetMBS

32.35.1 class NSIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The NSIndexSet class represents an immutable collection of unique unsigned integers, known as indexes because of the way they are used.
Example:

```pascal
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes:

This collection is referred to as a index set.

You use index sets in your code to store indexes into some other data structure. For example, given an array, you could use an index set to identify a subset of objects in that array.

Each index value can appear only once in the index set. This is an important concept to understand and is why you would not use index sets to store an arbitrary collection of integer values. To illustrate how this works, if you created an NSIndexSet object with the values 4, 5, 2, and 5, the resulting set would only have the values 4, 5, and 2 in it. Because index values are always maintained in sorted order, the actual order of the values when you created the set would be 2, 4, and then 5.

In most cases, using an index set is more efficient than storing a collection of individual integers. Internally, the NSIndexSet class represents indexes using ranges. For maximum performance and efficiency, overlapping ranges in an index set are automatically coalesced that is, ranges merge rather than overlap. Thus, the more contiguous the indexes in the set, the fewer ranges are required to specify those indexes.

You must not subclass the NSIndexSet class.

The mutable subclass of NSIndexSet is NS MUTABLE INDEX SET.

32.35.2 Methods

32.35.3 Constructor

Example:
32.35. CLASS NSINDEXSETMBS

dim x as new NSIndexSetMBS

See also:

- 32.35.4 Constructor(index as Integer)
- 32.35.5 Constructor(indexes as NSIndexSetMBS)
- 32.35.6 Constructor(StartIndex as Integer, Length as Integer)

32.35.4 Constructor(index as Integer)

Example:

dim n as new NSIndexSetMBS(5)
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)

See also:

- 32.35.3 Constructor
- 32.35.5 Constructor(indexes as NSIndexSetMBS)
- 32.35.6 Constructor(StartIndex as Integer, Length as Integer)

32.35.5 Constructor(indexes as NSIndexSetMBS)

Example:

dim n as new NSIndexSetMBS(5)
dim x as new NSIndexSetMBS(n)
MsgBox str(x.firstIndex)

See also:

- 32.35.3 Constructor
- 32.35.4 Constructor(index as Integer)
- 32.35.6 Constructor(StartIndex as Integer, Length as Integer)
32.35.6 Constructor(StartIndex as Integer, Length as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object with an index range. **Example:**

```vba
Dim n as New NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
```

**Notes:** This method raises an NSRangeException when indexRange would add an index that exceeds the maximum allowed value for unsigned integers. See also:

- 32.35.3 Constructor
- 32.35.4 Constructor(index as Integer)
- 32.35.5 Constructor(indexes as NSIndexSetMBS)

32.35.7 containsIndex(index as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver contains a specific index. **Example:**

```vba
Dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10

If n.ContainsIndex(6) then
    MsgBox "OK"
Else
    MsgBox "Error."
End If

If n.ContainsIndex(11) then
    MsgBox "Error."
Else
    MsgBox "OK"
End If
```

**Notes:** Returns true when the receiver contains index, false otherwise.
32.35.8  containsIndexes(indexes as NSIndexSetMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Indicates whether the receiver contains a superset of the indexes in another index set. Example:

```vba
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim m as new NSIndexSetMBS(6,2)
if n.containsIndexes(m) then
    MsgBox "OK"
else
    MsgBox "Error."
end if
```

Notes: True when the receiver contains a superset of the indexes in indexSet, false otherwise.

32.35.9  containsIndexesInRange(StartIndex as Integer, Length as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Indicates whether the receiver contains the indexes represented by an index range. Example:

```vba
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
if n.containsIndexesInRange(6,2) then
    MsgBox "OK"
else
    MsgBox "Error."
end if
```

Notes: Returns true when the receiver contains the indexes in indexRange, false otherwise.

32.35.10  copy as NSIndexSetMBS

32.35.11  count as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of indexes in the receiver.

**Example:**

```vba
Dim n As New NSIndexSetMBS(5, 6) ' 5, 6, 7, 8, 9, 10
MsgBox Str(n.count) ' shows 6
```

32.35.12  countOfIndexesInRange(StartIndex as Integer, Length as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of indexes in the receiver that are members of a given range.

**Example:**

```vba
Dim n As New NSIndexSetMBS(5, 6) ' 5, 6, 7, 8, 9, 10
MsgBox Str(n.countOfIndexesInRange(1, 8)) ' shows 4
```

**Notes:** Available in Mac OS X v10.5 and later.

32.35.13  firstIndex as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the first index in the receiver or the not-found indicator.

**Example:**

```vba
Dim n As New NSIndexSetMBS(5, 6) ' 5, 6, 7, 8, 9, 10
MsgBox Str(n.firstIndex) + " " + Str(n.lastIndex)
```

**Notes:** First index in the receiver or NSNotFound (& h7fffffff) when the receiver is empty.

32.35.14  indexGreaterThanIndex(index as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the closest index in the receiver that is greater than a specific index or the not-found indicator.

**Example:**
32.35. **CLASS NSINDEXSETMBS**

```basic
Dim n As New NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox Str(n.indexGreaterThanIndex(1)) // shows(5)
```

**Notes**: Returns the lowest index in the receiver greater than index; NSNotFound (F7FFFFFFF) when the receiver contains no qualifying index.

### 32.35.15 indexGreaterThanOrEqualToIndex(index as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Returns either the closest index in the receiver that is greater than or equal to a specific index or the not-found indicator.  
**Example:**

```basic
Dim n As New NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox Str(n.indexGreaterThanOrEqualToIndex(1)) // shows(5)
```

**Notes**: Returns closest index in the receiver greater than or equal to index; NSNotFound (F7FFFFFFF) when the receiver contains no qualifying index.

### 32.35.16 indexLessThanIndex(index as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Returns either the closest index in the receiver that is less than a specific index or the not-found indicator.  
**Example:**

```basic
Dim n As New NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox Str(n.indexLessThanIndex(20)) // shows 10
MsgBox Str(n.indexLessThanIndex(1)) // shows 2147483647 for not found
```

**Notes**: Returns closest index in the receiver less than index; NSNotFound (F7FFFFFFF) when the receiver contains no qualifying index.

### 32.35.17 indexLessThanOrEqualToIndex(index as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Returns either the closest index in the receiver that is less than or equal to a specific index or the
not-found indicator.

**Example:**

```dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.indexLessThanOrEqualToIndex(20)) // shows 10```

**Notes:** Returns closest index in the receiver less than or equal to index; NSNotFound (& h7FFFFFFF) when the receiver contains no qualifying index.

### 32.35.18 indexSet as NSIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty index set.

**Example:**

```dim n as NSIndexSetMBS = NSIndexSetMBS.indexSet
MsgBox str(n.count) // 0 -> empty```

**Notes:** Available in Mac OS X v10.3 and later.

### 32.35.19 indexSetWithIndex(index as Integer) as NSIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an index set with an index.

**Example:**

```dim n as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndex(3)
MsgBox str(n.count) // 1```

**Notes:** Available in Mac OS X v10.3 and later.

### 32.35.20 indexSetWithIndexesInRange(StartIndex as Integer, Length as Integer) as NSIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an index set with an index range.

**Example:**

```
32.35. **CLASS NSINDEXSETMBS**

```vbnet
dim n as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(3,2)
MsgBox str(n.count) // 2 and contains 3,4
```

**Notes:** Available in Mac OS X v10.3 and later.

### 32.35.21 intersectsIndexesInRange(StartIndex as Integer, Length as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver contains any of the indexes in a range.

**Example:**

```vbnet
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
if n.intersectsIndexesInRange(1,4) then
    MsgBox "Error"
else
    MsgBox "OK"
end if
if n.intersectsIndexesInRange(1,6) then
    MsgBox "OK"
else
    MsgBox "Error"
end if
```

### 32.35.22 isEqualToIndexSet(other as NSIndexSetMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the indexes in the receiver are the same indexes contained in another index set.

**Example:**

```vbnet
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim m as NSIndexSetMBS = n.mutableCopy
if m.isEqualToIndexSet(n) then
    MsgBox "OK"
else
    MsgBox "Failed."
end if
```
### 32.35.23 lastIndex as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the last index in the receiver or the not-found indicator.

**Example:**

```delphi
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

**Notes:** Returns Last index in the receiver or NSNotFound (& hFFFFFFF) when the receiver is empty.

### 32.35.24 mutableCopy as NSMutableIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an editable copy of the indexset.

**Example:**

```delphi
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim m as NSMutableIndexSetMBS = n.mutableCopy
m.addIndex 20
MsgBox str(n.lastIndex)+" "+str(m.lastIndex)
```

### 32.35.25 Operator_Convert as string

MBS MacCocoa Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts an indexset to string for display.

**Example:**

```delphi
dim n as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(10,40)
MsgBox n
```

**Notes:**

This is for having str() function and msgbox work with NSIndexSetMBS class.
If more than 20 values, you get only 20 values followed with dots and last value on the end.
32.35. CLASS NSINDEXSETMBS

32.35.26 Values as Integer()

Function: Returns all values in array.
Example:

```vbnet
dim n1 as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(10,10)
dim n2 as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(30,5)
dim n3 as new NSMutableIndexSetMBS
n3.addIndexes n1
n3.addIndexes n2
dim count1 as Integer = n1.count // 10
dim count2 as Integer = n2.count // 5
dim count3 as Integer = n3.count // 15
dim values1() as Integer = n1.Values
dim values2() as Integer = n2.Values
dim values3() as Integer = n3.Values
break // look in debugger
```

32.35.27 Properties

32.35.28 Handle as Integer

Notes: (Read and Write property)
32.36 class NSInputStreamMBS

32.36.1 class NSInputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A stream that provides read-only stream functionality. **Notes:** Subclass of the NSStreamMBS class.

32.36.2 Methods

32.36.3 Constructor(filePath as string)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSInputStream object that reads data from the file at a given path. **Notes:** The stream must be opened before it can be used.

32.36.4 inputStreamWithData(data as Memoryblock) as NSInputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized NSInputStream object for reading from a given NSData object. **Notes:** data: The data object from which to read. The contents of data are copied.

Returns an initialized NSInputStream object for reading from data. If data is not an NSData object, this method returns nil.

The stream must be opened before it can be used.

32.36.5 inputStreamWithPath(path as string) as NSInputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSInputStream object that reads data from the file at a given path. **Notes:** path: The path to the file.

Returns an initialized NSInputStream object that reads data from the file at path.
The stream must be opened before it can be used.

**32.36.6 inputStreamWithURL(URL as string) as NSInputStreamMBS**

**Function:** Creates and returns an initialized NSInputStream object that reads data from the file at a given URL.

**Notes:**

url: The URL to the file.

Returns an initialized NSInputStream object that reads data from the URL at url.

The stream must be opened before it can be used.

**32.36.7 LookAHead as MemoryBlock**

**Function:** Returns copy of read buffer.

**Notes:** Allows looking into data before reading it.

**32.36.8 Read(maxLength as Integer) as MemoryBlock**

**Function:** Reads up to a given number of bytes into a given buffer.

**32.36.9 Properties**

**32.36.10 hasBytesAvailable as Boolean**

**Function:** A Boolean value that indicates whether the receiver has bytes available to read.

**Notes:**

True if the receiver has bytes available to read, otherwise false. May also return true if a read must be attempted in order to determine the availability of bytes.

(Read only property)
32.37 class NSKeyedArchiverMBS

32.37.1 class NSKeyedArchiverMBS

Example:

```plaintext
// make archiver
dim a as new NSKeyedArchiverMBS

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data
dim m as MemoryBlock = a.archiverData

// start unarchiver
dim u as new NSKeyedUnarchiverMBS(m)

// query and display a value
dim s as string = u.decodeString( "Greeting")
MsgBox s
```

Notes:

NSKeyedArchiver, a concrete subclass of NSCoder, provides a way to encode objects (and scalar values) into an architecture-independent format that can be stored in a file. When you archive a set of objects, the class information and instance variables for each object are written to the archive. NSKeyedArchiver's companion class, NSKeyedUnarchiver, decodes the data in an archive and creates a set of objects equivalent to the original set.

A keyed archive differs from a non-keyed archive in that all the objects and values encoded into the archive are given names, or keys. When decoding a non-keyed archive, values have to be decoded in the same order in which they were encoded. When decoding a keyed archive, because values are requested by name, values can be decoded out of sequence or not at all. Keyed archives, therefore, provide better support for forward and backward compatibility.

The keys given to encoded values must be unique only within the scope of the current object being encoded. A keyed archive is hierarchical, so the keys used by object A to encode its instance variables do not conflict with the keys used by object B, even if A and B are instances of the same class. Within a single object, however, the keys used by a subclass can conflict with keys used in its superclasses.
32.37. CLASS NSKEYEDARCHIVERMBS

Subclass of the NSCoderMBS class.

32.37.2   Methods

32.37.3   archiverData as memoryblock

**Function:** Returns the archived data.

32.37.4   Constructor

**Function:** Returns the receiver, initialized for encoding an archive.

32.37.5   finishEncoding

**Function:** Instructs the receiver to construct the final data stream.  
**Notes:** No more values can be encoded after this method is called. You must call this method when finished.

32.37.6   Properties

32.37.7   outputFormat as Integer

**Function:** Sets or queries the format in which the receiver encodes its data.  
**Example:**

```ruby
// make archiver
dim a as new NSKeyedArchiverMBS
a.outputFormat = a.kCFPropertyListXMLFormat_v1_0

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data and show
```
dim m as MemoryBlock = a.archiverData
dim s as string = DefineEncoding(m, encodings.UTF8)
MsgBox s

Notes: (Read and Write computed property)

32.37.8 Constants

32.37.9 kCFPropertyListBinaryFormat_v1_0 = 200

MBS MacBase Plugin, Plugin Version: 13.2. Function: One of the possible formats. Notes: Specifies the binary property list format.

32.37.10 kCFPropertyListXMLFormat_v1_0 = 100

MBS MacBase Plugin, Plugin Version: 13.2. Function: One of the possible formats. Notes: Specifies the XML property list format.
32.38.1  class NSKeyedUnarchiverMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plugin class for unarchiving objects.

**Example:**

```vba
// make archiver
dim a as new NSKeyedArchiverMBS

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data
dim m as MemoryBlock = a.archiverData

// start unarchiver
dim u as new NSKeyedUnarchiverMBS(m)

// query and display a value
dim s as string = u.decodeString("Greeting")
MsgBox s
```

**Notes:**

NSKeyedUnarchiver, a concrete subclass of NSCoder, defines methods for decoding a set of named objects (and scalar values) from a keyed archive. Such archives are produced by instances of the NSKeyedArchiver class.

A keyed archive is encoded as a hierarchy of objects. Each object in the hierarchy serves as a namespace into which other objects are encoded. The objects available for decoding are restricted to those that were encoded within the immediate scope of a particular object. Objects encoded elsewhere in the hierarchy, whether higher than, lower than, or parallel to this particular object, are not accessible. In this way, the keys used by a particular object to encode its instance variables need to be unique only within the scope of that object.

If you invoke one of the decode... methods of this class using a key that does not exist in the archive, a non-positive value is returned. This value varies by decoded type. For example, if a key does not exist in an archive, decodeBoolForKey returns false, decodeIntForKey returns 0, and decodeObjectForKey returns nil.
NSKeyedUnarchiver supports limited type coercion. A value encoded as any type of integer, whether a standard int or an explicit 32-bit or 64-bit integer, can be decoded using any of the integer decode methods. Likewise, a value encoded as a float or double can be decoded as either a float or a double value. If an encoded value is too large to fit within the coerced type, the decoding method raises an NSRangeException. Further, when trying to coerce a value to an incompatible type, for example decoding an int as a float, the decoding method raises an NSInvalidUnarchiveOperationException.

Subclass of the NSCoderMBS class.

### 32.38.2 Methods

### 32.38.3 Constructor(data as memoryblock)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver for decoding an archive previously encoded by NSKeyedArchiverMBS. **Notes:**

When you finish decoding data, you should invoke finishDecoding. This method raises an NSExceptionMBS if data is not a valid archive.

### 32.38.4 finishDecoding

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tells the receiver that you are finished decoding objects. **Notes:** Invoking this method allows the receiver to notify its delegate and to perform any final operations on the archive. Once this method is invoked, the receiver cannot decode any further values.
32.39. **CLASS NSKEYVALUEOBSERVERMBS**

### 32.39 class NSKeyValueObserverMBS

**MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:** The Plugin class to use a key value observer.

**Notes:**

The NSKeyValueObserving (KVO) informal protocol defines a mechanism that allows objects to be notified of changes to the specified properties of other objects.

You can observe any object properties including simple attributes, to-one relationships, and to-many relationships. Observers of to-many relationships are informed of the type of change made as well as which objects are involved in the change.

NSObject provides an implementation of the NSKeyValueObserving protocol that provides an automatic observing capability for all objects. You can further refine notifications by disabling automatic observer notifications and implementing manual notifications using the methods in this protocol.

This class implements an observer with event for use in Real Studio.

### 32.39.2 Methods

#### 32.39.3 addObserver(keyPath as string, options as Integer = 5, context as Variant = nil)

**Function:** Registers observer to receive KVO notifications for the specified key-path relative to the receiver.

**Notes:**

- **keyPath:** The key path, relative to the receiver, of the property to observe. This value must not be nil.
- **options:** A combination of the option constants that specifies what is included in observation notifications.
- **context:** Arbitrary data that is passed to anObserver in observeValueForPath.

This class holds a strong references to context and a weak reference to target.

Available in OS X v10.3 and later.

### 32.39.4 Constructor(TargetHandle as Integer)

**Function:** The constructor.
Notes:
Please pass the handle of the target Cocoa object.
Like NSWindowMBS.handle or CALayerMBS.

32.39.5 Destructor

32.39.6 NSKeyValueChangeIndexesKey as string
MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes:
If the value of the NSKeyValueChangeKindKey entry is NSKeyValueChangeInsertion, NSKeyValueChangeRemoval, or NSKeyValueChangeReplacement, the value of this key is an NSIndexSetMBS object that contains the indexes of the inserted, removed, or replaced objects.
Available in OS X v10.3 and later.

32.39.7 NSKeyValueChangeKindKey as string
MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the keys for the dictionary passed to observedValueForKeyPathChanged event.

32.39.8 NSKeyValueChangeNewKey as string
MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes:
If the value of the NSKeyValueChangeKindKey entry is NSKeyValueChangeSetting, and NSKeyValueObservingOptionNew was specified when the observer was registered, the value of this key is the new value for the attribute.
For NSKeyValueChangeInsertion or NSKeyValueChangeReplacement, if NSKeyValueObservingOptionNew was specified when the observer was registered, the value for this key is an NSArray instance that contains the objects that have been inserted or replaced other objects, respectively.
Available in OS X v10.3 and later.
32.39. **CLASS NSKeyValueObserverMBS**

### 32.39.9 NSKeyValueChangeNotificationIsPriorKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionary passed to observedValueForKeyPathChanged event. **Notes:**

If the option NSKeyValueObservingOptionPrior was specified when the observer was registered this notification is sent prior to a change.
The change dictionary contains an NSKeyValueChangeNotificationIsPriorKey entry whose value is a boolean. Available in OS X v10.5 and later.

### 32.39.10 NSKeyValueChangeOldKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionary passed to observedValueForKeyPathChanged event. **Notes:**

If the value of the NSKeyValueChangeKindKey entry is NSKeyValueChangeSetting, and NSKeyValueObservingOptionOld was specified when the observer was registered, the value of this key is the value before the attribute was changed.
For NSKeyValueChangeRemoval or NSKeyValueChangeReplacement, if NSKeyValueObservingOptionOld was specified when the observer was registered, the value is an NSArray instance that contains the objects that have been removed or have been replaced by other objects, respectively. Available in OS X v10.3 and later.

### 32.39.11 removeObserver(keyPath as string, context as Variant = nil)

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops a given object from receiving change notifications for the property specified by a given key-path relative to the receiver and a context. **Notes:**

keyPath: A key-path, relative to the receiver, for which observer is registered to receive KVO change notifications.
context: Arbitrary data that more specifically identifies the observer to be removed.

Examining the value in context you are able to determine precisely which addObserver method was used to create the observation relationship. When the same observer is registered for the same key-path multiple times, but with different context pointers, an application can determine specifically which object to stop observing.

The context object is only used in OS X v10.7 and later.
32.39.12 Properties

32.39.13 Handle as Integer

32.39.14 Events

32.39.15 observedValueForKeyPathChanged(keyPath as string, target as Variant, change as dictionary, context as Variant, ChangeNSDictionaryRef as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event is called when the value at the specified key path relative to the given object has changed. Notes:

keyPath: The key path, relative to object, to the value that has changed.
oobject: The source object of the key path keyPath.
change: A dictionary that describes the changes that have been made to the value of the property at the key path keyPath relative to object. Entries are described in Keys used by the change dictionary.
context: The value that was provided when the receiver was registered to receive key-value observation notifications.

The receiver must be registered as an observer for the specified keyPath and object. ChangeNSDictionaryRef provides for debugging the reference to the original NSDictionary object.

32.39.16 Constants

32.39.17 kChangeInsertion = 2

MBS MacBase Plugin, Plugin Version: 13.1. Function: One of the kind constants used with NSKeyValueChangeKindKey. Notes: Indicates that an object has been inserted into the to-many relationship that is being observed.

32.39.18 kChangeRemoval = 3

MBS MacBase Plugin, Plugin Version: 13.1. Function: One of the kind constants used with NSKeyValueChangeKindKey.
32.39.  CLASS NSKEYVALUEOBSERVERMBS

Notes: Indicates that an object has been removed from the to-many relationship that is being observed.

32.39.19  kChangeReplacement = 4

MBS MacBase Plugin, Plugin Version: 13.1.  Function: One of the kind constants used with NSKeyValueChangeKindKey.
Notes: Indicates that an object has been replaced in the to-many relationship that is being observed.

32.39.20  kChangeSetting = 1

MBS MacBase Plugin, Plugin Version: 13.1.  Function: One of the kind constants used with NSKeyValueChangeKindKey.
Notes: Indicates that the value of the observed key path was set to a new value. This change can occur when observing an attribute of an object, as well as properties that specify to-one and to-many relationships.

32.39.21  kOptionInitial = 4

MBS MacBase Plugin, Plugin Version: 13.1.  Function: One of the constants to be passed to addObserver and determine the values that are returned as part of the change dictionary passed to observedValueForKeyPathChanged.
Notes:
If specified, a notification should be sent to the observer immediately, before the observer registration method even returns.
The change dictionary in the notification will always contain an NSKeyValueChangeNewKey entry if kOptionNew is also specified but will never contain an NSKeyValueChangeOldKey entry. (In an initial notification the current value of the observed property may be old, but it’s new to the observer.) You can use this option instead of explicitly invoking, at the same time, code that is also invoked by the observer’s observedValueForKeyPathChanged method. When this option is used with addObserver a notification will be sent for each indexed object to which the observer is being added.
Available in OS X v10.5 and later.

32.39.22  kOptionNew = 1

MBS MacBase Plugin, Plugin Version: 13.1.  Function: One of the constants to be passed to addObserver and determine the values that are returned as part of the change dictionary passed to observedValueForKeyPathChanged.
Notes:
Indicates that the change dictionary should provide the new attribute value, if applicable.
Available in OS X v10.3 and later.

**32.39.23 kOptionOld = 2**

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the constants to be passed to addObserver and determine the values that are returned as part of the change dictionary passed to observedValueForKeyPathChanged.

**Notes:**
Indicates that the change dictionary should contain the old attribute value, if applicable.
Available in OS X v10.3 and later.

**32.39.24 kOptionPrior = 8**

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the constants to be passed to addObserver and determine the values that are returned as part of the change dictionary passed to observedValueForKeyPathChanged.

**Notes:**
Whether separate notifications should be sent to the observer before and after each change, instead of a single notification after the change.
The change dictionary in a notification sent before a change always contains an NSKeyValueChangeNotificationIsPriorKey entry whose value is true, but never contains an NSKeyValueChangeNewKey entry. When this option is specified the change dictionary in a notification sent after a change contains the same entries that it would contain if this option were not specified. You can use this option when the observer’s own key-value observing-compliance requires it to invoke one of the -willChange... methods for one of its own properties, and the value of that property depends on the value of the observed object’s property. (In that situation it’s too late to easily invoke -willChange... properly in response to receiving an observedValueForKeyPathChanged message after the change.)
Available in OS X v10.5 and later.
32.40. **CLASS NSLAYOUTMANAGERMBS**

32.40  **class NSLayoutManagerMBS**

32.40.1  **class NSLayoutManagerMBS**

**Function:** An NSLayoutManager object coordinates the layout and display of characters held in an NSTextStorage object.

**Notes:**

It maps Unicode character codes to glyphs, sets the glyphs in a series of NSTextContainer objects, and displays them in a series of NSTextView objects. In addition to its core function of laying out text, an NSLayoutManager object coordinates its NSTextView objects, provides services to those text views to support NSRulerView instances for editing paragraph styles, and handles the layout and display of text attributes not inherent in glyphs (such as underline or strikethrough). You can create a subclass of NSLayoutManager to handle additional text attributes, whether inherent or not.

**Text Antialiasing**

NSLayoutManager provides the threshold for text antialiasing. It looks at the AppleAntiAliasingThreshold default value. If the font size is smaller than or equal to this threshold size, the text is rendered aliased by NSLayoutManager. You can change the threshold value from the Appearance pane of System Preferences.

**Thread Safety of NSLayoutManager**

Generally speaking, a given layout manager (and associated objects) should not be used in more than one block, operation, or thread at a time. Most layout managers are used on the main thread, since it is the main thread on which their text views are displayed, and since background layout occurs on the main thread. If it is intended that a layout manager should be used on a background thread, first make sure that text views associated with that layout manager (if any) are not displayed while the layout manager is being used on the background thread, and, second, turn off background layout for that layout manager while it is being used on the background thread.

**Noncontiguous Layout**

Noncontiguous layout is an optional layout manager behavior new in Mac OS X v10.5. Previously, both glyph generation and layout were always performed, in order, from the beginning to the end of the document. When noncontiguous layout is turned on, however, the layout manager gains the option of performing glyph generation or layout for one portion of the document without having done so for previous sections. This can provide significant performance improvements for large documents.

Noncontiguous layout is not turned on automatically because direct clients of NSLayoutManager typically have relied on the previous behavior for example, by forcing layout for a given glyph range, and then assuming that previous glyphs would therefore be laid out. Clients who use NSLayoutManager only indirectly for example, those who use NSTextView without directly calling the underlying layout manager can usually turn on noncontiguous layout without difficulty. Clients using NSLayoutManager directly need to examine their usage before turning on noncontiguous layout.
To turn on noncontiguous layout, use AllowsNonContiguousLayout. In addition, see the other methods in "Managing Noncontiguous Layout," many of which enable you to ensure that glyph generation and layout are performed for specified portions of the text. The behavior of a number of other layout manager methods is affected by the state of noncontiguous layout, as noted in the discussion sections of those method descriptions.

So far the plugin implements a small subset of the functions in NSLayoutManager. If you miss a function, please email us and we can check whether we can add it for you.

### 32.40.2 Methods

#### 32.40.3 addTextContainer(container as NSTextContainerMBS)

**Function:** Apps the given text container to the series of text containers where the receiver arranges text.

**Notes:**
- container: The text container to append.

Invalidates glyphs and layout as needed, but doesn’t perform glyph generation or layout.

#### 32.40.4 characterIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS, byref partialFraction as Double) as Integer

**Function:** Returns the index of the character falling under the given point, expressed in the given container’s coordinate system.

**Notes:**
- point: The point to test.
- container: The text container within which the point is tested.
- partialFraction: A fraction of the distance from the insertion point, logically before the given character to the next one.

Returns the index of the character falling under point.

Analogous to glyphIndexForPoint:inTextContainer, but expressed in character index terms. The method returns the index of the character falling under point, expressed in coordinate system of container; if no character is under the point, the nearest character is returned, where nearest is defined according to the requirements of selection by mouse. However, this is not simply equivalent to taking the result of the corresponding glyph index method and converting it to a character index, because in some cases a single glyph represents more than one selectable character, for example an fi ligature glyph. In that case, there is an
insertion point within the glyph, and this method returns one character or the other, depending on whether the specified point lies to the left or the right of that insertion point.

In general, this method returns only character indexes for which there is an insertion point. The partial-Fraction is a fraction of the distance from the insertion point, logically before the given character to the next one, which may be either to the right or to the left depending on directionality.

Available in OS X v10.6 and later.

### 32.40.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates new NSLayoutManager object.

### 32.40.6 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This method is a primitive for glyphIndexForPoint. You should always call the main method, not the primitives.

See also:

- 32.40.7 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS, byref partial-Fraction as Double) as Integer

### 32.40.7 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS, byref partialFraction as Double) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the glyph falling under the given point, expressed in the given container’s coordinate system.

**Notes:**

point: The point for which to return the glyph, in coordinates of container.
container: The container in which the returned glyph is laid out.
partialFraction: On output, the fraction of the distance between the location of the glyph returned and the location of the next glyph.

Returns the index of the glyph falling under the given point, expressed in the given container’s coordinate system.
If no glyph is under point, the nearest glyph is returned, where nearest is defined according to the requirements of selection by mouse. Clients who wish to determine whether the the point actually lies within the bounds of the glyph returned should follow this with a call to boundingRectForGlyphRange and test whether the point falls in the rectangle returned by that method. If partialFraction is non-NULL, it returns by reference the fraction of the distance between the location of the glyph returned and the location of the next glyph.

For purposes such as dragging out a selection or placing the insertion point, a partial percentage less than or equal to 0.5 indicates that point should be considered as falling before the glyph index returned; a partial percentage greater than 0.5 indicates that it should be considered as falling after the glyph index returned. If the nearest glyph doesn’t lie under point at all (for example, if point is beyond the beginning or end of a line), this ratio is 0 or 1.

If the glyph stream contains the glyphs ”A” and ”b”, with the width of ”A” being 13 points, and the user clicks at a location 8 points into ”A”, partialFraction is 8/13, or 0.615. In this case, the point given should be considered as falling between ”A” and ”b” for purposes such as dragging out a selection or placing the insertion point.

Performs glyph generation and layout if needed.

As part of its implementation, this method calls fractionOfDistanceThroughGlyphForPoint and glyphIndexForPoint. To change this method’s behavior, override those two methods instead of this one.

See also:

- 32.40.6 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS) as Integer 5769

32.40.8 glyphRangeForTextContainer(container as NSTextContainerMBS) as NSRangeMBS

Function: Returns the range of glyphs laid out within the given text container.

Notes:

This is a less efficient method than the similar textContainerForGlyphAtIndex.

Performs glyph generation and layout if needed.

32.40.9 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS

Function: Returns the rectangle for the line fragment in which the given glyph is laid out and (optionally), by reference, the whole range of glyphs that are in that fragment.

Notes:
glyphIndex: The glyph for which to return the line fragment rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.

Returns the line fragment in which the given glyph is laid out.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, for all of the text up to and including that line fragment.

Line fragment rectangles are always in container coordinates.

Overriding this method is not recommended. If the the line fragment rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect:forGlyphRange.

See also:

- 32.40.10 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS

32.40.10 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS

Function: Returns the line fragment rectangle containing the glyph at the given glyph index.

Notes:

glyphIndex: The glyph for which to return the line fragment rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.
withoutAdditionalLayout: If true, glyph generation and layout are not performed, so this option should not be used unless layout is known to be complete for the range in question, or unless noncontiguous layout is enabled; if false, both are performed as needed.

Returns the line fragment in which the given glyph is laid out.

This method is primarily for use from within NSTypesetter, after layout is complete for the range in question, but before the layout manager’s call to NSTypesetter has returned. In that case glyph and layout holes have not yet been recalculated, so the layout manager does not yet know that layout is complete for that range, and this variant must be used.

Overriding this method is not recommended. If the the line fragment rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect.

See also:

- 32.40.9 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS)
32.40.11 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS

Function: Returns the usage rectangle for the line fragment in which the given glyph is laid and (optionally) by reference the whole range of glyphs that are in that fragment.

Notes:

glyphIndex: The glyph for which to return the line fragment used rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.

Returns the used rectangle for the line fragment in which the given glyph is laid out.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Line fragment used rectangles are always in container coordinates.

Overriding this method is not recommended. If the the line fragment used rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect.

See also:

• 32.40.12 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS

32.40.12 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS

Function: Returns the usage rectangle for the line fragment in which the given glyph is laid and (optionally) by reference the whole range of glyphs that are in that fragment.

Notes:

glyphIndex: The glyph for which to return the line fragment used rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.
withoutAdditionalLayout: If true, glyph generation and layout are not performed, so this option should not be used unless layout is known to be complete for the range in question, or unless noncontiguous layout is enabled; if false, both are performed as needed.

Returns the used rectangle for the line fragment in which the given glyph is laid out.
This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Line fragment used rectangles are always in container coordinates.

Overriding this method is not recommended. If the line fragment used rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect.

See also:

- 32.40.11 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS

### 32.40.13 locationForGlyphAtIndex(glyphIndex as Integer) as NSPointMBS

**Function:** Returns the location for the given glyph within its line fragment.

**Notes:**

glyphIndex: The glyph whose location is returned.

Returns the location of the given glyph.

If the given glyph does not have an explicit location set for it (for example, if it is part of (but not first in) a sequence of nominally spaced characters), the location is calculated by glyph advancements from the location of the most recent preceding glyph with a location set.

Glyph locations are relative to their line fragment rectangle’s origin. The line fragment rectangle in turn is defined in the coordinate system of the text container where it resides.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

### 32.40.14 rangeOfNominallySpacedGlyphsContainingIndex(glyphIndex as Integer) as NSRangeMBS

**Function:** Returns the range for the glyphs around the given glyph that can be displayed using only their advancements from the font, without pairwise kerning or other adjustments to spacing.

**Notes:**
glyphIndex: Index of the glyph to test.

Returns the range of nominally spaced glyphs.

The range returned begins with the first glyph, counting back from glyphIndex, that has a location set, and it continues up to, but does not include, the next glyph that has a location set.

Performs glyph generation and layout if needed.

### 32.40.15 rectArrayForCharacterRange(charRange as NSRangeMBS, selCharRange as NSRangeMBS, container as NSTextContainerMBS, byref rectCount as Integer) as NSRectMBS()

**Function:** Returns an array of rectangles and, by reference, the number of such rectangles, that define the region in the given container enclosing the given character range.

**Notes:**

charRange: The character range for which to return rectangles.

selCharRange: Selected characters within charRange, which can affect the size of the rectangles; it must be equal to or contain charRange. If the caller is interested in this more from an enclosing point of view rather than a selection point of view, pass `{ NSNotFound, 0 }` as the selected range.

container: The text container in which the text is laid out.

rectCount: The number of rectangles returned.

Returns the array of rectangles enclosing the given range.

These rectangles can be used to draw the text background or highlight for the given range of characters. If a selected range is given in selCharRange, the rectangles returned are correct for drawing the selection. Selection rectangles are generally more complicated than enclosing rectangles and supplying a selected range is the clue this method uses to determine whether to go to the trouble of doing this special work.

The number of rectangles returned isn’t necessarily the number of lines enclosing the specified range. Contiguous lines can share an enclosing rectangle, and lines broken into several fragments have a separate enclosing rectangle for each fragment.

These rectangles don’t necessarily enclose glyphs that draw outside their line fragment rectangles; use boundingRectForGlyphRange to determine the area that contains all drawing performed for a range of glyphs.

Performs glyph generation and layout if needed.
32.40.16 rectArrayForGlyphRange(glyphRange as NSRangeMBS, selGlyphRange as NSRangeMBS, container as NSTextContainerMBS, byref rectCount as Integer) as NSRectMBS()

Function: Returns an array of rectangles and, by reference, the number of such rectangles, that define the region in the given container enclosing the given glyph range.
Notes:
glyphRange: The glyph range for which to return rectangles.
selGlyphRange: Selected glyphs within glyphRange, which can affect the size of the rectangles; it must be equal to or contain glyphRange. If the caller is interested in this more from an enclosing point of view rather than a selection point of view, pass \{NSNotFound, 0\} as the selected range.
container: The text container in which the text is laid out.
rectCount: The number of rectangles returned.

Returns the array of rectangles enclosing the given range.

These rectangles can be used to draw the text background or highlight for the given range of characters. If a selected range is given in selGlyphRange, the rectangles returned are correct for drawing the selection. Selection rectangles are generally more complicated than enclosing rectangles and supplying a selected range is the clue this method uses to determine whether to go to the trouble of doing this special work.

The number of rectangles returned isn’t necessarily the number of lines enclosing the specified range. Contiguous lines can share an enclosing rectangle, and lines broken into several fragments have a separate enclosing rectangle for each fragment.

The purpose of this method is to calculate line rectangles for drawing the text background and highlighting. These rectangles don’t necessarily enclose glyphs that draw outside their line fragment rectangles; use boundingRectForGlyphRange to determine the area that contains all drawing performed for a range of glyphs.

Performs glyph generation and layout if needed.

32.40.17 removeTextContainerAtIndex(index as Integer)

Function: Removes the text container at the given index and invalidates the layout as needed.
Notes:
index: The index of the text container to remove.

This method invalidates glyph information as needed.
32.40.18 replaceGlyphAtIndex(glyphIndex as Integer, newGlyph as Integer)

**Function:** Replaces the glyph at the given index with a new glyph.  
**Notes:**  
glyphIndex: Index of the glyph to replace.  
newGlyph: The new glyph.  

Doesn’t alter the glyph-to-character mapping or invalidate layout information. The character index of the glyph is assumed to remain the same (although it can, of course, be set explicitly if needed).  

This method is for use by the glyph-generation mechanism and doesn’t perform any invalidation or generation of the glyphs or layout. This method should be invoked only during glyph generation and typesetting, in almost all cases only by the glyph generator or typesetter. For example, a custom glyph generator or typesetter might invoke it.

32.40.19 replaceTextStorage(newTextStorage as NSTextStorageMBS)

**Function:** Replaces the NSTextStorage object for the group of text-system objects containing the receiver with the given text storage object.  
**Notes:** All NSLayoutManager objects sharing the original NSTextStorage object then share the new one. This method makes all the adjustments necessary to keep these relationships intact, unlike setting textStorage property.  

32.40.20 setCharacterIndex(charIndex as Integer, glyphIndex as Integer)

**Function:** Sets the index of the character corresponding to the glyph at the given glyph index.  
**Notes:**  
charIndex: The index to set.  
glyphIndex: The glyph corresponding to the character whose index is set. The glyph must already be present.  

This method is for use by the glyph-generation mechanism and doesn’t perform any invalidation or generation of the glyphs or layout. This method should be invoked only during glyph generation and typesetting, in almost all cases only by the glyph generator or typesetter. For example, a custom glyph generator or typesetter might invoke it.
32.40.21  setExtraLineFragmentRect(fragmentRect as NSRectMBS, usedRect as NSRectMBS, TextContainer as NSTextContainerMBS)

**Function:** Sets the bounds and container for the extra line fragment.

**Notes:**

fragmentRect: The rectangle to set.
usedRect: Indicates where the insertion point is drawn.
TextContainer: The text container where the rectangle is to be laid out.

The extra line fragment is used when the text backing ends with a hard line break or when the text backing is totally empty, to define the extra line which needs to be displayed at the end of the text. If the text backing is not empty and does not end with a hard line break, this should be set to NSRectMBS.Zero and nil.

Line fragment rectangles and line fragment used rectangles are always in container coordinates.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

32.40.22  setLineFragmentRect(fragmentRect as NSRectMBS, glyphRange as NSRangeMBS, usedRect as NSRectMBS)

**Function:** Associates the given line fragment bounds with the given range of glyphs.

**Notes:**

fragmentRect: The rectangle of the line fragment.
glyphRange: The range of glyphs to be associated with fragmentRect.
usedRect: The portion of fragmentRect that actually contains glyphs or other marks that are drawn (including the text containers line fragment padding. Must be equal to or contained within fragmentRect.

The typesetter must specify the text container first with setTextContainer, and it sets the exact positions of the glyphs afterwards with setLocation.

In the course of layout, all glyphs should end up being included in a range passed to this method, but only glyphs that start a new line fragment should be at the start of such ranges.

Line fragment rectangles and line fragment used rectangles are always in container coordinates.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.
32.40.23 `usedRectForTextContainer(container as NSTextContainerMBS) as NSRectMBS`

**Function:** Returns the bounding rectangle for the glyphs laid out in the given text container.

**Notes:**
Returns the text container’s currently used area, which determines the size that the view would need to be in order to display all the glyphs that are currently laid out in the container. This causes neither glyph generation nor layout.

Used rectangles are always in container coordinates.

32.40.24 **Properties**

32.40.25 `allowsNonContiguousLayout as boolean`

**Function:** Whether noncontiguous layout is enabled.

**Notes:**
Setting to true allows but does not require the layout manager to use noncontiguous layout, and the layout manager may in fact not do so, depending on its configuration.

(Read and Write property)

32.40.26 `attributedString as NSAttributedStringMBS`

**Function:** Returns the text storage object from which the NSGlyphGenerator object procures characters for glyph generation.

**Notes:**
This method is part of the NSGlyphStorage protocol, for use by the glyph generator. For NSLayoutManager the attributed string is equivalent to the text storage.

Available in Mac OS X v10.5 and later.

(Read only property)

32.40.27 `backgroundLayoutEnabled as boolean`

**Function:** Whether the receiver generates glyphs and lays them out when the application’s run loop is idle.

**Notes:**
If true, background layout is enabled; if false, the receiver performs glyph generation and layout only when necessary. (Read and Write property)

### 32.40.28 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The font for the invisible character drawing. **Notes:** Use nil font for using the font of the current text. This method is only available if the NSLayoutManagerMBS object has been created with new NSLayoutManagerMBS, so the plugin can use the special NSLayoutManager subclass with support for invisible character drawing. (Read and Write property)

### 32.40.29 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

### 32.40.30 hasNonContiguousLayout as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the layout manager currently has any areas of noncontiguous layout. **Notes:** There may be times at which there is no noncontiguous layout, such as when layout is complete; this method enables the layout manager to report that to clients. (Read only property)

### 32.40.31 hyphenationFactor as Double

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The threshold controlling when hyphenation is done. **Notes:** factor: The hyphenation factor, ranging from 0.0 to 1.0. By default, the value is 0.0, meaning hyphenation is off. A factor of 1.0 causes hyphenation to be attempted always.
Whenever (width of the real contents of the line) / (the line fragment width) is below factor, hyphenation is attempted when laying out the line. Hyphenation slows down text layout and increases memory usage, so it should be used sparingly.

May be overridden on a per-paragraph basis by the NSParagraphStyle method hyphenationFactor. (Read and Write property)

### 32.40.32 showInvisibleCharacters as boolean

**Function:** Whether to show invisible characters.

**Notes:**
This method is only available if the NSLayoutManagerMBS object has been created with new NSLayoutManagerMBS, so the plugin can use the special NSLayoutManager subclass with support for invisible character drawing. (from MBS Plugin)
(Read and Write property)

### 32.40.33 showsControlCharacters as boolean

**Function:** Whether to substitute visible glyphs for control characters in layout.

**Example:**

```plaintext
if TargetCocoa then
    dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
    dim l as NSLayoutManagerMBS = t.layoutManager
    l.showsControlCharacters = true
else
   // not supported
   break
end if
```

**Notes:**
If true, the receiver substitutes visible glyphs for control characters if the font and script support it; if false, it doesn’t. The default is false.
(Read and Write property)
32.40. showsInvisibleCharacters as boolean

Function: Whether to substitute visible glyphs for whitespace and other typically invisible characters in
layout.
Example:

if TargetCocoa then

dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim l as NSLayoutManagerMBS = t.layoutManager

l.showsInvisibleCharacters = true

else
  // not supported
  break
end if

Notes:
If true, the receiver substitutes visible glyphs for invisible characters if the font and script support it; if false,
it doesn’t. The default is false. (from Apple framework)
(Read and Write property)

32.40.35 textColor as NSColorMBS

Function: The text color for drawing invisible characters.
Notes:
This method is only available if the NSLayoutManagerMBS object has been created with new NSLayoutMan-
gerMBS, so the plugin can use the special NSLayoutManager subclass with support for invisible character
drawing.
(Read and Write property)

32.40.36 textStorage as NSTextStorageMBS

Notes: (Read and Write property)
32.40.37  usesFontLeading as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver uses the leading provided in the font. **Notes:** (Read and Write property)

32.40.38  usesScreenFonts as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether screen fonts to calculate layout and display text. **Notes:**

If true, the receiver uses screen fonts; if false, it doesn’t. (Read and Write property)

32.40.39  InvisibleCharMapping(character as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets/gets character mapping for invisible character. **Example:**

```dim l as new NSLayoutManagerMBS
// ...
// set tab to map to plus sign
l.InvisibleCharMapping(9) = "+"
// set space to map to star sign
l.InvisibleCharMapping(asc(" ")) = "*"
```

**Notes:**

By default characters are set for endofline, tab and spaces. Set showInvisibleCharacters to true and put here all the characters you need. (Read and Write computed property)
32.41. CLASS NSLEVELINDICATORMBS

32.41 class NSLevelIndicatorMBS

32.41.1 class NSLevelIndicatorMBS

Function: NSLevelIndicatorMBS is a subclass of NSControlMBS that displays a value on a linear scale.

Notes:

Level indicators provide a visual representation of a level or amount of something, using discrete values. While similar to NSSlider, it provides a more customized visual feedback to the user. Level indicators do not have a "knob" indicating the current setting or allowing the user to adjust settings. The supported indicator styles include:

- A capacity style level indicator. The continuous mode for this style is often used to indicate conditions such as how much data is on hard disk. The discrete mode is similar to audio level indicators in audio playback applications. You can specify both a warning value and a critical value that provides additional visual feedback to the user.
- A ranking style level indicator. This is similar to the star ranking displays provided in iTunes and iPhoto. You can also specify your own ranking image.
- A relevancy style level indicator. This style is used to display the relevancy of a search result, for example in Mail.

NSLevelIndicator uses an NSLevelIndicatorCell to implement much of the control's functionality. NSLevelIndicator provides cover methods for most of NSLevelIndicatorCell’s methods, which invoke the corresponding cell method.

Subclass of the NSControlMBS class.

32.41.2 Methods

32.41.3 Constructor

Function: Creates a new level indicator with size 100/100 and position 0/0

Example:

```
dim t as new NSLevelIndicatorMBS
```

Notes: On success the handle property is not zero.

See also:

- 32.41.4 Constructor(Handle as Integer) 5784
- 32.41.5 Constructor(left as Double, top as Double, width as Double, height as Double) 5784
32.41.4 Constructor(Handle as Integer)

Function: Creates an object based on the given NSLevelIndicator handle.
Example:

```vbnet
dim t as new NSLevelIndicatorMBS(0, 0, 100, 100)
dim v as new NSLevelIndicatorMBS(t.handle)
```

MsgBox str(v.Bounds.Width)+” x ”+str(v.Bounds.Height)

Notes: The handle is casted to a NSLevelIndicator and the plugin retains this handle.
See also:

- 32.41.3 Constructor

- 32.41.5 Constructor(left as Double, top as Double, width as Double, height as Double)

32.41.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new level indicator with the given size and position.
Example:

```vbnet
dim x as new NSLevelIndicatorMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.41.3 Constructor

- 32.41.4 Constructor(Handle as Integer)

32.41.6 rectOfTickMarkAtIndex(index as Integer) as NSRectMBS

Function: Returns the bounding rectangle of the tick mark identified by index (the minimum-value tick mark is at index 0).
Notes: If no tick mark is associated with index, the method raises a NSExceptionMBS.
32.41.7  tickMarkValueAtIndex(index as Integer) as Double

Function: Returns the receiver’s value represented by the tick mark at index (the minimum-value tick
mark has an index of 0).

32.41.8  Properties

32.41.9  criticalValue as Double

Function: The critical value.
Notes: (Read and Write computed property)

32.41.10  levelIndicatorStyle as Integer

Function: Set style of the indicator.
Notes: (Read and Write computed property)

32.41.11  maxValue as Double

Function: The maximum value the level indicator can represent.
Notes: (Read and Write computed property)

32.41.12  minValue as Double

Function: The minimum value.
Notes: (Read and Write computed property)

32.41.13  numberOfMajorTickMarks as Integer

Function: The number of major tick marks displayed.
Notes:
CHAPTER 32. COCOA

The count must be less than or equal to the number of tick marks returned by numberOfTickMarks. For example, if the number of tick marks is 11 and you specify 3 major tick marks, the resulting level indicator will display 3 major tickmarks alternating with 8 minor tick marks. (Read and Write computed property)

32.41.14 numberOfTickMarks as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The number of tick marks displayed by the receiver (which include those assigned to the minimum and maximum values) to count.
Notes: By default, this value is 0, and no tick marks appear. The number of tick marks assigned to a slider, along with the slider’s minimum and maximum values, determines the values associated with the tick marks. (Read and Write computed property)

32.41.15 tickMarkPosition as Integer

Notes: This method has no effect if no tick marks have been assigned (that is, numberOfTickMarks returns 0). (Read and Write computed property)

32.41.16 warningValue as Double

Notes: (Read and Write computed property)

32.41.17 Constants

32.41.18 NSContinuousCapacityLevelIndicatorStyle = 1

MBS MacControls Plugin, Plugin Version: 12.2. Function: One of the style constants. Notes: A style that is often used to indicate conditions such as how much data is on a hard disk.
32.41. CLASS NSLEVELINDICATORMBS

32.41.19 NSDiscreteCapacityLevelIndicatorStyle = 2

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the style constants. **Notes:** A style similar to audio level indicators in iTunes.

32.41.20 NSRatingLevelIndicatorStyle = 3

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the style constants. **Notes:** A style similar to the star ranking displays provided in iTunes and iPhoto.

32.41.21 NSRelevancyLevelIndicatorStyle = 0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the style constants. **Notes:** A style similar to the rank column displayed when searching in Mail.app.

32.41.22 NSTickMarkAbove = 1

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the tick mark constants. **Notes:** Tick marks above (for horizontal sliders).

32.41.23 NSTickMarkBelow = 0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the tick mark constants. **Notes:** Tick marks below (for horizontal sliders); the default for horizontal sliders.

32.41.24 NSTickMarkLeft = 0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the tick mark constants. **Notes:** Tick marks to the left (for vertical sliders); the default for vertical sliders.

32.41.25 NSTickMarkRight = 1

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the tick mark constants. **Notes:** Tick marks to the right (for vertical sliders).
32.42 class NSMutableAttributedStringMBS

32.42.1 class NSMutableAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
NSMutableAttributedString declares the programmatic interface to objects that manage mutable attributed strings.
**Notes:**
You can add and remove characters (raw strings) and attributes separately or together as attributed strings.
See the class description for NSAttributedString for more information about attributed strings.
Subclass of the NSAttributedStringMBS class.

32.42.2 Methods

32.42.3 addAttribute(name as string, value as Variant, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an attribute with the given name and value to the characters in the specified range.
**Example:**

```swift
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString(“Hello World”)  
dim m as NSMutableAttributedStringMBS = a.mutableCopy
m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

**Notes:**
name: A string specifying the attribute name. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference.
value: The attribute value associated with name.
Range: The range of characters to which the specified attribute/value pair applies.

You may assign any name/value pair you wish to a range of characters, in addition to the standard attributes described in the "Constants" section of NSAttributedString Additions. Raises an NSInvalidArgumentException if name or value is nil and an NSRangeException if any part of range lies beyond the end of the receiver’s characters.
Plugin version 16.0 or newer ignores calls here with value = nil or empty name to avoid exceptions.

32.42.4  addAttributes(attrs as Dictionary, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Adds the given collection of attributes to the characters in the specified range.

**Notes:**

attributes: A dictionary containing the attributes to add. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference.

Range: The range of characters to which the specified attributes apply.

You may assign any name/value pair you wish to a range of characters, in addition to the standard attributes described in the "Constants" section of NSAttributedString Additions. Raises an NSInvalidArgument Exception if attributes is nil and an NSRangeException if any part of range lies beyond the end of the receiver’s characters.

32.42.5  appendAttributedString(attrString as NSAttributedStringMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Adds the characters and attributes of a given attributed string to the end of the receiver.

**Example:**

```
const NSWritingDirectionNatural = -1  // Determines direction using the Unicode Bidi Algorithm rules P2 and P3
const NSWritingDirectionLeftToRight = 0  // Left to right writing direction
const NSWritingDirectionRightToLeft = 1  // Right to left writing direction

const NSTextWritingDirectionEmbedding = 0
const NSTextWritingDirectionOverride = 2

dim t as NSTextStorageMBS = TextArea1.NSTextViewMBS.textStorage

// get hello in arabic
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

// now set attributes for right to left
m.addAttribute t.NSWritingDirectionAttributeName, array(NSWritingDirectionRightToLeft+NSTextWritingDirectionOverride), new NSRangeMBS(0,m.Length)

// and add to textarea
t.appendAttributedString m
```
Notes: attributedString: The string whose characters and attributes are added.

32.42.6 appendString(attrString as String)

32.42.7 applyFontTraits(FontTraitMask as Integer, offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Applies the font attributes specified by mask to the characters in a range. Notes: See the NSFontManager class specification for a description of the font traits available. Raises an NSRangeException if any part of aRange lies beyond the end of the receivers characters.

32.42.8 AsCFMutableAttributedString as Variant

// make NS version
dim n as new NSAttributedStringMBS
if n.initWithString("Hello World") then

dim m as NSMutableAttributedStringMBS = n.mutableCopy

// convert
dim c as CFMutableAttributedStringMBS = m.AsCFMutableAttributedString

// and check content
MsgBox c.String
end if

Notes: For passing to functions which need a CFMutableAttributedStringMBS.
32.42.9  \textbf{beginEditing}

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Overridden by subclasses to buffer or optimize a series of changes to the receiver’s characters or attributes, until it receives a matching endEditing message, upon which it can consolidate changes and notify any observers that it has changed.

\textbf{Notes:} You can nest pairs of beginEditing and endEditing messages.

32.42.10  \textbf{containsAttachmentsInRange}(offset as Integer, length as Integer) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Returns true if the receiver contains a property configured (NSAttachmentAttributeName with NSAttachmentCharacter) in range.

32.42.11  \textbf{deleteCharactersInRange}(range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Deletes the characters in the given range along with their associated attributes.

\textbf{Notes:} Raises an NSRangeException if any part of aRange lies beyond the end of the receiver’s characters.

32.42.12  \textbf{endEditing}

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Overridden by subclasses to consolidate changes made since a previous beginEditing message and to notify any observers of the changes.

\textbf{Notes:} The NSMutableAttributedString implementation does nothing. NSTextStorage, for example, overrides this method to invoke fixAttributesInRange and to inform its NSLayoutManager objects that they need to re-lay the text.

32.42.13  \textbf{fixAttachmentAttributeInRange}(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Cleans up attachment attributes in a range, removing all attachment attributes assigned to characters other than NSAttachmentCharacter.

\textbf{Notes:} Raises an NSRangeException if any part of aRange lies beyond the end of the receivers characters.
32.42.14 fixAttributesInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invokes the other fix... methods, allowing you to clean up an attributed string with a single message. **Notes:** Raises an NSRangeException if any part of aRange lies beyond the end of the receivers characters.

NSTextStorage subclasses that return YES from the fixesAttributesLazily method should avoid directly calling fixAttributesInRange: or else bracket such calls with beginEditing and endEditing messages.

32.42.15 fixFontAttributeInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fixes the font attribute in aRange, assigning default fonts to characters with illegal fonts for their scripts and otherwise correcting font attribute assignments. **Notes:** For example, Kanji characters assigned a Latin font are reassigned an appropriate Kanji font. Raises an NSRangeException if any part of aRange lies beyond the end of the receivers characters.

32.42.16 fixParagraphStyleAttributeInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fixes the paragraph style attributes in a range, assigning the first paragraph style attribute value in each paragraph to all characters of the paragraph. **Notes:** This method extends the range as needed to cover the last paragraph partially contained. A paragraph is delimited by any of these characters, the longest possible sequence being preferred to any shorter:

- U+000D (\r or CR)
- U+000A (\n or LF)
- U+2029 (Unicode paragraph separator) \r\n, in that order (also known as CRLF)

 Raises an NSRangeException if any part of aRange lies beyond the end of the receivers characters.
### 32.42.17 fontAttributesInRange(offset as Integer, length as Integer) as Dictionary

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Attributes which should be copied/pasted with ”copy font”.

### 32.42.18 insertAttributedString(attrString as NSAttributedStringMBS, location as UInt64)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Inserts the characters and attributes of the given attributed string into the receiver at the given index. **Notes**: 

attributedString: The string whose characters and attributes are inserted. 
index: The index at which the characters and attributes are inserted. 

The new characters and attributes begin at the given index and the existing characters and attributes from the index to the end of the receiver are shifted by the length of the attributed string. Raises an NSRangeException if index lies beyond the end of the receiver’s characters.

### 32.42.19 insertString(attrString as String, location as UInt64)

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Inserts the text into the receiver at the given index.

### 32.42.20 removeAttribute(name as string, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Removes the named attribute from the characters in the specified range. **Notes**: 

name: A string specifying the attribute name to remove. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference. 
Range: The range of characters from which the specified attribute is removed. 

Raises an NSRangeException if any part of range lies beyond the end of the receiver’s characters.
32.42.21 replaceCharactersInRange(range as NSRangeMBS, attrString as NSAttributedStringMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the characters and attributes in a given range with the characters and attributes of the given attributed string.

**Notes:**
- Range: The range of characters and attributes replaced.
- attrString: The attributed string whose characters and attributes replace those in the specified range.

Raises an NSRangeException if any part of range lies beyond the end of the receiver’s characters.

See also:
- 32.42.22 replaceCharactersInRange(range as NSRangeMBS, text as string)

32.42.22 replaceCharactersInRange(range as NSRangeMBS, text as string)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the characters in the given range with the characters of the given string.

**Notes:**
- Range: A range specifying the characters to replace.
- text: A string specifying the characters to replace those in range.

The new characters inherit the attributes of the first replaced character from range. Where the length of range is 0, the new characters inherit the attributes of the character preceding range if it has any, otherwise of the character following range.

Raises an NSRangeException if any part of range lies beyond the end of the receiver’s characters.

See also:
- 32.42.21 replaceCharactersInRange(range as NSRangeMBS, attrString as NSAttributedStringMBS)

32.42.23 rulerAttributesInRange(offset as Integer, length as Integer) as Dictionary

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attributes which should be copied/pasted with "copy ruler".
32.42.24  setAlignment(alignment as Integer, offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the alignment characteristic of the paragraph style attribute for the characters in aRange to alignment. **Notes:** When attribute fixing takes place, this change will affect only paragraphs whose first character was included in aRange. Raises an NSRangeException if any part of a range lies beyond the end of the receivers characters.

32.42.25  setAttributedString(attrString as NSAttributedStringMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the receiver’s entire contents with the characters and attributes of the given attributed string. **Example:**

```// create Hello World in red
  dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
  dim m as NSMutableAttributedStringMBS = a.mutableCopy
  m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

  // put it in a text area
  TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

**Notes:** attributedString: The attributed string whose characters and attributes replace those in the receiver.

32.42.26  setAttributes(attrs as Dictionary, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the attributes for the characters in the specified range to the specified attributes.

**Notes:**

attributes: A dictionary containing the attributes to set. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference. **Range:** The range of characters whose attributes are set.

These new attributes replace any attributes previously associated with the characters in range. Raises an NSRangeException if any part of range lies beyond the end of the receiver’s characters.

To set attributes for a zero-length NSMutableAttributedString displayed in a text view, use the NSTextView
method setTypingAttributes.

### 32.42.27 setBaseWritingDirection(writingDirection as Integer, offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the base writing direction for the characters in range to writingDirection.

### 32.42.28 setString(attrString as String)

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the receiver’s entire contents with the given string.

### 32.42.29 subscriptRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decrements the value of the superscript attribute for characters in a range by 1. **Example:**

```
textarea1.text = "Hello World"
```

```dim n as NSTextViewMBS = textarea1.NSTextViewMBS
dim s as NSTextStorageMBS = n.textStorage
s.subscriptRange(6, 5)```

### 32.42.30 superscriptRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Increments the value of the superscript attribute for characters in a range by 1.

### 32.42.31 unscriptRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the superscript attribute from the characters in a range.
updateAttachmentsFromPath(file as folderitem)

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates all attachments based on files contained in the RTFD file package at path.

See also:

- 32.42.33 updateAttachmentsFromPath(path as string)

updateAttachmentsFromPath(path as string)

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates all attachments based on files contained in the RTFD file package at path.

See also:

- 32.42.32 updateAttachmentsFromPath(file as folderitem)
32.43 class NSMutableCharacterSetMBS

32.43.1 class NSMutableCharacterSetMBS

NSMutableCharacterSetMBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSMutableCharacterSet class declares the programmatic interface to objects that manage a modifiable set of Unicode characters.

**Notes:**
You can add or remove characters from a mutable character set as numeric values in NSRange structures or as character values in strings, combine character sets by union or intersection, and invert a character set.

Mutable character sets are less efficient to use than immutable character sets. If you don’t need to change a character set after creating it, create an immutable copy with copy and use that.

NSMutableCharacterSet defines no primitive methods. Subclasses must implement all methods declared by this class in addition to the primitives of NSCharacterSet. They must also implement mutableCopy. Subclass of the NSCharacterSetMBS class.

32.43.2 Methods

32.43.3 addCharactersInRange(aRange as NSRangeMBS)

NSMutableCharacterSetMBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds to the receiver the characters whose Unicode values are in a given range.

**Example:**
```
dim m as new NSMutableCharacterSetMBS
dim r as new NSRangeMBS(65,3)
m.addCharactersInRange r
MsgBox m // shows "ABC"
```

**Notes:**
aRange: The range of characters to add.

aRange.location is the value of the first character to add; aRange.location + aRange.length 1 is the value of the last. If aRange.length is 0, this method has no effect.
32.43. CLASS NSMUTABLECHARACTERSETMBS

32.43.4 addCharactersInString(aString as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds to the receiver the characters in a given string.

**Example:**

```plaintext
dim m as new NSMutableCharacterSetMBS
m.addCharactersInString "Hello"
MsgBox m // shows "Helo"
```

**Notes:** This method has no effect if aString is empty.

32.43.5 Constructor

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty mutable character set.

32.43.6 formIntersectionWithCharacterSet(otherset as NSMutableCharacterSetMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Modifies the receiver so it contains only characters that exist in both the receiver and otherSet.

32.43.7 formUnionWithCharacterSet(otherset as NSMutableCharacterSetMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Modifies the receiver so it contains all characters that exist in either the receiver or otherSet.

32.43.8 invert

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces all the characters in the receiver with all the characters it didn’t previously contain.

**Notes:** Inverting a mutable character set, whether by invert or by invertedSet, is much less efficient than inverting an immutable character set with invertedSet.
**32.43.9 removeCharactersInRange(aRange as NSRangeMBS)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes from the receiver the characters whose Unicode values are in a given range.

**Example:**

```swift
dim m as new NSMutableCharacterSetMBS
dim r as new NSRangeMBS(65,3)
m.addCharactersInRange new NSRangeMBS(65,6)
m.removeCharactersInRange r
MsgBox m // shows "DEF"
```

**Notes:**

aRange: The range of characters to remove.

aRange.location is the value of the first character to remove; aRange.location + aRange.length + 1 is the value of the last. If aRange.length is 0, this method has no effect.

**32.43.10 removeCharactersInString(aString as string)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes from the receiver the characters in a given string.

**Example:**

```swift
dim m as new NSMutableCharacterSetMBS
m.addCharactersInString "Hello"
m.removeCharactersInString "World"
MsgBox m // shows "He"
```

**Notes:** This method has no effect if aString is empty.
32.44. CLASS NSMUTABLEINDEXSETMBS

32.44 class NSMutableIndexSetMBS

32.44.1 class NSMutableIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The NSMappableIndexSet class represents a mutable collection of unique unsigned integers, known as indexes because of the way they are used.

Example:
```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes:
This collection is referred to as a mutable index set.

The values in a mutable index set are always sorted, so the order in which values are added is irrelevant.

You must not subclass the NSMutableIndexSet class.
Subclass of the NSIndexSetMBS class.

32.44.2 Methods

32.44.3 addIndex(index as Integer)

Example:
```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.addIndex 12
MsgBox str(n.count)
```

32.44.4 addIndexes(indexes as NSIndexSetMBS)

Example:
```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim x as new NSIndexSetMBS(12,5)
```
32.44.5  addIndexesInRange(StartIndex as Integer, Length as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the indexes in an index range to the receiver.

**Example:**

```plaintext
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.addIndexesInRange 12,5
MsgBox str(n.count)
```

**Notes:**

Index range to add. Must include only indexes representable as unsigned integers.

This method raises an NSRangeException when indexRange would add an index that exceeds the maximum allowed value for unsigned integers.

32.44.6  Constructor

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object.

**Example:**

```plaintext
dim x as new NSIndexSetMBS
```

See also:

- 32.44.7 Constructor(index as Integer) 5802
- 32.44.8 Constructor(indexes as NSIndexSetMBS) 5803
- 32.44.9 Constructor(StartIndex as Integer, Length as Integer) 5803

32.44.7  Constructor(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object with an index.
32.44. **CLASS NSMUTABLEINDEXSETMBS**

**Example:**

```plaintext
dim n as new NSMutableIndexSetMBS(5)
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

See also:

- 32.44.6 Constructor
- 32.44.8 Constructor(indexes as NSIndexSetMBS)
- 32.44.9 Constructor(StartIndex as Integer, Length as Integer)

### 32.44.8 Constructor(indexes as NSIndexSetMBS)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object with an index set.

**Example:**

```plaintext
dim n as new NSMutableIndexSetMBS(5)
dim x as new NSMutableIndexSetMBS(n)
MsgBox str(x.firstIndex)
```

See also:

- 32.44.6 Constructor
- 32.44.7 Constructor(index as Integer)
- 32.44.9 Constructor(StartIndex as Integer, Length as Integer)

### 32.44.9 Constructor(StartIndex as Integer, Length as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object with an index range.

**Example:**

```plaintext
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
```

**Notes:** This method raises an NSRangeException when indexRange would add an index that exceeds the maximum allowed value for unsigned integers.

See also:

- 32.44.6 Constructor
32.44.10  removeAllIndexes

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the receiver’s indexes.

**Example:**

```plaintext
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.removeAllIndexes
MsgBox str(n.count)
```

32.44.11  removeIndex(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes an index from the receiver.

**Example:**

```plaintext
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.count)
n.removeIndex 8
MsgBox str(n.count)
```

32.44.12  removeIndexes(indexes as NSIndexSetMBS)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the indexes in an index set from the receiver.

**Example:**

```plaintext
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim x as new NSIndexSetMBS(5,2)
n.removeIndexes x
MsgBox str(n.firstIndex)+” “+str(n.lastIndex)
```

32.44.13  removeIndexesInRange(StartIndex as Integer, Length as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the indexes in an index range from the receiver.
32.44. **CLASS NSMUTABLEINDEXSETMBS**

Example:

```javascript
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.removeIndexesInRange 5,2
MsgBox str(n.firstIndex)+" " +str(n.lastIndex)
```

32.44.14 **shiftIndexes(StartingAtIndex as Integer, delta as Integer)**

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Shifts a group of indexes to the left or the right within the receiver.

Example:

```javascript
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.shiftIndexes 7,3
MsgBox str(n.firstIndex)+" " +str(n.lastIndex)
```

Notes:

startIndex: Head of the group of indexes to shift.

delta: Amount and direction of the shift. Positive integers shift the indexes to the right. Negative integers shift the indexes to the left.

The group of indexes shifted is made up by startIndex and the indexes that follow it in the receiver.

A left shift deletes the indexes in the range (startIndex-delta,delta) from the receiver.

A right shift inserts empty space in the range (indexStart,delta) in the receiver.
### 32.45 class NSMutableParagraphStyleMBS

#### 32.45.1 class NSMutableParagraphStyleMBS

**Function:** NSMutableParagraphStyle adds methods to its superclass, NSParagraphStyle, for changing the values of the subattributes in a paragraph style attribute.

**Example:**

```vba
' Example code snippet
' ...
```

**Notes:**

See the NSParagraphStyle and NSAttributedString specifications for more information.

Important: A paragraph style object should not be mutated after adding it to an attributed string; doing so can cause your program to crash.

Subclass of the NSParagraphStyleMBS class.

#### 32.45.2 Methods

#### 32.45.3 addTabStop(tabstop as NSTextTabMBS)

**Function:** Adds tabStop to the receiver.

#### 32.45.4 Constructor

**Function:** The constructor.
32.45.5 removeTabStop(tabstop as NSTextTabMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the first text tab whose location and type are equal to those of tabStop.

32.45.6 setAlignment(alignment as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the alignment of the receiver to alignment.

**Example:**
```vbs
dim n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural

dim m as NSMutableParagraphStyleMBS = n.mutableCopy
m.setAlignment NSParagraphStyleMBS.NSCenterTextAlignment
MsgBox str(m.alignment) // 2 = center
```

**Notes:**
alignment may be one of:

NSLeftTextAlignment
NSRightTextAlignment
NSCenterTextAlignment
NSJustifiedTextAlignment
NSNaturalTextAlignment

32.45.7 setBaseWritingDirection(writingDirection as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the base writing direction for the receiver.

**Notes:** It can be NSWritingDirectionNaturalDirection, NSWritingDirectionLeftToRight, or NSWritingDirectionRightToLeft. If you specify NSWritingDirectionNaturalDirection, the receiver resolves the writing direction to either NSWritingDirectionLeftToRight or NSWritingDirectionRightToLeft, depending on the direction for the user’s language preference setting.
32.45.8  setDefaultTabInterval(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the default tab interval for the receiver.

**Notes:** Tabs after the last specified in tabStops are placed at integral multiples of this distance. This value must be nonnegative.

32.45.9  setFirstLineHeadIndent(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the distance in points from the leading margin of a text container to the beginning of the paragraph’s first line to value.

**Notes:** This value must be nonnegative.

32.45.10  setHeaderLevel(level as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.

**Notes:** Should be set to 0 (the default value) if the paragraph is not a header, or from 1 through 6 if the paragraph is to be treated as a header.

32.45.11  setHeadIndent(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the distance in points from the leading margin of a text container to the beginning of lines other than the first to value.

**Notes:** This value must be nonnegative.

32.45.12  setHyphenationFactor(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the threshold for hyphenation.

**Notes:** Valid values lie between 0.0 and 1.0 inclusive. The default value is 0.0. Hyphenation is attempted when the ratio of the text width (as broken without hyphenation) to the width of the line fragment is less than the hyphenation factor. When the paragraph’s hyphenation factor is 0.0, the layout manager’s hyphenation factor is used instead. When both are 0.0, hyphenation is disabled.
32.45.13 setLineBreakMode(mode as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the mode used to break lines in a layout container to mode. **Notes:**

The mode parameter may be one of:

- NSLineBreakByWordWrapping
- NSLineBreakByCharWrapping
- NSLineBreakByClipping
- NSLineBreakByTruncatingHead
- NSLineBreakByTruncatingTail
- NSLineBreakByTruncatingMiddle

See the description of lineBreakMode in the NSParagraphStyle class specification for descriptions of these values.

32.45.14 setLineHeightMultiple(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the line height multiple for the receiver. **Notes:** The natural line height of the receiver is multiplied by this factor before being constrained by minimum and maximum line height. This value must be nonnegative.

32.45.15 setLineSpacing(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the space in points added between lines within the paragraph to value. **Example:**

```plaintext
// works for Labels, TextArea and TextFields

// control is either a textfield or a textview
dim n as NSTextFieldMBS = me.NSTextFieldMBS
dim v as NSTextViewMBS = me.NSTextViewMBS

// get text with attributes
dim a as NSAttributedStringMBS

if n<>Nil then
    a = n.attributedStringValue
else if v<>nil then
    a = v.textStorage
end if
```
// get style
dim p as NSParagraphStyleMBS

try
p = a.attributeAtIndex(a.NSParagraphStyleAttributeName, 0)
catch ex as NSExceptionMBS
// we have none, so make one
p = new NSParagraphStyleMBS
end try

// modify it
dim m as NSMutableParagraphStyleMBS = p.mutableCopy
m.setLineSpacing 5

// add back to styled text
dim s as NSAttributedStringMBS = a.mutableCopy
s.addAttribute(a.NSParagraphStyleAttributeName, m, new NSRangeMBS(0, s.length))

// and apply to control
if n<>Nil then
n.attributedStringValue = s
elseif v<>nil then
v.textStorage.setAttributedString s
end if

Notes: This value must be nonnegative.

32.45.16 setMaximumLineHeight(value as Double)

Function: Sets the maximum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to value.

Notes:
Glyphs and graphics exceeding this height will overlap neighboring lines; however, a maximum height of 0 implies no line height limit. This value must be nonnegative.

Although this limit applies to the line itself, line spacing adds extra space between adjacent lines.
32.45.17 setMinimumLineHeight(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the minimum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to value.

**Notes:** This value must be nonnegative.

32.45.18 setParagraphSpacing(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the space added at the end of the paragraph to separate it from the following paragraph to value.

**Notes:** This value must be nonnegative.

32.45.19 setParagraphSpacingBefore(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the distance between the paragraph’s top and the beginning of its text content.

**Notes:** This value must be nonnegative.

32.45.20 setParagraphStyle(ParagraphStyle as NSParagraphStyleMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the subattributes of the receiver with those in ParagraphStyle.

32.45.21 setTabStops(tabStops() as NSTextTabMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the tab stops in the receiver with tabStops.

32.45.22 setTailIndent(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the distance in points from the margin of a text container to the end of lines to value.

**Notes:**

If positive, this is the distance from the leading margin (for example, the left margin in left-to-right text). That is, it’s the absolute line width. If 0 or negative, it’s the distance from the trailing margin the value is
added to the line width.

For example, to create a paragraph style that fits exactly in a 2-inch wide container, set its head indent to 0.0 and its tail indent to 0.0. To create a paragraph style with quarter-inch margins, set its head indent to 0.25 and its tail indent to 0.25.

32.45.23  setTextLists(TextLists() as NSTextListMBS)

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the text lists containing the paragraph.

32.45.24  setTighteningFactorForTruncation(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the threshold for using tightening as an alternative to truncation. **Notes:** When the line break mode specifies truncation, the text system attempts to tighten intercharacter spacing as an alternative to truncation, provided that the ratio of the text width to the line fragment width does not exceed \(1.0 + \text{the value returned by tighteningFactorForTruncation}\). Otherwise the text is truncated at a location determined by the line break mode. The default value is 0.05. This method accepts positive and negative values. Values less than or equal to 0.0 result in not tightening.
32.46 class NSMutableURLRequestMBS

32.46.1 class NSMutableURLRequestMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The Cocoa class for a mutable URL Request.

**Notes:**
NSMutableURLRequest is a subclass of NSURLRequest provided to aid developers who may find it more
convenient to mutate a single request object for a series of URL load requests instead of creating an im-
mutable NSURLRequest for each load.

This programming model is supported by the following contract between NSMutableURLRequest and
NSURLConnection: NSURLConnection makes a deep copy of each NSMutableURLRequest object passed
to one of its initializers.

Subclass of the NSURLRequestMBS class.

32.46.2 Methods

32.46.3 addValue(value as string, field as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an HTTP header to the receiver’s HTTP header dictionary.

**Example:**

```dim m as new NSMutableURLRequestMBS("http://test.test")
m.addValue "Hello", "test"
m.addValue "World", "test"
MsgBox m.valueForHTTPHeaderField("test")```

**Notes:**

value: The value for the header field.
field: The name of the header field. In keeping with the HTTP RFC, HTTP header field names are case-
insensitive

This method provides the ability to add values to header fields incrementally. If a value was previously
set for the specified field, the supplied value is appended to the existing value using the appropriate field
delimiter. In the case of HTTP, this is a comma.
32.46.4 Constructor(url as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSURLRequest with the given URL.

**Example:**

```pascal
dim m as new NSMutableURLRequestMBS("http://test.test")
```

**Notes:**

Default values are used for cache policy (NSURLRequestUseProtocolCachePolicy) and timeout interval (60 seconds).

On success, handle property is not zero.

**See also:**

- 32.46.5 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double)

32.46.5 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSURLRequest with the given URL.

**See also:**

- 32.46.4 Constructor(url as string)

32.46.6 setAllHTTPHeaderFields(headerFields as Dictionary)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the receiver’s header fields with the passed values.

**Notes:** headerFields: A dictionary with the new header fields. HTTP header fields must be string values; therefore, each object and key in the headerFields dictionary must be a String. If either the key or value for a key-value pair is not a string, the key-value pair is skipped.

32.46.7 setCachePolicy(policy as Integer)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the cache policy of the receiver.

**Notes:**
policy: The new cache policy.

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

These constants are used to specify interaction with the cached responses.
- NSURLRequestUseProtocolCachePolicy = 0,
- NSURLRequestReloadIgnoringLocalCacheData = 1,
- NSURLRequestReloadIgnoringLocalAndRemoteCacheData = 4,
- NSURLRequestReturnCacheDataElseLoad = 2,
- NSURLRequestReturnCacheDataDontLoad = 3,
- NSURLRequestReloadRevalidatingCacheData = 5

### 32.46.8 setHTTPBody(data as MemoryBlock)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the request body of the receiver to the specified data.  
**Notes:** data: The new request body for the receiver. This is sent as the message body of the request, as in an HTTP POST request.

### 32.46.9 setHTTPMethod(HTTPMethod as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver’s HTTP request method.  
**Example:**

```dim m as new NSMutableURLRequestMBS("http://test.test")m.setHTTPMethod "PUT"MsgBox m.HTTPMethod```

**Notes:** HTTPMethod: The new HTTP request method. The default HTTP method is "GET".

### 32.46.10 setHTTPShouldHandleCookies(should as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the receiver should use the default cookie handling for the request.  
**Example:**

```dim r as NSURLRequestMBS = NSURLRequestMBS.requestWithURL("http://www.apple.de")Dim m as NSMutableURLRequestMBS = r.mutableCopy```
m.setHTTPShouldHandleCookies(false)
HTMLViewer1.LoadRequest m

**Notes:** handleCookies: True if the receiver should use the default cookie handling for the request, false otherwise. The default is true.

### 32.46.11 setHTTPShouldUsePipelining(shouldUsePipelining as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the request should not wait for the previous response before transmitting.  
**Notes:**  
True if the receiver should transmit before the previous response is received. False to wait for the previous response before transmitting.

Calling this method with a true value does not guarantee HTTP pipelining behavior. HTTP 1.1 allows the client to send multiple requests to the server without waiting for a response. Though HTTP 1.1 requires support for pipelining, some servers report themselves as being HTTP 1.1 but do not support pipelining. To maintain compatibility with these servers, requests may have to wait for the previous response before transmitting.

Available on Mac OS X 10.7 or newer.

### 32.46.12 setMainDocumentURL(url as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the main document URL for the receiver.  
**Example:**

```none
dim m as new NSMutableURLRequestMBS("http://test.test/test.jpg")
m.setMainDocumentURL "http://test.test/"
MsgBox m.mainDocumentURL
```

**Notes:**  
url: The new main document URL. Can be nil.

The caller should set the main document URL to an appropriate main document, if known. For example, when loading a web page the URL of the HTML document for the top-level frame would be appropriate. This URL will be used for the "only from same domain as main document" cookie accept policy.
32.46. **CLASS NSMUTABLEURLREQUESTMBS**

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

### 32.46.13 **setNetworkServiceType**(networkServiceType as Integer)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the NSURLRequestNetworkServiceType to associate with this request.
**Notes:**

networkServiceType: The service type to associate with the request.
This method is used to provide the network layers with a hint as to the purpose of the request. Most clients should not need to use this method. See NSURLNetworkServiceType* constants.
Available in Mac OS X 10.7 or newer.

### 32.46.14 **setTimeoutInterval**(seconds as Double)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver’s timeout interval, in seconds.
**Notes:**

seconds: The timeout interval, in seconds. If during a connection attempt the request remains idle for longer than the timeout interval, the request is considered to have timed out. The default timeout interval is 60 seconds.

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

### 32.46.15 **setURL**(url as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the URL of the receiver.
**Notes:**

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

### 32.46.16 **setValue**(value as string, field as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the specified HTTP header field.
Example:

```swift
dim m as new NSMutableURLRequestMBS("http://test.test")
m.setValue("just a test", "test")
MsgBox m.valueForHTTPHeaderField("test")
```

Notes:

value: The new value for the header field. Any existing value for the field is replaced by the new value.
field: The name of the header field to set. In keeping with the HTTP RFC, HTTP header field names are case-insensitive.
32.47. CLASS NSOUTPUTSTREAMMBS

32.47 class NSOutputStreamMBS

32.47.1 class NSOutputStreamMBS

32.47.2 Methods

32.47.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an initialized output stream that will write stream data to memory. Notes: Returns an initialized output stream that will write stream data to memory. The stream must be opened before it can be used.

You retrieve the contents of the memory stream by OutputData property. See also:

- 32.47.4 Constructor(filePath as string, append as boolean)

32.47.4 Constructor(filePath as string, append as boolean)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an initialized output stream for writing to a specified file. Notes: path: The path to the file the output stream will write to. append: True if newly written data should be appended to any existing file contents, otherwise false.

Returns an initialized output stream that can write to path. The stream must be opened before it can be used. See also:

- 32.47.3 Constructor
32.47.5 OutputData as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The output of the memory stream.

32.47.6 outputStreamToFileAtPath(filePath as string, append as boolean) as NSOutputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized output stream for writing to a specified file. **Notes:**
- path: The path to the file the output stream will write to.
- append: True if newly written data should be appended to any existing file contents, otherwise false.

Returns an initialized output stream that can write to path.

The stream must be opened before it can be used.

32.47.7 outputStreamToMemory as NSOutputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized output stream that will write stream data to memory. **Notes:**

Returns an initialized output stream that will write stream data to memory.

The stream must be opened before it can be used.

You retrieve the contents of the memory stream by OutputData property.

32.47.8 outputStreamWithURL(fileURL as string, append as boolean) as NSOutputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized output stream for writing to a specified URL. **Notes:**
- fileURL: The URL to the file the output stream will write to.
- append: True if newly written data should be appended to any existing file contents, otherwise false.
Returns an initialized output stream that can write to url.

The stream must be opened before it can be used.

32.47.9  write(data as MemoryBlock) as Integer

Function: Writes the contents of a provided data buffer to the receiver.
Notes:
Returns a number indicating the outcome of the operation:
A positive number indicates the number of bytes written.
0 indicates that a fixed-length stream and has reached its capacity.
-1 means that the operation failed; more information about the error can be obtained with streamError.

32.47.10  Properties

32.47.11  hasSpaceAvailable as Boolean

Function: A boolean value that indicates whether the receiver can be written to.
Notes:
True if the receiver can be written to or if a write must be attempted in order to determine if space is available, false otherwise.
(Read only property)
32.48 class NSPanelMBS

32.48.1 class NSPanelMBS

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The NSPanel class implements a special kind of window (known as a panel), typically performing an auxiliary function.
**Example:**
```
static n as NSPanelMBS

dim style as Integer = NSPanelMBS.NSClosableWindowMask + NSPanelMBS.NSTitledWindowMask +
NSPanelMBS.NSUtilityWindowMask + NSPanelMBS.NSHUDWindowMask + NSPanelMBS.NSResizableWindowMask

n = new NSPanelMBS(100,100,200,200, style, NSPanelMBS.NSWindowBackingLocationDefault, false)

n.Title = "Hello World"
n.Show
```

**Notes:** Subclass of the NSWindowMBS class.

32.48.2 Methods

32.48.3 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer, deferCreation as boolean)

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The constructor to create a new Cocoa Windows.
**Example:**
```
static n as NSPanelMBS

dim style as Integer = NSPanelMBS.NSClosableWindowMask + NSPanelMBS.NSTitledWindowMask +
NSPanelMBS.NSUtilityWindowMask + NSPanelMBS.NSHUDWindowMask + NSPanelMBS.NSResizableWindowMask

n = new NSPanelMBS(100,100,200,200, style, NSPanelMBS.NSWindowBackingLocationDefault, false)

n.Title = "Hello World"
n.Show
```
32.48. CLASS NSPANELMBS

Notes:

x,y,w,h:
Location and size of the window’s content area in screen coordinates. Note that the window server limits window position coordinates to 16,000 and sizes to 10,000.

styleMask:
The window’s style. Either it can be NSBorderlessWindowMask, or it can contain any of the options described in the constants, combined using the bitwiseOR function. Borderless windows display none of the usual peripheral elements and are generally useful only for display or caching purposes; you should normally not need to create them. Also, note that a window’s style mask should include NSTitledWindowMask if it includes any of the others.

bufferingType:
Specifies how the drawing done in the window is buffered by the window device, and possible values are described in "Constants."

deferCreation:
Specifies whether the window server creates a window device for the window immediately. When true, the window server defers creating the window device until the window is moved onscreen. All display messages sent to the window or its views are postponed until the window is created, just before it’s moved onscreen.

Initialized NSWindow object.

This method is the designated initializer for the NSWindow class.

Deferring the creation of the window improves launch time and minimizes the virtual memory load on the window server.

The new window creates a view to be its default content view. You can replace it with your own object by using the ContentView property.

32.48.4 RunAlertPanel(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string) as Integer

32.48.5  RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Run an alert panel.
See also:

- 32.48.6 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

32.48.6  RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Run an alert panel.
See also:

- 32.48.5 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

32.48.7  RunCriticalAlertPanel(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Runs a critical alert panel.

32.48.8  RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Runs a critical alert panel.
See also:

- 32.48.9 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer
32.48.9 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

See also:
• 32.48.8 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 5824

32.48.10 RunInformationalAlertPanel(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string) as Integer

32.48.11 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

See also:
• 32.48.12 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer 5825

32.48.12 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

See also:
• 32.48.11 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 5825
32.48.13 Properties

32.48.14 becomesKeyOnlyIfNeeded as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: whether the panel becomes the key window only when needed. Notes: By default, this attribute is set to false, indicating that the panel becomes key as other windows do. (Read and Write computed property)

32.48.15 isFloatingPanel as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the panel is a floating panel. Notes: True when the receiver is a floating panel, false otherwise.

By default, panels do not float above other windows. It’s appropriate for an panel to float above other windows only if all of the following conditions are true:

- It is small enough not to obscure whatever is behind it.
- It is oriented more to the mouse than to the keyboard that is, if it doesn’t become the key window or becomes so only when needed.
- It needs to remain visible while the user works in the application’s normal windows for example, if the user must frequently move the cursor back and forth between a normal window and the panel (such as a tool palette), or if the panel gives information relevant to the user’s actions in a normal window.
- It hides when the application is deactivated (the default behavior for panels).

(Read and Write computed property)

32.48.16 worksWhenModal as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the receiver receives keyboard and mouse events even when some other window is being run modally. Notes: True when the receiver receives keyboard and mouse events even when some other window is being run modally, false otherwise.
By default, this attribute is set to false, indicating a panel’s ineligibility for events during a modal loop or session.
(Read and Write computed property)

32.48.17 Constants

32.48.18 NSAlertAlternateReturn=0

MBS MacBase Plugin, Plugin Version: 8.4. Function: One of the possible return values for the alert panels. Notes: The user pressed the alternate button.

32.48.19 NSAlertDefaultReturn=1

MBS MacBase Plugin, Plugin Version: 8.4. Function: One of the possible return values for the alert panels. Notes: The user pressed the default button.

32.48.20 NSAlertErrorReturn=-2

MBS MacBase Plugin, Plugin Version: 8.4. Function: One of the possible return values for the alert panels. Notes: The alert cannot identify the reason it was closed; it may have been closed by an external source or by a button other than those listed above.

32.48.21 NSAlertOtherReturn=-1

MBS MacBase Plugin, Plugin Version: 8.4. Function: One of the possible return values for the alert panels. Notes: The user pressed a second alternate button.

32.48.22 NSCancelButton=0

MBS MacBase Plugin, Plugin Version: 8.4. Function: One of the constants for the modal panel return values. Notes: The Cancel button.
32.48.23  NSDocModalWindowMask=64

MBS MacBase Plugin, Plugin Version: 8.4. **Function**: One of the constants you can use to specify the style when creating a window.
**Notes**: The panel is created as a modal sheet.

32.48.24  NSHUDWindowMask=8192

MBS MacBase Plugin, Plugin Version: 8.4. **Function**: One of the constants you can use to specify the style when creating a window.

32.48.25  NSNonactivatingPanelMask=128

MBS MacBase Plugin, Plugin Version: 8.4. **Function**: One of the constants you can use to specify the style when creating a window.
**Notes**: The panel can receive keyboard input without activating the owning application.

32.48.26  NSOKButton=1

MBS MacBase Plugin, Plugin Version: 8.4. **Function**: One of the constants for the modal panel return values.
**Notes**: The OK button.

32.48.27  NSUtilityWindowMask=16

MBS MacBase Plugin, Plugin Version: 8.4. **Function**: One of the constants you can use to specify the style when creating a window.
**Notes**: The panel is created as a floating window.
32.49 class NSParagraphStyleMBS

32.49.1 class NSParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSParagraphStyle and its subclass NSMutableParagraphStyle encapsulate the paragraph or ruler attributes used by the NSAttributedString classes. **Example:**

```vbnet
dim n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural
```

**Notes:**
Instances of these classes are often referred to as paragraph style objects or, when no confusion will result, paragraph styles.
The mutable subclass of NSParagraphStyle is NSMutableParagraphStyle.

32.49.2 Methods

32.49.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

32.49.4 copy as NSParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the paragraph style.

32.49.5 defaultParagraphStyle as NSParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default paragraph style. **Example:**

```vbnet
dim n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural
```
Notes:
The default paragraph style has the following default values:

<table>
<thead>
<tr>
<th>Subattribute</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alignment</td>
<td>NSNaturalTextAlignment</td>
</tr>
<tr>
<td>Tab stops</td>
<td>12 left-aligned tabs, spaced by 28.0 points</td>
</tr>
<tr>
<td>Line break mode</td>
<td>NSLineBreakByWordWrapping</td>
</tr>
<tr>
<td>All others</td>
<td>0.0</td>
</tr>
</tbody>
</table>

32.49.6 defaultWritingDirectionForLanguage(languageName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default writing direction for the specified language. **Notes:** languageName: The language specified in ISO language region format. Can be nil to return a default writing direction derived from the user’s defaults database.

32.49.7 mutableCopy as NSMutableParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a mutable copy of the paragraph style.

32.49.8 tabStops as NSTextTabMBS()

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s tab stops. **Notes:** The NSTextTab objects, sorted by location, that define the tab stops for the paragraph style.

32.49.9 textLists as NSTextListMBS()

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array specifying the text lists containing the paragraph.
32.49.10 Properties

32.49.11 alignment as Integer

Function: Returns the text alignment of the receiver.
Example:

```vbnet
dim n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural

dim m as NSMutableParagraphStyleMBS = n.mutableCopy
m.setAlignment NSParagraphStyleMBS.NSCenterTextAlignment
MsgBox str(m.alignment) // 2 = center
```

Notes:
Natural text alignment is realized as left or right alignment depending on the line sweep direction of the first script contained in the paragraph.
(Read only property)

32.49.12 baseWritingDirection as Integer

Function: Returns the base writing direction for the receiver.
Notes: (Read only property)

32.49.13 defaultTabInterval as Double

Function: Returns the document-wide default tab interval.
Notes:
The default tab interval in points. Tabs after the last specified in tabStops are placed at integer multiples of this distance (if positive). Default return value is 0.0.
(Read only property)

32.49.14 firstLineHeadIndent as Double

Function: Returns the indentation of the first line of the receiver.
CHAPTER 32. COCOA

Notes:
The distance in points from the leading margin of a text container to the beginning of the paragraph’s first line. This value is always nonnegative.
(Read only property)

32.49.15  firstTabStop as NSTextTabMBS

Function: The first tab stop entry.
Notes:
For debugging.
(Read only property)

32.49.16  firstTextList as NSTextListMBS

Function: The first text list entry.
Notes:
For debugging.
(Read only property)

32.49.17  Handle as Integer

Notes: (Read and Write property)

32.49.18  headerLevel as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.
Notes:
Returns 0 (the default value), if the paragraph is not a header, or from 1 through 6 if the paragraph is to be treated as a header.
(Read only property)
32.49.19  headIndent as Double

Function: Returns the indentation of the receiver’s lines other than the first.
Notes:
The distance in points from the leading margin of a text container to the beginning of lines other than the first. This value is always nonnegative.
(Read only property)

32.49.20  hyphenationFactor as Double

Function: Returns the paragraph’s threshold for hyphenation.
Notes:
A value between 0.0 and 1.0 inclusive. The default value is 0.0.

Hyphenation is attempted when the ratio of the text width (as broken without hyphenation) to the width of the line fragment is less than the hyphenation factor. When the paragraph’s hyphenation factor is 0.0, the layout manager’s hyphenation factor is used instead. When both are 0.0, hyphenation is disabled.
(Read only property)

32.49.21  lineBreakMode as Integer

Function: Returns the mode that should be used to break lines in the receiver.
Notes:
The line break mode to be used laying out the paragraph’s text.
(Read only property)

32.49.22  lineHeightMultiple as Double

Function: Returns the line height multiple.
Notes:
The line height multiple. The natural line height of the receiver is multiplied by this factor (if positive) before being constrained by minimum and maximum line height. Default return value is 0.0.
(Read only property)
### 32.49.23 lineSpacing as Double

**Function:** Returns the space between lines in the receiver (commonly known as leading).

**Notes:**
The space in points added between lines within the paragraph. This value is always nonnegative.
(Read only property)

### 32.49.24 maximumLineHeight as Double

**Function:** Returns the receiver’s maximum line height.

**Notes:**
The maximum height in points that any line in the receiver will occupy, regardless of the font size or size of any attached graphic. This value is always nonnegative. The default value is 0.

Glyphs and graphics exceeding this height will overlap neighboring lines; however, a maximum height of 0 implies no line height limit. Although this limit applies to the line itself, line spacing adds extra space between adjacent lines.
(Read only property)

### 32.49.25 minimumLineHeight as Double

**Function:** Returns the receiver’s minimum height.

**Notes:**
The minimum height in points that any line in the receiver will occupy, regardless of the font size or size of any attached graphic. This value is always nonnegative.
(Read only property)

### 32.49.26 paragraphSpacing as Double

**Function:** Returns the space after the end of the paragraph.

**Notes:**
The space in points added at the end of the paragraph to separate it from the following paragraph. This value is always nonnegative.
This value is determined by adding the previous paragraph’s paragraphSpacing and the current paragraph’s paragraphSpacingBefore.
(Read only property)

### 32.49.27 paragraphSpacingBefore as Double

**Function:** Returns the distance between the paragraph’s top and the beginning of its text content.
**Notes:**
The distance in points between the paragraph’s top and the beginning of its text content. Default return value is 0.0.
(Read only property)

### 32.49.28 tailIndent as Double

**Function:** Returns the trailing indentation of the receiver.
**Notes:**
The distance in points from the margin of a text container to the end of lines.

If positive, this value is the distance from the leading margin (for example, the left margin in left-to-right text). If 0 or negative, it’s the distance from the trailing margin.

For example, a paragraph style designed to fit exactly in a 2-inch wide container has a head indent of 0.0 and a tail indent of 0.0. One designed to fit with a quarter-inch margin has a head indent of 0.25 and a tail indent of 0.25.
(Read only property)

### 32.49.29 tighteningFactorForTruncation as Double

**Function:** Returns the threshold for using tightening as an alternative to truncation.
**Notes:**
The tightening threshold value. The default value is 0.05.

When the line break mode specifies truncation, the text system attempts to tighten intercharacter spacing as an alternative to truncation, provided that the ratio of the text width to the line fragment width does not exceed 1.0 + the tightening factor returned by this method. Otherwise the text is truncated at a location
determined by the line break mode.
(Read only property)

32.49.30 Constants

32.49.31 NSCenterTextAlignment=2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.
**Notes:** Visually centered

32.49.32 NSJustifiedTextAlignment=3

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.
**Notes:** Fully-justified. The last line in a paragraph is natural-aligned.

32.49.33 NSLeftTextAlignment=0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.
**Notes:** Visually left aligned

32.49.34 NSLineBreakByCharWrapping = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.
**Notes:** Wrapping occurs before the first character that doesn’t fit.

32.49.35 NSLineBreakByClipping = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.
**Notes:** Lines are simply not drawn past the edge of the text container.
32.49.36  **NSLineBreakByTruncatingHead = 3**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.  
**Notes:** Each line is displayed so that the end fits in the container and the missing text is indicated by some kind of ellipsis glyph.

32.49.37  **NSLineBreakByTruncatingMiddle = 5**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.  
**Notes:** Each line is displayed so that the beginning and end fit in the container and the missing text is indicated by some kind of ellipsis glyph in the middle.

32.49.38  **NSLineBreakByTruncatingTail = 4**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.  
**Notes:** Each line is displayed so that the beginning fits in the container and the missing text is indicated by some kind of ellipsis glyph.

32.49.39  **NSLineBreakByWordWrapping = 0**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.  
**Notes:** Wrapping occurs at word boundaries, unless the word itself doesn’t fit on a single line.

32.49.40  **NSNaturalTextAlignment=4**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.  
**Notes:** Indicates the default alignment for script.

32.49.41  **NSRightTextAlignment=1**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.
32.49.42  **NSWritingDirectionLeftToRight=0**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify the writing directions.

**Notes:**

The writing direction is left to right.

Available in Mac OS X v10.2 and later.

32.49.43  **NSWritingDirectionNatural=-1**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify the writing directions.

**Notes:**

The writing direction is determined using the Unicode Bidi Algorithm rules P2 and P3. Default.

Available in Mac OS X v10.4 and later.

32.49.44  **NSWritingDirectionRightToLeft=1**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify the writing directions.

**Notes:**

The writing direction is right to left.

Available in Mac OS X v10.2 and later.
32.50  class NSPointMBS

32.50.1  class NSPointMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A REALbasic class for the point structure in Cocoa.

**Example:**

```realbasic
dim n as NSPointMBS = NSMakePointMBS(500,600)
MsgBox n.String
```

32.50.2  Methods

32.50.3  Constructor

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty point.

**Example:**

```realbasic
dim p as new NSPointMBS
MsgBox p // shows { 0, 0 }
```

See also:

- 32.50.4 Constructor(p as Ptr)
- 32.50.5 Constructor(s as string)
- 32.50.6 Constructor(x as Double, y as Double)

32.50.4  Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new instance using data at the pointer.

**Notes:** Make sure the pointer is valid and has the right data and size.

See also:

- 32.50.3 Constructor
- 32.50.5 Constructor(s as string)
- 32.50.6 Constructor(x as Double, y as Double)
32.50.5 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSPoint object using the given string.

**Example:**

```vba
dim p as new NSPointMBS("{3,4}")
MsgBox p // shows {3,4}
```

See also:
- 32.50.3 Constructor 5839
- 32.50.4 Constructor(p as Ptr) 5839
- 32.50.6 Constructor(x as Double, y as Double) 5840

32.50.6 Constructor(x as Double, y as Double)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSPoint object using the given values.

See also:
- 32.50.3 Constructor 5839
- 32.50.4 Constructor(p as Ptr) 5839
- 32.50.5 Constructor(s as string) 5840

32.50.7 Equal(other as NSPointMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether two points are equal.

32.50.8 Operator_Convert as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the object to string.

**Example:**

```vba
dim p as new NSPointMBS(1,2)
MsgBox p // shows {1,2}
```
32.50.9  String as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the string representation of this point.
**Example:**

```vbnet
dim p as new NSPointMBS(1,2)
MsgBox p.String // shows { 1,2 }
```

32.50.10  Zero as NSPointMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns a point with all values being zero.

32.50.11  Properties

32.50.12  Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The pointer to the internal data structure.
**Notes:**
May be useful for passing to declares requiring a NSPoint*.
Size of structure is 8 bytes for 32-bit (two singles) and 16 bytes for 64-bit (two doubles).
(Read only property)

32.50.13  X as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The horizontal coordinate.
**Notes:** (Read and Write property)

32.50.14  Y as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The vertical coordinate.
**Notes:** (Read and Write property)
CHAPTER 32. COCOA

32.51 class NSPopoverMBS

32.51.1 class NSPopoverMBS

Function: The Real Studio class for a pop-over.
Notes:
A popover is a unit of content that is positioned relative to some other content on the screen. An anchor
is used to express the relation between these two units of content. Each popover has an appearance that
specifies its visual characteristics, as well as a behavior that determines which user interactions will cause
the popover to close. A transient popover is closed in response to most user interactions, whereas a semi-
transient popovers is closed when the user interacts with the window containing the popover’s positioning
view. Popovers with application-defined behavior are not usually closed on the developer’s behalf. AppKit
automatically positions each popover relative to its positioning view and moves the popover whenever its
positioning view moves. A positioning rectangle within the positioning view can be specified for additional
granularity. Popovers can be detached to become a separate window when they are dragged by implementing
the appropriate delegate method.

Please also check the documentation from Apple for the NSPopover class.
Available in Mac OS X v10.7 and later.

32.51.2 Methods

32.51.3 available as boolean

Function: Whether pop-overs are available.
Example:
msgbox "NSPopover available: " + str(NSPopoverMBS.available)

Notes: Returns true on Mac OS X 10.7.

32.51.4 Close

Function: Forces the popover to close without calling events.
Notes: Any popovers nested within the popovers will also receive a close message. When a window is closed
in response to the close message being sent, all of its popovers will be closed. The popover will animate out
when closed (unless the animates property is set to false).
32.51.5  Constructor

Function: Creates a new popover.

32.51.6  Destructor

Function: The destructor.

32.51.7  isShown as boolean

Function: Whether popover is visible.
Notes: True if the popover is being shown, false otherwise. The popover is considered to be shown from
the point when showRelativeToRect is invoked until the popover is closed in response to an invocation of
either close or performClose.

32.51.8  NSPopoverCloseReasonDetachToWindow as string

Function: One of the constant for the close reason.
Notes: Specifies that the popover has been closed because it is being detached to a window; a possible value
for NSPopoverCloseReasonKey.

32.51.9  NSpopoverCloseReasonKey as string

Function: One of the constants for the close notification parameter dictionary.
Notes: Specifies the close reason. Currently used only as the userInfo key for the NSPopoverWillCloseNo-
tification.
32.51.10 NSPopoverCloseReasonStandard as string

Function: One of the constant for the close reason.
Notes: Specifies that the popover is being closed in a standard way; a possible value for NSPopoverCloseReasonKey.

32.51.11 NSPopoverDidCloseNotification as string

Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent after the popover has finished animating offscreen. This notification has the same user info keys as NSPopoverWillCloseNotification.

32.51.12 NSPopoverDidShowNotification as string

Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent after the popover has finished animating onscreen.

32.51.13 NSPopoverWillCloseNotification as string

Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent before the popover is closed. The userInfo key NSPopoverCloseReasonKey specifies the reason for closing. It can currently be either NSPopoverCloseReasonStandard or NSPopoverCloseReasonDetachToWindow, although more reasons for closing may be added in the future.

32.51.14 NSPopoverWillShowNotification as string

Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent before the popover is shown.

32.51.15 performClose

Function: Attempts to close the popover.
**Notes:** The popover will not be closed if popoverShouldClose event returns false. The operation will fail if it is displaying a nested popover, or if it has a child window. A window will attempt to close its popovers when it receives a performClose message. The popover will animate out when closed (unless the animates property is set to false).

### 32.51.16 `showRelativeToRect(positioningRect as NSRectMBS, view as NSViewMBS, edge as Integer)`

**MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Shows the popover positioned relative to positioningRect of positioningView (see the description of positioningRect).

**Notes:** The common case is to pass positioningView.bounds for positioningRect, in which case the popover will be placed adjacent to the positioningView and there is no need to update positioningRect (AppKit will detect the bounds of the positioning view was specified and automatically update the positioningView). preferredEdge is a hint to AppKit about the desired placement of the anchor of the popover towards the positioningRect, and is with respect to the isFlipped state of the positioningView. Also, if positioningRect is an empty rect, the view.bounds will automatically be used. The current (but not guaranteed) behavior is that AppKit will place the anchor towards the preferredEdge of the positioningRect unless such a placement would cause the popover to not fit on the screen of positioningView. If the anchor cannot be placed towards the preferredEdge, AppKit will (in the current implementation) attempt to place the anchor on the opposite side of the positioningRect. If that cannot be done, AppKit will attempt to place the anchor on a remaining sides of the popover, and failing that will center the popover on the screen, causing it to (at least temporarily) lose its anchor. The popover will animate onscreen and eventually animate offscreen when it is closed (unless the property animates is set to false). This method will throw a NSInvalidArgumentException if view is nil or if view is not in a window, or if the popover’s behavior is NSPopoverBehaviorSemitransient and the popover’s positioningView is in a popover or child window. It will throw a NSInternalInconsistencyException if the popover’s content view controller (or the view controller’s view) is nil. If the popover is already being shown, this method will update to be associated with the new view and positioningRect passed. If the positioning view is not visible, this method does nothing.

### 32.51.17 Properties

### 32.51.18 Handle as Integer

**MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The internal reference to the NSPopover object.

**Notes:** (Read and Write property)
32.51.19   Tag as Variant

Function: The tag.
Notes:
You can use this property for whatever you like.
e.g. to keep the reference to the NSViewControllerMBS object.
(Read and Write property)

32.51.20   animates as boolean

Function: Should the popover be animated when it shows, closes, or appears to transition to a detachable
window.
Notes:
This property also controls whether the popover animates when the content view or content size changes.
AppKit does not guarantee which behaviors will be animated or that this property will be respected; it is
regarded as a hint. The default value is true.
(Read and Write computed property)

32.51.21   appearance as Integer

Function: The appearance of the popover.
Notes:
The default appearance is NSPopoverAppearanceMinimal. See the declaration of NSPopoverAppearance*
constants for more information about appearances.
(Read and Write computed property)

32.51.22   behavior as Integer

Function: The behavior of the popover.
Notes:
The default behavior is NSPopoverBehaviorApplicationDefined. See the declaration of NSPopoverBehavior*
constants for more information about popover behaviors.
(Read and Write computed property)
32.51.23  **contentSize** as NSSizeMBS

**Function:** The content size of the popover.
**Notes:**
The popover’s content size is set to match the size of the content view when the content view controller is set. Changes to the content size of the popover will animate while the popover is shown (provided animates is true).
(Read and Write computed property)

32.51.24  **contentViewController** as NSViewControllerMBS

**Function:** The view controller that manages the content of the popover.
**Notes:**
Please use with NSViewControllerMBS class.
The default value is nil. You must set the content view controller of the popover to a non-nil value before the popover is shown. Changes to the popover’s content view controller while the popover is shown will animate (provided animates is true).
(Read and Write computed property)

32.51.25  **positioningRect** as NSRectMBS

**Function:** The positioning rectangle.
**Notes:**
Popovers are positioned relative a positioning view and are automatically moved when the location or size of the positioning view changes. Sometimes it is desirable to position popovers relative to a rectangle within the positioning view. In this case, you must update the positioningRect binding whenever this rectangle changes, or use the positioningRect binding so AppKit can re-position the popover when appropriate.
(Read and Write computed property)

32.51.26  **Events**

32.51.27  **detachableWindowForPopover** as NSWindowMBS

**Function:** Detaches the popover creating a window containing the content.
**Notes:**
You return a window instance to which the popover should be detached.

You should not remove the popover's content view as part of your implementation of this method.

The popover and the detachable window may be shown at the same time and therefore cannot share a content view (or a content view controller).

If the popover and the detachable window should have the same content, you should define the content with a separate view and use a view controller to instantiate separate copies of the content for the popover and the detachable window.

The popover will animate to appear as though it morphs into the detachable window (unless the popover animates property is set to false. The exact animation used is not guaranteed.

If you do not implement this event or it returns nil, the default behavior is that the popup is not detached.

### 32.51.28 popoverDidClose(notification as NSNotificationMBS)

**Function:** Invoked when the popover did close.

**Notes:** Invoked on the delegate when the NSPopoverDidCloseNotification notification is sent.

### 32.51.29 popoverDidShow(notification as NSNotificationMBS)

**Function:** Invoked when the popover has been shown.

**Notes:** Invoked on the delegate when the NSPopoverDidShowNotification notification is sent.

### 32.51.30 popoverShouldClose as boolean

**Function:** Allows a delegate to override a close request.

**Notes:**

Return true if the popover should close, false otherwise.

The popover invokes this method on its delegate whenever it is about to close. This gives you a chance to override the close.
If you do not implement this method the default behavior is that the popover will close.

32.51.31  popoverWillClose(notification as NSNotificationMBS)

Function: Invoked when the popover is about to close.
Notes: Invoked on the delegate when the NSPopoverWillCloseNotification notification is sent.

32.51.32  popoverWillShow(notification as NSNotificationMBS)

Function: Invoked when the popover will show.
Notes: Invoked on the delegate when the NSPopoverWillShowNotification notification is sent.

32.51.33  Constants

32.51.34  MaxXEdge = 2

MBS MacControls Plugin, Plugin Version: 11.2. Function: One of the edge constants.
Notes: right

32.51.35  MaxYEdge = 3

MBS MacControls Plugin, Plugin Version: 11.2. Function: One of the edge constants.
Notes: top
(Cocoa coordinates have 0 on bottom of screen)

32.51.36  MinXEdge = 0

MBS MacControls Plugin, Plugin Version: 11.2. Function: One of the edge constants.
Notes: left
32.51.37 MinYEdge = 1

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the edge constants.
**Notes:**
bottom
(Cocoa coordinates have 0 on bottom of screen)

32.51.38 NSPopoverAppearanceHUD = 1

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the appearance mode constants.
**Notes:** The popover will draw with a HUD appearance.

32.51.39 NSPopoverAppearanceMinimal = 0

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the appearance mode constants.
**Notes:** The popover will use a minimal appearance, currently a solid color border and a solid color fill (although this may change in the future). This is the default appearance.

32.51.40 NSPopoverBehaviorApplicationDefined = 0

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the behavior modes.
**Notes:** Your application assumes responsibility for closing the popover. AppKit will still close the popover in a limited number of circumstances. For instance, AppKit will attempt to close the popover when the window of its positioningView is closed. The exact interactions in which AppKit will close the popover are not guaranteed. You may consider implementing `-cancel:` to close the popover when the escape key is pressed.

32.51.41 NSPopoverBehaviorSemitransient = 2

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the behavior modes.
**Notes:** AppKit will close the popover when the user interacts with user interface elements in the window containing the popover's positioning view. Semi-transient popovers cannot be shown relative to views in other popovers, nor can they be shown relative to views in child windows. The exact interactions that cause semi-transient popovers to close are not specified.
32.51.42 NSPopoverBehaviorTransient = 1

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the behavior modes. **Notes:** AppKit will close the popover when the user interacts with a user interface element outside the popover. Note that interacting with menus or panels that become key only when needed will not cause a transient popover to close. The exact interactions that will cause transient popovers to close are not specified.
32.52 class NSRangeMBS

32.52.1 class NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This is the Cocoa class for a Range.

32.52.2 Methods

32.52.3 Constructor

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty range.  
**Example:**

```vbnet
dim r as new NSRangeMBS
MsgBox r // { 0, 0 }
```

See also:

- 32.52.4 Constructor(Location as UInt32, Length as UInt32) 5852
- 32.52.5 Constructor(p as Ptr) 5852
- 32.52.6 Constructor(s as string) 5853

32.52.4 Constructor(Location as UInt32, Length as UInt32)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new range with the given values.  
See also:

- 32.52.3 Constructor 5852
- 32.52.5 Constructor(p as Ptr) 5852
- 32.52.6 Constructor(s as string) 5853

32.52.5 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new instance using data at the pointer.
32.52. CLASS NSRANGEMBS

Notes: Make sure the pointer is valid and has the right data and size.
See also:

- 32.52.3 Constructor
- 32.52.4 Constructor(Location as UInt32, Length as UInt32)
- 32.52.6 Constructor(s as string)

32.52.6 Constructor(s as string)

Example:

dim r as new NSRangeMBS(" \{ 3, 4 \ }")
MsgBox r // \{ 3, 4 \}

See also:

- 32.52.3 Constructor
- 32.52.4 Constructor(Location as UInt32, Length as UInt32)
- 32.52.5 Constructor(p as Ptr)

32.52.7 Equal(other as NSRangeMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether two ranges are equal.

32.52.8 Intersection(other as NSRangeMBS) as NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the intersection of the two ranges.

32.52.9 LocationInRange(location as UInt32) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the location is in the range.
32.52.10 Operator Convert as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Converts the object to string.
Example:

```dim r as new NSRangeMBS("\{ 3, 4 \} ")
MsgBox r // \{ 3, 4 \}
```

32.52.11 String as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the string representation of this range.
Example:

```dim r as new NSRangeMBS("\{ 3, 4 \} ")
MsgBox r.String // \{ 3, 4 \}
```

32.52.12 Union(other as NSRangeMBS) as NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Creates the union of two ranges.

32.52.13 Properties

32.52.14 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The pointer to the internal data structure.
Notes:
May be useful for passing to declares requiring a NSRange*.
(Read only property)

32.52.15 Length as UInt32

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The length of the range.
Example:
32.52. CLASS NSRANGEMBS

```vbnet
dim r as new NSRangeMBS("{ 3, 4 }")
MsgBox str(R.Length) ' // 4
```

**Notes:** (Read and Write property)

### 32.52.16 Location as UInt32

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The position of the range.  
**Notes:** (Read and Write property)

### 32.52.17 MaxRange as UInt32

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum value of the range.  
**Notes:**  
Same as location+length.  
(Read only property)
32.53  class NSRectMBS

32.53.1  class NSRectMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A REALbasic class for the rect structure in Cocoa.

**Example:**

```REALbasic
dim n as NSRectMBS = NSMakeRectMBS(100, 200, 500, 600)
MsgBox n.String
```

32.53.2  Methods

32.53.3  Constructor

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty rectangle.

**Example:**

```REALbasic
dim p as new NSRectMBS
MsgBox p // shows { { 0, 0 }, { 0, 0 } }
```

See also:

- 32.53.4 Constructor(p as Ptr) 5856
- 32.53.5 Constructor(s as string) 5857
- 32.53.6 Constructor(X as Double, Y as Double, W as Double, H as Double) 5857

32.53.4  Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new instance using data at the pointer.

**Notes:** Make sure the pointer is valid and has the right data and size.

See also:

- 32.53.3 Constructor 5856
- 32.53.5 Constructor(s as string) 5857
- 32.53.6 Constructor(X as Double, Y as Double, W as Double, H as Double) 5857
32.53. CLASS NSRECTMBS

32.53.5 Constructor(s as string)

Example:

dim p as new NSRectMBS(" { { 1,2 }, { 3,4 } } ")
MsgBox p // shows { { 1, 2 }, { 3, 4 } }

See also:

- 32.53.3 Constructor
- 32.53.4 Constructor(p as Ptr)
- 32.53.6 Constructor(X as Double, Y as Double, W as Double, H as Double)

32.53.6 Constructor(X as Double, Y as Double, W as Double, H as Double)

See also:

- 32.53.3 Constructor
- 32.53.4 Constructor(p as Ptr)
- 32.53.5 Constructor(s as string)

32.53.7 Contains(other as NSPointMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the rectangle contains the given point.
See also:

- 32.53.8 Contains(other as NSRectMBS) as boolean

32.53.8 Contains(other as NSRectMBS) as boolean

See also:

- 32.53.7 Contains(other as NSPointMBS) as boolean
32.53.9  Equal(other as NSRectMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether two rectangles are equal.

32.53.10  Inset(dx as Double, dy as Double) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Insets the rectangle by the given delta.
**Example:**
```plaintext
dim p as new NSRectMBS(1.1,2.2,3.3,4.4)
dim r as NSRectMBS = p.Inset(2,3)
MsgBox r.String // shows { { 3.1, 5.2 }, { -0.7, -1.6 } }
```

32.53.11  Integral as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the integral of the rectangle.
**Example:**
```plaintext
dim p as new NSRectMBS(1.1,2.2,3.3,4.4)
dim r as NSRectMBS = p.Integral
MsgBox r.String // shows { { 1, 2 }, { 4, 5 } }
```

32.53.12  Intersection(other as NSRectMBS) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the intersection of two rectangles.

32.53.13  Intersects(other as NSRectMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the intersection of the rectangle with the other rectangle.
32.53.14 Operator Convert as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the object to string.
**Example:**
```
dim p as new NSRectMBS(1,2,3,4)
MsgBox p // shows { { 1, 2 }, { 3, 4 } }
```

32.53.15 String as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string representation of this point.
**Example:**
```
dim p as new NSRectMBS(1,2,3,4)
MsgBox p.String // shows { { 1, 2 }, { 3, 4 } }
```

32.53.16 Union(other as NSRectMBS) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the union of two rectangles.

32.53.17 Zero as NSRectMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a rect with all values being zero.

32.53.18 Properties

32.53.19 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The pointer to the internal data structure.
**Notes:**
- May be useful for passing to declares requiring a NSRect*.
- Size of structure is 16 bytes for 32-bit (four singles) and 32 bytes for 64-bit (four doubles).
32.53.20 Height as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height of this rectangle. **Notes:** (Read and Write property)

32.53.21 IsEmpty as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the rectangle is empty. **Notes:** (Read only property)

32.53.22 MaxX as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns maximum x coordinate. **Notes:**

return x + width.

(Read only property)

32.53.23 MaxY as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns maximum y coordinate. **Notes:**

return y + height.

(Read only property)

32.53.24 MidX as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns center x coordinate. **Notes:** (Read only property)
32.53. CLASS NSRECTMBS

32.53.25 MidY as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns center y coordinate.
**Notes:** (Read only property)

32.53.26 MinX as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns x coordinate.
**Notes:** (Read only property)

32.53.27 MinY as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns y coordinate.
**Notes:** (Read only property)

32.53.28 Origin as NSPointMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The origin of the rectangle.
**Notes:** (Read and Write property)

32.53.29 Size as NSSizeMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The size of the rectangle.
**Notes:** (Read and Write property)

32.53.30 Width as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of this rectangle.
**Notes:** (Read and Write property)
32.53.31 X as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The horizontal coordinate. **Notes:** (Read and Write property)

32.53.32 Y as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The vertical coordinate. **Notes:** (Read and Write property)
32.54. **class NSResponderMBS**

32.54.1 **class NSResponderMBS**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSResponder is an abstract class that forms the basis of event and command processing in the Application Kit.

**Notes:**

See the Cocoa documentation for more details.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

32.54.2 **Methods**

32.54.3 **beginGestureWithEvent(e as NSEventMBS)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has begun a touch gesture.

**Notes:**

The event will be sent to the view under the touch in the key window.

Available in Mac OS X v10.6 and later.

32.54.4 **cancelOperation**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to cancel the current operation.

**Notes:**

This method is bound to the Escape and Command-. (period) keys. The key window first searches the view hierarchy for a view whose key equivalent is Escape or Command-. , whichever was entered. If none of these views handles the key equivalent, the window sends a default action message of cancelOperation: to the first responder and from there the message travels up the responder chain.

If no responder in the responder chain implements cancelOperation:, the key window searches the view hierarchy for a view whose key equivalent is Escape (note that this may be redundant if the original key equivalent was Escape). If no such responder is found, then a cancel: action message is sent to the first responder in the responder chain that implements it.

NSResponder declares but does not implement this method.
### 32.54.5 capitalizeWord

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to capitalize the word or words surrounding the insertion point or selection, expanding the selection if necessary. **Notes:** If either end of the selection partially covers a word, that entire word is made lowercase. The sender argument is typically the object that invoked this method. NSResponder declares but doesn’t implement this method.

### 32.54.6 centerSelectionInVisibleArea

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the selection, whatever it is, inside its visible area. **Notes:** NSResponder declares but doesn’t implement this method.

### 32.54.7 changeCaseOfLetter

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to change the case of a letter or letters in the selection, perhaps by opening a panel with capitalization options or by cycling through possible case combinations. **Notes:** NSResponder declares but doesn’t implement this method.

### 32.54.8 complete

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to complete an operation in progress or a partially constructed element. **Notes:** This method can be interpreted, for example, as a request to attempt expansion of a partial word, such as for expanding a glossary shortcut, or to close a graphics item being drawn. NSResponder declares but doesn’t implement this method.

### 32.54.9 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
32.54.10  cursorUpdate(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the mouse cursor has moved into a cursor rectangle.

**Notes:**

Override this method to set the cursor image. The default implementation uses cursor rectangles, if cursor rectangles are currently valid. If they are not, it calls super to send the message up the responder chain.

If the responder implements this method, but decides not to handle a particular event, it should invoke the superclass implementation of this method.

Available in Mac OS X v10.5 and later.

32.54.11  deleteBackward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single element backward from the insertion point (a letter or character in text, for example).

**Notes:** NSResponder declares but doesn’t implement this method.

32.54.12  deleteBackwardByDecomposingPreviousCharacter

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single character backward from the insertion point.

**Notes:** If the previous character is canonically decomposable, this method should try to delete only the last character in the grapheme cluster (for example, deleting “a”+”’” results in “a”). NSResponder declares but does not implement this method.

32.54.13  deleteForward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single element forward from the insertion point (a letter or character in text, for example).

**Notes:** NSResponder declares but doesn’t implement this method.
CHAPTER 32. COCOA

32.54.14 deleteToBeginningOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a line (typically of text).

**Notes:** Also places the deleted text into the kill buffer. NSResponder declares but doesn’t implement this method.

32.54.15 deleteToBeginningOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a paragraph of text.

**Notes:** Also places the deleted text into the kill buffer. NSResponder declares but doesn’t implement this method.

32.54.16 deleteToEndOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a line (typically of text).

**Notes:** Also places the deleted text into the kill buffer. NSResponder declares but doesn’t implement this method.

32.54.17 deleteToEndOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a paragraph of text.

**Notes:** Also places the deleted text into the kill buffer. NSResponder declares but doesn’t implement this method.

32.54.18 deleteToMark

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all items from the insertion point to a previously placed mark, including the selection itself if not empty.

**Notes:** Also places the deleted text into the kill buffer. NSResponder declares but doesn’t implement this method.
32.54. **CLASS NSRESPONDERMBS**

32.54.19 **deleteWordBackward**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single word backward from the insertion point. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.20 **deleteWordForward**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single word forward from the insertion point. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.21 **endGestureWithEvent(e as NSEventMBS)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has ended a touch gesture. **Notes:** Available in Mac OS X v10.6 and later.

32.54.22 **flagsChanged(e as NSEventMBS)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed or released a modifier key (Shift, Control, and so on). **Notes:** The default implementation simply passes this message to the next responder.

32.54.23 **flushBufferedKeyEvents**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Overridden by subclasses to clear any unprocessed key events.

32.54.24 **helpRequested(e as NSEventMBS)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays context-sensitive help for the receiver if such exists; otherwise passes this message to the next responder. **Notes:** NSWindow invokes this method automatically when the user clicks for help while processing the Event.
Subclasses need not override this method, and application code shouldn’t directly invoke it.

### 32.54.25 indent

**MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**  
**Function:** Implemented by subclasses to indent the selection or the insertion point if there is no selection.  
**Notes:** NSResponder declares but doesn’t implement this method.

### 32.54.26 insertBacktab

**MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**  
**Function:** Implemented by subclasses to handle a backward tab.  
**Notes:** A field editor might respond to this method by selecting the field before it, while a regular text object either doesn’t respond to or ignores such a message. NSResponder declares but doesn’t implement this method.

### 32.54.27 insertContainerBreak

**MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**  
**Function:** Implemented by subclasses to insert a container break (typically a page break) at the insertion point or selection, deleting the selection if there is one.  
**Notes:** NSResponder declares but doesn’t implement this method. NSTextView implements it to insert an NSFormFeedCharacter character (0x000c).

### 32.54.28 insertDoubleQuoteIgnoringSubstitution

**MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**  
**Function:** Implemented by subclasses to insert a double quote character at the insertion point without interference by automatic quote correction.  
**Notes:** NSResponder declares but doesn’t implement this method. Available in Mac OS X v10.6 and later.

### 32.54.29 insertLineBreak

**MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**  
**Function:** Implemented by subclasses to insert a line break (as distinguished from a paragraph break) at the insertion
point or selection, deleting the selection if there is one.

**Notes:** NSResponder declares but doesn’t implement this method. NSTextView implements it to insert an NSLineSeparatorCharacter character (0x2028).

### 32.54.30 insertNewline

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a newline character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.  
**Notes:** NSResponder declares but doesn’t implement this method.

### 32.54.31 insertNewlineIgnoringFieldEditor

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a line-break character at the insertion point or selection, deleting the selection if there is one.  
**Notes:** Unlike insertNewline:, this method always inserts a line-break character and doesn’t cause the receiver to end editing. NSResponder declares but doesn’t implement this method.

### 32.54.32 insertParagraphSeparator

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a paragraph separator at the insertion point or selection, deleting the selection if there is one.  
**Notes:** NSResponder declares but doesn’t implement this method.

### 32.54.33 insertSingleQuoteIgnoringSubstitution

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a single quote character at the insertion point without interference by automatic quote correction.  
**Notes:** NSResponder declares but doesn’t implement this method.  
Available in Mac OS X v10.6 and later.
32.54.34 insertTab

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.35 insertTabIgnoringFieldEditor

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one. **Notes:** Unlike insertTab:, this method always inserts a tab character and doesn’t cause the receiver to end editing. NSResponder declares but doesn’t implement this method.

32.54.36 keyDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed a key. **Notes:** The receiver can interpret theEvent itself, or pass it to the system input manager using interpretKeyEvents. The default implementation simply passes this message to the next responder.

32.54.37 keyUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has released a key. **Notes:** The default implementation simply passes this message to the next responder.

32.54.38 lowercaseWord

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to make lowercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary. **Notes:** If either end of the selection partially covers a word, that entire word is made lowercase. NSResponder declares, but doesn’t implement this method.
32.54. Class NsResponderMBS

32.54.39 magnifyWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that the user has begun a pinch gesture.
**Notes:**
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

32.54.40 makeBaseWritingDirectionLeftToRight

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the paragraph base writing direction to be left to right.
**Notes:**
Sets the NSAttributedString key NSWritingDirectionAttributeName to NSWritingDirectionLeftToRight.

This action method is intended to be used both as the target of a menu item and for key bindings. The
base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or
Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

32.54.41 makeBaseWritingDirectionNatural

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the paragraph base writing direction to be natural.
**Notes:**
Natural directionality is determined from the text in accordance with the Unicode bi-di algorithm. For more
information see NSParagraphStyle.

Sets the NSAttributedString key NSWritingDirectionAttributeName to NSTextWritingDirectionEmbedding.

This action method is intended to be used both as the target of a menu item and for key bindings. The
base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or
Arabic, or those who have otherwise enabled a suitable preference.
Available in Mac OS X v10.6 and later.

32.54.42 makeBaseWritingDirectionRightToLeft

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** 
Sets the paragraph base writing direction to be right to left. **Notes:** 
Sets the NSAttributedString key NSWritingDirectionAttributeName to NSWritingDirectionRightToLeft. 

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu. 

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference. 

Available in Mac OS X v10.6 and later.

32.54.43 makeTextWritingDirectionLeftToRight

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** 
Sets the character level attributed string direction attribute for left to right text. **Notes:** 
Sets the NSAttributedString NSWritingDirectionAttributeName to NSWritingDirectionLeftToRight. 

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu. 

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference. 

Available in Mac OS X v10.6 and later.
32.54. CLASS NSRESPONDERMBS

32.54.44 makeTextWritingDirectionNatural

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the character-level writing direction attribute.

**Notes:**
Removes the NSWritingDirectionAttributeName from an NSAttributedString.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

32.54.45 makeTextWritingDirectionRightToLeft

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the character-level writing direction attribute to a single right-to-left embedding.

**Notes:**
Sets the NSAttributedString key NSWritingDirectionAttributeName to NSWritingDirectionRightToLeft.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

32.54.46 mouseDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed the left mouse button.

**Notes:** The default implementation simply passes this message to the next responder.
### 32.54.47 mouseDragged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that the user has moved the mouse with the left button pressed.
**Notes:** The default implementation simply passes this message to the next responder.

### 32.54.48 mouseEntered(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that the cursor has entered a tracking rectangle.
**Notes:**
The default implementation simply passes this message to the next responder.
Available in Mac OS X v10.0 and later.

### 32.54.49 mouseExited(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that the cursor has exited a tracking rectangle.
**Notes:** The default implementation simply passes this message to the next responder.

### 32.54.50 mouseMoved(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that the mouse has moved.
**Notes:** The default implementation simply passes this message to the next responder.

### 32.54.51 mouseUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that the user has released the left mouse button.
**Notes:** The default implementation simply passes this message to the next responder.

### 32.54.52 moveBackward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Implemented by subclasses to move the selection or insertion point one element or character backward.
**Notes:** In text, if there is a selection it should be deselected, and the insertion point should be placed at
32.54. CLASS NSRESPONDERMBS

the beginning of the former selection. NSResponder declares but doesn’t implement this method.

32.54.53 moveBackwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection backward by one element or character.

**Notes:**

If the end being modified is the backward end, this method expands the selection; if the end being modified is the forward end, it reduces the selection. The first moveBackwardAndModifySelection: or moveForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the backward end becoming the mobile one if invoked first. By default, moveLeftAndModifySelection: is bound to the left arrow key.

NSResponder declares but doesn’t implement this method.

32.54.54 moveDown

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character down.

**Notes:** In text, if there is a selection it should be deselected, and the insertion point should be placed below the beginning of the former selection. NSResponder declares but doesn’t implement this method.

32.54.55 moveDownAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce the top or bottom end of the selection downward by one element, character, or line (whichever is appropriate for text direction).

**Notes:**

If the end being modified is the bottom, this method expands the selection; if the end being modified is the top, it reduces the selection. The first moveDownAndModifySelection: or moveUpAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the bottom end becoming the mobile one if invoked first.

NSResponder declares but doesn’t implement this method.
32.54.56 moveForward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character forward. **Notes:** In text, if there is a selection it should be deselected, and the insertion point should be placed at the end of the former selection. NSResponder declares but doesn’t implement this method.

32.54.57 moveForwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection forward by one element or character. **Notes:** If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first moveBackwardAndModifySelection: or moveForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. By default, moveRightAndModifySelection: is bound to the right arrow key. NSResponder declares but doesn’t implement this method.

32.54.58 moveLeft

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character to the left. **Notes:** In text, if there is a selection it should be deselected, and the insertion point should be placed at the left end of the former selection. NSResponder declares but doesn’t implement this method.

32.54.59 moveLeftAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection to the left (display order) by one element or character. **Notes:** If the end being modified is the left end, this method expands the selection; if the end being modified is the right end, it reduces the selection. The first moveLeftAndModifySelection: or moveRightAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first. By default, this method is bound to the left arrow key.
NSResponder declares but doesn’t implement this method.

The essential difference between this method and the corresponding moveBackwardAndModifySelection: is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

### 32.54.60 moveParagraphBackwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the previous paragraph, expanding or reducing the current selection.  
**Notes:**  
If the cursor is already at the beginning of a paragraph, the selection moves backward to the beginning of the previous paragraph.  
NSResponder declares but doesn’t implement this method.  
Available in Mac OS X v10.6 and later.

### 32.54.61 moveParagraphForwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the next paragraph, expanding or reducing the current selection.  
**Notes:**  
If the cursor is already at the end of a paragraph, the selection moves forward to the end of the next paragraph.  
NSResponder declares but doesn’t implement this method.  
Available in Mac OS X v10.6 and later.

### 32.54.62 moveRight

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character to the right.  
**Notes:** In text, if there is a selection it should be deselected, and the insertion point should be placed at the right end of the former selection. NSResponder declares but doesn’t implement this method.
**32.54.63 moveRightAndModifySelection**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection to the right (display order) by one element or character.

**Notes:**

If the end being modified is the left end, this method reduces the selection; if the end being modified is the right end, it expands the selection. The first moveLeftAndModifySelection: or moveRightAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the right end becoming the mobile one if invoked first. By default, this method is bound to the right arrow key.

NSResponder declares but doesn’t implement this method.

The essential difference between this method and the corresponding moveForwardAndModifySelection: is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

**32.54.64 moveToBeginningOfDocument**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the first element of the document or the insertion point to the beginning.

**Notes:** NSResponder declares but doesn’t implement this method.

**32.54.65 moveToBeginningOfDocumentAndModifySelection**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the document, expanding or reducing the current selection.

**Notes:** Available in Mac OS X v10.6 and later.

**32.54.66 moveToBeginningOfLine**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the first element of the selected line or the insertion point to the beginning of the line.

**Notes:** NSResponder declares but doesn’t implement this method.
32.54. **moveToBeginningOfLineAndModifySelection**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the line, expanding or reducing the current selection. **Notes:** NSResponder declares but doesn’t implement this method. Available in Mac OS X v10.6 and later.

32.54. **moveToBeginningOfParagraph**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the insertion point to the beginning of the selected paragraph. **Notes:** NSResponder declares but doesn’t implement this method.

32.54. **moveToBeginningOfParagraphAndModifySelection**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the current paragraph, expanding or reducing the current selection. **Notes:** NSResponder declares but doesn’t implement this method. Available in Mac OS X v10.6 and later.

32.54. **moveToEndOfDocument**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the last element of the document or the insertion point to the end. **Notes:** NSResponder declares but doesn’t implement this method.

32.54. **moveToEndOfDocumentAndModifySelection**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the end of the document, expanding or reducing the current selection. **Notes:** Available in Mac OS X v10.6 and later.
32.54.72  moveToEndOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the last element of the selected line or the insertion point to the end of the line. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.73  moveToEndOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the last element of the selected line or the insertion point to the end of the line. **Notes:** NSResponder declares but doesn’t implement this method. Available in Mac OS X v10.0 and later.

32.54.74  moveToEndOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the insertion point to the end of the selected paragraph. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.75  moveToEndOfParagraphAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the end of the line, expanding or reducing the current selection. **Notes:** NSResponder declares but doesn’t implement this method. Available in Mac OS X v10.6 and later.

32.54.76  moveToLeftEndOfLine

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the left end of the line. **Notes:** In text, if there is a selection it should be deselected, and the insertion point should be placed at left end of the line. NSResponder declares but doesn’t implement this method.
32.54. CLASS NSRESPONDERMBS

Available in Mac OS X v10.6 and later.

32.54.77 moveToLeftEndOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the left end of the line, expanding or contracting the selection as required.
**Notes:** Available in Mac OS X v10.6 and later.

32.54.78 moveToRightEndOfLine

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the right end of the line.
**Notes:** Available in Mac OS X v10.6 and later.

32.54.79 moveToRightEndOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the right end of the line, expanding or contracting the selection as required.
**Notes:** Available in Mac OS X v10.6 and later.

32.54.80 moveUp

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character up.
**Notes:** In text, if there is a selection it should be deselected, and the insertion point should be placed above the beginning of the former selection. NSResponder declares but doesn’t implement this method.

32.54.81 moveUpAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce the top or bottom end of the selection upward by one element, character, or line (whichever is appropriate for text direction).
**Notes:** If the end being modified is the bottom, this method reduces the selection; if the end being modified is the top, it expands the selection. The first moveDownAndModifySelection: or moveUpAndModifySelection:
method in a series determines the end being modified by always expanding. Hence, this method results in
the top end becoming the mobile one if invoked first.

NSResponder declares but doesn’t implement this method.

### 32.54.82 moveWordBackward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Implemented by subclasses to move the selection or insertion point one word backward.
**Notes:** If there is a selection it should be deselected, and the insertion point should be placed at the end of
the first word preceding the former selection. NSResponder declares but doesn’t implement this method.

### 32.54.83 moveWordBackwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Implemented by subclasses to expand or reduce either end of the selection backward by one whole word.
**Notes:**
If the end being modified is the backward end, this method expands the selection; if the end being modified is
the forward end, it reduces the selection. The first moveWordBackwardAndModifySelection: or moveWord-
ForwardAndModifySelection: method in a series determines the end being modified by always expanding.
Hence, this method results in the backward end becoming the mobile one if invoked first.

NSResponder declares but doesn’t implement this method.

### 32.54.84 moveWordForward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Implemented by subclasses to move the selection or insertion point one word forward, in logical order.
**Notes:** If there is a selection it should be deselected, and the insertion point should be placed at the be-
ginning of the first word following the former selection. NSResponder declares but doesn’t implement this
method.

### 32.54.85 moveWordForwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Implemented by subclasses to expand or reduce either end of the selection forward by one whole word.
**Notes:** If the end being modified is the backward end, this method reduces the selection; if the end being
modified is the forward end, it expands the selection. The first moveWordBackwardAndModifySelection:
or moveWordForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. NSResponder declares but doesn’t implement this method.

32.54.86 moveWordLeft

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one word to the left, in display order. **Notes:**

If there is a selection it should be deselected, and the insertion point should be placed at the end of the first word to the left of the former selection. NSResponder declares but doesn’t implement this method.

The main difference between this method and the corresponding moveWordBackward: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

32.54.87 moveWordLeftAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection left by one whole word in display order. **Notes:**

If the end being modified is the left end, this method expands the selection; if the end being modified is the right end, it reduces the selection. The first moveWordLeftAndModifySelection: or moveWordRightAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first.

NSResponder declares but doesn’t implement this method.

The main difference between this method and the corresponding moveWordBackwardAndModifySelection: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

32.54.88 moveWordRight

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one word right. **Notes:**
If there is a selection it should be deselected, and the insertion point should be placed at the beginning of the first word to the right of the former selection. NSResponder declares but doesn’t implement this method.

The main difference between this method and the corresponding moveWordForward: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

32.54.89  moveWordRightAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection to the right by one whole word. **Notes:**

If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first moveWordBackwardAndModifySelection: or moveWordForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. NSResponder declares but doesn’t implement this method.

The main difference between this method and the corresponding moveWordForwardAndModifySelection: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

32.54.90  otherMouseDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed a mouse button other than the left or right one. **Notes:**

The default implementation simply passes this message to the next responder. Available in Mac OS X v10.1 and later.

32.54.91  otherMouseDragged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed. **Notes:**

The default implementation simply passes this message to the next responder. Available in Mac OS X v10.1 and later.
32.54.92 otherMouseUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has released a mouse button other than the left or right button. **Notes:** The default implementation simply passes this message to the next responder.

32.54.93 pageDown

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.94 pageDownAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as required. **Notes:**
NSResponder declares but doesn’t implement this method. Available in Mac OS X v10.6 and later.

32.54.95 pageUp

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.96 pageUpAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as necessary. **Notes:**
NSResponder declares but doesn’t implement this method. Available in Mac OS X v10.6 and later.
32.54.97  `performMnemonic(theString as string) as boolean`

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Overridden by subclasses to handle a mnemonic.

**Notes:** If the character code or codes in theString match the receiver’s mnemonic, the receiver should perform the mnemonic and return true. The default implementation does nothing and returns false. Mnemonics are not supported in Mac OS X.

32.54.98  `presentError(e as NSErrorMBS) as boolean`

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Presents an error alert to the user as an application-modal dialog.

**Notes:**

e: An object containing information about an error.

The alert displays information found in the NSError object e; this information can include error description, recovery suggestion, failure reason, and button titles (all localized). The method returns true if error recovery succeeded and false otherwise. For error recovery to be attempted, an recovery-attempter object (that is, an object conforming to the NSErrorRecoveryAttempting informal protocol) must be associated with e.

The default implementation of this method sends willPresentError to self. By doing this, NSResponder gives subclasses an opportunity to customize error presentation. It then forwards the message, passing any customized error object, to the next responder; if there is no next responder, it passes the error object to NSApp, which displays a document-modal error alert. When the user dismisses the alert, any recovery attempter associated with the error object is given a chance to recover from the error. See the class description for the precise route up the responder chain (plus document and controller objects) this message might travel.

Available in OS X v10.4 and later.

32.54.99  `rightMouseDown(e as NSEventMBS)`

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed the right mouse button.

**Notes:** The default implementation simply passes this message to the next responder.

32.54.100  `rightMouseDragged(e as NSEventMBS)`

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has moved the mouse with the right button pressed.
Notes: The default implementation simply passes this message to the next responder.

32.54.101 rightMouseUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that the user has released the right mouse button.
**Notes:** The default implementation simply passes this message to the next responder.

32.54.102 rotateWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that the user has begun a rotation gesture.
**Notes:**
The event will be sent to the view under the touch in the key window. Available in Mac OS X v10.6 and later.
32.54.103 scrollLineDown

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Implemented by subclasses to scroll the receiver one line down in its scroll view, without changing the selection. Notes: NSResponder declares but doesn’t implement this method.

32.54.104 scrollLineUp

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Implemented by subclasses to scroll the receiver one line up in its scroll view, without changing the selection. Notes: NSResponder declares but doesn’t implement this method.

32.54.105 scrollPageDown

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Implemented by subclasses to scroll the receiver one page down in its scroll view, without changing the selection. Notes: NSResponder declares but doesn’t implement this method.

32.54.106 scrollPageUp

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Implemented by subclasses to scroll the receiver one page up in its scroll view, without changing the selection. Notes: NSResponder declares but doesn’t implement this method.

32.54.107 scrollToBeginningOfDocument

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Implemented by subclasses to scroll the receiver to the beginning of the document, without changing the selection. Notes: NSResponder declares but doesn’t implement this method. Available in Mac OS X v10.6 and later.
32.54. CLASS NSRESPONDERMBS

32.54.108 scrollToEndOfDocument

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver to the end of the document, without changing the selection. **Notes:**

NSResponder declares but doesn’t implement this method.

Available in Mac OS X v10.6 and later.

32.54.109 scrollWheel(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the mouse’s scroll wheel has moved. **Notes:**

The default implementation simply passes this message to the next responder. Available in Mac OS X v10.0 and later.

32.54.110 selectAll

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to select all selectable elements. **Notes:**

NSResponder declares but doesn’t implement this method.

32.54.111 selectLine

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to select all elements in the line or lines containing the selection or insertion point. **Notes:**

NSResponder declares but doesn’t implement this method.

32.54.112 selectParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to select all paragraphs containing the selection or insertion point. **Notes:**

NSResponder declares but doesn’t implement this method.
32.54.113 selectToMark

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to select all items from the insertion point or selection to a previously placed mark, including the selection itself if not empty. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.114 selectWord

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to extend the selection to the nearest word boundaries outside it (up to, but not including, word delimiters). **Notes:** NSResponder declares but doesn’t implement this method.

32.54.115 setMark

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to set a mark at the insertion point or selection, which is used by deleteToMark and selectToMark. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.116 showContextHelp

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to invoke the help system, displaying information relevant to the receiver and its current state.

32.54.117 swapWithMark

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Swaps the mark and the selection or insertion point, so that what was marked is now the selection or insertion point, and what was the insertion point or selection is now the mark. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.118 swipeWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has begun a rotation gesture.
Notes:
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

### 32.54.119 tabletPoint(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that a tablet-point event has occurred.

**Notes:**
Tablet events are represented by NSEvent objects of type NSTabletPoint. They describe the current state of a transducer (that is, a pointing device) that is in proximity to its tablet, reflecting changes such as location, pressure, tilt, and rotation. See the NSEvent reference for the methods that allow you to extract this and other information from theEvent. The default implementation of NSResponder passes the message to the next responder.
Available in Mac OS X v10.4 or later.

### 32.54.120 tabletProximity(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Informs the receiver that a tablet-proximity event has occurred.

**Notes:**
Tablet events are represented by NSEvent objects of type NSTabletProximity. Tablet devices generate proximity events when the transducer (pointing device) nears a tablet and when it moves away from a tablet. From an event object of this type you can extract information about the kind of device and its capabilities, as well as the relation of this tablet-proximity event to various tablet-point events; see the NSEvent reference for details. The default implementation passes the message to the next responder.
Available in Mac OS X v10.4 or later.

### 32.54.121 transpose

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Transposes the characters to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text.

**Notes:** NSResponder declares but doesn’t implement this method.
32.54.122 transposeWords

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Transposes the words to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text. **Notes:** NSResponder declares but doesn’t implement this method.

32.54.123 undoManager as NSUndoManagerMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The undo manager for this item. **Notes:** Subclasses may implement this property.

32.54.124 uppercaseWord

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to make uppercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary. **Notes:** If either end of the selection partially covers a word, that entire word is made uppercase. NSResponder declares but doesn’t implement this method.

32.54.125 yank

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the insertion point or selection with text from the kill buffer. **Notes:** If invoked sequentially, cycles through the kill buffer in reverse order. See ”Standard Action Methods for Selecting and Editing” for more information on the kill buffer. NSResponder declares but doesn’t implement this method.

32.54.126 Properties

32.54.127 Handle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle of this Responder. **Notes:** (Read and Write property)
32.54.128 menu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s menu.
**Notes:**
(On useful for NSApplication class on Mac)
(Read and Write computed property)

32.54.129 nextResponder as NSResponderMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The next responder in the responder chain.
**Notes:** (Read and Write computed property)
CHAPTER 32. COCOA

32.55 class NSRunLoopMBS

32.55.1 class NSRunLoopMBS

Function: The NSRunLoop class declares the programmatic interface to objects that manage input sources.

Notes:

An NSRunLoop object processes input for sources such as mouse and keyboard events from the window system, NSPort objects, and NSConnection objects. An NSRunLoop object also processes NSTimer events.

Your application cannot either create or explicitly manage NSRunLoop objects. Each NSThread object, including the application’s main thread, has an NSRunLoop object automatically created for it as needed. If you need to access the current thread’s run loop, you do so with the class method currentRunLoop.

Note that from the perspective of NSRunLoop, NSTimer objects are not "input"they are a special type, and one of the things that means is that they do not cause the run loop to return when they fire.

Warning:
The NSRunLoop class is generally not considered to be thread-safe and its methods should only be called within the context of the current thread. You should never try to call the methods of an NSRunLoop object running in a different thread, as doing so might cause unexpected results.

32.55.2 Methods

32.55.3 AddDummyPort

Function: Adds a dummy port as event source.

Notes: Run loops don’t loop unless there is an event source, so you can add a dummy one here.

32.55.4 allModes as string()

Function: Returns array with all mode strings.
32.55. **CLASS NSRUNLOOPMBS**

### 32.55.5 Constructor

**MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Creates a new object using current run loop.

### 32.55.6 currentRunLoop as NSRunLoopMBS

**MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the NSRunLoop object for the current thread.

**Notes:** If a run loop does not yet exist for the thread, one is created and returned.

### 32.55.7 mainRunLoop as NSRunLoopMBS

**MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the run loop of the main thread.

**Notes:**

An object representing the main thread’s run loop.
Available in OS X v10.5.

### 32.55.8 NSDefaultRunLoopMode as string

**MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** One of the runloop mode.

**Notes:**

The mode to deal with input sources other than NSConnection objects.
This is the most commonly used run-loop mode.

### 32.55.9 NSRunLoopCommonModes as string

**MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** One of the runloop mode.

**Notes:**

Objects added to a run loop using this value as the mode are monitored by all run loop modes that have been declared as a member of the set of "common" modes; see the description of CFRunLoopAddCommonMode for details.
Available in OS X v10.5 and later.
32.55.10 run

Function: Puts the receiver into a permanent loop, during which time it processes data from all attached input sources.
Notes:
If no input sources or timers are attached to the run loop, this method exits immediately; otherwise, it runs the receiver in the NSDefaultRunLoopMode by repeatedly invoking runMode:beforeDate:. In other words, this method effectively begins an infinite loop that processes data from the run loop’s input sources and timers.

Manually removing all known input sources and timers from the run loop is not a guarantee that the run loop will exit. OS X can install and remove additional input sources as needed to process requests targeted at the receiver’s thread. Those sources could therefore prevent the run loop from exiting.

If you want the run loop to terminate, you shouldn’t use this method. Instead, use one of the other run methods and also check other arbitrary conditions of your own, in a loop.
See also:
- 32.55.11 run(Seconds as Double)

32.55.11 run(Seconds as Double)

Function: Runs the runloop for the given number of seconds.
See also:
- 32.55.10 run

32.55.12 runMode(Mode as string, Seconds as Double) as boolean

Function: Runs the runloop for the given number of seconds in the given mode.

32.55.13 runModeUntilDate(Mode as string, limitDate as date) as boolean

Function: Runs the loop once, blocking for input in the specified mode until a given date.
Notes:
mode: The mode in which to run. You may specify custom modes or use one of the modes listed in "Run Loop Modes."
limitDate: The date until which to block.

Returns true if the run loop ran and processed an input source or if the specified timeout value was reached; otherwise, false if the run loop could not be started.

If no input sources or timers are attached to the run loop, this method exits immediately and returns false; otherwise, it returns after either the first input source is processed or limitDate is reached. Manually removing all known input sources and timers from the run loop does not guarantee that the run loop will exit immediately. OS X may install and remove additional input sources as needed to process requests targeted at the receiver’s thread. Those sources could therefore prevent the run loop from exiting.

Note: A timer is not considered an input source and may fire multiple times while waiting for this method to return.

### 32.55.14 runUntilDate(limitDate as date)

**MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Runs the loop until the specified date, during which time it processes data from all attached input sources.

**Notes:**

limitDate: The date up until which to run.

If no input sources or timers are attached to the run loop, this method exits immediately; otherwise, it runs the receiver in the NSDefaultRunLoopMode by repeatedly invoking runMode until the specified expiration date.

Manually removing all known input sources and timers from the run loop is not a guarantee that the run loop will exit. OS X can install and remove additional input sources as needed to process requests targeted at the receiver’s thread. Those sources could therefore prevent the run loop from exiting.

### 32.55.15 Properties

### 32.55.16 currentMode as String

**MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the receiver’s current input mode.

**Notes:**

The receiver’s current input mode. This method returns the current input mode only while the receiver is running; otherwise, it returns nil.
32.55.17 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object handle.  
**Notes:** (Read and Write property)
32.56. class NSScreenMBS

32.56.1 class NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSScreen object describes the attributes of a computer’s monitor, or screen. **Notes:**

An application may use an NSScreen object to retrieve information about a screen and use this information to decide what to display upon that screen. For example, an application may use the deepestScreen method to find out which of the available screens can best represent color and then may choose to display all of its windows on that screen.

The application object should be created before you use the methods in this class, so that the application object can make the necessary connection to the window system. You can make sure the application object exists by invoking the sharedApplication method of NSApplication. If you created your application with Xcode, the application object is automatically created for you during initialization.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

32.56.2 Methods

32.56.3 backingAlignedRect(r as NSRectMBS, options as UInt64) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a rectangle in global screen coordinates to a pixel aligned rectangle. **Notes:**

r: The input rectangle in global screen coordinates.
options: Specifies the alignment options. See NSAlignmentOptions for possible values.
Returns a a pixel aligned rectangle on the target screen from the given input rectangle in global screen coordinates.

This method uses NSIntegralRectWithOptions() to produce the pixel aligned rectangle.
Available in Mac OS X v10.7 and later.

32.56.4 backingScaleFactor as Double

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the backing store pixel scale factor for the screen. **Notes:**

Returns the scale factor representing the number of backing store pixels corresponding to each linear unit in screen space on this NSScreen.
This method is provided for rare cases when the explicit scale factor is needed. Please use the NSView class’s convert backing methods whenever possible.
Available in Mac OS X v10.7 and later.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.

### 32.56.5 colorSpace as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the colorSpace of the screen.

**Example:**
```
dim s as NSScreenMBS = NSScreenMBS.mainScreen
dim c as NSColorSpaceMBS = s.colorSpace
MsgBox c.localizedDescription
```

**Notes:**
Available in Mac OS X v10.6 and later.

Value is a NSColorSpaceMBS but declared as Variant to reduce plugin interdependencies.

### 32.56.6 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

### 32.56.7 convertRectFromBacking(r as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the rectangle from the device pixel aligned coordinates system of a screen.

**Notes:**
r: The rectangle.

Returns the rectangle converted from the device pixel aligned coordinates system of the screen. Available in Mac OS X v10.7 and later.
32.56. **CLASS NSSCREENMBS**

32.56.8 **convertRectToBacking(r as NSRectMBS) as NSRectMBS**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the rectangle to the device pixel aligned coordinates system of a screen.
**Notes:**

r: The rectangle.

Returns the rectangle converted to the device pixel aligned coordinates system of the screen. Available in Mac OS X v10.7 and later.

32.56.9 **deepestScreen as NSScreenMBS**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSScreen object representing the screen that can best represent color.
**Notes:** This method always returns an object, even if there is only one screen and it is not a color screen.

32.56.10 **depth as Integer**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s current bit depth and colorspace information.
**Notes:** Returns the window depth information. This value cannot be used directly. You must pass it to a function such as NSBitsPerPixelFromDepth or NSColorSpaceFromDepth to obtain a concrete value for the desired information.

32.56.11 **deviceDescription as dictionary**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the device dictionary for the screen.
**Notes:** A dictionary containing the attributes of the receiver’s screen.

32.56.12 **firstScreen as NSScreenMBS**

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSScreen object for the first screen.
**Notes:** Returns nil if no display is present.
32.56.13 frame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the dimensions and location of the receiver.
**Notes:** The full screen rectangle at the current resolution. This rectangle includes any space currently occupied by the menu bar and dock.

32.56.14 mainScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the NSScreen object containing the window with the keyboard focus.
**Notes:**
The main screen is not necessarily the same screen that contains the menu bar or has its origin at (0, 0). The main screen refers to the screen containing the window that is currently receiving keyboard events. It is the main screen because it is the one with which the user is most likely interacting.

The screen containing the menu bar is always the first object (index 0) in the array returned by the screens method.

32.56.15 NSScreenColorSpaceDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The notification name for the notification sent when the screen colorspace changed.
**Notes:**
The notification object is the NSScreen whose colorSpace has changed. This notification does not contain a userInfo dictionary. Use this constant with NSNotificationCenter class to get an event when such a notification is sent. Available in Mac OS X v10.6 and later.

32.56.16 screens as NSScreenMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an array of NSScreen objects representing all of the screens available on the system.
**Notes:**
Returns an array of the NSScreen objects available on the current system or nil if the screen information could not be obtained from the window system.

The screen at index 0 in the returned array corresponds to the primary screen of the user’s system. This is the screen that contains the menu bar and whose origin is at the point (0, 0). In the case of mirroring,
first screen is the largest drawable display; if all screens are the same size, it is the screen with the highest pixel depth. This primary screen may not be the same as the one returned by the mainScreen method, which returns the screen with the active window.

The array should not be cached. Screens can be added, removed, or dynamically reconfigured at any time. When the display configuration is changed, the default notification center sends a NSApplicationDidChange-ScreenParametersNotification notification.

32.56.17 secondScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the NSScreen object for the second screen. Notes: Returns nil if no second display is present.

32.56.18 supportedWindowDepths as Integer()

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a zero-terminated array of the window depths supported by the receiver.

32.56.19 userSpaceScaleFactor as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the scaling factor from user space to device space on the screen represented by the receiver. Notes: Returns the scaling factor, measured in pixels per point, where a point is always equal to 1/72 of an inch. For example, a scaling factor of 2.0 indicates the display has a resolution 2 pixels per point or 144 pixels-per-inch. Available in Mac OS X v10.4 and later.

32.56.20 visibleFrame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the current location and dimensions of the visible screen. Notes: The returned rectangle is always based on the current user-interface settings and does not include the area currently occupied by the dock and menu bar. Because it is based on the current user -interface settings,
the returned rectangle can change between calls and should not be cached.

Note: Even when dock hiding is enabled, the rectangle returned by this method may be smaller than the full screen. The system uses a small boundary area to determine when it should display the dock.

32.56.21 Properties

32.56.22 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSScreen object.

**Notes:** (Read and Write property)
32.57 .  CLASS NNSERVICEPROVIDERMBS

32.57 class NSServiceProviderMBS

32.57.1 class NSServiceProviderMBS

Function: The class to do service handlers in Cocoa applications.  
Notes:  
This class must be subclassed to implement services.  
Use ServiceInvoked as the name of the selector when declaring service (NSMessage parameter).  
Use NSUserData parameter to distinguish between all the services you offer.  
This class implements NSServiceProvider for Xojo and Real Studio for Cocoa applications. For Carbon, please use CarbonApplicationEventsMBS events.

see also:  

32.57.2 Methods

32.57.3 Constructor

32.57.4 Destructor

32.57.5 Properties

32.57.6 Handle as Integer

Notes: (Read and Write property)
32.57.7 Events

32.57.8 ServiceInvoked(pboard as NSPasteboardMBS, userData as string, byref error as string)

Function: This event is called when a service should perform.
Notes:

Use ServiceInvoked as the name of the selector when declaring service (NSMessage parameter).
Use NSUserData parameter to distinguish between all the services you offer.
32.58. class NSShadowMBS

32.58.1 class NSShadowMBS

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSShadow object encapsulates the attributes used to create a drop shadow during drawing operations. **Notes:**

Shadows are always drawn in the default user coordinate space, regardless of any transformations applied to that space. This means that rotations, translations and other transformations of the current transformation matrix (the CTM) do not affect the resulting shadow. Another way to think about this is that changes to the CTM do not move or change the apparent position of the shadows light source.

There are two positional parameters for a shadow: an x-offset and a y-offset. These values are expressed using a single size data type (CGSize on iOS, NSSize on OS X) and using the units of the default user coordinate space. Positive values for these offsets extend up and to the right.

In addition to its positional parameters, a shadow also contains a blur radius, which specifies how much a drawn object’s image mask is blurred before it is composited onto the destination. A value of 0 means there is no blur. Larger values give correspondingly larger amounts of blurring.

An NSShadow object may be used in one of two ways. First, it may be set, like a color or a font, in which case its attributes are applied to all content drawn thereafter or at least until another shadow is applied or a previous graphics state is restored. Second, it may be used as the value for the NSShadowAttributeName text attribute, in which case it is applied to the glyphs corresponding to the characters bearing this attribute.

32.58.2 Methods

32.58.3 Constructor

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor. **Notes:** Initialized with 0 as its offset, 0 as its blur radius, and the default color as its color.

32.58.4 copy as NSShadowMBS

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the shadow object.
32.58.5 set

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the shadow of subsequent drawing operations to the shadow represented by the receiver. **Notes:** The shadow attributes of the receiver are used until another shadow is set or until the graphics state is restored.

32.58.6 Properties

32.58.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

32.58.8 shadowBlurRadius as Double

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The blur radius of the shadow. **Notes:** This property contains the blur radius, as measured in the default user coordinate space. A value of 0 indicates no blur, while larger values produce correspondingly larger blurring. The default value is 0. (Read and Write property)

32.58.9 shadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color of the shadow. **Notes:** The default shadow color is black with an alpha of 1/3. If you set this property to nil, the shadow is not drawn. (Read and Write property)

32.58.10 shadowOffset as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The offset values of the shadow. **Notes:**
This property contains the horizontal and vertical offset values, specified using the width and height fields of the NSSize data type. These offsets are measured using the default user coordinate space and are not affected by custom transformations. This means that positive values always extend down and to the right from the user’s perspective.

(Read and Write property)
32.59 class NSSizeMBS

32.59.1 class NSSizeMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A REALbasic class for the size structure in Cocoa.

**Example:**

```realbasic
dim n as NSSizeMBS = NSMakeSizeMBS(500,600)
MsgBox n.String
```

32.59.2 Methods

32.59.3 Constructor

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty size.

**Example:**

```realbasic
dim p as new NSSizeMBS
MsgBox p // shows { 0, 0 }
```

See also:

- 32.59.4 Constructor(p as Ptr)
- 32.59.5 Constructor(s as string)
- 32.59.6 Constructor(Width as Double, Height as Double)

32.59.4 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new instance using data at the pointer.

**Notes:** Make sure the pointer is valid and has the right data and size.

See also:

- 32.59.3 Constructor
- 32.59.5 Constructor(s as string)
- 32.59.6 Constructor(Width as Double, Height as Double)
32.59. CLASS NSSIZEMBS

32.59.5 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSSize object using the given string.

**Example:**

```vba
dim p as new NSSizeMBS("{1,2}")
MsgBox p // shows {1, 2}
```

See also:

- 32.59.3 Constructor
- 32.59.4 Constructor(p as Ptr)
- 32.59.6 Constructor(Width as Double, Height as Double)

32.59.6 Constructor(Width as Double, Height as Double)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSSize object using the given values.

See also:

- 32.59.3 Constructor
- 32.59.4 Constructor(p as Ptr)
- 32.59.5 Constructor(s as string)

32.59.7 Equal(other as NSSizeMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether two sizes are equal.

32.59.8 Operator.Convert as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the object to string.

**Example:**

```vba
dim p as new NSSizeMBS(1,2)
MsgBox p // shows { 1, 2 }
```
### 32.59.9 String as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string representation of this size object.  
**Example:**
```vba
dim p as new NSSizeMBS(1,2)
MsgBox p.String // shows { 1, 2 }
```

### 32.59.10 Zero as NSSizeMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a size with all values being zero.

### 32.59.11 Properties

#### 32.59.12 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The pointer to the internal data structure.  
**Notes:**  
May be useful for passing to declares requiring a NSSize*.  
Size of structure is 8 bytes for 32-bit (two singles) and 16 bytes for 64-bit (two doubles).  
(Read only property)

#### 32.59.13 Height as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height of this size.  
**Notes:** (Read and Write property)

#### 32.59.14 Width as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of this size.  
**Notes:** (Read and Write property)
32.60. class NSSoundDelegateMBS

32.60.1 class NSSoundDelegateMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for the delegate to receive events from NSSoundMBS objects.

32.60.2 Events

32.60.3 SoundFinished(s as NSSoundMBS, didFinishPlaying as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This delegate method is called when an NSSoundMBS instance has completed playback of its sound data.

**Notes:**

s: The NSSound that has completed playback of its sound data.

didFinishPlaying: True when playback was successful; false otherwise.

The parameter s is not the NSSoundMBS object you used before but a new one. But it has the same handle value as the one where you called play, so you can still compare which one was affected.
32.61 class NSSoundMBS

32.61.1 class NSSoundMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSSound class provides a simple interface for loading and playing audio files.

**Notes:**

This class supports the same audio encodings and file formats that are supported by Core Audio and QuickTime.

To use this class, initialize a new instance with the desired file or audio data. You can configure assorted aspects of the audio playback, including the volume and whether the sound loops before you play it. Depending on the type of the audio data, this class may use either Core Audio or QuickTime to handle the actual playback. (Typically, it uses Core Audio to play files in the AIFF, WAVE, NeXT, SD2, AU, and MP3 formats and may use it for other formats in the future as well.) Playback occurs asynchronously so that your application can continue doing work.

You should retain NSSound objects before initiating playback or make sure you have a strong reference to them in a garbage-collected environment. Upon deallocation, a sound object stops playback of the sound (as needed) so that it can free up the corresponding audio resources. If you want to deallocate a sound object immediately after playback, assign a delegate and use the sound:didFinishPlaying: method to deallocate it.

If you want to play the system beep sound, use the NSBeep function.

32.61.2 Methods

32.61.3 availableSounds as string()

**Example:**

```
dim sounds(-1) as string = NSSoundMBs.availableSounds

// play first sound
dim n as NSSoundMBS = NSSoundMBS.soundNamed(sounds(0))

call n.play

// show list of sounds
MsgBox Join(sounds,EndOfLine)
```
32.61. **CLASS NSSOUNDMBS**

**Notes:** You can use the names in this array for the soundNamed function.

### 32.61.4 canInitWithPasteboard as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver can create an instance of itself from the data in a pasteboard.

**Notes:**
true when the receiver can handle the data represented by pasteboard; false otherwise.

The soundUnfilteredPasteboardTypes method is used to find out whether the class can handle the data in the pasteboard.

### 32.61.5 channelMapping as Integer()

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the receivers channel map.

**Notes:**
A channel map correlates a sounds channels to the the output-devices channels. For example, a two-channel sound being played on a five-channel device should have a channel map to optimize the sound-playing experience. The default map, correlates the first sound channel to the first output channel, the second sound channel to the second output channel, and so on.

Available in OS X v10.5 and later. Deprecated in OS X v10.9.

### 32.61.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver with data from a pasteboard.

**Notes:** NSSound expects the data to have a proper magic number, sound header, and data for the formats it supports.

See also:

- 32.61.7 Constructor(data as MemoryBlock)
- 32.61.8 Constructor(file as folderitem, ByReference as boolean)
- 32.61.9 Constructor(url as string, ByReference as boolean)
32.61.7 Constructor(data as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver with a given audio data. **Notes:** data: Audio data with which the receiver is to be initialized. The data must have a proper magic number, sound header, and data for the formats the NSSound class supports. See also:

- 32.61.6 Constructor
- 32.61.8 Constructor(file as folderitem, ByReference as boolean)
- 32.61.9 Constructor(url as string, ByReference as boolean)

32.61.8 Constructor(file as folderitem, ByReference as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver with the audio data located at a given file. **Example:**

```plaintext
dim s as NSSoundMBS
dim f as FolderItem

f=SpecialFolder.Desktop.Child("test.mp3")

s=new NSSoundMBS(f,true)

call s.play
```

**Notes:**

file: Path to the sound file.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder:, otherwise the audio data is archived along with the instance. (not used in REALbasic) See also:

- 32.61.6 Constructor
- 32.61.7 Constructor(data as MemoryBlock)
- 32.61.9 Constructor(url as string, ByReference as boolean)

32.61.9 Constructor(url as string, ByReference as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver with the audio data located at a given URL. **Notes:**
url: URL to the sound file with which the receiver is to be initialized.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder; otherwise the audio data is archived along with the instance. (not used in REALbasic)
See also:

- 32.61.6 Constructor
- 32.61.7 Constructor(data as MemoryBlock)
- 32.61.8 Constructor(file as folderitem, ByReference as boolean)

### 32.61.10 duration as Double

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the duration of the receiver in seconds.
**Notes:** Available in Mac OS X v10.5 and later.

### 32.61.11 isPlaying as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver is playing its audio data.
**Notes:** True when the receiver is playing its audio data, false otherwise.

### 32.61.12 name as string

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name assigned to the receiver.
**Notes:** Name assigned to the receiver; "" when no name has been assigned.

### 32.61.13 NSSoundPboardType as string

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSSound class defines this common pasteboard data type.

### 32.61.14 pause as boolean

**Notes:** True when playback is paused successfully, false when playback is already paused or when an error
32.61.15  play as boolean

Notes: True when playback is initiated, false when playback is already in progress or when an error occurred.

This method initiates playback asynchronously and returns control to your application. Therefore, your application can continue doing work while the audio is playing.

32.61.16  resume as boolean

Notes: True when playback is resumed, false when playback is in progress or when an error occurred.

Assumes the receiver has been previously paused by sending it pause.

32.61.17  setChannelMapping(mapping() as Integer)

Notes: Mapping: Audio-channeltodevicechannel mappings for the receiver.

Available in OS X v10.5 and later. Deprecated in OS X v10.9.

32.61.18  setDelegate(delegate as NSSoundDelegateMBS)

Notes:
You can assign one delegate to several sounds. But the delegate object is not referenced, so keep it alive with your own reference, so RB won’t destroy it too early.

### 32.61.19 setName(name as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers the receiver under a given name.

**Notes:**

Returns True when successful; false otherwise.

If the receiver is already registered under another name, this method first unregisters the prior name.

### 32.61.20 soundNamed(name as string) as NSSoundMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSSound instance associated with a given name.

**Example:**

```plaintext
dim s as NSSoundMBS

s=NSSoundMBS.soundNamed("Submarine")
call s.play
```

**Notes:**

NSSound instance initialized with the sound data identified by soundName.

The returned object can be one of the following:

One that’s been assigned a name with setName.

One of the named system sounds provided by the Application Kit framework If there’s no known NSSound object with soundName, this method tries to create one by searching for sound files in the application’s main bundle (see NSBundle for a description of how the bundle’s contents are searched). If no sound file can be located in the application main bundle, the following directories are searched in order: textasciitilde /Library/Sounds, /Library/Sounds, /Network/Library/Sounds or /System/Library/Sounds.
If no data can be found for soundName, no object is created, and nil is returned.

The preferred way to locate a sound is to pass a name without the file extension. See the class description for a list of the supported sound file extensions.

### 32.61.21 soundUnfilteredFileTypes as string()

**Function:** Provides the list of file types the NSSound class understands.

**Notes:**

Returns array of strings representing the file types the NSSound class understands.
The returned array may be passed directly to the runModalForTypes method of the NSOpenPanel class.
Available in OS X v10.0 and later. Deprecated in OS X v10.5.

### 32.61.22 soundUnfilteredPasteboardTypes as string()

**Function:** Provides a list of the pasteboard types that the NSSound class can accept.

**Notes:**

Array of pasteboard types that the NSSound class can accept.
Available in OS X v10.0 and later. Deprecated in OS X v10.5.

### 32.61.23 soundUnfilteredTypes as string()

**Function:** Provides the file types the NSSound class understands.

**Notes:**

Returns array of UTIs identifying the file types the NSSound class understands.

Available in OS X v10.5 and later.

### 32.61.24 soundWithContentsOfFile(file as folderitem, ByValReference as boolean) as NSSoundMBS

**Function:** Initializes a NSSound object with the audio data located at a given file.

**Example:**
dim s as NSSoundMBS
dim f as FolderItem

f=SpecialFolder.Desktop.Child(”test.mp3”)
s=NSSoundMBS.soundWithContentsOfFile(f,true)
call s.play

// sound continues to play even after NSSoundMBS object is destroyed.

Notes:

file: Path to the sound file.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder; otherwise the audio data is archived along with the instance. (not used in REAL-basic)

32.61.25 soundWithContentsOfURL(url as string, ByReference as boolean) as NSSoundMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes a NSSoundMBS object with the audio data located at a given URL.
Notes:

url: URL to the sound file with which the receiver is to be initialized.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder; otherwise the audio data is archived along with the instance. (not used in REAL-basic)

32.61.26 soundWithData(data as MemoryBlock) as NSSoundMBS

Notes: data: Audio data with which the receiver is to be initialized. The data must have a proper magic number, sound header, and data for the formats the NSSound class supports.

32.61.27 soundWithPasteboard as NSSoundMBS

Notes: NSSound expects the data to have a proper magic number, sound header, and data for the formats it supports.

### 32.61.28 stop as boolean

**Notes:** True when playback is concluded successfully or if it’s paused, false otherwise.

### 32.61.29 writeToPasteboard

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the receiver’s data to a pasteboard.

### 32.61.30 Properties

### 32.61.31 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSSound object.  
**Notes:** (Read and Write property)

### 32.61.32 currentTime as Double

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the receiver’s playback progress in seconds.  
**Notes:**  
Receiver’s playback progress in seconds.  
Sounds start with currentTime == 0 and end with currentTime == ( sound.duration ) - 1).  
Available in Mac OS X v10.5 and later.  
This property is not archived, copied, or stored on the pasteboard.  
(Read and Write computed property)
32.61.33 loops as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver restarts playback when it reaches the end of its content.

**Notes:**
True when the receiver restarts playback when it finishes, false otherwise.
Default: false

Available in Mac OS X v10.5 and later.

When loops is true, the delegate does not call the SoundFinished event on the end of its content and restarts playback.
(Read and Write computed property)

32.61.34 playbackDeviceIdentifier as string

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Identifies the receiver’s output device.

**Notes:**
Returns an unique identifier of a sound output device.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

32.61.35 volume as Double

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the volume of the receiver.

**Notes:**
This method does not affect the systemwide volume.
Available in Mac OS X v10.5 and later.

0.0 is not sound and 1.0 is full sound.
(Read and Write computed property)
32.62 class NSStreamMBS

32.62.1 class NSStreamMBS

**Function:** An abstract class representing a stream.  
**Notes:**  
This class’s interface is common to all Cocoa stream classes, including its concrete subclasses NSInputStream and NSOutputStream.  
NSStream objects provide an easy way to read and write data to and from a variety of media in a device-independent way. You can create stream objects for data located in memory, in a file, or on a network (using sockets), and you can use stream objects without loading all of the data into memory at once.  
By default, NSStream instances that are not file-based are non-seekable, one-way streams (although custom seekable subclasses are possible). Once the data has been provided or consumed, the data cannot be retrieved from the stream.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

32.62.2 Methods

32.62.3 Close

**Function:** Closes the receiver.  
**Notes:** Closing the stream terminates the flow of bytes and releases system resources that were reserved for the stream when it was opened. If the stream has been scheduled on a run loop, closing the stream implicitly removes the stream from the run loop. A stream that is closed can still be queried for its properties.

32.62.4 Constructor

**Function:** The private constructor.

32.62.5 Open

**Function:** Opens the receiving stream.  
**Notes:** A stream must be created before it can be opened. Once opened, a stream cannot be closed and reopened.
32.62.6  SetPosition(pos as Int64) as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets position in a stream.  
**Notes:** Returns true on success or false on failure.

32.62.7  Properties

32.62.8  Error as NSErrorMBS

**Function:** Returns an NSError object representing the stream error.  
**Notes:**  
An NSError object representing the stream error, or nil if no error has been encountered.  
(Read only property)

32.62.9  Handle as Integer

**Function:** The internal object reference.  
**Notes:** (Read and Write property)

32.62.10  position as Int64

**Function:** Queries position in file stream.  
**Notes:** (Read only property)

32.62.11  Status as Integer

**Function:** Returns the receivers status.  
**Notes:**  
See kStatus* constants.  
(Read only property)
32.62.12 Constants

32.62.13 kStatusAtEnd = 5

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the status constants. Notes: There is no more data to read, or no more data can be written to the stream. When this status is returned, the stream is in a non-blocking mode and no data are available.

32.62.14 kStatusClosed = 6

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the status constants. Notes: The stream is closed (close has been called on it).

32.62.15 kStatusError = 7

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the status constants. Notes: The remote end of the connection can not be contacted, or the connection has been severed for some other reason.

32.62.16 kStatusNotOpen = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the status constants. Notes: The stream is not open for reading or writing. This status is returned before the underlying call to open a stream but after its been created.

32.62.17 kStatusOpen = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the status constants. Notes: The stream is open, but no reading or writing is occurring.

32.62.18 kStatusOpening = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the status constants. Notes: The stream is in the process of being opened for reading or for writing. For network streams, this status might include the time after the stream was opened, but while network DNS resolution is happening.
32.62.19  kStatusReading = 3

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.

**Notes:**

Data is being read from the stream. This status would be returned if code on another thread were to call Status on the stream while a read() was in progress.

32.62.20  kStatusWriting = 4

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.

**Notes:**

Data is being written to the stream. This status would be returned if code on another thread were to call Status on the stream while a write() was in progress.
32.63 class NSTextAttachmentMBS

32.63.1 class NSTextAttachmentMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: An attachment to a text.

Notes:

NSTextAttachment objects are used by the NSAttributedString class cluster as the values for attachment attributes (stored in the attributed string under the key named NSAttachmentAttributeName). The objects you create with this class are referred to as text attachment objects, or when no confusion will result, as text attachments or merely attachments.

A text attachment object contains an NSFileWrapper in NSFileWrapper Class Reference object, which in turn holds the contents of the attached file. It also uses a cell object conforming to the NSTextAttachmentCell in NSTextAttachmentCell Protocol Reference protocol to draw and handle mouse events. Most of the behavior of a text attachment is relegated to the file wrapper and the attachment cell. See the corresponding class and protocol specifications for more information.

See the NSAttributedString in NSAttributedString Class Reference and NSTextView in NSTextView Class Reference class specifications for general information on text attachments.

see also

32.63.2 Methods

32.63.3 attributedStringWithAttachment(attachment as NSTextAttachmentMBS) as NSAttributedStringMBS

Example:

```plaintext
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"

dim a as new NSTextAttachmentMBS(f)
dim s as NSAttributedStringMBS = NSTextAttachmentMBS.attributedStringWithAttachment(a)
```
**Notes:** This is a convenience method for creating an attributed string containing an attachment using \NSAttachmentCharacter as the base character.

### 32.63.4 Constructor(fileWrapper as NSFileWrapperMBS)

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly allocated NSTextAttachment object to contain the given file wrapper.

**Example:**

```vba
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"

dim a as new NSTextAttachmentMBS(f)

Break // inspect in debugger
```

**Notes:** If fileWrapper contains an image file that the receiver can interpret as an NSImage object, sets the attachment cells image to the NSImage rather than to the icon of fileWrapper.

See also:

- 32.63.5 Constructor(image as NSImageMBS)

### 32.63.5 Constructor(image as NSImageMBS)

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly allocated NSTextAttachment object with a cell and given image.

See also:

- 32.63.4 Constructor(fileWrapper as NSFileWrapperMBS)

### 32.63.6 Properties

#### 32.63.7 attachmentCell as Variant

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The attachment cell.

**Notes:**

As our plugin currently has no NSTextAttachmentCell class, we just give you a NSCell object. This allows accessing most of the properties.

Value is a NSCellMBS declared as Variant to reduce plugin dependencies.
32.63.8 fileWrapper as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file wrapper.  
**Notes:**  
The file wrapper holds the contents of the attached file.  
(Read and Write property)

32.63.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:**  
Must not be 0 to have the object being valid.  
(Read and Write property)

32.63.10 Constants

32.63.11 NSAttachmentCharacter = & hFFFC

MBS MacBase Plugin, Plugin Version: 15.0. **Function:** This character is used to denote an attachment.  
**Example:**  
```
dim s as string = encodings.UTF16.Chr(NSTextAttachmentMBS.NSAttachmentCharacter)
```
32.64 class NSTextContainerMBS

32.64.1 class NSTextContainerMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The NSTextContainer class defines a region where text is laid out. Notes: An NSLayoutManager uses NSTextContainer to determine where to break lines, lay out portions of text, and so on. NSTextContainer defines rectangular regions, but you can create subclasses that define regions of other shapes, such as circular regions, regions with holes in them, or regions that flow alongside graphics.

32.64.2 Methods

32.64.3 Constructor(size as NSSizeMBS)

The new text container must be added to an NSLayoutManager object before it can be used. The text container must also have an NSTextView object set for text to be displayed. This method is the designated initializer for the NSTextContainer class.

32.64.4 containsPoint(p as NSPointMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Overridden by subclasses to return whether a point lies within the receiver's region or on the region’s edgenot simply within its bounding rectangle. Notes: True if aPoint lies within the receiver's region or on the region’s edgenot simply within its bounding rectangle - false otherwise.

For example, if the receiver defines a donut shape and aPoint lies in the hole, this method returns false. This method can be used for hit testing of mouse events.

The default NSTextContainer implementation merely checks that aPoint lies within its bounding rectangle.
32.64.5  isSimpleRectangularTextContainer as boolean

**Function:** Overridden by subclasses to return whether the receiver’s region is a rectangle with no holes or gaps and whose edges are parallel to the text view’s coordinate system axes.  
**Notes:**  
True if the receiver’s region is a rectangle with no holes or gaps and whose edges are parallel to the text view’s coordinate system axes, false otherwise.  

A text container whose shape changes can return true if its region is currently a simple rectangle, but when its shape does change it must send textContainerChangedGeometry to its layout manager so the layout can be recalculated.  

The default NSTextContainer implementation of this method returns true.

32.64.6  replaceLayoutManager(l as NSLayoutManagerMBS)

**Function:** Replaces the layout manager for the group of text system objects containing the receiver.  
**Notes:** All text containers and text views sharing the original layout manager share the new layout manager. This method makes all the adjustments necessary to keep these relationships intact, unlike setLayoutManager.

32.64.7  Properties

32.64.8  Handle as Integer

**Function:** The internal object reference.  
**Notes:** (Read and Write property)

32.64.9  containerSize as NSSizeMBS

**Function:** The size of the receiver’s bounding rectangle.  
**Notes:**
32.64. **CLASS NSTEXTCONTAINERMBS**

size: The new size of the text container's bounding rectangle.
This method also sends textContainerChangedGeometry to the text container's layout manager.
(Read and Write computed property)

32.64.10 **heightTracksTextView as boolean**

**Function:** Controls whether the receiver adjusts the height of its bounding rectangle when its text view is resized.
**Notes:**
value: True if the receiver should follow changes to the height of its text view, false otherwise.
(Read and Write computed property)

32.64.11 **layoutManager as NSLayoutManagerMBS**

**Function:** The layout manager.
**Notes:**
This method is invoked automatically when you add a text container to a layout manager; you should never
need to invoke it directly, but might want to override it. If you want to replace the layout manager for an
established group of text system objects, use replaceLayoutManager.
(Read and Write computed property)

32.64.12 **lineFragmentPadding as Double**

**Function:** The amount by which text is inset within line fragment rectangles.
**Notes:**
Value: The amount by which text is inset within line fragment rectangles, in points.

This method also sends textContainerChangedGeometry to the text container's layout manager.

Line fragment padding is not designed to express text margins. Instead, use the NSTextView method set-
TextContainerInset, paragraph margin attributes, or the position of the text view within a superview.
(Read and Write computed property)
32.64.13 **textView as NSTextViewMBS**

**Function:** The text view.  
**Notes:**  
This method sends setTextContainer to aTextView to complete the association of the text container and text view.  

Because you usually specify a text container when you create a text view, you should rarely need to invoke this method. A text container doesn’t need a text view to calculate line fragment rectangles, but must have one to display text.  

You can use this method to disconnect a text view from a group of text system objects by sending this message to its text container and passing nil as aTextView.  
(Read and Write computed property)

32.64.14 **widthTracksTextView as boolean**

**Function:** Controls whether the receiver adjusts the width of its bounding rectangle when its text view is resized.  
**Notes:**  
Returns true if the receiver adjusts the width of its bounding rectangle when its text view is resized, false otherwise.  

If the receiver does track the text view width, its width is adjusted to the width of the text view minus twice the inset width (as given by NSTextView’s textContainerInset method).  
(Read and Write computed property)

32.64.15 **Constants**

32.64.16 **NSLineDoesntMove = 0**

MBS MacCocoa Plugin, Plugin Version: 12.4.  
**Function:** One of the line movement constants.  
**Notes:** Line has no movement.
32.64.17  NSLineMovesDown = 3

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line movement constants.
**Notes:** Lines move from top to bottom.

32.64.18  NSLineMovesLeft = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line movement constants.
**Notes:** Lines move from right to left.

32.64.19  NSLineMovesRight = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line movement constants.
**Notes:** Lines move from left to right.

32.64.20  NSLineMovesUp = 4

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line movement constants.
**Notes:** Lines move from bottom to top.

32.64.21  NSLineSweepDown = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line sweep direction constants.
**Notes:** Characters move from top to bottom.

32.64.22  NSLineSweepLeft = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line sweep direction constants.
**Notes:** Characters move from right to left.

32.64.23  NSLineSweepRight = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line sweep direction constants.
**Notes:** Characters move from left to right.
32.64.24  **NSLineSweepUp = 3**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line sweep direction constants.  
**Notes:** Characters move from bottom to top.
32.65. `CLASS NSTEXTLISTMBS`

32.65 class NSTextListMBS

32.65.1 class NSTextListMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A section of text that forms a single list.  
**Notes:**

The visible elements of the list, including list markers, appear in the text as they do for lists created by hand. The list object, however, allows the list to be recognized as such by the text system. This enables automatic creation of markers and spacing. Text lists are used in HTML import and export.

Text lists appear as attributes on paragraphs, as part of the paragraph style. An NSParagraphStyle may have an array of text lists, representing the nested lists containing the paragraph, in order from outermost to innermost. For example, if list1 contains four paragraphs, the middle two of which are also in the inner list2, then the text lists array for the first and fourth paragraphs is (list1), while the text lists array for the second and third paragraphs is (list1, list2). The methods implementing this are textLists on NSParagraphStyle, and textLists on NSMutableParagraphStyle.

In addition, NSAttributedString has convenience methods for lists, such as rangeOfTextList, which determines the range covered by a list, and itemNumberInTextList, which determines the ordinal position within a list of a particular item.

32.65.2 Methods

32.65.3 Constructor(format as String, OptionsMask as Integer = 0)

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized text list.  
**Notes:**

format: The marker format for the text list.  
mask: The marker options for the text list. Values for mask are listed in Constants.

Returns an initialized text list.

The marker format is specified as a constant string, except for a numbering specifier, which takes the form `{ keyword }`. The currently supported values for keyword include:

- box
- check
• circle
• diamond
• disc
• hyphen
• square
• lower-hexadecimal
• upper-hexadecimal
• octal
• lower-alpha or lower-latin
• upper-alpha or upper-latin
• lower-roman
• upper-roman
• decimal

Thus, for example, "( { decimal } )" would specify the format for a list numbered (1), (2), (3), and so on, and "@" { upper-roman } " would specify the format for a list numbered I, II, III, IV, and so on. (All of these keywords are included in the Cascading Style Sheets level 3 specification.)

32.65.4 copy as NSTextListMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the text list.

32.65.5 markerForItemNumber(ItemNum as Integer) as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the computed value for a specific ordinal position in the list.

**Notes:**

itemNum: The ordinal position in the list whose computed marker value is desired.

Returns the computed maker value for itemNum.
32.65. **NSTextListMarkerBox as String**

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts. **Notes:** Available on MacOS 10.13 or newer.

32.65.7 **NSTextListMarkerCheck as String**

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts. **Notes:** Available on MacOS 10.13 or newer.

32.65.8 **NSTextListMarkerCircle as String**

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts. **Notes:** Available on MacOS 10.13 or newer.

32.65.9 **NSTextListMarkerDecimal as String**

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts. **Notes:** Available on MacOS 10.13 or newer.

32.65.10 **NSTextListMarkerDiamond as String**

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts. **Notes:** Available on MacOS 10.13 or newer.

32.65.11 **NSTextListMarkerDisc as String**

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts. **Notes:** Available on MacOS 10.13 or newer.
32.65.12  NSTextListMarkerHyphen as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.  **Notes:** Available on MacOS 10.13 or newer.

32.65.13  NSTextListMarkerLowerCaseAlpha as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.  **Notes:** Available on MacOS 10.13 or newer.

32.65.14  NSTextListMarkerLowerCaseHexadecimal as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.  **Notes:** Available on MacOS 10.13 or newer.

32.65.15  NSTextListMarkerLowerCaseLatin as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.  **Notes:** Available on MacOS 10.13 or newer.

32.65.16  NSTextListMarkerLowerCaseRoman as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.  **Notes:** Available on MacOS 10.13 or newer.

32.65.17  NSTextListMarkerOctal as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.  **Notes:** Available on MacOS 10.13 or newer.
32.65.18  NSTextListMarkerSquare as String

Notes: Available on MacOS 10.13 or newer.

32.65.19  NSTextListMarkerUppercaseAlpha as String

Notes: Available on MacOS 10.13 or newer.

32.65.20  NSTextListMarkerUppercaseHexadecimal as String

Notes: Available on MacOS 10.13 or newer.

32.65.21  NSTextListMarkerUppercaseLatin as String

Notes: Available on MacOS 10.13 or newer.

32.65.22  NSTextListMarkerUppercaseRoman as String

Notes: Available on MacOS 10.13 or newer.

32.65.23  Properties

32.65.24  Handle as Integer

32.65.25  listOptions as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list options mask value of the receiver.

**Notes:**
Can be NSTextListPrependEnclosingMarker.
(Read only property)

32.65.26  markerFormat as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the marker format string used by the receiver.

**Notes:** (Read only property)

32.65.27  startingItemNumber as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the starting item number for the text list.

**Notes:**
The default value is 1. This value will be used only for ordered lists, and ignored in other cases.
(Read and Write property)

32.65.28  Constants

32.65.29  NSTextListPrependEnclosingMarker = 1

MBS MacBase Plugin, Plugin Version: 18.1. **Function:** One of the constants for options.
**Notes:** Specifies that a nested list should include the marker for its enclosing superlist before its own marker.
32.66. CLASS NSTEXTMBS

32.66.1 class NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for text controls.

**Notes:**

You may prefer to use the NSTextViewMBS class which is a subclass from NSTextMBS.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

32.66.2 Methods

32.66.3 alignCenter

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies center alignment to selected paragraphs (or all text if the receiver is a plain text object).

32.66.4 alignLeft

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies left alignment to selected paragraphs (or all text if the receiver is a plain text object).

32.66.5 alignRight

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies right alignment to selected paragraphs (or all text if the receiver is a plain text object).

32.66.6 changeFont

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method changes the font of the selection for a rich text object, or of all text for a plain text object.

**Notes:**
If the receiver doesn’t use the Font panel, this method does nothing.

This method changes the font by sending a convertFont message to the shared NSFontManager and applying each NSFont returned to the appropriate text. See the NSFontManager class specification for more information on font conversion.

### 32.66.7 checkSpelling

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method searches for a misspelled word in the receiver’s text. **Notes:** The search starts at the end of the selection and continues until it reaches a word suspected of being misspelled or the end of the text. If a word isn’t recognized by the spelling server, a showGuessPanel message then opens the Guess panel and allows the user to make a correction or add the word to the local dictionary.

### 32.66.8 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text with size 100/100 and position 0/0

**Example:**

```plaintext
dim t as new NSTextMBS
```

**Notes:** On success the handle property is not zero.

See also:

- 32.66.9 Constructor(Handle as Integer) 5944
- 32.66.10 Constructor(left as Double, top as Double, width as Double, height as Double) 5945

### 32.66.9 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSText handle.

**Example:**

```plaintext
dim t as new NSTextMBS(0, 0, 100, 100)
dim v as new NSTextMBS(t.handle)
```

`MsgBox str(v.Bounds.Width)+” x “+str(v.Bounds.Height)`
32.66. CLASS NSTEXTMBS

Notes: The handle is casted to a NSText and the plugin retains this handle.
See also:

- 32.66.8 Constructor
- 32.66.10 Constructor(left as Double, top as Double, width as Double, height as Double)

32.66.10 Constructor(left as Double, top as Double, width as Double, height as Double)

Example:

```
dim x as new NSTextMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.66.8 Constructor
- 32.66.9 Constructor(Handle as Integer)

32.66.11 copy

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This action method copies the selected text onto the general pasteboard, in as many formats as the receiver supports.

32.66.12 copyFont

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This action method copies the font information for the first character of the selection (or for the insertion point) onto the font pasteboard, as NSFontPboardType.

32.66.13 copyRuler

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This action method copies the paragraph style information for first selected paragraph onto the ruler pasteboard, as NSRulerPboardType, and expands the selection to paragraph boundaries.
32.66.14 cut
MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method deletes the selected text and places it onto the general pasteboard, in as many formats as the receiver supports.

32.66.15 delete
MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method deletes the selected text.

32.66.16 isRulerVisible as boolean
MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver’s enclosing scroll view shows its ruler.

32.66.17 maxSizeHeight as Double
MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s maximum height.

32.66.18 maxSizeWidth as Double
MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s maximum width.

32.66.19 minSizeHeight as Double
MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s minimum height.

32.66.20 minSizeWidth as Double
MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s maximum width.
32.66.21 paste

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method pastes text from the general pasteboard at the insertion point or over the selection.

32.66.22 pasteFont

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method pastes font information from the font pasteboard onto the selected text or insertion point of a rich text object, or over all text of a plain text object.

32.66.23 pasteRuler

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method pastes paragraph style information from the ruler pasteboard onto the selected paragraphs of a rich text object.

32.66.24 readRTFDFromFile(file as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to read the RTFD file, returning true if successful and false if not. **Notes:** file should be the path for an .rtf file or an .rtfd file wrapper, not for the RTF file within an .rtfd file wrapper.

32.66.25 replaceCharactersInRangeWithRTF(start as Integer, length as Integer, rtfData as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the characters in the given range with RTF text interpreted from the given RTF data. **Notes:**

This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

This method is designed for transferring text from out-of-process sources such as the pasteboard. In most cases, programmatic modification of the text is best done by operating on the text storage directly, using
CHAPTER 32. COCOA

the general methods of NSMutableAttributedString.

32.66.26 replaceCharactersInRangeWithRTFD(start as Integer, length as Integer, rtfdData as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Replaces the characters in the given range with RTFD text interpreted from the given RTFD data. Notes:

This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

This method is designed for transferring text from out-of-process sources such as the pasteboard. In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of NSMutableAttributedString.

32.66.27 replaceCharactersInRangeWithString(start as Integer, length as Integer, text as string)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Replaces the characters in the given range with those in the given string. Notes:

For a rich text object, the text is assigned the formatting attributes of the first character of the text it replaces, or of the character immediately before aRange if the range’s length is 0. If the range’s location is 0, the formatting attributes of the first character in the receiver are used.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of NSMutableAttributedString.

32.66.28 RTFDInRange(start as Integer, length as Integer) as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a string that contains an RTFD stream corresponding to the characters and attributes within
aRange.

Notes:

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver’s characters.

When writing data to the pasteboard, you can use the memoryblock object as the first argument to NSPasteboard’s setDataForType method, with a second argument of NSRTFPboardType.

32.66.29 RTFFromRange(start as Integer, length as Integer) as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a string object that contains an RTF stream corresponding to the characters and attributes within aRange, omitting any attachment characters and attributes.

Notes:

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver’s characters.

When writing data to the pasteboard, you can use the memoryblock as the first argument to NSPasteboard’s setDataForType method, with a second argument of NSRTFPboardType.

32.66.30 scrollRangeToVisible(start as Integer, length as Integer)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Scrolls the receiver in its enclosing scroll view so the first characters of aRange are visible.

32.66.31 selectAll

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This action method selects all of the receiver’s text.

32.66.32 setFontForRange(font as NSFontMBS, start as Integer, length as Integer)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Sets the font of characters within the given range to font.

Notes:

This method applies only to a rich text object.
This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

### 32.66.33 setMaxSize(width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver’s maximum size.

### 32.66.34 setMinSize(width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver’s minimum size.

### 32.66.35 setTextColorForRange(colorValue as NSColorMBS, start as Integer, length as Integer)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the text color of characters within the given range to colorValue. **Notes:** Removes the text color attribute if colorValue is nil. This method applies only to rich text objects. This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

### 32.66.36 showGuessPanel

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method opens the Spelling panel, allowing the user to make a correction during spell checking.

### 32.66.37 sizeToFit

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resizes the receiver to fit its text. **Notes:** The text view will not be sized any smaller than its minimum size, however.
32.66.38 subscript

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies a subscript attribute to selected text (or all text if the receiver is a plain text object), lowering its baseline offset by a predefined amount.

32.66.39 superscript

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies a superscript attribute to selected text (or all text if the receiver is a plain text object), raising its baseline offset by a predefined amount.

32.66.40 textLength as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the length of the text in unicode chars.

32.66.41 toggleRuler

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method shows or hides the ruler, if the receiver is enclosed in a scroll view.

32.66.42 underline

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the underline attribute to the selected text attributes if absent; removes the attribute if present. **Notes:**

If there is a selection and the first character of the selected range has any form of underline on it, or if there is no selection and the typing attributes have any form of underline, then underline is removed; otherwise a single simple underline is added.

Operates on the selected range if the receiver contains rich text. For plain text the range is the entire contents of the receiver.
32.66.43  unscript

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method removes any superscripting or subscripting from selected text (or all text if the receiver is a plain text object).

32.66.44  writeRTFDToFile(file as folderitem, atomically as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the receiver’s text as RTF with attachments to a file or directory at file. **Notes:** Returns true on success and false on failure. If atomically is true, attempts to write the file safely so that an existing file at path is not overwritten, nor does a new file at path actually get created, unless the write is successful.

32.66.45  Properties

32.66.46  alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text alignment. **Notes:** (Read and Write computed property)

32.66.47  backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background color. **Notes:** (Read and Write computed property)

32.66.48  baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The initial writing direction used to determine the actual writing direction for text. **Notes:**

The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly. If no writing direction is set, returns NSWritingDirection-Natural.
Available in Mac OS X v10.4 and later.

(Read and Write computed property)

32.66.49 **drawsBackground as boolean**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the scrollview draws its background. **Notes:** (Read and Write computed property)

32.66.50 **Enabled as boolean**

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables/disables the control. **Notes:**

If enabled, text is in default text color. if disabled, you can’t edit or select and the text color is gray. **(Read and Write computed property)**

32.66.51 **font as NSFontMBS**

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The font of the first character in the receiver’s text, or of the insertion point if there’s no text. **Notes:** (Read and Write computed property)

32.66.52 **importsGraphics as boolean**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver allows the user to import files by dragging. **Notes:** (Read and Write computed property)

32.66.53 **isEditable as boolean**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver allows the user to edit text, false if it doesn’t. **Notes:**

You can change the receiver’s text programmatically regardless of this setting.
32.66.54  isFieldEditor as boolean

**Function:**  A Boolean value that indicates whether the receiver interprets Tab, Shift-Tab, and Return (Enter) as 
cues to end editing and possibly to change the first responder.  
**Notes:**  True if the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to 
change the first responder; false if it accepts them as text input.  
See the NSWindow class specification for more information on field editors.  By default, NSText objects 
don’t behave as field editors.  
(Read and Write computed property)

32.66.55  isHorizontallyResizable as boolean

**Function:**  True if the receiver automatically changes its width to accommodate the width of its text, false if it 
doesn’t.  
**Notes:**  By default, an NSText object is not horizontally resizable.  
(Read and Write computed property)

32.66.56  isRichText as boolean

**Function:**  A Boolean value that indicates whether the NSText allows the user to apply attributes to specific 
ranges of the text.  
**Notes:**  (Read and Write computed property)

32.66.57  isSelectable as boolean

**Function:**  A Boolean value that indicates whether the text allows the user to select text, false if it doesn’t.  
**Notes:**  (Read and Write computed property)
32.66. **CLASS NSTEXTMBS**

### 32.66.58 isVerticallyResizable as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the receiver automatically changes its height to accommodate the height of its text, false if it doesn’t.  
**Notes:**  
By default, an NSText object is vertically resizable.  
(Read and Write computed property)

### 32.66.59 selectedRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The range of selected characters.  
**Example:**
```vbnet
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS  
dim s as NSTextStorageMBS = t.textStorage

const NSUnderlineStyleSingle = 1

dim r as NSRangeMBS = t.selectedRange  
s.addAttribute NSAttributedStringMBS.NSStrikethroughStyleAttributeName, NSUnderlineStyleSingle, r
```

**Notes:** (Read and Write computed property)

### 32.66.60 text as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The characters of the text.  
**Notes:**  
For performance reasons, this method returns the current backing store of the text object. If you want to maintain a snapshot of this as you manipulate the text storage, you should make a copy of the appropriate substring.  
(Read and Write computed property)

### 32.66.61 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text color.
32.66.62 usesFontPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver uses the Font panel. **Notes:** (Read and Write computed property)

32.66.63 Events

32.66.64 textDidBeginEditing

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs you that the text object has begun editing (that the user has begun changing it).

32.66.65 textDidChange

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs you that the text object has changed its characters or formatting attributes.

32.66.66 textDidEndEditing

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs you that the text object has finished editing (that it has resigned first responder status).

32.66.67 textShouldBeginEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a text object begins to change its text, this method requests permission to begin editing. **Notes:** If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.
32.66.68  `textShouldEndEditing` as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked from a text object’s implementation of resignFirstResponder, this method requests permission to end editing. **Notes:** If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

32.66.69  Constants

32.66.70  `NSBackspaceCharacter` = 8

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

32.66.71  `NSBackTabCharacter` = \&h19

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

32.66.72  `NSBacktabTextMovement` = \&h12

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?" **Notes:** The Backtab (Shift-Tab) key was pressed.

32.66.73  `NSCancelTextMovement` = \&h17

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?" **Notes:**
The user cancelled the completion.
Available in Mac OS X v10.3 and later.
32.66.74 NSCarriageReturnCharacter=13

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

32.66.75 NSCenterTextAlignment=2

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the text alignment constants for the alignment property.
**Notes:** Visually centered

32.66.76 NSDeleteCharacter=\& h7F

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

32.66.77 NSDownTextMovement=\& h16

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question “why am I leaving the field?”
**Notes:** The down arrow key was pressed.

32.66.78 NSEnterCharacter=3

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

32.66.79 NSFormFeedCharacter=12

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

32.66.80 NSIllegalTextMovement=0

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question “why am I leaving the field?”
32.66.81  **NSJustifiedTextAlignment=3**

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the text alignment constants for the alignment property.
**Notes:** Fully-justified. The last line in a paragraph is natural-aligned.

32.66.82  **NSLeftTextAlignment=0**

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the text alignment constants for the alignment property.
**Notes:** Visually left aligned

32.66.83  **NSLeftTextMovement=&h13**

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
**Notes:** The left arrow key was pressed.

32.66.84  **NSLineSeparatorCharacter=&h2028**

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

32.66.85  **NSNaturalTextAlignment=4**

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the text alignment constants for the alignment property.
**Notes:** Indicates the default alignment for script.

32.66.86  **NSNewlineCharacter=10**

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.
32.66.87 NSOtherTextMovement=0

MBS MacCocoa Plugin, Plugin Version: 8.4. Function: One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: The user performed some undefined action.
Available in Mac OS X v10.3 and later.

32.66.88 NSParagraphSeparatorCharacter=&h2029

MBS MacCocoa Plugin, Plugin Version: 8.4. Function: One of the constants to specify commonly used Unicode characters.

32.66.89 NSReturnTextMovement=&h10

MBS MacCocoa Plugin, Plugin Version: 8.4. Function: One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: The Return key was pressed.

32.66.90 NSRightTextAlignment=1

MBS MacCocoa Plugin, Plugin Version: 8.4. Function: One of the text alignment constants for the alignment property.
Notes: Visually right aligned

32.66.91 NSRightTextMovement=&h14

MBS MacCocoa Plugin, Plugin Version: 8.4. Function: One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: The right arrow key was pressed.

32.66.92 NSTabCharacter=9

MBS MacCocoa Plugin, Plugin Version: 8.4. Function: One of the constants to specify commonly used Unicode characters.
32.66.93 NSTabTextMovement=& h11

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"

**Notes:** The Tab key was pressed.

32.66.94 NSTextWritingDirectionEmbedding=0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** An additional constant to specify the writing direction.

**Notes:**
- Direction is embedded.
- Available in Mac OS X v10.6 and later.

32.66.95 NSTextWritingDirectionOverride=1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** An additional constant to specify the writing direction.

**Notes:**
- Direction override
- Available in Mac OS X v10.6 and later.

32.66.96 NSUpTextMovement=& h15

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"

**Notes:** The up arrow key was pressed.

32.66.97 NSWritingDirectionLeftToRight=0

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the writing directions.

**Notes:**
- The writing direction is left to right.
CHAPTER 32. COCOA

Available in Mac OS X v10.2 and later.

### 32.66.98 `NSWritingDirectionNatural=−1`

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the writing directions.

**Notes:**

The writing direction is determined using the Unicode Bidi Algorithm rules P2 and P3. Default.

Available in Mac OS X v10.4 and later.

### 32.66.99 `NSWritingDirectionRightToLeft=1`

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the writing directions.

**Example:**

```objc
const NSWritingDirectionNatural = -1 // Determines direction using the Unicode Bidi Algorithm rules P2 and P3
const NSWritingDirectionLeftToRight = 0 // Left to right writing direction
const NSWritingDirectionRightToLeft = 1 // Right to left writing direction

const NSTextWritingDirectionEmbedding = 0
const NSTextWritingDirectionOverride = 2

dim t as NSTextStorageMBS = TextArea1.NSTextViewMBS.textStorage

// get hello in arabic
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

// now set attributes for right to left
m.addAttribute t.NSWritingDirectionAttributeName, array(NSWritingDirectionRightToLeft+NSTextWritingDirectionOverride), new NSRangeMBS(0,m.Length)

// and add to textarea
t.appendAttributedString m
```

**Notes:**

The writing direction is right to left.
32.66. **CLASS NSTEXTMBS**

Available in Mac OS X v10.2 and later.
32.67.1 class NSTextStorageMBS

NSTextStorage is a semiconcrete subclass of NSMutableAttributedString that manages a set of client NSLayoutManager objects, notifying them of any changes to its characters or attributes so that they can relay and redisplay the text as needed. NSTextStorage defines the fundamental storage mechanism of the Application Kit’s extended text-handling system.

NSTextStorage also defines a set of methods, listed under “Getting and setting scriptable properties” in the Method Types section, useful for getting and setting scriptable properties of NSTextStorage objects. Unless you are dealing with scriptability, you do not normally need to invoke these methods directly. In particular, using the characters, words or paragraphs methods or their corresponding setter methods is an inefficient way to manipulate the text storage, since these methods create and return many objects. Instead, use the text access methods defined by NSMutableAttributedString, NSAttributedString, NSMutableString, and NSString to perform character-level manipulation.

Subclass of the NSMutableAttributedStringMBS class.

32.67.2 Methods

32.67.3 addLayoutManager(l as NSLayoutManagerMBS)

Notes: l: The layout manager to add.

32.67.4 changeInLength as Integer

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the difference between the current length of the edited range and its length before editing began.

Notes:

Returns the difference between the current length of the edited range and its length before editing began. That is, before the receiver was sent the first beginEditing message or a single edited:range:changeInLength: message.

This difference is accumulated with each invocation of edited:range:changeInLength:, until a final message
processes the changes.

The receiver’s delegate and layout managers can use this information to determine the nature of edits in their respective notification methods.

### 32.67.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new empty text storage object.

### 32.67.6 editedMask as Integer

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the kinds of edits pending for the receiver. **Notes:** Returns a mask describing the kinds of edits pending for the receiver.

### 32.67.7 editedRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the range of the receiver to which pending changes have been made, whether of characters or of attributes. **Notes:** The receiver’s delegate and layout managers can use this information to determine the nature of edits in their respective notification methods.

### 32.67.8 ensureAttributesAreFixedInRange(Range as NSRangeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Ensures that attributes are fixed in the given range. **Notes:** range: The range of characters whose attributes might be examined.

An NSTextStorage object using lazy attribute fixing is required to call this method before accessing any attributes within range. This method gives attribute fixing a chance to occur if necessary. NSTextStorage subclasses wishing to support laziness must call this method from all attribute accessors they implement.
32.67.9  \texttt{fixesAttributesLazily} as \texttt{boolean}

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  \textbf{Function:} Returns whether the receiver fixes attributes lazily.
\textbf{Notes:} By default, custom NSTextStorage subclasses are not lazy, but the provided concrete subclass is lazy by default.

32.67.10  \texttt{invalidateAttributesInRange} (\texttt{Range} as \texttt{NSRangeMBS})

\textbf{Notes:} range: The range of characters whose attributes should be invalidated.

Called from processEditing to invalidate attributes when the text storage changes. If the receiver is not lazy, this method simply calls fixAttributesInRange. If lazy attribute fixing is in effect, this method instead records the range needing fixing.

32.67.11  processEditing

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  \textbf{Function:} Cleans up changes made to the receiver and notifies its delegate and layout managers of changes.

32.67.12  \texttt{removeLayoutManager} (\texttt{l} as \texttt{NSLayoutManagerMBS})

\textbf{Notes:} \texttt{l}: The layout manager to remove.

32.67.13  Constants

32.67.14  \texttt{NSTextStorageEditedAttributes} = \texttt{1}

MBS MacCocoa Plugin, Plugin Version: 8.6.  \textbf{Function:} The constants for text messages.
\textbf{Notes:} Attributes were added, removed, or changed.
MBS MacCocoa Plugin, Plugin Version: 8.6. **Function:** The constants for text messages. **Notes:** Characters were added, removed, or replaced.
32.68 class NSTextTabMBS

32.68.1 class NSTextTabMBS

Function: An NSTextTab object represents a tab in an NSParagraphStyle object, storing an alignment type and location.

Notes: NSTextTab objects are most frequently used with the Application Kit’s text system and with NSRulerView and NSRulerMarker objects. See the appropriate class specifications for more information on these uses.

The text system supports four alignment types: left, center, right, and decimal (based on the decimal separator character of the locale in effect). These alignment types are absolute, not based on the line sweep direction of text. For example, tabbed text is always positioned to the left of a right-aligned tab, whether the line sweep direction is left to right or right to left. A tab’s location, on the other hand, is relative to the back margin. A tab set at 1.5”, for example, is at 1.5” from the right in right to left text.

32.68.2 Methods

32.68.3 Constructor

Function: The default constructor.

See also:

- 32.68.4 Constructor(alignment as Integer, location as Double, options as dictionary) 5968
- 32.68.5 Constructor(type as Integer, location as Double) 5969

32.68.4 Constructor(alignment as Integer, location as Double, options as dictionary)

Function: Initializes a text tab with the text alignment, location, and options.

Notes: The text alignment is used to determine the position of text inside the tab column. See NSTextTabType for a mapping between alignments and tab stop types.

See also:

- 32.68.3 Constructor 5968
- 32.68.5 Constructor(type as Integer, location as Double) 5969
32.68. CLASS NSTEXTTABMBS

32.68.5 Constructor(type as Integer, location as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly allocated NSTextTab with an alignment of type at location on the paragraph. **Notes:** The location is relative to the back margin, based on the line sweep direction of the paragraph. type can be any of the values described in NSTextTabType. See also:

- 32.68.3 Constructor
- 32.68.4 Constructor(alignment as Integer, location as Double, options as dictionary)

32.68.6 copy as NSTextTabMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the text tab.

32.68.7 Properties

32.68.8 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the text alignment of the receiver. **Notes:** (Read only property)

32.68.9 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

32.68.10 location as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s ruler location relative to the back margin. **Notes:** (Read only property)
32.68.11  options as Dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the dictionary of attributes associated with the receiver. **Notes:** (Read only property)

32.68.12  tabStopType as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s tab stop type. **Notes:** (Read only property)

32.68.13  Constants

32.68.14  NSCenterTabStopType = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the type constants for tab stops. **Notes:** A center-aligned tab stop.

32.68.15  NSDecimalTabStopType = 3

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the type constants for tab stops. **Notes:** Aligns columns of numbers by the decimal point.

32.68.16  NSLeftTabStopType = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the type constants for tab stops. **Notes:** A left-aligned tab stop.

32.68.17  NSRightTabStopType = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the type constants for tab stops. **Notes:** A right-aligned tab stop.
32.69. CLASS NSTIMERMBS

32.69 class NSTimerMBS

32.69.1 class NSTimerMBS

Function: The cocoa timer class.

Example:

dim n as new NSTimerMBS(5, true)

Notes:

You use the NSTimer class to create timer objects or, more simply, timers. A timer waits until a certain
time interval has elapsed and then fires, calling the action event. For example, you could create an NSTimer
object that calls the action event, telling it to update itself after a certain time interval.

A timer is not a real-time mechanism; it fires only when one of the run loop modes to which the timer has
been added is running and able to check if the timer’s firing time has passed. Because of the various input
sources a typical run loop manages, the effective resolution of the time interval for a timer is limited to on
the order of 50-100 milliseconds. If a timer’s firing time occurs during a long callout or while the run loop is
in a mode that is not monitoring the timer, the timer does not fire until the next time the run loop checks
the timer. Therefore, the actual time at which the timer fires potentially can be a significant period of time
after the scheduled firing time.

Repeating Versus Non-Repeating Timers

You specify whether a timer is repeating or non-repeating at creation time. A non-repeating timer fires
once and then invalidates itself automatically, thereby preventing the timer from firing again. By contrast,
a repeating timer fires and then reschedules itself on the same run loop.

A repeating timer always schedules itself based on the scheduled firing time, as opposed to the actual firing
time. For example, if a timer is scheduled to fire at a particular time and every 5 seconds after that, the
scheduled firing time will always fall on the original 5 second time intervals, even if the actual firing time
gets delayed. If the firing time is delayed so far that it passes one or more of the scheduled firing times, the
timer is fired only once for that time period; the timer is then rescheduled, after firing, for the next scheduled
firing time in the future.

Scheduling Timers in Run Loops

A timer object can be registered in only one run loop at a time, although it can be added to multiple run
loop modes within that run loop. There are three ways to create a timer:

Use the Constructor to create the timer and schedule it on the current run loop in the default mode.

Once scheduled, the timer fires at the specified interval until it is invalidated. A non-repeating timer invali-
dates itself immediately after it fires. However, for a repeating timer, you must invalidate the timer object yourself by calling its invalidate method. Calling this method requests the removal of the timer from the current run loop; as a result, you should always call the invalidate method from the same thread on which the timer was installed. Invalidating the timer immediately disables it so that it no longer affects the run loop. The run loop then removes and releases the timer, either just before the invalidate method returns or at some later point. Once invalidated, timer objects cannot be reused.

### 32.69.2 Methods

#### 32.69.3 Constructor(fireDate as date, timeInterval as Double, repeats as boolean)

**Function:** Initializes a new NSTimer.

**Example:**

```plaintext
dim d as new date
d.hour = d.hour + 1 // start in one hour

dim n as new NSTimerMBS(d, 5, true)
```

**Notes:**

- **fireDate:** The time at which the timer should first fire.
- **timeInterval:** For a repeating timer, this parameter contains the number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
- **repeats:** If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

The time is initialized such that, when added to a run loop, it will fire at date and then, if repeats is true, every seconds after that.

See also:

- 32.69.4 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string)

- 32.69.5 Constructor(timeInterval as Double, repeats as boolean)
32.69.4 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string)

Function: Initializes a new NSTimer.
Notes:

fireDate: The time at which the timer should first fire.

timeInterval: For a repeating timer, this parameter contains the number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

The time is initialized such that, when added to a run loop, it will fire at date and then, if repeats is true, every seconds after that.

Schedules the timer to run on the given runloop in the given mode.
See also:

- 32.69.3 Constructor(fireDate as date, timeInterval as Double, repeats as boolean) 5972
- 32.69.5 Constructor(timeInterval as Double, repeats as boolean) 5973

32.69.5 Constructor(timeInterval as Double, repeats as boolean)

Function: Creates and returns a new NSTimer object and schedules it on the current run loop in the default mode.
Example:

dim n as new NSTimerMBS(5, true)
MsgBox str(n.timeInterval)

Notes:

timeInterval: The number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

After seconds seconds have elapsed, the timer fires, calling the Action event.
See also:
32.69.3 Constructor(fireDate as date, timeInterval as Double, repeats as boolean)

32.69.4 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string)

32.69.6 fire

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Causes the receiver’s message to be sent to its target. **Notes:** You can use this method to fire a repeating timer without interrupting its regular firing schedule. If the timer is non-repeating, it is automatically invalidated after firing, even if its scheduled fire date has not arrived.

32.69.7 invalidate

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the receiver from ever firing again and requests its removal from its run loop. **Example:**

```plaintext
dim n as new NSTimerMBS(5, true)
// later
n.invalidate
```

**Notes:**
The destructor calls invalidate automatically for you.

This method is the only way to remove a timer from an NSRunLoop object. The NSRunLoop object removes and releases the timer, either just before the invalidate method returns or at some later point.

You must send this message from the thread on which the timer was installed. If you send this message from another thread, the input source associated with the timer may not be removed from its run loop, which could prevent the thread from exiting properly.

32.69.8 isValid as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is currently valid. **Example:**
dim n as new NSTimerMBS(5, true)
MsgBox str(n.isValid)

Notes: True if the receiver is still capable of firing or false if the timer has been invalidated and is no longer capable of firing.

32.69.9 `timeInterval as Double`

Function: The receiver’s time interval.
Example:
`dim n as new NSTimerMBS(5, true)
MsgBox str(n.timeInterval)`

Notes: The receiver’s time interval. If the receiver is a non-repeating timer, returns 0 (even if a time interval was set).

32.69.10 `Timer(t as timer) as NSTimerMBS`

Function: Creates a NSTimerMBS object referencing the given timer object.
Example:
`dim n as NSTimerMBS = NSTimerMBS.timer(timer1)
n.tolerance = 0.1`

Notes:
Only for Cocoa 32bit currently.
Works fine in Real Studio 2012 and Xojo 2014r1 in Cocoa target.

32.69.11 Properties

32.69.12 Handle as Integer

Function: The internal reference to the NSTimer object.
Example:

```vba
dim n as new NSTimerMBS(5, true)
MsgBox str(n.Handle)
```

Notes: (Read and Write property)

### 32.69.13 fireDate as date

**Function:** The date at which the receiver will fire.

**Example:**

```vba
dim d as new date
d.hour = d.hour + 1 // start in one hour

dim n as new NSTimerMBS(d, 5, true)
MsgBox n.fireDate.ShortDate+" "+n.fireDate.ShortTime
```

Notes:

The date at which the receiver will fire. If the timer is no longer valid, this method returns the last date at which the timer fired.

Use the isValid method to verify that the timer is valid.

You typically use this method to adjust the firing time of a repeating timer. Although resetting a timer’s next firing time is a relatively expensive operation, it may be more efficient in some situations. For example, you could use it in situations where you want to repeat an action multiple times in the future, but at irregular time intervals. Adjusting the firing time of a single timer would likely incur less expense than creating multiple timer objects, scheduling each one on a run loop, and then destroying them.

You should not call this method on a timer that has been invalidated, which includes non-repeating timers that have already fired. You could potentially call this method on a non-repeating timer that had not yet fired, although you should always do so from the thread to which the timer is attached to avoid potential race conditions.

(Read and Write computed property)
32.69.14  tag as Variant

Function: A value you can use in your app however you like.
Example:

dim n as new NSTimerMBS(5, true)
n.tag = window1 // some value you may later use

Notes: (Read and Write computed property)

32.69.15  tolerance as Double

Function: The tolerance for this timer.
Notes:
Requires Mac OS X 10.9.

Setting a tolerance for a timer allows it to fire later than the scheduled fire date, improving the ability of
the system to optimize for increased power savings and responsiveness. The timer may fire at any time
between its scheduled fire date and the scheduled fire date plus the tolerance. The timer will not fire before
the scheduled fire date. For repeating timers, the next fire date is calculated from the original fire date
regardless of tolerance applied at individual fire times, to avoid drift. The default value is zero, which means
no additional tolerance is applied. The system reserves the right to apply a small amount of tolerance to
certain timers regardless of the value of this property.

As the user of the timer, you will have the best idea of what an appropriate tolerance for a timer may be.
A general rule of thumb, though, is to set the tolerance to at least 10% of the interval, for a repeating
timer. Even a small amount of tolerance will have a significant positive impact on the power usage of your
application. The system may put a maximum value of the tolerance.
(Read and Write computed property)

32.69.16  Events

32.69.17  Action

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event called when the timer fires.
32.70 class NSTimeZoneMBS

32.70.1 class NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: NSTimeZone is an abstract class that defines the behavior of time zone objects.

Notes:
Time zone objects represent geopolitical regions. Consequently, these objects have names for these regions. Time zone objects also represent a temporal offset, either plus or minus, from Greenwich Mean Time (GMT) and an abbreviation (such as PST for Pacific Standard Time).

NSTimeZone provides several class methods to get time zone objects: timeZoneWithName, timeZoneWithAbbreviation, and timeZoneForSecondsFromGMT. The class also permits you to set the default time zone within your application (setDefaultTimeZone). You can access this default time zone at any time with the defaultTimeZone class method, and with the localTimeZone class method, you can get a relative time zone object that decodes itself to become the default time zone for any locale in which it finds itself.

Cocoa does not provide any API to change the time zone of the computer, or of other applications.

Some NSCalendarDate methods return date objects that are automatically bound to time zone objects. These date objects use the functionality of NSTimeZone to adjust dates for the proper locale. Unless you specify otherwise, objects returned from NSCalendarDate are bound to the default time zone for the current locale.

Note that, strictly, time zone database entries such as "America/Los_Angeles" are IDs not names. An example of a time zone name is "Pacific Daylight Time". Although many NSTimeZone method names include the word "name", they refer to IDs.

32.70.2 Methods

32.70.3 abbreviationDictionary as Dictionary

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a dictionary holding the mappings of time zone abbreviations to time zone names.

Notes:
Note that more than one time zone may have the same abbreviation for example, US/Pacific and Canada/Pacific both use the abbreviation "PST." In these cases, abbreviationDictionary chooses a single name to map the abbreviation to.
(Read and Write computed property)
32.70. **CLASS NSTIMEZONEMBS**

32.70.4 **Constructor**

See also:

- 32.70.5 Constructor(name as string)

32.70.5 **Constructor(name as string)**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a time zone initialized with a given ID.

**Example:**

```dim t as NSTimeZoneMBS = new NSTimeZoneMBS("Europe/Berlin") MsgBox t.name```

**Notes:**

If name is a known ID, this method calls initWithName:data: with the appropriate data object.

In Mac OS X v10.4 and earlier providing nil for the parameter would have caused a crash. In Mac OS X v10.5 and later, this now raises an invalid argument exception.

See also:

- 32.70.4 Constructor

32.70.6 **copy as NSTimeZoneMBS**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the timezone object.

**Example:**

```dim t as NSTimeZoneMBS = NSTimeZoneMBS.systemTimeZone
dim c as NSTimeZoneMBS = t.copy```

MsgBox c.name

32.70.7 **defaultTimeZone as NSTimeZoneMBS**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default time zone for the current application.
Example:
MsgBox NSTimeZoneMBS.defaultTimeZone.name

Notes:
The default time zone for the current application. If no default time zone has been set, this method invokes systemTimeZone and returns the system time zone.

Discussion
The default time zone is the one that the application is running with, which you can change (so you can make the application run as if it were in a different time zone).

If you get the default time zone and hold onto the returned object, it does not change if a subsequent invocation of setDefaultTimeZone changes the default time zone you still have the specific time zone you originally got. Contrast this behavior with the object returned by localTimeZone.

32.70.8 isEqualToTimeZone(timeZone as NSTimeZoneMBS) as boolean

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value that indicates whether the receiver has the same name and data as another given time zone.
Example:
if NSTimeZoneMBS.systemTimeZone isEqualToTimeZone(NSTimeZoneMBS.localTimeZone) then
    MsgBox "equal"
else
    MsgBox "not equal"
end if

Notes:
TimeZone: The time zone to compare with the receiver.
Returns true if TimeZone and the receiver have the same name and data, otherwise false.

32.70.9 knownTimeZoneNames as string()

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns an array of strings listing the IDs of all the time zones known to the system.
Example:
32.70. **localTimeZone as NSTimeZoneMBS**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an object that forwards all messages to the default time zone for the current application.  
**Example:**

_msgsBox NSTimeZoneMBS.localTimeZone.name_

**Notes:**  
An object that forwards all messages to the default time zone for the current application.

**Discussion**

The local time zone represents the current state of the default time zone at all times. If you get the default time zone (using defaultTimeZone) and hold onto the returned object, it does not change if a subsequent invocation of setDefaultTimeZone changes the default time zone; you still have the specific time zone you originally got. The local time zone adds a level of indirection, it acts as if it were the current default time zone whenever you invoke a method on it.

32.70.11 **Print**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the time zone to debug output.  
**Example:**

_NSTimeZoneMBS.localTimeZone.print_

**Notes:** This may help for debugging and you see output in console app.

32.70.12 **systemTimeZone as NSTimeZoneMBS**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the time zone currently used by the system.  
**Example:**

_MsgBox NSTimeZoneMBS.systemTimeZone.name_
Notes:
The time zone currently used by the system. If the current time zone cannot be determined, returns the GMT time zone.

Special Considerations
If you get the system time zone, it is cached by the application and does not change if the user subsequently changes the system time zone. The next time you invoke systemTimeZone, you get back the same time zone you originally got. You have to invoke resetSystemTimeZone to clear the cached object.

32.70.13  timeZoneForSecondsFromGMT(seconds as Integer) as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates time zone object based on a delta from GMT.
Notes: Time zones created with this never have daylight savings and the offset is constant no matter the date; the name and abbreviation do NOT follow the POSIX convention (of minutes-west).

32.70.14  timeZoneWithName(name as string) as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the time zone object identified by a given ID.
Example:

```dim t as NSTimeZoneMBS = NSTimeZoneMBS.timeZoneWithName("Europe/Berlin")
MsgBox t.name
```

Notes:
Name: The ID for the time zone.

Returns the time zone in the information directory with a name matching name.
Returns nil if there is no match for the name.
32.70. **CLASS NSTIMEZONEMBS**

### 32.70.15 Properties

#### 32.70.16 abbreviation as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the abbreviation for the receiver.  
**Example:**

MsgBox NSTimeZoneMBS.localTimeZone.Abbreviation

**Notes:**

The abbreviation for the receiver, such as "EDT" (Eastern Daylight Time). Invokes abbreviationForDate with the current date as the argument.  
(Read only property)

#### 32.70.17 DaylightSavingTimeOffset as Double

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current daylight saving time offset of the receiver.  
**Example:**

MsgBox str(NSTimeZoneMBS.localTimeZone.DaylightSavingTimeOffset)

**Notes:**

Available in OS X v10.5 and later.  
(Read only property)

#### 32.70.18 description as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the description of the receiver.  
**Example:**

MsgBox NSTimeZoneMBS.localTimeZone.Description

**Notes:**

The description of the receiver, including the name, abbreviation, offset from GMT, and whether or not daylight savings time is currently in effect.
32.70.19 Handle as Integer

**Notes:** (Read only property)

32.70.20 isDaylightSavingTime as Boolean

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is currently using daylight saving time.  
**Example:**

```
MsgBox str(NSTimeZoneMBS.localTimeZone.isDaylightSavingTime)
```

**Notes:**

Returns true if the receiver is currently using daylight savings time, otherwise false.  
(Read only property)

32.70.21 name as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the geopolitical region ID that identifies the receiver.  
**Example:**

```
MsgBox NSTimeZoneMBS.localTimeZone.Name
```

**Notes:** (Read only property)

32.70.22 SecondsFromGMT as Double

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current difference in seconds between the receiver and Greenwich Mean Time.  
**Example:**
32.70. CLASS NSTIMEZONEMBS

MsgBox str(NSTimeZoneMBS.localTimeZone.SecondsFromGMT)

Notes:
The current difference in seconds between the receiver and Greenwich Mean Time.
(Read only property)
CHAPTER 32. COCOA

32.71 class NSTokenFieldMBS

32.71.1 class NSTokenFieldMBS

Function: NSTokenField is a subclass of NSTextField that provides tokenized editing similar to the address field in the Mail application.

Notes:
NSTokenField uses an NSTokenFieldCell to implement much of the control’s functionality. NSTokenField provides cover methods for most methods of NSTokenFieldCell, which invoke the corresponding cell method.

In MBS Plugin the objects must be strings or numbers. With plugin version 12.5, you can also use normal Real Studio objects.

In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the representedObjectForEditingString event. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

Please note: Due to the way the plugin is implemented the Action, textShouldEndEditing and textShouldBeginEditing events do nothing, so please use tokenFieldAction, tokenFieldTextShouldEndEditing and tokenFieldTextShouldBeginEditing.

Subclass of the NSTextFieldMBS class.

32.71.2 Methods

32.71.3 Constructor

Function: Creates a new control with size 100/100 and position 0/0

Example:

```dim t as new NSTokenFieldMBS```

Notes: On success the handle property is not zero.
See also:

- 32.71.4 Constructor(Handle as Integer) 5987
- 32.71.5 Constructor(left as Double, top as Double, width as Double, height as Double) 5987
32.71. CLASS NSTOKENFIELDMBS

32.71.4 Constructor(Handle as Integer)

Function: Creates an object based on the given NSControl handle.

Example:

```vbnet
dim t as new NSTokenFieldMBS(0, 0, 100, 100)
dim v as new NSTokenFieldMBS(t.handle)
MsgBox str(v.Bounds.Width)+” x ”+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSControl and the plugin retains this handle.
See also:

- 32.71.3 Constructor 5986

- 32.71.5 Constructor(left as Double, top as Double, width as Double, height as Double) 5987

32.71.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new control with the given size and position.

Example:

```vbnet
dim x as new NSTokenFieldMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 32.71.3 Constructor 5986

- 32.71.4 Constructor(Handle as Integer) 5987

32.71.6 defaultCompletionDelay as Double

Function: Returns the default completion delay.

Notes: The default completion delay is 0.
32.71.7  defaultTokenizingCharacterSet as NSCharacterSetMBS

Function: Returns the default tokenizing character set.
Notes: The default tokenizing character set is ",".

32.71.8  objects as Variant()

Function: Queries list of represented objects.

32.71.9  setObjects(objects() as Variant)

Function: Sets current objects.

32.71.10  Properties

32.71.11  completionDelay as Double

Function: The completion delay.
Notes: (Read and Write computed property)

32.71.12  tokenizingCharacterSet as NSCharacterSetMBS

Function: The tokenizing character set.
Notes: (Read and Write computed property)

32.71.13  tokenStyle as Integer

Function: The token style.
Notes: (Read and Write computed property)
32.71. CLASS NSTOKENFIELDMBS

32.71.14 Events

32.71.15 completionsForSubstring(substring as string, tokenIndex as Integer, 
byref selectedIndex as Integer) as Variant()

Function: Allows the delegate to provide an array of appropriate completions for the contents of the 
receiver.
Notes:
substring: The partial string that is to be completed.
tokenIndex: The index of the token being edited.
selectedIndex: Optionally, you can return by-reference an index into the returned array that specifies which 
of the completions should be initially selected. If none are to be selected, return by reference -1.

Returns an array of strings that are possible completions.
If the delegate does not implement this method, no completions are provided.

32.71.16 displayStringForRepresentedObject(representedObject as Variant) as 
string

Function: Allows the delegate to provide a string to be displayed as a proxy for the given represented 
object.
Notes:
representedObject: A represented object of the token field.

Returns the string to be used as a proxy for representedObject. If you return nil or do not implement this 
method, then representedObject is displayed as the string.

32.71.17 editingStringForRepresentedObject(representedObject as Variant) as 
string

Function: Allows the delegate to provide a string to be edited as a proxy for a represented object.
Notes:
representedObject: A represented object of the token field.

Returns a string that’s an editable proxy of the represented object, or nil if the token should not be editable.
CHAPTER 32. COCOA

32.71.18 hasMenuForRepresentedObject(representedObject as Variant) as boolean

Function: Allows the delegate to specify whether the given represented object provides a menu.
Notes:

representedObject: A represented object of the token field.

Returns true if the represented object has a menu, false otherwise.
By default tokens in a token field have no menus.

32.71.19 menuForRepresentedObject(representedObject as Variant) as NSMenuMBS

Function: Allows the delegate to provide a menu for the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the menu associated with the represented object.
By default tokens in a token field do not return menus.

32.71.20 readFromPasteboard(pboard as NSPasteboardMBS) as Variant()

Function: Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
Notes:

pboard: The pasteboard from which to read the represented objects.

Returns an array of represented objects created from the pasteboard data.

32.71.21 representedObjectForEditingString(editingString as string) as Variant

Function: Allows the delegate to provide a represented object for the given editing string.
Notes:

editingString: The edited string representation of a represented object.
Returns a represented object that is displayed rather than the editing string.

Note: In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

### 32.71.22 shouldAddObjects(tokens() as Variant, index as Integer) as Variant()

**Function:** Allows to validate the tokens to be added to the receiver at a particular location.  
**Notes:**

- tokens: An array of tokens to be inserted in the receiver at index.  
- index: The index of the receiver in which the array of tokens to be validated (tokens) will be inserted.

Returns an array of validated tokens.

The event can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning nil causes an error.

### 32.71.23 styleForRepresentedObject(representedObject as Variant) as Integer

**Function:** Allows the delegate to return the token style for editing the specified represented object.  
**Notes:**

- representedObject: A represented object of the token field.

Returns the style that should be used to display the representedObject. Possible values are shown in NSTokenStyle Values.

If the event implements this method and returns an NSTokenStyle that differs from the style set by setTokenStyle:, the value the event returns is preferred.

If you don’t implement this method, the token field’s tokenStyle is used.
32.71.24  **tokenFieldAction**

**Function:** The control’s action was triggered.
**Notes:** For a button if it was pressed.

32.71.25  **tokenFieldTextShouldBeginEditing(fieldEditor as NSTextMBS) as boolean**

**Function:** The event called to decide whether text editing should be allowed.
**Notes:** Return true to allow text editing.

32.71.26  **tokenFieldTextShouldEndEditing(fieldEditor as NSTextMBS) as boolean**

**Function:** The event called to decide whether ending text editing should be allowed.
**Notes:** Return true to allow text editing.

32.71.27  **writeRepresentedObjects(objects() as Variant, pboard as NSPasteboardMBS) as boolean**

**Function:** Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.
**Notes:**
- objects: An array of represented objects associated with the token field.
- pboard: The pasteboard to which to write the represented objects.

Return true if you writes the represented objects to the pasteboard, false otherwise. If false, the token field writes the display strings to the NSStringPboardType pasteboard.

32.71.28  **Constants**

32.71.29  **NSUserDefaultsTokenStyle = 0**

MBS MacControls Plugin, Plugin Version: 12.5. **Function:** One of the token styles.
**Notes:**
Style best used for keyword type tokens. Available in OS X v10.4 and later.

32.71.30  **NSPlainTextTokenType** = 1

MBS MacControls Plugin, Plugin Version: 12.5. **Function:** One of the token styles. **Notes:**
Style to use for data you want represented as plain-text and without any token background. Available in OS X v10.4 and later.

32.71.31  **NSRoundedTokenType** = 2

MBS MacControls Plugin, Plugin Version: 12.5. **Function:** One of the token styles. **Notes:**
Style best used for address type tokens. Available in OS X v10.4 and later.
CHAPTER 32. COCOA

32.72 class NSToolbarItemGroupMBS

32.72.1 class NSToolbarItemGroupMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: NSToolbarItemGroup is a subclass of NSToolbarItem which contains subitems.
Notes:
The views and labels of the subitems are used, but the parent’s attributes take precedence.
Subclass of the NSToolbarItemMBS class.

32.72.2 Methods

32.72.3 Constructor(itemIdentifier as string)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes:
itemIdentifier: The identifier for the receiver. itemIdentifier is never seen by users and should not be localized.
The identifier is used by the toolbar and its delegate to identify the kind of the toolbar item.

32.72.4 SetSubItems(items() as NSToolbarItemMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the subitems for the receiver.
Notes:
subitems: An array of instances of NSToolbarItem objects that form the subitems for the receiver.
You should call this method to set the subitems before returning the item to the toolbar. NSToolbarItemGroup objects cannot contain other NSToolbarItemGroup objects as subitems.

32.72.5 subitems as NSToolbarItemMBS()

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the subitems for the receiver.
Notes: By default, an NSToolbarItemGroup instance has an empty array of subitems.
class NSToolbarItemMBS

32.73.1 class NSToolbarItemMBS

**Function:** The class for Cocoa toolbar items.
**Notes:** Each item in an NSToolbar is an instance of NSToolbarItem.

32.73.2 Methods

32.73.3 Constructor(itemIdentifier as string)

**Function:** The constructor.
**Notes:**
- `itemIdentifier`: The identifier for the receiver. `itemIdentifier` is never seen by users and should not be localized.

The identifier is used by the toolbar and its delegate to identify the kind of the toolbar item.

32.73.4 NSToolbarCustomizeToolbarItemIdentifier as string

**Function:** One of the standard toolbar item identifiers.
**Notes:**
The Customize item. Shows the customization palette.

Deprecated. In OS X v10.7 and later the customization icon has been removed from the toolbar and customization palettes. This constant is ignored.

32.73.5 NSToolbarFlexibleSpaceItemIdentifier as string

**Function:** One of the standard toolbar item identifiers.
**Notes:** The Flexible Space item.
32.73.6 NSToolbarPrintItemIdentifier as string

**Function:** One of the standard toolbar item identifiers.  
**Notes:** The Print item. Sends printDocument to firstResponder, but you can change this in toolbarWillAddItem if you need to do so.

32.73.7 NSToolbarSeparatorItemIdentifier as string

**Function:** One of the standard toolbar item identifiers.  
**Notes:** The Separator item.

32.73.8 NSToolbarShowColorsItemIdentifier as string

**Function:** One of the standard toolbar item identifiers.  
**Notes:** The Colors item. Shows the color panel.

32.73.9 NSToolbarShowFontsItemIdentifier as string

**Function:** One of the standard toolbar item identifiers.  
**Notes:** The Fonts item. Shows the font panel.

32.73.10 NSToolbarSpaceItemIdentifier as string

**Function:** One of the standard toolbar item identifiers.  
**Notes:** The Space item.

32.73.11 validate

**Function:** This method is called by the receiver’s toolbar during validation.  
**Notes:** You may invoke this method directly if you have disabled automatic validation for an item typically you do this for performance reasons if your validation code is slow.
32.73.12 Properties

32.73.13 allowsDuplicatesInToolbar as boolean

**Function:** Returns a Boolean value that indicates whether the receiver can be represented in the toolbar at more than one position.

**Notes:**

Returns true to allow dragging the receiver into the toolbar at more than one position, otherwise false.

You use this method by overriding it in a subclass to always return true; typically, you wouldn’t call it. By default, if an item with the same identifier is already in the toolbar, dragging it in again will effectively move it to the new position.

(Read only property)

32.73.14 autovalidates as boolean

**Function:** Whether this item auto validates.

**Notes:**

By default NSToolbar automatically invokes the receiver’s validate method on a regular basis. If your validate method is time consuming, you can disable auto validation on a per toolbar item basis.

(Read and Write property)

32.73.15 ClassName as String

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The name of this NSWindow class.

**Notes:** (Read only property)

32.73.16 ClassPath as String

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The path of this NSView class.

**Notes:** Useful for debugging to know what super classes the window has.

(Read only property)
### 32.73.17 Enabled as boolean

**Function:** A Boolean value that indicates whether the receiver is enabled.
**Notes:**
For a view item, this method calls isEnabled/setEnabled on the view if it responds and returns the result.
(Read and Write property)

### 32.73.18 Handle as Integer

**Function:** The internal reference to the NSToolbarItem object.
**Notes:** (Read and Write property)

### 32.73.19 image as NSImageMBS

**Function:** The image for this toolbar item.
**Notes:**
For a custom view item (one whose view has already been set), this method calls setImage on the view if it responds. If image contains multiple representations, NSToolbarItem chooses the most appropriately sized representation when displaying.
(Read and Write property)

### 32.73.20 itemIdentifier as string

**Function:** The receiver’s identifier.
**Notes:**
Returns the receiver’s identifier, which was provided in the initializer.
(Read only property)

### 32.73.21 label as string

**Function:** The label, which normally appears in the toolbar and in the overflow menu.
**Notes:**
32.73. **CLASS NSTOOLBARTITEMMBS**

The length of the label should be appropriate and not too long. The label may be empty.
(Read and Write property)

### 32.73.22 MaxSize as NSSizeMBS

**Function:** The maximum size.

**Notes:** (Read and Write property)

### 32.73.23 menuFormRepresentation as NSMenuItemMBS

**Function:** The menu form representation.

**Notes:**
By default, this method returns nil, even though there is a default menu form representation.
(Read and Write property)

### 32.73.24 MinSize as NSSizeMBS

**Function:** The minimum size.

**Notes:** (Read and Write property)

### 32.73.25 paletteLabel as string

**Function:** The label that appears when the receiver is in the customization palette.

**Notes:**
An item must have a palette label if the customization palette is to be used, and for most items it is reasonable to set paletteLabel to be the same value as label. One reason for paletteLabel to be different from label would be if it's more descriptive; another might be if there is no label.
(Read and Write property)

### 32.73.26 tag as Integer

**Function:** The tag value.
Notes:
You can use the tag for your own custom purpose.
(Read and Write property)

32.73.27 toolbar as NSToolbarMBS

Function: Returns the toolbar that is using the receiver.
Notes: (Read only property)

32.73.28 toolTip as string

Function: The tooltip to be used when the receiver is displayed in the toolbar.
Notes: (Read and Write property)

32.73.29 view as NSViewMBS

Function: The custom view for this item.
Notes:
view: The view for the receiver. The view and all of its contents must conform to the NSCoding protocol if
the toolbar supports customization.

Note that many of the set/get methods are implemented by calls forwarded to view, if it responds to it.
(Read and Write property)

32.73.30 visibilityPriority as Integer

Function: The visibility priority.
Notes: (Read and Write property)
32.73. Constants

32.73.32  **NSToolbarItemVisibilityPriorityHigh** = 1000

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the visibility priority constants.  
**Notes:**
When a toolbar does not have enough space to fit all its items, it must push some items into the overflow menu. These values allow you to suggest a priority for a toolbar item.

Items with this priority are less inclined to be pushed to the overflow menu.

32.73.33  **NSToolbarItemVisibilityPriorityLow** = -1000

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the visibility priority constants.  
**Notes:**
When a toolbar does not have enough space to fit all its items, it must push some items into the overflow menu. These values allow you to suggest a priority for a toolbar item.

Items with this priority will be the first items to be pushed to the overflow menu.

32.73.34  **NSToolbarItemVisibilityPriorityStandard** = 0

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the visibility priority constants.  
**Notes:**
When a toolbar does not have enough space to fit all its items, it must push some items into the overflow menu. These values allow you to suggest a priority for a toolbar item.

The default visibility priority.

32.73.35  **NSToolbarItemVisibilityPriorityUser** = 2000

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the visibility priority constants.  
**Notes:**
When a toolbar does not have enough space to fit all its items, it must push some items into the overflow menu. These values allow you to suggest a priority for a toolbar item.
Items with this priority are the last to be pushed to the overflow menu. Only the user should set items to this priority.
32.74. CLASS NSTOOLBARMBS

32.74 class NSToolbarMBS

32.74.1 class NSToolbarMBS

Function: NSToolbar and NSToolbarItem provide the mechanism for a titled window to display a toolbar just below its title bar.

32.74.2 Methods

32.74.3 Constructor(Identifier as string)

Function: The constructor.
Notes:
Initializes a newly allocated toolbar with the specified identifier.
identifier is never seen by users and should not be localized.

32.74.4 insertItemWithItemIdentifier(identifier as string, atIndex as Integer)

Function: Inserts the specified item at the specified index.
Notes:
Identifier: The identifier of the item to insert.
index: The index at which to insert the item.
If the toolbar needs a new instance, it will get it from itemForItemIdentifier. Typically, you should not call this method; you should let the user reconfigure the toolbar.

32.74.5 items as NSToolbarItemMBS()

Function: Returns the receiver’s current items, in order.
32.74.6 NSToolbarDidRemoveItemNotification as string

Function: One of the notification identifiers.
Notes: Posted after an item is removed from a toolbar. The notification item is the NSToolbar object that had an item removed from it. The userInfo dictionary contains the following information: item: The NSToolbarItem object that was removed.

32.74.7 NSToolbarWillAddItemNotification as string

Function: One of the notification identifiers.
Notes: Posted before a new item is added to the toolbar. The notification item is the NSToolbar object having an item added to it. The userInfo dictionary contains the following information: item: The NSToolbarItem object being added.

32.74.8 removeItemAtIndex(index as Integer)

Function: Removes the specified item.
Notes:
Typically, you should not call this method; you should let the user reconfigure the toolbar.

Index is zero based.

32.74.9 runCustomizationPalette

Function: Runs the receiver’s customization palette.

32.74.10 validateVisibleItems

Function: Called on window updates to validate the visible items.
Notes:
You typically use this method by overriding it in a subclass. The default implementation of this method iterates through the list of visible items, sending each a validate message. Override it and call super if you...
want to know when this method is called.

In Mac OS X v 10.6 and later toolbars no longer automatically validate for some events, including: NSLeft-
MouseDragged, NSRightMouseDragged, NSOtherMouseDragged, NSMouseEntered, NSMouseExited, NSS-
crollWheel, NSCursorUpdate, NSKeyDown. In addition, validation for NSKeyUp and NSFlagsChanged
events is deferred with the timer restarting for every new deferrable event. So a sequence of key events will
not trigger any validation at all, until either a pause of .85 seconds, or an event other than NSKeyUp or
NSFlagsChanged is processed. This change was made as an optimization.

To trigger validation for a single toolbar manually, send the toolbar a validateVisibleItems message. To
trigger validation for all toolbars, invoke NSApplication’s setWindowsNeedUpdate passing true.

32.74.11 visibleItems as NSToolbarItemMBS()

Function: Returns the receiver’s currently visible items.
Notes: Items in the overflow menu are not considered visible.

32.74.12 Properties

32.74.13 allowsUserCustomization as boolean

Function: A Boolean value that indicates whether users are allowed to modify the toolbar.
Notes: True if users are allowed to modify the toolbar, false otherwise. The default is false.

If the value is false, then the Customize Toolbar menu item is disabled and other modification is disabled.
This attribute does not affect the user’s ability to show or hide the toolbar.
(Read and Write property)

32.74.14 autosavesConfiguration as boolean

Function: A Boolean value that indicates whether the receiver autosaves its configuration.
Notes: True if the receiver autosaves its configuration, otherwise false. The default is false.
When autosaving is enabled, the receiver will automatically write the toolbar settings to user defaults if the toolbar configuration changes. The toolbar’s configuration is identified in user defaults by the toolbar identifier. If there are multiple toolbars active with the same identifier, they all share the same configuration. (Read and Write property)

32.74.15 configurationDictionary as dictionary

Function: The receiver’s configuration as a dictionary.
Notes:
Set/get a dictionary containing configuration information for the toolbar.
Contains displayMode, isVisible, and a list of the item identifiers currently in the toolbar.
Do not depend on any details of the normal contents of a configuration dictionary.
(Read and Write property)

32.74.16 configurationDictionaryData as Memoryblock

Function: The receiver’s configuration as a memoryblock.
Notes:
Set/get a memoryblock containing configuration information for the toolbar.
Contains displayMode, isVisible, and a list of the item identifiers currently in the toolbar.
Do not depend on any details of the normal contents of a configuration dictionary.
you can read/write the data to preferences.
(Read and Write property)

32.74.17 customizationPaletteIsRunning as boolean

Function: Returns a Boolean value that indicates whether the receiver’s customization palette is running (in use).
Notes:
True if the receiver’s customization palette is running, otherwise false.
(Read only property)
### 32.74.18 `displayMode` as Integer

**Function:** The receiver’s display mode.  
**Notes:** (Read and Write property)

### 32.74.19 `fullScreenAccessoryView` as `NSViewMBS`

**Function:** The fullscreen mode accessory view.  
**Notes:**  
Requires Mac OS X 10.7.  
(Read and Write property)

### 32.74.20 `fullScreenAccessoryViewMaxHeight` as Double

**Function:** The fullscreen mode accessory view's maximum height.  
**Notes:**  
Requires Mac OS X 10.7.  
(Read and Write property)

### 32.74.21 `fullScreenAccessoryViewMinHeight` as Double

**Function:** The fullscreen mode accessory view’s minimum height.  
**Notes:**  
Requires Mac OS X 10.7.  
(Read and Write property)

### 32.74.22 `Handle` as Integer

**Function:** The internal reference for this object.  
**Notes:** (Read and Write property)
32.74.23 identifier as string

**Function:** Returns the receiver’s identifier.
**Notes:**
Returns the receiver’s identifier, a string used by the class to identify the kind of toolbar.

Within the application all toolbars with the same identifier are synchronized to maintain the same state, including for example, the display mode and item order. The identifier is used as the autosave name for toolbars that save their configuration.
(Read only property)

32.74.24 selectedItemIdentifier as string

**Function:** The selected item to the specified toolbar item.
**Notes:**
Typically, a toolbar will manage the selection of items automatically. This method can be used to select identifiers of custom view items, or to force a selection change. See toolbarSelectableItemIdentifiers for more details. If itemIdentifier is not recognized by the receiver, the current selected item identifier does not change.
(Read and Write property)

32.74.25 showsBaselineSeparator as boolean

**Function:** A Boolean value that indicates whether the toolbar shows the separator between the toolbar and the main window contents.
**Notes:**
True if the toolbar shows the separator between the toolbar and the main window contents, otherwise false. The default is true.
(Read and Write property)

32.74.26 sizeMode as Integer

**Function:** The size mode.
**Notes:**
If there is no icon of the given size for a toolbar item, the toolbar item creates one by scaling an icon of another size.
32.74.27 toolbarView as NSViewMBS

Function: The internal NSView used for displaying the toolbar.
Notes: Useful to query values like the bounds of the toolbar.

Works for 64-bit with 17.5 version, but returns nil in older versions.
(Read only property)

32.74.28 visible as boolean

Function: Whether the receiver is visible or hidden.
Notes: True to indicate the receiver should be made visible, false to indicate it should be hidden.
(Read and Write property)

32.74.29 Constants

32.74.30 NSToolbarDisplayModeDefault = 0

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants for displayMode property.
Notes: The default display mode.

32.74.31 NSToolbarDisplayModeIconAndLabel = 1

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants for displayMode property.
Notes: The toolbar will display icons and labels.

32.74.32 NSToolbarDisplayModeIconOnly = 2

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants for displayMode property.
Notes: The toolbar will display only icons.
32.74.33 NSToolbarDisplayModeLabelOnly = 3

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants for displayMode property. Notes: The toolbar will display only labels.

32.74.34 NSToolbarSizeModeDefault = 0

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants for the sizeMode property. Notes: The toolbar uses the system-defined default size, which is NSToolbarSizeModeRegular.

32.74.35 NSToolbarSizeModeRegular = 1

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants for the sizeMode property. Notes: The toolbar uses regular-sized controls and 32 by 32 pixel icons.

32.74.36 NSToolbarSizeModeSmall = 2

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants for the sizeMode property. Notes: The toolbar uses small-sized controls and 24 by 24 pixel icons.
32.75. CLASS NSUNDOMANAGERMBS

32.75. class NSUndoManagerMBS

32.75.1. class NSUndoManagerMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
NSUndoManager is a general-purpose recorder of operations for undo and redo.

**Notes:**
You register an undo operation by specifying the object that’s changing (or the owner of that object), along with a method to invoke to revert its state, and the arguments for that method. When performing undo an NSUndoManager saves the operations reverted so that you can redo the undos. If used in a Cocoa Application Kit-based application, NSUndoManager groups all operations within a single cycle of the run loop, so that performing an undo reverts all changes that occurred during the cycle.

NSUndoManager is implemented as a class of the Foundation framework because executables other than applications might want to revert changes to their states. For example, you might have an interactive command-line tool with undo and redo commands, or there could be distributed object implementations that can revert operations "over the wire." However, users typically see undo and redo as application features. The Application Kit implements undo and redo in its NSTextView object and makes it easy to implement it in objects along the responder chain. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

32.75.2. Methods

32.75.3. beginUndoGrouping

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Marks the beginning of an undo group.

**Notes:** All individual undo operations before a subsequent endUndoGrouping message are grouped together and reversed by a later undo message. By default undo groups are begun automatically at the start of the event loop, but you can begin your own undo groups with this method, and nest them within other groups.

32.75.4. canRedo as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a Boolean value that indicates whether the receiver has any actions to redo.

32.75.5. canUndo as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a Boolean value that indicates whether the receiver has any actions to undo.
Notes: The return value does not mean you can safely invoke undo or undoNestedGroupyou may have to close open undo groups first.

### 32.75.6 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

### 32.75.7 disableUndoRegistration

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disables the recording of undo operations.

**Notes:** This method can be invoked multiple times by multiple clients. The enableUndoRegistration method must be invoked an equal number of times to re-enable undo registration.

### 32.75.8 enableUndoRegistration

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables the recording of undo operations.

**Notes:** Because undo registration is enabled by default, it is often used to balance a prior disableUndoRegistration message. Undo registration isn’t actually re-enabled until an enable message balances the last disable message in effect. Raises an NSInternalInconsistencyException if invoked while no disableUndoRegistration message is in effect.

### 32.75.9 endUndoGrouping

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Marks the end of an undo group.

**Notes:** All individual undo operations back to the matching beginUndoGrouping message are grouped together and reversed by a later undo or undoNestedGroup message. Undo groups can be nested, thus providing functionality similar to nested transactions. Raises an NSInternalInconsistencyException if there’s no beginUndoGrouping message in effect.

### 32.75.10 groupingLevel as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of nested undo groups (or redo groups, if Redo was invoked last) in the current event loop.
32.75. **CLASS NSUNDO MANAGER MBS**

**Notes:** An integer indicating the number of nested groups. If 0 is returned, there is no open undo or redo group.

### 32.75.11 isRedoing as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is in the process of performing its redo method. **Notes:** True if the method is being performed, otherwise false.

### 32.75.12 isUndoing as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is in the process of performing its undo or undoNestedGroup method. **Notes:** True if the method is being performed, otherwise false.

### 32.75.13 isUndoRegistrationEnabled as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the recording of undo operations is enabled. **Notes:** True if registration is enabled; otherwise, false. Undo registration is enabled by default.

### 32.75.14 redo

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs the operations in the last group on the redo stack, if there are any, recording them on the undo stack as a single group. **Notes:** Raises an NSInternalInconsistencyException if the method is invoked during an undo operation.

### 32.75.15 redoActionName as string

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name identifying the redo action. **Notes:**
The redo action name. Returns an empty string if no action name has been assigned or if there is nothing to redo.

For example, if the menu title is "Redo Delete," the string returned is "Delete."

### 32.75.16 redoMenuItemTitle as string

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the complete title of the Redo menu command, for example, "Redo Paste." **Notes:** Returns "Redo" if no action name has been assigned or an empty string if there is nothing to redo.

### 32.75.17 redoMenuTitleForUndoActionName(actionName as string) as string

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the complete, localized title of the Redo menu command for the action identified by the given name. **Notes:** Override this method if you want to customize the localization behavior. This method is invoked by redoMenuItemTitle.

Available in Mac OS X v10.0 and later.

### 32.75.18 removeAllActions

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the undo and redo stacks and re-enables the receiver.

### 32.75.19 setActionName(actionName as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the name of the action associated with the Undo or Redo command. **Notes:** If actionName is an empty string, the action name currently associated with the menu command is removed. There is no effect if actionName is ".".
32.75. **undo**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the top-level undo group if necessary and invokes undoNestedGroup.

**Notes:** This method also invokes endUndoGrouping if the nesting level is 1. Raises an NSInternalInconsistencyException if more than one undo group is open (that is, if the last group isn’t at the top level).

32.75.21 **undoActionName as string**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name identifying the undo action.

**Notes:**

The undo action name. Returns an empty string if no action name has been assigned or if there is nothing to undo.

For example, if the menu title is "Undo Delete," the string returned is "Delete."

32.75.22 **undoMenuItemTitle as string**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the complete title of the Undo menu command, for example, "Undo Paste."

**Notes:** Returns "Undo" if no action name has been assigned or "" if there is nothing to undo.

32.75.23 **undoMenuTitleForUndoActionName(actionName as string) as string**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the complete, localized title of the Undo menu command for the action identified by the given name.

**Notes:** Override this method if you want to customize the localization behavior. This method is invoked by undoMenuItemTitle.

32.75.24 **undoNestedGroup**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs the undo operations in the last undo group (whether top-level or nested), recording the operations on the redo stack as a single group.

**Notes:** Raises an NSInternalInconsistencyException if any undo operations have been registered since the last enableUndoRegistration message.
32.75.25 Properties

32.75.26 Handle as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal uses reference to the NSUndoManager object.
**Notes:** (Read and Write property)

32.75.27 groupsByEvent as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver automatically creates undo groups around each pass of the run loop.
**Notes:**
True if the receiver automatically creates undo groups around each pass of the run loop, otherwise false. (Read and Write computed property)

32.75.28 levelsOfUndo as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the maximum number of top-level undo groups the receiver holds.
**Notes:**
An integer specifying the number of undo groups. A limit of 0 indicates no limit, so old undo groups are never dropped.

When ending an undo group results in the number of groups exceeding this limit, the oldest groups are dropped from the stack. The default is 0. (Read and Write computed property)
32.76. CLASS NSUSERDEFAULTSMBS

32.76 class NSUserDefaultsMBS

32.76.1 class NSUserDefaultsMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class to handle preferences.

**Example:**

```vbnet
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setStringValue "test", "Hello World"
MsgBox u.stringForKey("test")
```

**Notes:**

The NSUserDefaults class provides a programmatic interface for interacting with the defaults system. The defaults system allows an application to customize its behavior to match a user’s preferences. For example, you can allow users to determine what units of measurement your application displays or how often documents are automatically saved. Applications record such preferences by assigning values to a set of parameters in a user’s defaults database. The parameters are referred to as defaults since they’re commonly used to determine an application’s default state at startup or the way it acts by default.

At runtime, you use an NSUserDefaults object to read the defaults that your application uses from a user’s defaults database. NSUserDefaults caches the information to avoid having to open the user’s defaults database each time you need a default value. The synchronize method, which is automatically invoked at periodic intervals, keeps the in-memory cache in sync with a user’s defaults database.

The NSUserDefaults class provides convenience methods for accessing common types such as floats, doubles, integers, Booleans, and URLs. A default object must be a property list, that is, an instance of (or for collections a combination of instances of): NSData, NSString, NSNumber, NSDate, NSArray, or NSDictionary. If you want to store any other type of object, you should typically archive it to create an instance of NSData.

Values returned from NSUserDefaults are immutable, even if you set a mutable object as the value. For example, if you set a mutable string as the value for "MyStringDefault", the string you later retrieve using stringForKey will be immutable.

A defaults database is created automatically for each user. The NSUserDefaults class does not currently support per-host preferences. To do this, you must use the CFPrefeferencesMBS class. However, NSUserDefaults correctly reads per-host preferences, so you can safely mix CFPrefeferencesMBS code with NSUserDefaultsMBS code.

If your application supports managed environments, you can use an NSUserDefaults object to determine which preferences are managed by an administrator for the benefit of the user. Managed environments correspond to computer labs or classrooms where an administrator or teacher may want to configure the
systems in a particular way. In these situations, the teacher can establish a set of default preferences and force those preferences on users. If a preference is managed in this manner, applications should prevent users from editing that preference by disabling any appropriate controls.

TheNSUserDefaults class is thread-safe.

### 32.76.2 Methods

#### 32.76.3 `addSuiteNamed(suiteName as string)`

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts the specified domain name into the receiver’s search list.  
**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.addSuiteNamed "testsuite"
```

**Notes:**

suiteName: The domain name to insert. This domain is inserted after the application domain.

The suiteName domain is similar to a bundle identifier string, but is not tied to a particular application or bundle. A suite can be used to hold preferences that are shared between multiple applications.

#### 32.76.4 `arrayForKey(key as string) as Variant()`

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the array associated with the specified key.  
**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim t(-1) as Variant
  t.Append "Hello"
  t.Append "World"

  u.setArrayValue "test", t

  dim a(-1) as Variant = u.ArrayForKey("test")

  for each v as Variant in a
    MsgBox v
  next
```
**Notes:** The array associated with the specified key, or an empty array if the key does not exist or its value is not an array.

### 32.76.5 Constructor

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new user defaults object initialized with the defaults for the current user account.

**Example:**

```vbs
dim u as new NSUserDefaultsMBS
u.setURLValue "test", "http://www.apple.de/"
MsgBox u.URLForKey("test")
```

**Notes:** This method does not put anything in the search list.

See also:

- 32.76.6 Constructor(username as string)

### 32.76.6 Constructor(username as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSUserDefaultsMBS object initialized with the defaults for the specified user account.

**Notes:**

- username: The name of the user account.

Returns an initialized NSUserDefaultsMBS object whose argument and registration domains are already set up. If the current user does not have access to the specified user account, the object is invalid.

This method does not put anything in the search list. Invoke it only if you’ve allocated your own NSUserDefaults instance instead of using the shared one.

You do not normally use this method to initialize an instance of NSUserDefaults. Applications used by a superuser might use this method to update the defaults databases for a number of users. The user who started the application must have appropriate access (read, write, or both) to the defaults database of the new user, or this method returns nil.

See also:

- 32.76.5 Constructor
32.76.7  dictionaryRepresentation as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary that contains a union of all key-value pairs in the domains in the search list. **Example:**

```java
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim d as Dictionary = u.dictionaryRepresentation

break // "Look here in the dictionary in the debugger."
```

**Notes:**

Returns a dictionary containing the keys. The keys are names of defaults and the value corresponding to each key is a property list object as Variant.

As with variantForKey, key-value pairs in domains that are earlier in the search list take precedence. The combined result does not preserve information about which domain each entry came from.

32.76.8  NSArgumentDomain as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants to specify the domain. **Notes:** The domain consisting of defaults parsed from the application’s arguments. These are one or more pairs of the form -default value included in the command-line invocation of the application.

32.76.9  NSGlobalDomain as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants to specify the domain. **Notes:** The domain consisting of defaults meant to be seen by all applications.

32.76.10  NSRegistrationDomain as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants to specify the domain. **Notes:** The domain consisting of a set of temporary defaults whose values can be set by the application to ensure that searches will always be successful.
32.76. **CLASS NSUSERDEFAULTSMBS**

32.76.11  **NSUserDefaultsDidChangeNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The notification name for a did change notification. **Notes:** Use with the NSNotification* objects.

32.76.12  **objectIsForcedForKey(key as string) as boolean**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the specified key is managed by an administrator. **Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
MsgBox str(u.objectIsForcedForKey("test"))
```

**Notes:**

key: The key whose status you want to check.

Returns true if the value of the specified key is managed by an administrator, otherwise false.

This method assumes that the key is a preference associated with the current user and application. For managed keys, the application should disable any user interface that allows the user to modify the value of key.

Available in Mac OS X v10.2 and later. **See also:**

- 32.76.13 objectIsForcedForKey(key as string, domain as string) as boolean

32.76.13  **objectIsForcedForKey(key as string, domain as string) as boolean**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the key in the specified domain is managed by an administrator. **Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
MsgBox str(u.objectIsForcedForKey("test", u.NSGlobalDomain))
```

**Notes:**
key: The key whose status you want to check.
domain: The domain of the key.

Returns true if the key is managed by an administrator in the specified domain, otherwise false.

This method assumes that the key is a preference associated with the current user. For managed keys, the application should disable any user interface that allows the user to modify the value of key.

Available in Mac OS X v10.2 and later.

See also:

- 32.76.12 objectIsForcedForKey(key as string) as boolean

32.76.14 persistentDomainForName(domainName as string) as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a dictionary containing the keys and values in the specified persistent domain.
Notes: Returns a dictionary containing the keys. The keys are names of defaults and the value corresponding to each key is a property list object (NSData, NSString, NSNumber, NSDate, NSArray, or NSDictionary).

32.76.15 persistentDomainNames as string()

Notes: You can get the keys and values for each domain by passing the returned domain names to the persistentDomainForName method.

32.76.16 registerDefaults(dic as dictionary)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Adds the contents the specified dictionary to the registration domain.
Notes:
dic: The dictionary of keys and values you want to register.

If there is no registration domain, one is created using the specified dictionary, and NSRegistrationDomain is added to the end of the search list.

The contents of the registration domain are not written to disk; you need to call this method each time your application starts. You can place a plist file in the application’s Resources directory and call registerDefaults
with the contents that you read in from that file.

32.76.17 **removeObjectForKey**(defaultName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the value of the specified default key in the standard application domain.

**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setBoolValue("test", true)
u.removeObjectForKey "test"
MsgBox str(u.boolForKey("test")) // shows false as key does not exist
```

**Notes:**

defaultName: The key whose value you want to remove.

Removing a default has no effect on the value returned by the variantForKey method if the same key exists in a domain that precedes the standard application domain in the search list.

32.76.18 **removePersistentDomainForName**(domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the contents of the specified persistent domain from the user’s defaults.

**Notes:**

domainName: The domain whose keys and values you want. This value should be equal to your application’s bundle identifier.

When a persistent domain is changed, an NSUserDefaultsDidChangeNotification is posted.

32.76.19 **removeSuiteNamed**(suiteName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the specified domain name from the receiver’s search list.

**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.removeSuiteNamed "testsuite"
```
**Notes:** suiteName: The domain name to remove.

### 32.76.20  `removeVolatileDomainForName(domainName as string)`

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the specified volatile domain from the user’s defaults.  
**Notes:** domainName: The volatile domain you want to remove.

### 32.76.21  `resetStandardUserDefaults`

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronizes any changes made to the shared user defaults object and releases it from memory.  
**Example:**
```
NSUserDefaultsMBS.resetStandardUserDefaults
```

**Notes:** A subsequent invocation of standardUserDefaults creates a new shared user defaults object with the standard search list.

### 32.76.22  `setArrayValue(key as string, values() as Variant)`

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified array.  
**Example:**
```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim t(-1) as Variant
t.Append "Hello"
t.Append "World"

u.setArrayValue "test", t

dim a(-1) as Variant = u.ArrayForKey("test")

for each v as Variant in a
    MsgBox v
next
```
32.76.23  setBoolValue(key as string, value as boolean)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified Boolean value.

**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.SetBoolValue("test", true)
MsgBox str(u.boolForKey("test"))
```

32.76.24  setDataValue(key as string, value as memoryblock)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified binary string.

**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setDataValue("test", "Hello ")
MsgBox u.dataForKey("test") // shows no umlauts as encoding is away in binary string
```

**Notes:** setStringValue is for text with encoding and setDataValue is for strings containing binary data.

32.76.25  setDictionaryValue(key as string, value as dictionary)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified dictionary.

**Example:**

```vba
dim u as new NSUserDefaultsMBS
dim d as new Dictionary

d.Value("First")="Hello"
d.Value("Second")=1234.5678
u.setDictionaryValue "test", d

dim e as Dictionary = u.dictionaryForKey("test")
for each key as Variant in e.keys
    dim value as Variant = e.Value(key)
    MsgBox key+": "+value
next
```
32.76.26  
**setDoubleValue(key as string, value as Double)**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the double value.  
**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setDoubleValue("test", 5)
MsgBox str(u.DoubleForKey("test"))
```

**Notes:** Available in Mac OS X v10.5 and later. On Mac OS X 10.4 the plugin will call setFloatValue for you to avoid an exception.

32.76.27  
**setFileValue(key as string, value as folderitem)**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified URL.  
**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim f as FolderItem = SpecialFolder.Desktop

// write
u.isFileValue "test", f

// read
MsgBox u.fileForKey("test").AbsolutePath
```

**Notes:** Available in Mac OS X v10.6 and later.

32.76.28  
**setFloatValue(key as string, value as single)**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified floating-point value.  
**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setFloatValue("test", 5)
```
32.76. CLASS NSUSERDEFAULTSMBS

MsgBox str(u.FloatForKey("test"))

32.76.29 setIntegerValue(key as string, value as Integer)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified integer value.

**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setIntegerValue("test", 5)
MsgBox str(u.integerForKey("test"))
```

32.76.30 setPersistentDomain(domain as dictionary, domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the dictionary for the specified persistent domain.

**Notes:**

- **domain:** The dictionary of keys and values you want to assign to the domain.
- **domainName:** The domain whose keys and values you want to set. This value should be equal to your application’s bundle identifier.

When a persistent domain is changed, an NSUserDefaultsDidChangeNotification is posted.

32.76.31 setStringArrayValue(key as string, values() as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified string array.

**Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim t(-1) as string = array("Hello","World")
```

```vba
u.setStringArrayValue "test", t
```

```vba
dim a(-1) as string = u.stringArrayForKey("test")
```

```vba
MsgBox Join(a) // shows "Hello World"
```
32.76.32  setStringValue(key as string, value as string)

Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setStringValue "test", "Hello "
MsgBox u.stringForKey("test")
```

Notes: setStringValue is for text with encoding and setDataValue is for strings containing binary data.

32.76.33  setURLValue(key as string, value as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: Sets the value of the specified default key to the specified URL.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setURLValue "test", "http://www.apple.de/"
MsgBox u.URLForKey("test")
```

Notes: Available in Mac OS X v10.6 and later.

32.76.34  setVariantValue(key as string, value as Variant)

Example:

```
dim u as new NSUserDefaultsMBS
u.setVariantValue "test", "Hello World"
MsgBox u.variantForKey("test")
```

Notes:

The value parameter can be only property list objects: String, Number, Date, an Array of variant, or Dictionary. For Arrays and Dictionaries, their contents must be property list objects.
Setting a default has no effect on the value returned by the objectForKey: method if the same key exists in a domain that precedes the application domain in the search list.

### 32.76.35 setVolatileDomain(domain as dictionary, domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the dictionary for the specified volatile domain.  
**Notes:**

- **domain:** The dictionary of keys and values you want to assign to the domain.
- **domainName:** The domain whose keys and values you want to set.

This method raises an NSInvalidArgumentException if a volatile domain with the specified name already exists.

### 32.76.36 standardUserDefaults as NSUserDefaultsMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the shared defaults object.  
**Example:**

```python
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
```

**Notes:**

If the shared defaults object does not exist yet, it is created with a search list containing the names of the following domains, in this order:

- **NSArgumentDomain,** consisting of defaults parsed from the application’s arguments. A domain identified by the application’s bundle identifier
- **NSGlobalDomain,** consisting of defaults meant to be seen by all applications. Separate domains for each of the user’s preferred languages
- **NSRegistrationDomain,** a set of temporary defaults whose values can be set by the application to ensure that searches will always be successful

The defaults are initialized for the current user. Subsequent modifications to the standard search list remain in effect even when this method is invoked again; the search list is guaranteed to be standard only the first time this method is invoked. The shared instance is provided as a convenience; you can create custom instances using the Constructor.
**32.76.37** stringArrayForKey(key as string) as string()

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the array of strings associated with the specified key. **Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim t(-1) as string = array("Hello","World")

u.setStringArrayValue "test", t

dim a(-1) as string = u.stringArrayForKey("test")

MsgBox Join(a) // shows "Hello World"
```

**Notes:** Returns an array with strings. The array is empty if the value for the key is not an array.

---

**32.76.38** synchronize as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes any modifications to the persistent domains to disk and updates all unmodified persistent domains to what is on disk. **Example:**

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

// do something

if u.synchronize then
    MsgBox "Saved preferences."
else
    MsgBox "Failed to save preferences."
end if
```

**Notes:**

Returns true if the data was saved successfully to disk, otherwise false.

Because this method is automatically invoked at periodic intervals, use this method only if you cannot wait for the automatic synchronization (for example, if your application is about to exit) or if you want to update the user defaults to what is on disk even though you have not made any changes.
32.76.39  volatileDomainForName(domainName as string) as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the dictionary for the specified volatile domain.

**Notes:** Returns the dictionary of keys and values belonging to the domain. The keys in the dictionary are names of defaults, and the value corresponding to each key is a property list object (String, Number, Date, Array, or Dictionary).

32.76.40  volatileDomainNames as string()

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the current volatile domain names.

**Notes:** You can get the contents of each domain by passing the returned domain names to the volatileDomainForName method.

32.76.41  Properties

32.76.42  boolForKey(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Boolean value associated with the specified key.

**Example:**

```dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.boolForKey(“test”) = true
MsgBox str(u.boolForKey(“test”))
```

**Notes:**

If a boolean value is associated with defaultName in the user defaults, that value is returned. Otherwise, false is returned.
(Read and Write computed property)

32.76.43  dataForKey(key as string) as memoryblock

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The data string associated with the specified key.

**Example:**

```dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
```
u.dataForKey("test")="Hello \\

MsgBox u.dataForKey("test") // shows no umlauts as encoding is away in binary string

 Notes:
Returns the memoryblock or nil if there is no value for this key.

dataForKey is for any string and does not store encoding. stringForKey does store encoding and works only
for text strings.  
(Read and Write computed property)

32.76.44 dictionaryForKey(key as string) as dictionary

**Function:** The dictionary object associated with the specified key.  
**Example:**

dim u as new NSUserDefaultsMBS  
dim d as new Dictionary  
d.Value("First")="Hello"  
d.Value("Second")=1234.5678  
u.setDictionaryValue "test", d  

dim e as Dictionary = u.dictionaryForKey("test")  
for each key as Variant in e.keys  
dim value as Variant = e.Value(key)  
MsgBox key+: ""+value  
next  

Notes:
Returns dictionary object associated with the specified key, or nil if the key does not exist or its value is not
an dictionary.  
(Read and Write computed property)

32.76.45 doubleForKey(key as string) as Double

**Function:** The double value associated with the specified key.
Example:

dim u as NSUserDefaultsMBS =NSUserDefaultsMBS.standardUserDefaults
u.doubleForKey("test") = 5
MsgBox str(u.doubleForKey("test"))

Notes:

Returns the double value associated with the specified key. If the key does not exist, this method returns 0.
Available in Mac OS X v10.5 and later. On Mac OS X 10.4 the plugin will call floatForKey for you to avoid an exception.
(Read and Write computed property)

32.76.46  fileForKey(key as string) as folderitem

Example:

dim u as NSUserDefaultsMBS =NSUserDefaultsMBS.standardUserDefaults
dim f as FolderItem = SpecialFolder.Desktop

// write
u.fileForKey("test")=f

// read
MsgBox u.fileForKey("test").AbsolutePath

Notes:

Available in Mac OS X v10.6 and later.
(Read and Write computed property)

32.76.47  floatForKey(key as string) as single

Example:

dim u as NSUserDefaultsMBS =NSUserDefaultsMBS.standardUserDefaults
u.floatForKey("test") = 5
MsgBox str(u.floatForKey("test"))
Notes:
Returns the floating-point value associated with the specified key. If the key does not exist, this method returns 0. (Read and Write computed property)

32.76.48 integerForKey(key as string) as Integer

Example:

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.integerForKey("test") = 5
MsgBox str(u.integerForKey("test"))
```

Notes:
The integer value associated with the specified key. If the specified key does not exist, this method returns 0. (Read and Write computed property)

32.76.49 stringForKey(key as string) as string

Example:

```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setStringValue "test", "Hello "
MsgBox u.stringForKey("test")
```

Notes:
Returns the string or "" if there is no value for this key.

dataForKey is for any string and does not store encoding. stringForKey does store encoding and works only
for text strings.
(Read and Write computed property)

### 32.76.50 URLForKey(key as string) as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSURL instance associated with the specified key.

**Example:**
```vba
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setURLValue "test", "http://www.apple.de/
MsgBox u.URLForKey("test")
```

**Notes:**
Available in Mac OS X v10.6 and later.
(Read and Write computed property)

### 32.76.51 variantForKey(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The object associated with the first occurrence of the specified default.

**Example:**
```vba
dim u as new NSUserDefaultsMBS
u.setVariantValue "test", "Hello World"
MsgBox u.variantForKey("test")
```

**Notes:**
This method searches the domains included in the search list in the order they are listed.
(Read and Write computed property)
32.77 class NSUUIDMBS

32.77.1 class NSUUIDMBS

**Function:** An object representing a universally unique value that bridges to UUID; use NSUUID when you need reference semantics or other Foundation-specific behavior.

**Notes:**

UUIDs (Universally Unique Identifiers), also known as GUIDs (Globally Unique Identifiers) or IIDs (Interface Identifiers), are 128-bit values. UUIDs created by NSUUID conform to RFC 4122 version 4 and are created with random bytes.

The standard format for UUIDs represented in ASCII is a string punctuated by hyphens, for example 68753A44-4D6F-1226-9C60-0050E4C00067. The hex representation looks, as you might expect, like a list of numerical values preceded by 0x. For example, 0xD7, 0x36, 0x95, 0x0A, 0x4D, 0x6E, 0x12, 0x26, 0x80, 0x3A, 0x00, 0x50, 0xE4, 0xC0, 0x00, 0x67. Because a UUID is expressed simply as an array of bytes, there are no endianness considerations for different platforms.

32.77.2 Methods

32.77.3 Available as boolean

**Function:** Whether this class is available.

**Notes:** Returns true on macOS 10.8 or newer.

32.77.4 Constructor

**Function:** Initializes a new UUID with RFC 4122 version 4 random bytes.

See also:

- 32.77.5 Constructor(UUID as MemoryBlock)
- 32.77.6 Constructor(UUID as String)

32.77.5 Constructor(UUID as MemoryBlock)

**Function:** Initializes a new UUID with the given bytes.

See also:

- 32.77.4 Constructor
32.77. CLASS NSUUIDMBS

- 32.77.6 Constructor (UUID as String)

32.77.6 Constructor (UUID as String)

**Function:** Initializes a new UUID with the formatted string.

See also:

- 32.77.4 Constructor
- 32.77.5 Constructor (UUID as MemoryBlock)

32.77.7 copy as NSUUIDMBS

**Function:** Copies the UUID.

32.77.8 isEqual (other as NSUUIDMBS) as boolean

**Function:** Compares two UUIDs.

**Example:**

```plaintext
dim u1 as new NSUUIDMBS
dim s1 as string = u1.UUIDString

// make new object with same UUID
dim u2 as NSUUIDMBS = new NSUUIDMBS(s1)
dim s2 as string = u2.UUIDString

// other uuid
dim o as new NSUUIDMBS
dim so as string = o.UUIDString

dim e1 as Boolean = u1.isEqual(u2)
dim e2 as Boolean = u1.isEqual(o)

Break
```

**Notes:** Returns true if both are equal.
32.77.9  Operator_Compare(other as NSUUIDMBS) as Integer

**Function:** Compares two UUIDs.
**Example:**

```vbnet
dim u1 as new NSUUIDMBS
dim s1 as string = u1.UUIDString

// make new object with same UUID
dim u2 as NSUUIDMBS = new NSUUIDMBS(s1)
dim s2 as string = u2.UUIDString

// other uuid
dim o as new NSUUIDMBS
dim so as string = o.UUIDString

if u1 = u2 then
    MsgBox "u1 and u2 are equal."
else
    MsgBox "u1 and u2 are not equal. Problem?"
end if

if u1 = o then
    MsgBox "u1 and o are equal. Problem?"
else
    MsgBox "u1 and o are not equal."
end if
```

32.77.10  UUID as NSUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create and returns a new UUID with RFC 4122 version 4 random bytes.

32.77.11  Properties

32.77.12  data as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries copy of the bytes as memory block.
**Notes:** (Read only property)
32.77. CLASS NSUUIDMBS

32.77.13 Handle as Integer

32.77.14 UUIDString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The UUID as a string. Notes: (Read only property)
32.78  class NSViewControllerMBS

32.78.1  class NSViewControllerMBS

32.78.2  Methods

32.78.3  available as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available. Example:

MsgBox str(NSViewControllerMBS.available)

Notes: Returns true on Mac OS X 10.5 or newer.

32.78.4  Constructor

32.78.5  Properties

32.78.6  className as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The name of this NSViewController class. Notes: (Read only property)
32.78.7 classPath as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSViewController class.
**Notes:**
Useful for debugging to know what super classes the view controller has.
(Read only property)

32.78.8 Title as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The localized title of the receiver’s view.
**Notes:**
NSViewController does not use the title property directly. This property is here because so many anticipated uses of this class will involve letting the user choose among multiple named views using a pulldown menu or some other user interface.
(Read and Write property)

32.78.9 view as NSViewMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The view belonging to this view controller.
**Notes:** (Read and Write property)

32.78.10 viewLoaded as Boolean

MBS MacBase Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether view is already loaded.
**Notes:** (Read only property)
32.79 class NSViewMBS

32.79.1 class NSViewMBS

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for a view.

**Notes:**
To draw into a NSView, use either CustomNSViewMBS class with drawRect event or NSGraphicsMBS class. Subclass of the NSResponderMBS class.

32.79.2 Methods

32.79.3 addSubview(subview as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a view to the subviews so it’s displayed above its siblings.

**Example:**
```javascript
// create a button
dim n as new NSButtonMBS(100, 100, 50, 24)
n.bezelStyle = n.NSRoundedBezelStyle
n.Title = "Test"

// add directly to window’s content view
window1.NSWindowMBS.contentView.addSubview n
```

See also:
- 32.79.4 addSubview(subview as NSViewMBS, positioned as Integer, relativeToView as NSViewMBS)

32.79.4 addSubview(subview as NSViewMBS, positioned as Integer, relativeToView as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts a view among the receiver’s subviews so it’s displayed immediately above or below another view.

**Example:**
```javascript
// create a button
dim n as new NSButtonMBS(100, 100, 50, 24)
```
n.bezelStyle = n.NSRoundedBezelStyle
n.Title = "Test"

// add directly to window’s super view, below the content view
// so it is behind all RB controls
window1.NSWindowMBS.contentView.superview.addSubview n, NSWindowMBS.NSWindowBelow, window1.NSWindowMBS.contentView

Notes:

subView: The view object to add to the receiver as a subview.
positioned: A constant specifying the position of the aView relative to otherView. Valid values are NSWindowAbove or NSWindowBelow.
relativeToView: The other view subView is to be positioned relative to. If relativeToView is nil (or isn’t a subview of the receiver), subView is added above or below all of its new siblings.

This method also sets the receiver as the next responder of aView.
See also:

- 32.79.3 addSubview(subview as NSViewMBS)

32.79.5 addToolTipRect(rect as NSRectMBS, tooltip as NSViewTooltipMBS)

MBS MacBase Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a tooltip for a defined area the view and returns a tag that identifies the tooltip rectangle.
Notes:

Rect: A rectangle defining the region of the view to associate the tooltip with.
tooltip: The object to provide text.

Please keep reference of tooltip object as the tooltip is removed by it’s destructor.

32.79.6 ancestorSharedWithView(view as NSViewMBS) as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The closest ancestor shared by the receiver and a given view.
Notes: The closest ancestor or nil if there’s no such object. Returns self if aView is identical to the receiver.
32.79.7 animator as NSViewMBS

MBS MacBase Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the proxy object for this view which animates.
Example:

```dim v as NSViewMBS // your NSViewMBS object
v.alphaValue = 0.5 // switch alpha directly
v.animator.alphaValue = 0.5 // switch alpha animated```

32.79.8 beginDraggingSessionWithItems(items() as Variant, e as NSEventMBS, source as NSViewMBS) as Variant

Notes:

- items: The dragging items (array of variant containing NSDraggingItemMBS objects). The frame property of each NSDraggingItem must be in the view’s coordinate system.
- event: The mouse-down event object from which to initiate the drag operation. In particular, its mouse location is used for the offset of the icon being dragged.
- source: An object that serves as the controller of the dragging operation. It must conform to the NSDraggingSource informal protocol and is typically the receiver itself or its NSWindow object.

Returns the dragging session for the drag (NSDraggingSessionMBS object). Returned as Variant to reduce plugin dependencies.

A basic drag starts by calling beginDraggingSessionWithItems.

The caller can take the returned NSDraggingSession and continue to modify its properties such as slidesBackOnCancelOrFail. When the drag actually starts, the source is sent a draggingSessionWillBeginAtPoint message followed by multiple draggingSessionMovedToPoint messages as the user drags.

Once the drag is ended or cancelled, the source receives a draggingSessionEndedAtPoint:operation and the drag is complete.

Available in OS X v10.7 and later.
32.79. **CLASS NSVIEWMBS**

### 32.79.9 Constructor

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new control with size 100/100 and position 0/0

**Notes:** On success the handle property is not zero.

See also:

- 32.79.10 Constructor(Handle as Integer)
- 32.79.11 Constructor(left as Double, top as Double, width as Double, height as Double)

### 32.79.10 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSView handle.

**Example:**

```vbnet
dim t as new NSTextViewMBS(0, 0, 100, 100)
dim v as new NSTextViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

**Notes:** The handle is casted to a NSView and the plugin retains this handle.

See also:

- 32.79.9 Constructor
- 32.79.11 Constructor(left as Double, top as Double, width as Double, height as Double)

### 32.79.11 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new NSView.

**Notes:**

On success handle is set.

For a toolbar, please get the view directly: self.NSToolbarMBS.toolbarView.

See also:

- 32.79.9 Constructor
- 32.79.10 Constructor(Handle as Integer)
32.79.12 convertPointFromView(point as NSPointMBS, View as NSViewMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Converts a point from the coordinate system of a given view to that of the receiver.
Notes:
point: A point specifying a location in the coordinate system of aView.
View: The view with aPoint in its coordinate system. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the point converted to the coordinate system of the receiver.

32.79.13 convertPointToView(point as NSPointMBS, View as NSViewMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Converts a point from the receiver’s coordinate system to that of a given view.
Notes:
point: A point specifying a location in the coordinate system of the receiver.
View: The view into whose coordinate system point is to be converted. If View is nil, this method instead converts to window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the point converted to the coordinate system of View.

32.79.14 convertRectFromView(rect as NSRectMBS, View as NSViewMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Converts a rectangle from the coordinate system of another view to that of the receiver.
Notes:
rect: The rectangle in aView’s coordinate system.
view: The view with aRect in its coordinate system. If view is nil, this method instead converts from window base coordinates. Otherwise, both view and the receiver must belong to the same NSWindow object.

Returns the converted rectangle.
32.79. CLASS NSVIEWMBS

32.79.15 convertRectToView(rect as NSRectMBS, View as NSViewMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a rectangle from the receiver’s coordinate system to that of another view. **Notes:**

rect: A rectangle in the receiver’s coordinate system.
View: The view that is the target of the conversion operation. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the converted rectangle.

32.79.16 convertSizeFromView(Size as NSSizeMBS, View as NSViewMBS) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a size from another view’s coordinate system to that of the receiver. **Notes:**

Size: The size (width and height) in aView’s coordinate system.
View: The view with Size in its coordinate system. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the converted size, as an NSSize structure.

32.79.17 convertSizeToView(Size as NSSizeMBS, View as NSViewMBS) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a size from the receiver’s coordinate system to that of another view. **Notes:**

Size: The size (width and height) in the receiver’s coordinate system.
View: The view that is the target of the conversion operation. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the converted size, as an NSSize structure.
32.79.18  dataWithEPSInsideRect(left as Double, top as Double, width as Double, height as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns EPS data that draws the region of the receiver within a specified rectangle. **Example:**

```dim n as new NSProgressIndicatorMBS
n.sizeToFit

dim data as string = n.dataWithEPSInsideRect(0, 0, n.frameWidth, n.frameHeight)
dim f as FolderItem = SpecialFolder.Desktop.Child("test.ps")
dim b as BinaryStream = f.CreateBinaryFile(""")

b.Write data
f.Launch```

See also:

- 32.79.20 dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock

32.79.19  dataWithPDFInsideRect(left as Double, top as Double, width as Double, height as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns PDF data that draws the region of the receiver within a specified rectangle. **Example:**

```dim n as new NSProgressIndicatorMBS
n.sizeToFit

dim data as string = n.dataWithPDFInsideRect(0, 0, n.frameWidth, n.frameHeight)
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim b as BinaryStream = f.CreateBinaryFile(""")

b.Write data
f.Launch```

See also:

- 32.79.20 dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock

32.79.20  dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns PDF data that draws the region of the receiver within a specified rectangle. **See also:**
### 32.79.21 dragImage

**image as NSImageMBS, viewLocation as NSPointMBS, offset as NSSizeMBS, NSEvent as NSEventMBS, pboard as NSPasteboardMBS, source as NSViewMBS, slideFlag as boolean**

**MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:** Initiates a dragging operation from the receiver, allowing the user to drag arbitrary data with a specified icon into any application that has window or view objects that accept dragged data.

**Notes:**

- **Image:** The NSImage object to be dragged.
- **viewLocation:** The location of the image’s lower-left corner, in the receiver’s coordinate system. It determines the placement of the dragged image under the cursor. When determining the image location you should use the mouse down coordinate, provided in theEvent, rather than the current mouse location.
- **offset:** This parameter is ignored.
- **NSEvent:** The left mouse-down event that triggered the dragging operation (see discussion below).
- **pboard:** The pasteboard that holds the data to be transferred to the destination (see discussion below).
- **source:** An object that serves as the controller of the dragging operation. It must conform to the NSDraggingSource protocol and is typically the receiver itself or its NSWindow object.
- **slideBack:** A Boolean that determines whether the drag image should slide back if it’s rejected. The image slides back to imageLoc if slideBack is true and the image isn’t accepted by the dragging destination. If false the image doesn’t slide back.

This method must be invoked only within an implementation of the mouseDown or mouseDragged methods. Before invoking this method, you must place the data to be transferred on pboard. To do this, get the drag pasteboard object (NSDragPboard), declare the types of the data, and then put the data on the pasteboard.

### 32.79.22 drawFocusRingMask

**MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:** Draws the focus ring mask for the view.

**Notes:**

This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view’s interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke colors have been set to an arbitrary fully opaque color.

Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView implementation of this method simply fills self.bounds.
32.79.23 enclosingMenuItem as Variant

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the menu item containing the receiver or any of its superviews in the view hierarchy. Notes:

Returns the menu item containing the receiver or any of its superviews in the view hierarchy, or nil if the receiver’s view hierarchy is not in a menu item.

Available in Mac OS X v10.5 and later.

Declared as a variant to reduce plugin dependencies. Please assign to a NSScrollViewMBS variable.

32.79.24 enclosingScrollView as Variant

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the nearest ancestor NSScrollView object containing the receiver (not including the receiver itself); otherwise returns nil. Notes:

Declared as a variant to reduce plugin dependencies. Please assign to a NSScrollViewMBS variable.

32.79.25 focusRingMaskBounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the focus ring mask bounds. Notes:

Returns a rectangle containing the mask in the view's interior (bounds) coordinate space.

The mask bounds allows the focus ring’s overall size and position to be determined before it is drawn. Subclasses must override this method if they require the display of a focus ring. The NSView implementation of this method simply returns NSRectMBS.Zero.

Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box.
32.79. **CLASS NSVIEWMBS**

and that `noteFocusRingMaskChanged` is invoked as described.

### 32.79.26 isDescendantOf(view as NSViewMBS) as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the receiver is a subview of a given view or if it’s identical to that view; otherwise, it returns false.

### 32.79.27 makeBackingLayer as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates the view’s backing layer. **Notes:** Value is a CALayerMBS object. Available in OS X v10.6 and later.

### 32.79.28 nextValidKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the closest view object in the key view loop that follows the receiver and accepts first responder status. **Notes:** This method ignores hidden views when it determines the next valid key view. Returns nil on any error.

### 32.79.29 noteFocusRingMaskChanged

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked to notify the view that the focus ring mask requires updating. **Notes:** It is important to note that it is only necessary for developers to invoke this method when some internal state change of their application, that the Application Kit can’t determine, affects the shape of the focus ring mask.

It is assumed that if the view is marked as needing display, or is resized, its focus ring shape is likely to have changed, and there is no need for clients to explicitly send this message in such cases, they are handled automatically.
If, however, a view is showing a focus ring around some part of its content (an NSImage, perhaps), and that content changes, the client must provide notification by invoking this method so that focusRingMaskBounds and drawFocusRingMask will be invoked to redraw the focus ring. Available in Mac OS X v10.7 and later.

### 32.79.30 NSViewBoundsDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class. **Notes:**

Posted whenever the NSView’s bounds rectangle changes independently of the frame rectangle, if the NSView is configured using setPostsBoundsChangedNotifications to post such notifications.

The notification object is the NSView object whose bounds rectangle has changed. This notification does not contain a userInfo dictionary.

The following methods can result in notification posting

- setBounds
- setBoundsOrigin
- setBoundsRotation
- setBoundsSize
- translateOriginToPoint
- scaleUnitSquareToSize
- rotateByAngle

Note that the bounds rectangle resizes automatically to track the frame rectangle. Because the primary change is that of the frame rectangle, however, setFrame and setFrameSize don’t result in a bounds-changed notification.

### 32.79.31 NSViewDidUpdateTrackingAreasNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class. **Notes:**
Posted whenever an NSView object recalculates its tracking areas. It is sent after the view receives update-TrackingAreas.

Available in Mac OS X v10.5 and later.

32.79.32 **NSViewFocusDidChangeNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class. **Notes:** Sent when focus changed. Object for this notification is the view.

32.79.33 **NSViewFrameDidChangeNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class. **Notes:**

Posted whenever the view’s frame rectangle changes, if the view is configured using setPostsFrameChanged-Notifications to post such notifications.

The notification object is the NSView object whose frame rectangle has changed. This notification does not contain a userInfo dictionary.

The following methods can result in notification posting:

- setFrame
- setFrameOrigin
- setFrameRotation
- setFrameSize

32.79.34 **NSViewGlobalFrameDidChangeNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class. **Notes:**

Posted whenever an NSView object that has attached surfaces (that is, NSOpenGLContext objects) moves to a different screen, or other cases where the NSOpenGLContext object needs to be updated. The notification object is the surface’s view. This notification does not contain a userInfo dictionary.
32.79.35  pageFooter as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a default footer string that includes the current page number and page count. **Notes:**

A printable view class can override this method to substitute its own content in place of the default value. You should not need to call this method directly. The printing system calls it once per page during printing.

Footers are generated only if the user defaults contain the key NSPrintHeaderAndFooter with the value true.

32.79.36  pageHeader as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a default header string that includes the print job title and date. **Notes:**

Typically, the print job title is the same as the window title. A printable view class can override this method to substitute its own content in place of the default value. You should not need to call this method directly. The printing system calls it once per page during printing.

Headers are generated only if the user defaults contain the key NSPrintHeaderAndFooter with the value true.

32.79.37  previousKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the view object preceding the receiver in the key view loop. **Notes:**

This view should, if possible, be made first responder when the user navigates backward from the receiver using keyboard interface control. Returns nil on any error.

32.79.38  previousValidKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the closest view object in the key view loop that precedes the receiver and accepts first responder status. **Notes:**

This method ignores hidden views when it determines the previous valid key view. Returns nil on any error.
32.79.39  print

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This action method opens the Print panel, and if the user chooses an option other than canceling, prints the receiver and all its subviews to the device specified in the Print panel.

32.79.40  registeredDraggedTypes as string()

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the array of pasteboard drag types that the view can accept

Example:

// we register some types
Listbox1.AcceptPictureDrop
Listbox1.AcceptTextDrop

// and query them:
MsgBox Join(Listbox1.NSViewMBS.registeredDraggedTypes, EndOfLine)

' shows:
'NeXT TIFF v4.0 pasteboard type
'com.apple.traditional-mac-plain-text
'NSStringPboardType

Notes: This method returns the types registered by calling registerForDraggedTypes:. Each element of the array is a uniform type identifier. The returned elements are in no particular order, but the array is guaranteed not to contain duplicate entries.

32.79.41  registerForDraggedTypes(Types() as string)

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Registers the pasteboard types that the receiver will accept as the destination of an image-dragging session.

Notes:

Types: An array of uniform type identifiers. See Types for Standard Data (Mac OS X 10.6 and later) for descriptions of the pasteboard type identifiers.

Registering an NSView object for dragged types automatically makes it a candidate destination object for a
dragging session. As such, it must properly implement some or all of the NSDraggingDestination protocol methods. As a convenience, NSView provides default implementations of these methods. See the NSDraggingDestination protocol specification for details.

Real Studio with Cocoa target implements the methods listed above. So this method is useful to change the allowed types for the case the framework has a bug.

### 32.79.42 removeAllToolTips

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all tool tips assigned to the receiver.

### 32.79.43 removeFromSuperview

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unlinks the view from its superview and its window, removes it from the responder chain, and invalidates its cursor rectangles.

### 32.79.44 removeFromSuperviewWithoutNeedingDisplay

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unlinks the receiver from its superview and its window and removes it from the responder chain, but does not invalidate its cursor rectangles to cause redrawing.  
**Notes:**
The receiver is also released; if you plan to reuse it, be sure to retain it before sending this message and to release it as appropriate when adding it as a subview of another view.

Unlike its counterpart, removeFromSuperview, this method can be safely invoked during display.

### 32.79.45 RenderImage(subviews as boolean=false) as Variant

MBS MacBase Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Renders a picture of the view.  
**Example:**
```plaintext
dim n as new NSProgressIndicatorMBS  
n.sizeToFit
```
32.79. CLASS NSVIEWMBS

```pascal
dim image as NSImageMBS = n.RenderImage
dim pic as Picture = image.CopyPicture

Backdrop = pic
```

**Notes:**

May return nil on any error.
The value of this variant must be an object of class NSImageMBS.

---

### 32.79.46 replaceSubview(oldView as NSViewMBS, newView as NSViewMBS)

**Function:** Replaces one of the receiver’s subviews with another view.

**Notes:**

- `oldView`: The view to be replaced by `newView`. May not be nil.
- `newView`: The view to replace `oldView`. May not be nil.

This method does nothing if `oldView` is not a subview of the receiver.
Neither `oldView` nor `newView` may be nil, and the behavior is undefined if either of these parameters is nil.

---

### 32.79.47 rotateByAngle(angle as Double)

**Function:** Rotates the receiver’s bounds rectangle by a specified degree value around the origin of the coordinate system, (0.0, 0.0).

**Notes:**

- `angle`: A float value specifying the angle of rotation, in degrees.

See the BoundsRotation property description for more information. This method neither redisplaysthe receiver nor marks it as needing display. You must do this yourself with display or NeedsDisplay.

This method posts an NSViewBoundsDidChangeNotification to the default notification center if the receiver is configured to do so.
32.79.48 scaleUnitSquareToSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scales the receiver’s coordinate system so that the unit square scales to the specified dimensions. **Notes:**

For example, a newUnitSize of (0.5, 1.0) causes the receiver’s horizontal coordinates to be halved, in turn doubling the width of its bounds rectangle. Note that scaling is performed from the origin of the coordinate system, (0.0, 0.0), not the origin of the bounds rectangle; as a result, both the origin and size of the bounds rectangle are changed. The frame rectangle remains unchanged.

This method neither redisplay the receiver nor marks it as needing display. You must do this yourself with display or setNeedsDisplay.

This method posts an NSViewBoundsDidChangeNotification to the default notification center if the receiver is configured to do so.

32.79.49 setBoundsOrigin(origin as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bounds origin. **See also:**

- 32.79.50 setBoundsOrigin(x as Double, y as Double)

32.79.50 setBoundsOrigin(x as Double, y as Double)

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bounds origin. **See also:**

- 32.79.49 setBoundsOrigin(origin as NSPointMBS)

32.79.51 setBoundsSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bounds size of the nsview. **See also:**

- 32.79.52 setBoundsSize(width as Double, height as Double)
32.79. **CLASS NSVIEWMBS**

32.79.52  **setBoundsSize(width as Double, height as Double)**

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bounds size of the nsview.
See also:
- 32.79.51 setBoundsSize(size as NSSizeMBS)

32.79.53  **setFocus**

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Convenience function to set the focus to this view.
**Notes:** Calls internally makeFirstResponder on NSWindow.

32.79.54  **setFrameOrigin(origin as NSPointMBS)**

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the frame origin.
See also:
- 32.79.55 setFrameOrigin(x as Double, y as Double)

32.79.55  **setFrameOrigin(x as Double, y as Double)**

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the frame origin.
See also:
- 32.79.54 setFrameOrigin(origin as NSPointMBS)

32.79.56  **setFrameSize(size as NSSizeMBS)**

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the frame size.
See also:
- 32.79.57 setFrameSize(width as Double, height as Double)

32.79.57  **setFrameSize(width as Double, height as Double)**

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the frame size.
32.79.58  subviews(recursive as boolean = false) as NSViewMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The immediate subviews.
**Notes:**
The order of the subviews may be considered as being back-to-front, but this does not imply invalidation and drawing behavior. The order is based on the order of the receiver's subviews as specified in the nib file from which they were unarchived or the programmatic interface for modifying the receiver's subview list. This ordering is also the reverse of the order in which hit-testing is done.

If recursive is true, we include all subviews of all subviews. (new in 14.2)

32.79.59  unregisterDraggedTypes

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unregisters the receiver as a possible destination in a dragging session.

32.79.60  Properties

32.79.61  acceptsTouchEvents as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the view will accept touch events.
**Notes:**
Available in Mac OS X v10.6 and later.
(Read and Write property)

32.79.62  allowsVibrancy as Boolean

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** allowsVibrancy is queried when a vibrant appearance is used on a view hierarchy.
**Notes:**
When allowsVibrancy returns YES, the view will have an appropriate measure taken to ensure it is vibrant on top of its given material.
Specific subclasses, such as NSControl, will answer this question based on the artwork they draw for a given appearance.
(Read only property)

32.79.63 alphaValue as Double

Example:

// makes a checkbox half transparent on Cocoa target:
Checkbox1.NSViewMBS.alphaValue = 0.5

Notes:
This method returns the value of the opacity property of the view’s layer. Possible values are between 0.0 (transparent) and 1.0 (opaque). The default is 1.0.

Sending this message to a view that is not managing a Core Animation layer causes an exception.
(Read and Write property)

32.79.64 autoresizesSubviews as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: True if the receiver automatically resizes its subviews using resizeSubviewsWithOldSize whenever its frame size changes, false otherwise.
Notes: (Read and Write property)

32.79.65 autoresizingMask as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The receiver’s autoresizing mask, which determines how it’s resized by the resizeWithOldSuperviewSize method.
Notes:
If the autoresizing mask is equal to NSViewNotSizable (that is, if none of the options are set), then the receiver doesn’t resize at all in resizeWithOldSuperviewSize.

(Read and Write property)
CHAPTER 32. COCOA

NSViewNotSizable = 0 The receiver cannot be resized.
NSViewMinXMargin = 1 The left margin between the receiver and its superview is flexible.
NSViewWidthSizable = 2 The receiver’s width is flexible.
NSViewMaxXMargin = 4 The right margin between the receiver and its superview is flexible.
NSViewMinYMargin = 8 The bottom margin between the receiver and its superview is flexible.
NSViewHeightSizable = 16 The receiver’s height is flexible.
NSViewMaxYMargin = 32 The top margin between the receiver and its superview is flexible.

32.79.66 bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the receiver’s bounds rectangle, which expresses its location and size in its own coordinate system. Example:

```dim n as new NSProgressIndicatorMBS
n.sizeToFit
MsgBox n.bounds.String```

Notes:
The bounds rectangle may be rotated; use the boundsRotation method to check this.
(Read and Write property)

32.79.67 boundsRotation as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The angle, in degrees, of the view’s bounds rectangle relative to its frame rectangle. Notes: (Read and Write property)

32.79.68 canBecomeKeyView as boolean

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns whether the receiver can become key view. Notes:

Returns true if the receiver can become key view, false otherwise.
(Read only property)
### 32.79.69 canDraw as boolean

**MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:**
Returns true if drawing commands will produce any result, false otherwise.

**Notes:**
Use this method when invoking a draw method directly along with lockFocus and unlockFocus, bypassing the display... methods (which test drawing ability and perform locking for you). If this method returns false, you shouldn’t invoke lockFocus or perform any drawing.

A view object can draw on-screen if it is not hidden, it is attached to a view hierarchy in a window (NSWindow), and the window has a corresponding window device. A view object can draw during printing if it is a descendant of the view being printed.

To draw into a NSView, use either CustomNSViewMBS class with drawRect event or NSGraphicsMBS class. (Read only property)

### 32.79.70 canDrawConcurrently as boolean

**MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:**
Whether the view’s drawRect: method can be invoked on a background thread.

**Notes:**
Available in Mac OS X v10.6 and later. (Read and Write property)

### 32.79.71 className as string

**MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:**
The name of this NSView class.

**Example:**
```
// shows RBNSButton
MsgBox checkbox1.NSViewMBS.className
```

**Notes:** (Read only property)
32.79.72 classPath as string

MBS MacBase Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSView class.  
**Example:**

MsgBox TextArea1.NSViewMBS.classPath  
// shows "RBNSScrollView:NSScrollView:NSView:NSResponder:NSObject"

**Notes:**

Useful for debugging to know what super classes the view has.  
(Read only property)

32.79.73 focusRingType as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of focus ring to be drawn around the receiver.  
**Notes:**

This method only sets the desired focus ring type and does not cause the view to draw the actual focus ring.  
You are responsible for drawing the focus ring in your view’s drawRect method whenever your view is made the first responder.

possible values:

- NSFocusRingTypeDefault 0
- NSFocusRingTypeNone 1
- NSFocusRingTypeExterior 2

(Read and Write property)

32.79.74 frame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the frame size and position of the view.  
**Example:**

dim n as new NSProgressIndicatorMBS  
n.sizeToFit
32.79.75  frameCenterRotation as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The receiver’s rotation about the layer’s position.
**Notes:**
If the application has altered the layer’s anchorPoint property, the behavior is undefined. Sending this mes-
sage to a view that is not managing a Core Animation layer causes an exception.

Available in Mac OS X v10.5 and later.
(Read and Write property)

32.79.76  frameHeight as Double

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The height of the view frame.
**Example:**
```
dim n as new NSProgressIndicatorMBS
MsgBox str(n.frameHeight)
```

**Notes:**
This is a convenience property which calls the frame function to get the current rectangle, changes the value
and sets the frame to the new rectangle.
(Read and Write property)

32.79.77  frameLeft as Double

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The left position of the view frame.
**Example:**
```
dim n as new NSProgressIndicatorMBS
MsgBox str(n.frameLeft)
```
Notes:
This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

32.79.78 frameRotation as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The angle, in degrees, of the view’s frame relative to its superview’s coordinate system.
Notes:
dim n as new NSProgressIndicatorMBS
n.frameRotation=10
MsgBox str(n.frameRotation)
(Read and Write property)

32.79.79 frameTop as Double

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The top position of the view frame.
Example:
dim n as new NSProgressIndicatorMBS
MsgBox str(n.frameTop)

Notes:
This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

32.79.80 frameWidth as Double

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The width of the view frame.
Example:
dim n as new NSProgressIndicatorMBS
MsgBox str(n.frameWidth)
Notes:
This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

32.79.81 identifier as string

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A string that identifies this user interface item.
**Notes:**
It should be set to a unique value on NSViews when they are intended to be used inside a view-basedNSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a control but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a control is added to a window. Identifiers beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ': ' characters are reserved and should not be used in identifiers.
(Read and Write property)

32.79.82 isFlipped as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the nsview uses flipped drawing coordinates or false if it uses native coordinates.
**Notes:** (Read only property)

32.79.83 isHidden as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver is marked as hidden.
**Notes:** (Read and Write property)
32.79.84  isHiddenOrHasHiddenAncestor as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
True if the nsview is marked as hidden or has an ancestor in the view hierarchy that is marked as hidden;
returns false otherwise.
**Notes:** (Read only property)

32.79.85  isOpaque as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Overridden by subclasses to return true if the view is opaque, false otherwise.
**Notes:** (Read only property)

32.79.86  isRotatedFromBase as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
True if the nsview or any of its ancestors has ever set a FrameRotation or BoundsRotation properties;
otherwise returns false.
**Notes:** (Read only property)

32.79.87  isRotatedOrScaledFromBase as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
True if the nsview or any of its ancestors has ever had a nonzero frame or bounds rotation, or has been
scaled from the window’s base coordinate system; otherwise returns false.
**Notes:**
The intent of this information is to optimize drawing and coordinate calculation, not necessarily to reflect
the exact state of the receiver’s coordinate system, so it may not reflect the actual rotation or scaling. For
example, if an NSView object is rotated to 45 degrees and later back to 0, this method still returns true.
(Read only property)

32.79.88  layer as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Returns or sets the Core Animation layer that the receiver uses as its backing store.
**Notes:**
Value is a CALayerMBS object.
Available in OS X v10.5 and later.
32.79. CLASS NSVIEWMBS

(Read and Write property)

32.79.89 needsDisplay as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
whether the view needs to be displayed.
**Notes:** (Read and Write property)

32.79.90 nextKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The view object following the receiver in the key view loop.
**Notes:**
Returns the view object following the receiver in the key view loop, or nil if there is none.
On setting inserts a specified view object after the receiver in the key view loop of the receiver’s window.
This view should, if possible, be made first responder when the user navigates forward from the receiver
using keyboard interface control.
Returns nil on any error.
(Read and Write property)

32.79.91 opaqueAncestor as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the receiver’s closest opaque ancestor (including the receiver itself).
**Notes:** (Read only property)

32.79.92 RetainCount as Integer

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The retain count for the NSView object.
**Notes:**
Useful for debugging. Should always be >0.
(Read only property)
32.79.93 superview as NSViewMBS

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s superview, or nil if it has none. **Notes:** (Read only property)

32.79.94 toolTip as string

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tooltip text for this view. **Example:**

```plaintext
dim n as new NSProgressIndicatorMBS
n.toolTip = "Hello"
MsgBox n.toolTip
```

**Notes:** (Read and Write property)

32.79.95 visibleRect as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the portion of the receiver not clipped by its superviews. **Notes:**

Visibility for this method is defined quite simply and doesn’t account for whether other NSView objects (or windows) overlap the receiver or whether the receiver has a window at all. This method returns an empty rectangle if the receiver is effectively hidden.

During a printing operation the visible rectangle is further clipped to the page being imaged. **(Read only property)**

32.79.96 wantsDefaultClipping as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the Application Kit’s default clipping provided to drawRect implementations is in effect. **Notes:**

Subclasses may override this method to return false if they want to suppress the default clipping. They may want to do this in situations where drawing performance is critical to avoid the cost of setting up, enforcing, and cleaning up the clip path.
A view that overrides this method to refuse the default clipping must either set up whatever clipping it requires or constrain its drawing exactly to the list of rectangles returned by getRectsBeingDrawn. Failing to do so could result in corruption of other drawing in the view’s window.

(Read only property)

32.79.97  wantsLayer as Boolean

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the receiver and its subviews use a Core Animation layer as a backing store.

**Notes:**
True if the view and its subviews should use a Core Animation layer as its backing store, otherwise false.

Requires Mac OS X 10.5.
(Read and Write property)

32.79.98  wantsRestingTouches as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the view wants resting touches.

**Notes:**
A resting touch occurs when a user rests their thumb on a device (for example, the glass trackpad of a MacBook).

By default, these touches are not delivered and are not included in the event’s set of touches. Touches may transition in and out of resting at any time. Unless the view wants restingTouches, began / ended events are simulated as touches transition from resting to active and vice versa.

In general resting touches should be ignored.

Available in Mac OS X v10.6 and later.
(Read and Write property)

32.79.99  window as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the receiver’s window object, or nil if it has none.

**Notes:** (Read only property)
32.79.100  Constants

32.79.101  NSBezelBorder = 2

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the type of a view’s border.  
**Notes:** A concave border that makes the view look sunken.

32.79.102  NSFocusRingTypeDefault = 0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the focusringtype property.  
**Notes:** The default focus ring type for NSView or NSCell.

32.79.103  NSFocusRingTypeExterior = 2

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the focusringtype property.  
**Notes:** The standard Aqua focus ring.

32.79.104  NSFocusRingTypeNone = 1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the focusringtype property.  
**Notes:** No focus ring. If you set the focus ring type to this value, NSView and NSCell will not draw any focus ring.
32.79. CLASS NSVIEWMBS

32.79.105 NSGrooveBorder = 3

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the type of a view’s border.
**Notes:** A thin border that looks etched around the image.

32.79.106 NSLineBorder = 1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the type of a view’s border.
**Notes:** A black line border around the view.

32.79.107 NSNoBorder = 0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the type of a view’s border.
**Notes:** No border.

32.79.108 NSViewHeightSizable = 16

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask prop-
erty.
**Notes:** The receiver’s height is flexible.

32.79.109 NSViewLayerContentsRedrawBeforeViewResize = 3

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the view layer content redraw policy constants.

32.79.110 NSViewLayerContentsRedrawDuringViewResize = 2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the view layer content redraw policy constants.

32.79.111 NSViewLayerContentsRedrawNever = 0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the view layer content redraw policy constants.
32.79.112  **NSViewLayerContentsRedrawOnSetNeedsDisplay** = 1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the view layer content redraw policy constants.

32.79.113  **NSViewMaxXMargin** = 4

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.  
**Notes:** The right margin between the receiver and its superview is flexible.

32.79.114  **NSViewMaxYMargin** = 32

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.  
**Notes:** The top margin between the receiver and its superview is flexible.

32.79.115  **NSViewMinXMargin** = 1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.  
**Notes:** The left margin between the receiver and its superview is flexible.

32.79.116  **NSViewMinYMargin** = 8

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.  
**Notes:** The bottom margin between the receiver and its superview is flexible.

32.79.117  **NSViewNotSizable** = 0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.  
**Notes:** The receiver cannot be resized.
32.79. CLASS NSVIEWMBS

32.79.118  NSViewWidthSizable = 2

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autosizingMask property.
**Notes:** The receiver’s width is flexible.

32.79.119  NSWindowAbove = 1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the window order constants to specify how a window is ordered relative to another window.
**Notes:** Moves the window above the indicated window.

32.79.120  NSWindowBelow = -1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the window order constants to specify how a window is ordered relative to another window.
**Notes:** Moves the window below the indicated window.

32.79.121  NSWindowOut = 0

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the window order constants to specify how a window is ordered relative to another window.
**Notes:** Moves the window off the screen.
32.80 class NSViewTooltipMBS

32.80.1 class NSViewTooltipMBS

Notes: Can be used for customized helptags with event to return current text.

32.80.2 Methods

32.80.3 Constructor

32.80.4 Properties

32.80.5 Text as String

Notes: If event is not implemented, we use this default text.
(Read and Write property)

32.80.6 Events

32.80.7 stringForToolTip(point as NSPointMBS) as string

Notes: The point allows you to customize the tooltip for the location.
Please return the text to display.
32.81. CLASS NSVISUALEFFECTVIEWMBS

32.81  class NSVisualEffectViewMBS

32.81.1  class NSVisualEffectViewMBS

**Function:** The class to use visual effect view.  
**Notes:**

The NSVisualEffectView is the basis for all visual effects, including "vibrant" appearances. You can optionally set the appearance to NSAppearanceMBS.appearanceNamed(NSAppearanceNameVibrantDark) (or Light) to get the desired light or dark appearance. Combine this with an appropriate light or dark material to get the desired vibrant look. Combining NSAppearanceNameVibrantDark with a light material will look bad, and should not be done.

Requires Mac OS X 10.10 or newer.

Please review Apple’s documentation on this for details.

Subclass of the NSViewMBS class.

32.81.2  Methods

32.81.3  Available as boolean

**Function:** Whether this class is available.  
**Notes:** Only available on Mac OS X 10.10 or later.

32.81.4  Constructor

**Function:** The constructor for a new NSVisualEffectViewMBS object.  
See also:

- 32.81.5 Constructor(Handle as Integer)
- 32.81.6 Constructor(left as Double, top as Double, width as Double, height as Double)

32.81.5  Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSVisualEffectView handle.  
**Example:**

dim t as new NSVisualEffectViewMBS(0, 0, 100, 100)
dim v as new NSVisualEffectViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+” x “+str(v.Bounds.Height)

**Notes:** The handle is casted to a NSVisualEffectView and the plugin retains this handle. See also:

- 32.81.4 Constructor 6077
- 32.81.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6078

### 32.81.6 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** The constructor for a new NSVisualEffectViewMBS object. See also:

- 32.81.4 Constructor 6077
- 32.81.5 Constructor(Handle as Integer) 6077

### 32.81.7 Properties

#### 32.81.8 blendingMode as Integer

**Function:** How this backdrop view blurs its contents.
**Notes:**

It can either blend with the contents behind the window (NSVisualEffectBlendingModeBehindWindow – the default), or within the current window (NSVisualEffectBlendingModeWithinWindow). The blending mode for the material NSVisualEffectMaterialTitlebar can only be NSVisualEffectBlendingModeWithinWindow.

The blendingMode NSVisualEffectBlendingModeWithinWindow requires WantsLayer = true to be done on the parent view that you desire to blend with.
(Read and Write property)

### 32.81.9 interiorBackgroundStyle as Integer

**Function:** The interior background style.
Notes:
Returns "Light" or "Dark" depending on the material selected.
(Read only property)

32.81.10  maskImage as NSImageMBS

Notes: (Read and Write property)

32.81.11  material as Integer

Notes: The default value is NSVisualEffectMaterialAppearanceBased; the material is updated to be the correct material based on the appearance set on this view.
(Read and Write property)

32.81.12  state as Integer

Notes: The state defaults to NSVisualEffectStateFollowsWindowActiveState.
(Read and Write property)

32.81.13  Constants

32.81.14  NSBackgroundStyleDark = 1

MBS MacExtras Plugin, Plugin Version: 14.3. Function: One of the background style constants.
Notes: Dark
32.81.15 NSBackgroundStyleLight = 0

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** One of the background style constants.  
**Notes:** Light

32.81.16 NSVisualEffectBlendingModeBehindWindow = 0

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** One of the blending modes.  
**Notes:** Blends and blurs with the contents behind the window (such as the desktop or other windows). These can overlap, and the view lower in the hierarchy will "win".

32.81.17 NSVisualEffectBlendingModeWithinWindow = 1

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** One of the blending modes.  
**Notes:** Blends and blurs with contents behind the view in the current window only. For now, these cannot overlap each other. This mode REQUIRES layer-backing with view.wantsLayer = true.

32.81.18 NSVisualEffectMaterialAppearanceBased = 0

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** One of the material constants.  
**Notes:** When NSVisualEffectMaterialAppearanceBased is set, the material color is determined by the current effectiveAppearance that is on the view.

32.81.19 NSVisualEffectMaterialDark = 2

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** One of the material constants.  
**Notes:** Dark

32.81.20 NSVisualEffectMaterialLight = 1

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** One of the material constants.  
**Notes:** Light
32.81.1  CLASS NSVISUALEFFECTVIEWMBS

32.81.21  NSVisualEffectMaterialTitlebar = 3

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** One of the material constants. **Notes:** Title bar

32.81.22  NSVisualEffectStateActive = 1

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** The state constants. **Notes:** The backdrop is explicitly active, always.

32.81.23  NSVisualEffectStateFollowsWindowActiveState = 0

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** The state constants. **Notes:** The backdrop automatically appears active when the window is active, and inactive when it is not active.

32.81.24  NSVisualEffectStateInactive = 2

MBS MacExtras Plugin, Plugin Version: 14.3. **Function:** The state constants. **Notes:** The backdrop is explicitly inactive.
32.82 class NSWindowControllerMBS

32.82.1 class NSWindowControllerMBS

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSWindowController object manages a window, usually a window stored in a nib file. **Notes:**

Please read Apple's documentation for details:

Subclass of the NSResponderMBS class.

32.82.2 Methods

32.82.3 close

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the window if it was loaded. **Notes:** Because this method closes the window without asking the user for confirmation, you usually do not invoke it when the Close menu command is chosen. Instead invoke NSWindow's performClose on the receiver's window.

32.82.4 Constructor(win as NSWindowMBS)

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a window controller initialized with a given window. **Notes:**

window: The window object to manage; can be nil.
Returns a newly initialized window controller.
This method is the designated initializer for NSWindowController.

This initializer is useful when a window has been loaded but no window controller is assigned. The default initialization turns on cascading, sets the shouldCloseDocument flag to NO, and sets the window frame autosave name to an empty string. As a side effect, the created window controller is added as an observer of the NSWindowWillCloseNotifications posted by that window object (which is handled by a private method). If you make the window controller a delegate of the window, you can implement NSWindow’s windowShouldClose delegate method.

See also:

- 32.82.5 Constructor(windowNibName as string)
32.82. CLASS NSWindowControllerMBS

32.82.5 Constructor(windowNibName as string)

**Notes:**

windowNibName: The name of the nib file (minus the ".nib" extension) that archives the receiver’s window; cannot be empty.

Sets the owner of the nib file to the receiver. The default initialization turns on cascading, sets the shouldCloseDocument flag to false, and sets the autosave name for the window’s frame to an empty string.  
See also:

- 32.82.4 Constructor(win as NSWindowMBS)

32.82.6 showWindow

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays the window associated with the receiver.  
**Notes:** If the window is an NSPanel object and has its becomesKeyOnlyIfNeeded flag set to true, the window is displayed in front of all other windows but is not made key; otherwise it is displayed in front and is made key. This method is useful for menu actions.

32.82.7 synchronizeWindowTitleWithDocumentName

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronizes the displayed window title and the represented filename with the information in the associated document.  
**Notes:** Does nothing if the window controller has no associated document or loaded window. This method queries the window controller’s document to get the document’s display name and full filename path, then calls windowTitleForDocumentDirectoryName to get the display name to show in the window title.

32.82.8 Properties

32.82.9 className as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this NSWindowController class.  
**Notes:** (Read only property)
32.82.10 **classPath as string**

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSWindowController class.

**Notes:**
Useful for debugging to know what super classes the window controller has.
(Read only property)

32.82.11 **shouldCascadeWindows as boolean**

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver should necessarily close the associated document when the window it manages is closed.

**Notes:**
True if the receiver necessarily closes the associated document when the window it manages is closed, false otherwise.
If false, the document is closed only when the last remaining window of the document is closed.
The default is false.
(Read and Write property)

32.82.12 **shouldCloseDocument as boolean**

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver should necessarily close the associated document when the window it manages is closed.

**Notes:**
True if the receiver necessarily closes the associated document when the window it manages is closed, false otherwise.
If false, the document is closed only when the last remaining window of the document is closed.
The default is false.
(Read and Write property)

32.82.13 **window as NSWindowMBS**

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window owned by the controller.

**Notes:**
If the window has not yet been loaded, this method attempts to load the window’s nib file using loadWindow. Before it loads the window, it invokes windowWillLoad, and if the window controller has a document, it
invokes the document’s corresponding method windowControllerWillLoadNib (if implemented). After loading the window, this method invokes windowDidLoad and, if there is a document, the NSDocument method windowControllerDidLoadNib (if implemented).

(Read and Write property)

### 32.82.14 windowFrameAutosaveName as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name under which the frame rectangle of the window owned by the receiver is stored in the defaults database.

**Notes:**

By default, name is an empty string, causing no information to be stored in the defaults database.

(Read and Write property)

### 32.82.15 windowNibName as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the nib file that stores the window associated with the receiver.

**Notes:** (Read only property)

### 32.82.16 windowNibPath as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full path of the nib file that stores the window associated with the receiver.

**Notes:**

The full path of the nib file that stores the window associated with the receiver; ”” if it cannot be located.

(Read only property)
32.83 class NSWindowDelegateMBS

32.83.1 class NSWindowDelegateMBS

Function: A Real Studio class for a cocoa windows delegate.

Notes:
The NSWindowDelegate protocol defines the methods that a delegate of NSWindow should implement. All methods in this protocol are optional.

By implementing these methods, the delegate may respond to window resizing, moving, exposing, minimizing, and a number of other window events.

32.83.2 Methods

32.83.3 Constructor(win as NSWindowMBS)

Function: Initializes the delegate class pointing to the Cocoa window.

Notes: The original delegate on the window is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.

See also:
- 32.83.4 Constructor(win as window)

32.83.4 Constructor(win as window)

Function: Initializes the delegate class pointing to the Real Studio window.

Notes: This class does not keep a reference to the window, so you can keep this delegate as a property of the window without a memory leak.

The original delegate from Real Studio is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.

See also:
- 32.83.3 Constructor(win as NSWindowMBS)
32.83. CLASS NSWINDOWDELEGATEMBS

32.83.5 InstallRestoreEvents

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Activates plugin code to catch events restoreStateWithCoder and encodeRestorableStateWithCoder.

32.83.6 Events

32.83.7 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object’s animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

32.83.8 customWindowsToEnterFullScreenForWindow(win as NSWindowMBS) as NSWindowMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when the window is about to enter full screen mode.

**Notes:**

win: The window to enter to full screen mode.

Return an array of windows involved in the animation to fullscreen for window; otherwise nil.

This method lets a window delegate to customize the animation by providing a custom window or windows containing layers or other effects. If you do not want to perform custom animation, you can omit the implementation of this method, or it can return nil.
Available in Mac OS X v10.7 and later.

### 32.83.9 `customWindowsToExitFullScreenForWindow(win as NSWindowMBS) as NSWindowMBS()`

**Function:** The system has started its animation out of fullscreen, including transitioning back to the desktop space.

**Notes:**

- `win`: The window to exit fullscreen.

Return true if the window wants to run a custom animation; otherwise false if the default NSWindow animation should be used.

This method lets the window delegate customize the animation when the window is about to exit fullscreen. If you do not want to perform custom animation, you can omit the implementation of this method, or it can return nil.

Available in Mac OS X v10.7 and later.

### 32.83.10 `didDecodeRestorableState(win as NSWindowMBS, state as NSCoderMBS)`

**Function:** Tells the delegate the window is has extracted its restorable state from a given archiver.

**Notes:**

- `win`: The window extracting its restorable state from an archive.
- `state`: The coder extracting the archive.

This method is invoked during the window’s `restoreStateWithCoder` method.

Available in Mac OS X v10.7 and later.
32.83.11 draggingEnded(sender as NSDraggingInfoMBS)

Function: Implement this event to be notified when a drag operation ends in some other destination.

Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

32.83.12 draggingEntered(sender as NSDraggingInfoMBS) as Integer

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.

Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

32.83.13 draggingExited(sender as NSDraggingInfoMBS)

Function: Invoked when the dragged image exits the destination’s bounds rectangle (in the case of a view object)
or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

32.83.14 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

Function: Invoked periodically as the image is held within the destination area, allowing modification of
the dragging operation or mouse-pointer position.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-
DraggingInfo reference. The default return value (if this method is not implemented by the destination) is
the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the
drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on
the position of the mouse pointer inside of the destination view or window object. For example, you may have
several graphics or areas of text contained within the same view and wish to tailor the dragging operation,
or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the
time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examina-
tion is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is
within the bounds of two overlapping views that are both valid destinations, the uppermost view receives
these messages until the image is either released or dragged out.

32.83.15 encodeRestorableStateWithCoder(win as NSWindowMBS, coder as
NSCoderMBS)

Function: Method called to save the restorable state.
Notes:
The receiver is passed an NSCoderMBS that supports keyed encoding (but not decoding), and should encode
its restorable state. If you override this method, you should call through to super. You should not otherwise
invoke this method. If you encode an object that implements the NSUserInterfaceItemIdentification protocol, the object itself is not archived; only its identifier is stored. Thus, for example, a window may efficiently store its firstResponder as restorable state.

Called only if you called InstallRestoreEvents at least ones.

**32.83.16 performDragOperation(sender as NSDraggingInfoMBS) as boolean**

**Function:** Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

**32.83.17 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean**

**Function:** Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Returns true if the receiver agrees to perform the drag operation and false if not.

This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.

If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object’s animatesToDestination property to true in your implementation of this method.
32.83.18  **restoreStateWithCoder**(win as NSWindowMBS, coder as NSCoderMBS)

**Function:** Method called to restore state.
**Notes:**
The receiver is passed an NSCoder that supports keyed decoding (but not encoding). The receiver should decode any previously stored state. If you override this method, you should call through to super. You should not otherwise invoke this method.
Called only if you called InstallRestoreEvents at least ones.

32.83.19  **shouldDragDocumentWithEvent**(win as NSWindowMBS, evnt as NSEventMBS, dragImageLocation as NSPointMBS, pasteboard as Variant) as boolean

**Function:** Asks the delegate whether a user can drag the document icon from the window’s title bar.
**Notes:**
win: The window containing the document icon the user wants to drag.
evnt: The left-mouse down event that triggered the dragging operation.
dragImageLocation: The location at which the user started the dragging operation.
pasteboard: The pasteboard containing the contents of the document, which the delegate can modify. This is a NSPasteboardMBS object.

Return true to allow the drag to proceed; false to prevent it. Before turning no the delegate can implement its own dragging behavior as described below.

Implementing this method allows an application to customize the process of dragging the window’s document icon. Implement its own dragging process, the delegate can perform the dragging operation and return false.

The delegate can prohibit the drag by returning false. Before returning false, the delegate may implement its own dragging behavior.

Available in Mac OS X v10.5 and later.

32.83.20  **shouldPopUpDocumentPathMenu**(win as NSWindowMBS, menu as NSMenuMBS) as boolean

**Function:** Asks the delegate whether the window displays the title pop-up menu in response to a Command-click or Control-click on its title.
32.83. **CLASS NSWINDOWDELEGATEMBS**

**Notes:**

win: The window whose title the user Command-clicked or Control-clicked.

menu: The menu the window will display, if allowed. By default, its items are the path components of the file represented by window.

Returns true to allow the display of the title pop-up menu; false to prevent it.

Available in Mac OS X v10.5 and later.

### 32.83.21 startCustomAnimationToEnterFullScreenWithDuration(win as NSWindowMBS, duration as Double)

**Function:** Invoked when the window is about to enter fullscreen mode.

**Notes:**

win: The window to enter to full screen mode.

duration: The duration of the presentation change.

This method is called to start the window animation into fullscreen, including transitioning to a new space. You can implement this method to perform custom animation with the given duration to be in sync with the system animation.

**Special Considerations**

This method is called only if customWindowsToEnterFullScreenForWindow returned non-nil.

Available in Mac OS X v10.7 and later.

### 32.83.22 startCustomAnimationToExitFullScreenWithDuration(win as NSWindowMBS, duration as Double)

**Function:** Informs the delegate that the window is about to enter fullscreen mode.

**Notes:**

win: The window to exit to fullscreen.

duration: The duration of the presentation change.

**Special Considerations**

This method is called only if customWindowsToExitFullScreenForWindow returned non-nil.
Available in Mac OS X v10.7 and later.

32.83.23 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

**Function:** Invoked when the dragging images should be changed.

**Notes:**

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

32.83.24 wantsPeriodicDraggingUpdates as boolean

**Function:** Asks the destination object whether it wants to receive periodic draggingUpdated messages.

**Notes:**

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

32.83.25 willEncodeRestorableState(win as NSWindowMBS, state as NSCoderMBS)

**Function:** Tells the delegate the window is about to add its restorable state to a given archiver.

**Notes:**

win: The window adding its restorable state to an archive.
state: The coder creating the archive.
This method is invoked during the window’s encodeRestorableStateWithCoder method.

Available in Mac OS X v10.7 and later.

### 32.83.26 willPositionSheet

```objc
willPositionSheet(win as NSWindowMBS, sheet as NSWindowMBS,
rect as NSRectMBS) as NSRectMBS
```

**Function:** Tells the delegate that the window is about to show a sheet at the specified location, giving it the opportunity to return a custom location for the attachment of the sheet to the window.

**Notes:**

- **win:** The window containing the sheet to be animated.
- **sheet:** The sheet to be shown.
- **rect:** The default sheet location, just under the title bar of the window, aligned with the left and right edges of the window.

Return the custom location specified.

This method is also invoked whenever the user resizes window while sheet is attached.

This method is useful in many situations. If your window has a toolbar, for example, you can specify a location for the sheet that is just below it. If you want the sheet associated with a certain control or view, you could position the sheet so that it appears to originate from the object (through animation) or is positioned next to it.

Neither the rect parameter nor the returned NSRect value define the boundary of the sheet. They indicate where the top-left edge of the sheet is attached to the window. The origin is expressed in window coordinates; the default origin.y value is the height of the content view and the default origin.x value is 0. The size.width value indicates the width and behavior of the initial animation; if size.width is narrower than the sheet, the sheet genies out from the specified location, and if size.width is wider than the sheet, the sheet slides out. You cannot affect the size of the sheet through the size.width and size.height fields. It is recommended that you specify zero for the size.height value as this field may have additional meaning in a future release.

Available in Mac OS X v10.3 and later.
32.83.27 willResizeForVersionBrowser(win as NSWindowMBS, maxPreferredFrameSize as NSSizeMBS, maxAllowedFrameSize as NSSizeMBS) as NSSizeMBS

Function: Tells the delegate the the window will resize for presentation during version browsing.
Notes:
win: The window being presented in a version browser.
maxPreferredSize: The maximum size the version browser would prefer the window to be.
maxAllowedSize: The maximum allowed size for the window (the full screen frame minus the margins required to ensure the Versions controls are still visible).

Returns the size that the window should be.

Windows entering the version browser will be resized to the size returned by this method. If either dimension of the returned size is larger than the maxPreferredFrameSize, the window will also be scaled down to ensure it fits properly in the version browser.

If this method is not implemented, the version browser will use windowWillUseStandardFrame to determine the resulting window frame size.

Available in Mac OS X v10.7 and later.

32.83.28 willUseFullScreenContentSize(win as NSWindowMBS, proposedSize as NSSizeMBS) as NSSizeMBS

Function: Invoked to allow the delegate to modify the fullscreen content size.
Notes:
win: The window to enter to full screen mode.
proposedSize: The proposed window size.

Returns the window size to actually use when displaying content size.

Available in Mac OS X v10.7 and later.
32.83.29 willUseFullScreenPresentationOptions(win as NSWindowMBS, proposedOptions as Integer) as Integer

**Function:** Returns the presentation options the window will use when transitioning to fullscreen.

**Notes:**

win: The window to enter to full screen mode.
proposedOptions: The proposed options. See NSApplicationPresentationOptions for the possible values.

Return the options the window should use when transitioning to fullscreen. These may be the same as the proposedOptions or may be modified.

Available in Mac OS X v10.7 and later.

32.83.30 windowDid BecomeKey(notification as NSNotificationMBS)

**Function:** Informs the delegate that the window has become the key window.

**Notes:**

notification: A notification named NSWindowDidBecomeKeyNotification.

You can retrieve the window object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

32.83.31 windowDidBecomeMain(notification as NSNotificationMBS)

**Function:** Informs the delegate that the window has become main.

**Notes:**

notification: A notification named NSWindowDidBecomeMainNotification.

You can retrieve the window object in question by sending object to notification.

Available in Mac OS X v10.0 and later.
32.83.32 windowDidChangeScreen(notification as NSNotificationMBS)

Function: Tells the delegate that the window has changed screens.
Notes:
notification: A notification named NSWindowDidChangeScreenNotification.

You can retrieve the NSWindow object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

32.83.33 windowDidChangeScreenProfile(notification as NSNotificationMBS)

Function: Tells the delegate that the window has changed screen display profiles.
Notes:
notification: A notification named NSWindowDidChangeScreenProfileNotification.

You can retrieve the NSWindow object in question by sending object to notification.

Available in Mac OS X v10.4 and later.

32.83.34 windowDidDeminiaturize(notification as NSNotificationMBS)

Function: Tells the delegate that the window has been deminimized.
Notes:
notification: A notification named NSWindowDidDeminiaturizeNotification

You can retrieve the NSWindow object in question by sending object to notification.

Available in Mac OS X v10.0 and later.
32.83.35  windowDidEndLiveResize(notification as NSNotificationMBS)

Function: Informs the delegate that a live resize operation on the window has ended.
Notes:
notification: A notification named NSWindowDidEndLiveResizeNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.6 and later.

32.83.36  windowDidEndSheet(notification as NSNotificationMBS)

Function: Tells the delegate that the window has closed a sheet.
Notes:
notification: A notification named NSWindowDidEndSheetNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.1 and later.

32.83.37  windowDidEnterFullScreen(notification as NSNotificationMBS)

Function: The window just entered fullscreen mode.
Notes:
notification: A notification named NSWindowDidEnterFullScreenNotification.
Available in Mac OS X v10.7 and later.

32.83.38  windowDidEnterVersionBrowser(notification as NSNotificationMBS)

Function: Tells the delegate the the window just entered version browsing.
Notes:
notification: An NSWindowDidEnterVersionBrowserNotification notification.

Available in Mac OS X v10.7 and later.
32.83.39 windowDidExitFullScreen(notification as NSNotificationMBS)

Function: The window is about to enter fullscreen mode.
Notes:
notification: A notification named NSWindowDidExitFullScreenNotification.
Available in Mac OS X v10.7 and later.

32.83.40 windowDidExitVersionBrowser(notification as NSNotificationMBS)

Function: Tells the delegate the the window is about to leave version browsing.
Notes:
notification: An NSWindowDidExitVersionBrowserNotification notification.
Available in Mac OS X v10.7 and later.

32.83.41 windowDidExpose(notification as NSNotificationMBS)

Function: Tells the delegate that the window has been exposed.
Notes:
notification: A notification named NSWindowDidExposeNotification.
You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

32.83.42 windowDidFailToEnterFullScreen(win as NSWindowMBS)

Function: Invoked if the window failed to enter fullscreen.
Notes:
win: The window that failed to enter to full screen mode.

In some cases, the transition to enter fullscreen will fail, due to being in the midst of handling some other animation or user gesture. This method indicates that there was an error, and you should clean up any work you may have done to prepare to enter fullscreen.

This message is sent whether or not the delegate indicated a custom animation by returning non-nil from customWindowsToEnterFullScreenForWindow.
### 32.83.43 `windowDidFailToExitFullScreen(win as NSWindowMBS)`

**MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.**  
**Function:** Invoked if the window failed to exit fullscreen.  
**Notes:**  
- `win`: The window that failed to exit to fullscreen.  

In some cases, the transition to exit fullscreen will fail, due to being in the midst of handling some other animation or user gesture. This method indicates that there was an error, and you should clean up any work you may have done to prepare to enter fullscreen.

This message is sent whether or not the delegate indicated a custom animation by returning non-nil from `customWindowsToExitFullScreenForWindow`.

Available in Mac OS X v10.7 and later.

### 32.83.44 `windowDidMiniaturize(notification as NSNotificationMBS)`

**MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.**  
**Function:** Tells the delegate that the window has been minimized.  
**Notes:**  
- `notification`: A notification named `NSWindowDidMiniaturizeNotification`.

You can retrieve the `NSWindow` object in question by sending `object` to `notification`.

Available in Mac OS X v10.0 and later.

### 32.83.45 `windowDidMove(notification as NSNotificationMBS)`

**MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.**  
**Function:** Tells the delegate that the window has moved.  
**Notes:**  
- `notification`: A notification named `NSWindowDidMoveNotification`.
You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

32.83.46  windowDidResignKey(notification as NSNotificationMBS)

Function: Informs the delegate that the window has resigned key window status.
Notes:
notification: A notification named NSWindowDidResignKeyNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

32.83.47  windowDidResignMain(notification as NSNotificationMBS)

Function: Informs the delegate that the window has resigned main window status.
Notes:
notification: A notification named NSWindowDidResignMainNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

32.83.48  windowDidChange(notification as NSNotificationMBS)

Function: Informs the delegate that the window has been resized.
Notes:
notification: A notification named NSWindowDidChangeNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.
32.83.49 windowDidUpdate(notification as NSNotificationMBS)

Function: Tells the delegate that the window received an update message.
Notes:
notification: A notification named NSWindowDidUpdateNotification

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

32.83.50 windowShouldClose as boolean

Function: Tells the delegate that the user has attempted to close a window or the window has received a performClose message.
Notes:
Return true to allow sender to be closed; otherwise, false.

This method may not always be called during window closing. Specifically, this method is not called when a user quits an application.

Available in Mac OS X v10.0 and later.

32.83.51 windowShouldZoom(win as NSWindowMBS, newFrame as NSRectMBS) as boolean

Function: Asks the delegate whether the specified window should zoom to the specified frame.
Notes:
win: The window being zoomed.
newFrame: The rectangle to which the specified window is being zoomed.

Return true to allow window’s frame to become newFrame; otherwise, false.

Available in Mac OS X v10.0 and later.
32.83.52  windowWillBeginSheet(notification as NSNotificationMBS)

Function: Notifies the delegate that the window is about to open a sheet.
Notes: notification: A notification named NSWindowWillBeginSheetNotification.
You can retrieve the window object in question by sending object to notification. Available in Mac OS X v10.1 and later.

32.83.53  windowWillClose(notification as NSNotificationMBS)

Function: Tells the delegate that the window is about to close.
Notes: notification: A notification named NSWindowWillCloseNotification.
You can retrieve the NSWindow object in question by sending object to notification. Available in Mac OS X v10.0 and later.

32.83.54  windowWillEnterFullScreen(notification as NSNotificationMBS)

Function: The window is about to enter fullscreen mode.
Notes: notification: A notification named NSWindowWillEnterFullScreenNotification.
Available in Mac OS X v10.7 and later.

32.83.55  windowWillEnterVersionBrowser(notification as NSNotificationMBS)

Function: Tells the delegate the the window is about to enter version browsing.
Notes: notification: An NSWindowWillEnterVersionBrowserNotification notification. Available in Mac OS X v10.7 and later.
32.83.56 windowWillExitFullScreen(notification as NSNotificationMBS)

Function: The window is about to exit fullscreen mode.
Notes:
notification: A notification named NSWindowWillExitFullScreenNotification.
Available in Mac OS X v10.7 and later.

32.83.57 windowWillExitVersionBrowser(notification as NSNotificationMBS)

Function: Tells the delegate the the window just left version browsing.
Notes:
notification: An NSWindowWillExitVersionBrowserNotification notification.
Available in Mac OS X v10.7 and later.

32.83.58 windowWillMiniaturize(notification as NSNotificationMBS)

Function: Tells the delegate that the window is about to be minimized.
Notes:
notification: A notification named NSWindowWillMiniaturizeNotification.
You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

32.83.59 windowWillMove(notification as NSNotificationMBS)

Function: Tells the delegate that the window is about to move.
Notes:
notification: A notification named NSWindowWillMoveNotification.
You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.
32.83.60  windowWillResize(win as NSWindowMBS, newFrameSize as NSSizeMBS, newSize as NSSizeMBS) as NSSizeMBS

Function: Tells the delegate that the window is being resized (whether by the user or through one of the setFrame... methods other than setFrame:display:).
Notes: The plugin first passes the event to Real Studio runtime. In the newSize parameter you get the result from the runtime. Now you can decide. If you return nil, the newSize value is used.

win: The window being resized.
frameSize: The size to which the specified window is being resized.
newSize: The size Real Studio wants to use.

Return a custom size to which the specified window will be resized.

The frameSize contains the size (in screen coordinates) sender will be resized to. To resize to a different size, simply return the desired size from this method; to avoid resizing, return the current size. sender’s minimum and maximum size constraints have already been applied when this method is invoked.

While the user is resizing a window, the delegate is sent a series of windowWillResize messages as the window’s outline is dragged. The window’s outline is displayed at the constrained size as set by this method.

Available in Mac OS X v10.0 and later.

32.83.61  windowWillReturnUndoManager(win as NSWindowMBS) as NSUndoManagerMBS

Function: Tells the delegate that the window’s undo manager has been requested. Returns the appropriate undo manager for the window.
Notes: win: The window whose undo manager is being requested.

Return the appropriate undo manager for the specified window.

If this method is not implemented by the delegate, the window creates an NSUndoManager for window.

Available in Mac OS X v10.0 and later.
## 32.83.62 windowWillStartLiveResize(notification as NSNotificationMBS)

**Function:** Informs the delegate that the window is about to be live resized.

**Notes:**

notification: A notification named NSWindowWillStartLiveResizeNotification.

You can retrieve the window object in question by sending object to notification.

Available in Mac OS X v10.6 and later.

---

## 32.83.63 windowWillUseStandardFrame(win as NSWindowMBS, newFrame as NSRectMBS) as NSRectMBS

**Function:** Invoked by NSWindow’s zoom: method while determining the frame a window may be zoomed to.

**Notes:**

win: The window whose frame size is being determined.

newFrame: The size of the current screen, which is the screen containing the largest part of the window’s current frame, possibly reduced on the top, bottom, left, or right, depending on the current interface style. The frame is reduced on the top to leave room for the menu bar.

Return the specified window's standard frame.

The standard frame for a window should supply the size and location that are "best" for the type of information shown in the window, taking into account the available display or displays. For example, the best width for a window that displays a word-processing document is the width of a page or the width of the display, whichever is smaller. The best height can be determined similarly. On return from this method, the zoom: method modifies the returned standard frame, if necessary, to fit on the current screen.

Available in Mac OS X v10.0 and later.
32.84 class NSWindowMBS

32.84.1 class NSWindowMBS

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The Cocoa class for a window.
**Notes:** Subclass of the NSResponderMBS class.

32.84.2 Methods

32.84.3 addChildWindow(win as NSWindowMBS, order as Integer)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a given window as a child window of the window.
**Notes:**
- win: The child window to order.
- order: Either NSWindowAbove: childWindow is ordered immediately in front of the window, or NSWindowBelow: childWindow is ordered immediately behind the window.

After the childWindow is added as a child of the window, it is maintained in relative position indicated by order mode for subsequent ordering operations involving either window. While this attachment is active, moving childWindow will not cause the window to move (as in sliding a drawer in or out), but moving the window will cause childWindow to move.

Note that you should not create cycles between parent and child windows. For example, you should not add window B as child of window A, then add window A as a child of window B.

See also:
- 32.84.4 addChildWindow(win as window, order as Integer)

32.84.4 addChildWindow(win as window, order as Integer)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds a given window as a child window of the window.
**Notes:**
- win: The child window to order.
- order: Either NSWindowAbove: childWindow is ordered immediately in front of the window, or NSWindowBelow: childWindow is ordered immediately behind the window.

After the childWindow is added as a child of the window, it is maintained in relative position indicated by order mode for subsequent ordering operations involving either window. While this attachment is active,
moving childWindow will not cause the window to move (as in sliding a drawer in or out), but moving the window will cause childWindow to move.

Note that you should not create cycles between parent and child windows. For example, you should not add window B as child of window A, then add window A as a child of window B.

See also:

- 32.84.3 addChildWindow(win as NSWindowMBS, order as Integer)

32.84.5 addTabbedWindow(win as NSWindowMBS, ordered as Integer)

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Allows creating a group of tabbed windows, or adding a new window to an existing tabbed window group.

**Example:**

dim n as NSWindowMBS = window1.NSWindowMBS
n.addTabbedWindow(Window2, n.NSWindowAbove)

**Notes:**

The ‘window’ will be added to the receiver’s tabbed window group, or create a group if needed. The tabbingIdentifier for the entire group should be the same for all the windows, otherwise an exception will be thrown. Use the ordered parameter with "NSWindowAbove" and "NSWindowBelow" to place the new window before or after the receiver’s tab. Passing "NSWindowOut" will thrown an exception. Currently this method is not animatable, but that may change in the future.

Raises an exception when used on OS X 10.11 and older.

32.84.6 animator as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the proxy object for this window which animates.

**Example:**

dim v as NSWindowMBS // your NSWindowMBS object
v.alphaValue = 0.5 // switch alpha directly
v.animator.alphaValue = 0.5 // switch alpha animated
32.84.7 areCursorRectsEnabled as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the window's cursor rectangles are enabled. **Notes:** Available in Mac OS X v10.0 and later.

32.84.8 attachedSheet as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the sheet attached to the window. **Notes:** The sheet attached to the window; nil when the window doesn’t have a sheet attached. Available in Mac OS X v10.1 and later.

32.84.9 autorecalculatesContentBorderThicknessForEdge(edge as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window calculates the thickness of a given border automatically. **Notes:**

- **edge:** Border whose thickness autorecalculation status to set:
  - NSMaxYEdge: Top border.
  - NSMinYEdge: Bottom border.

Returns true when the window auto-recalculates the given border’s thickness; otherwise, false. Requires Mac OS X 10.5.

32.84.10 becomeKeyWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked automatically to inform the window that it has become the key window; never invoke this method directly. **Notes:** This method reestablishes the window’s first responder, sends the becomeKeyWindow message to that object if it responds, and posts an NSWindowDidBecomeKeyNotification to the default notification center.
32.84. CLASS NSWINDOWMBS

32.84.11 becomeMainWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Invoked automatically to inform the window that it has become the main window; never invoke this method directly.

32.84.12 cacheImageInRect(r as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Stores the window’s raster image from a given rectangle expressed in the window’s base coordinate system.
**Notes:**
This method allows the window to perform temporary drawing, such as a band around the selection as the user drags the mouse, and to quickly restore the previous image by invoking restoreCachedImage and flushWindowIfNeeded. The next time the window displays, it discards its cached image rectangles. You can also explicitly use discardCachedImage to free the memory occupied by cached image rectangles. aRect is made integral before caching the image to avoid antialiasing artifacts.

Only the last cached rectangle is remembered and can be restored.

32.84.13 Center

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the window’s location to the center of the screen.
**Notes:**
The window is placed exactly in the center horizontally and somewhat above center vertically. Such a placement carries a certain visual immediacy and importance. This method doesn’t put the receiver onscreen, however; use makeKeyAndOrderFront (show) to do that.

You typically use this method to place a windowmost likely an alert dialogwhere the user can’t miss it. This method is invoked automatically when a panel is placed on the screen by the runModalForWindow method of the NSApplication class.

32.84.14 childWindows as NSWindowMBS()

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an array of the window’s attached child windows.
32.84.15 ClearFocus

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Clears the focus.
**Notes:** Moves the focus back to the window.

32.84.16 Close

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Closes the window.

32.84.17 Constructor(w as window)

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a NSWindow for the given REALbasic window.
**Example:**

```realbasic
dim w as new NSWindowMBS(window1)
MsgBox w.Title
```

**Notes:**
In plugin version 9.4 and newer this works only with Cocoa windows.
In plugin version 9.7 and newer you can use it also for Carbon windows.
See also:
- 32.84.18 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer = 0, deferCreation as boolean = false, canBecomeKeyWindow as boolean = false)

32.84.18 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer = 0, deferCreation as boolean = false, canBecomeKeyWindow as boolean = false)

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The constructor to create a new Cocoa Windows.
**Notes:**
x, y, w, h:
Location and size of the window’s content area in screen coordinates. Note that the window server limits
window position coordinates to 16,000 and sizes to 10,000.

styleMask:
The window’s style. Either it can be NSBorderlessWindowMask, or it can contain any of the options described in the constants, combined using the bitwiseOR function. Borderless windows display none of the usual peripheral elements and are generally useful only for display or caching purposes; you should normally not need to create them. Also, note that a window’s style mask should include NSTitledWindowMask if it includes any of the others.

bufferingType:
Specifies how the drawing done in the window is buffered by the window device, and possible values are described in “Constants.”

deferCreation:
Specifies whether the window server creates a window device for the window immediately. When true, the window server defers creating the window device until the window is moved onscreen. All display messages sent to the window or its views are postponed until the window is created, just before it’s moved onscreen.

Initialized NSWindow object.

This method is the designated initializer for the NSWindow class.

Deferring the creation of the window improves launch time and minimizes the virtual memory load on the window server.

The new window creates a view to be its default content view. You can replace it with your own object by using the ContentView property.

Parameter canBecomeKeyWindow (in 11.3 plugin) controls whether we use a special NSWindow subclass which returns true for the canBecomeKeyWindow function. This way you can create windows which can take key focus.

See also:

- 32.84.17 Constructor(w as window)

32.84.19  contentBorderThicknessForEdge(edge as Integer) as Double

Notes:

dedge: The border whose thickness to get:
CHAPTER 32. COCOA

NSMaxYEdge: Top border.
NSMinYEdge: Bottom border.

Requires Mac OS X 10.5.

32.84.20 contentRectForFrameRect(windowFrame as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window’s content rectangle with a given frame rectangle.

**Example:**

dim w as NSWindowMBS = window1.NSWindowMBS
dim fr as NSRectMBS = w.frame
dim cr as NSRectMBS = w.contentRectForFrameRect(fr)

MsgBox "Title height: " +str(fr.Height-cr.Height)

**Notes:**

windowFrame: The frame rectangle for the window expressed in screen coordinates.

Returns the window’s content rectangle, expressed in screen coordinates, with windowFrame.

The window uses its current style mask in computing the content rectangle. See Window Style Mask constants for a list of style mask values. The main advantage of this instance-method counterpart to contentRectForFrameRect (With styleMask) is that it allows you to take toolbars into account when converting between content and frame rectangles. (The toolbar is not included in the content rectangle.)

See also:

- 32.84.21 contentRectForFrameRect(windowFrame as NSRectMBS, styleMask as UInt32) as NSRectMBS

6114

32.84.21 contentRectForFrameRect(windowFrame as NSRectMBS, styleMask as UInt32) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the content rectangle used by a window with a given frame rectangle and window style.

**Notes:**

windowFrame: The frame rectangle for the window expressed in screen coordinates.

windowStyle: The window style for the window. See constants for a list of style mask values.
Returns the content rectangle, expressed in screen coordinates, used by the window with windowFrame and windowStyle.
When a NSWindowMBS instance is available, you should use contentRectForFrameRect instead of this method.
See also:

- 32.84.20 contentRectForFrameRect(windowFrame as NSRectMBS) as NSRectMBS

32.84.22 convertBaseToScreen(p as NSPointMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a given point from the window’s base coordinate system to the screen coordinate system.

32.84.23 convertScreenToBase(p as NSPointMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a given point from the screen coordinate system to the window’s base coordinate system.

32.84.24 dataWithEPSInsideRect(r as NSRectMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns EPS data that draws the region of the window within a given rectangle.
**Notes:** This data can be placed on a pasteboard, written to a file, or used to create an NSImage object.

32.84.25 dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns PDF data that draws the region of the window within a given rectangle.
**Notes:** This data can be placed on a pasteboard, written to a file, or used to create an NSImage object.

32.84.26 deminiaturize

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method deminimizes the receiver.
**Notes:** Invoke this method to programmatically deminimize a minimized window in the Dock.
32.84.27 disableCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disables all cursor rectangle management within the window. **Notes:** Use this method when you need to do some special cursor manipulation and you don’t want the Application Kit interfering.

32.84.28 disableFlushWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disables the flushWindow method for the window. **Notes:**

If the window is buffered, disabling flushWindow prevents drawing from being automatically flushed by the NSView display... methods from the window’s backing store to the screen. This method permits several views to be drawn before the results are shown to the user.

Flushing should be disabled only temporarily, while the window’s display is being updated. Each disableFlushWindow message must be paired with a subsequent enableFlushWindow message. Invocations of these methods can be nested; flushing isn’t reenabled until the last (unnested) enableFlushWindow message is sent.

32.84.29 disableScreenUpdatesUntilFlush

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disables the window’s screen updates until the window is flushed. **Notes:**

This method can be invoked to synchronize hardware surface flushes with the window’s flushes. The window immediately disables screen updates using the NSDisableScreenUpdates function and reenables screen updates when the window flushes. Sending this message multiple times during a window update cycle has no effect.

Available in Mac OS X v10.4 and later.

32.84.30 disableSnapshotRestoration

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disable snapshot restoration. **Notes:**

While snapshot restoration is disabled, the window will not be snapshotted for restorable state. Available in OS X v10.7 and later.
32.84.31 discardCachedImage

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Discards all of the window’s cached image rectangles. **Notes:** An NSWindow object automatically discards its cached image rectangles when it displays.

32.84.32 discardCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates all cursor rectangles in the window. **Notes:** This method is invoked by resetCursorRects to clear out existing cursor rectangles before resetting them. You shouldn’t invoke it in the code you write, but you might want to override it to change its behavior.

32.84.33 display

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Passes a display message down the window’s view hierarchy, thus redrawing all views within the window, including the frame view that draws the border, title bar, and other peripheral elements. **Notes:** You rarely need to invoke this method. NSWindow objects normally record which of their views need display and display them automatically on each pass through the event loop.

32.84.34 displayIfNeeded

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Passes a displayIfNeeded message down the window’s view hierarchy, thus redrawing all views that need to be displayed, including the frame view that draws the border, title bar, and other peripheral elements. **Notes:** This method is useful when you want to modify some number of views and then display only the ones that were modified. You rarely need to invoke this method. NSWindow objects normally record which of their views need display and display them automatically on each pass through the event loop.
32.84.35 dockTile as Variant

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the application’s Dock tile. **Notes:** Available in Mac OS X v10.5 and later.

32.84.36 dragImage(image as NSImageMBS, viewLocation as NSPointMBS, offset as NSSizeMBS, NSEvent as NSEventMBS, pboard as NSPasteboardMBS, source as NSViewMBS, slideFlag as boolean)

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begins a dragging session. **Notes:**

- image: The object to be dragged.
- imageLocation: Location of the image’s bottom-left corner in the window’s coordinate system. It determines the placement of the dragged image under the pointer.
- offset: The pointer’s location relative to the mouse-down location. Not used in OS X v10.4 and later.
- NSEvent: The left-mouse down event that triggered the dragging operation.
- pasteboard: The pasteboard that holds the data to be transferred to the destination.
- source: The object serving as the controller of the dragging operation. It must conform to the NSDragging-Source protocol.
- slideBack: Specifies whether the drag image should slide back to imageLocation if it’s rejected by the drag destination. Pass true to specify slide back behavior or false to specify that it should not.

This method should be invoked only from within a view’s implementation of the mouseDown or mouseDragged methods (which overrides the version defined in NSResponder class). Essentially the same as the NSView method of the same name, except that imageLocation is given in the NSWindow object’s base coordinate system.

32.84.37 enableCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reenables cursor rectangle management within the window after a disableCursorRects message.

32.84.38 enableFlushWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reenables the flushWindow method for the window after it was disabled through a previous disableFlushWindow message.
32.84.39  enableSnapshotRestoration

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enable snapshot restoration.  **Notes:**

While snapshot restoration is enabled, the window will be snapshotted for restorable state.
Available in OS X v10.7 and later.

32.84.40  endEditingFor(anObject as object = nil)

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Forces the field editor to give up its first responder status and prepares it for its next assignment.  **Notes:**

anObject: The object that is using the window’s field editor.

If the field editor is the first responder, it’s made to resign that status even if its resignFirstResponder method returns false. This registration forces the field editor to send a textDidEndEditing message to its delegate. The field editor is then removed from the view hierarchy, its delegate is set to nil, and it’s emptied of any text it may contain.

This method is typically invoked by the object using the field editor when it’s finished. Other objects normally change the first responder by simply using makeFirstResponder, which allows a field editor or other object to retain its first responder status if, for example, the user has entered an invalid value. The endEditingFor: method should be used only as a last resort if the field editor refuses to resign first responder status. Even in this case, you should always allow the field editor a chance to validate its text and take whatever other action it needs first. You can do this by first trying to make the NSWindow object the first responder.

32.84.41  fieldEditor(createFlag as boolean = True, forObject as object = nil) as Variant

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window’s field editor, creating it if requested.  **Notes:**

Returns NSTextMBS object. Returned as Variant to reduce plugin dependencies.

createWhenNeeded: If true, creates a field editor if one doesn’t exist; if false, does not create a field editor. A freshly created NSWindow object doesn’t have a field editor. After a field editor has been created for a window, the createWhenNeeded argument is ignored. By passing false for createWhenNeeded and testing the return value, however, you can predicate an action on the existence of the field editor.

forObject: A text-displaying object for which the delegate (in windowWillReturnFieldEditor) assigns a cus-
tom field editor. Pass nil to get the default field editor, which can be the NSWindow field editor or a custom field editor returned by the delegate.

Returns the field editor for the designated object (anObject) or, if anObject is nil, the default field editor. Returns nil if createFlag is false and if the field editor doesn’t exist.

The field editor is a single NSTextView object that is shared among all the controls in a window for light text-editing needs. It is automatically instantiated when needed, and it can be used however your application sees fit. Typically, the field editor is used by simple text-bearing objects for example, an NSTextField object uses its window’s field editor to display and manipulate text. The field editor can be shared by any number of objects, and so its state may be constantly changing. Therefore, it shouldn’t be used to display text that demands sophisticated layout (for this you should create a dedicated NSTextView object).

The field editor may be in use by some view object, so be sure to properly dissociate it from that object before actually using it yourself (the appropriate way to do this is illustrated in the description of endEditingFor:). Once you retrieve the field editor, you can insert it in the view hierarchy, set a delegate to interpret text events, and have it perform whatever editing is needed. Then, when it sends a textDidEndEditing message to the delegate, you can get its text to display or store and remove the field editor using endEditingFor.

The window’s delegate can substitute a custom field editor in place of the window’s field editor by implementing windowWillReturnFieldEditor. The custom field editor can become the default editor (common to all text-displaying objects) or specific to a particular text-displaying object (anObject). The window sends this message to its delegate with itself and anObject as the arguments; if the delegate returns a non-nil value, the window returns that object instead of its field editor in fieldEditor. However, note the following:

If the window’s delegate is identical to anObject, windowWillReturnFieldEditor isn’t sent to the delegate. The object returned by the delegate method, though it may become first responder, does not become the window’s default field editor. Other objects continue to use the window’s default field editor.

32.84.42 firstResponder as NSResponderMBS

Notes:
The first responder is usually the first object in a responder chain to receive an event or action message. In most cases, the first responder is a view object in that the user selects or activates with the mouse or keyboard.

You can use the firstResponder method in custom subclasses of responder classes (NSWindow, NSApplication, NSView, and subclasses) to determine if an instance of the subclass is currently the first responder. You can also use it to help locate a text field that currently has first-responder status. For more on this subject, see Event Handling Basics (on developer.apple.com).
32.84.43 flushWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Flushes the window’s offscreen buffer to the screen if the window is buffered and flushing is enabled. **Notes:** Does nothing for other display devices, such as a printer. This method is automatically invoked by the NSWindow display and displayIfNeeded methods and the corresponding NSView display and display-IfNeeded methods.

32.84.44 flushWindowIfNeeded

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Flushes the window’s offscreen buffer to the screen if flushing is enabled and if the last flushWindow message had no effect because flushing was disabled. **Notes:** To avoid unnecessary flushing, use this method rather than flushWindow to flush an NSWindow object after flushing has been reenabled.

32.84.45 frame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window’s frame rectangle.

32.84.46 frameRectForContentRect(windowContent as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window’s frame rectangle with a given content rectangle. **Notes:**

- windowContent: The content rectangle for the window expressed in screen coordinates.

  Returns the window’s frame rectangle, expressed in screen coordinates, with windowContent.

  The window uses its current style mask in computing the frame rectangle. See "Window Style Masks" for a list of style mask values. The major advantage of this instance-method counterpart to frameRectForContentRect (with styleMask) is that it allows you to take toolbars into account when converting between content and frame rectangles. (The toolbar is included in the frame rectangle but not the content rectangle.) See also:

  • 32.84.47 frameRectForContentRect(windowContentRect as NSRectMBS, styleMask as UInt32) as NSRectMBS
32.84.47  frameRectForContentRect(windowContentRect as NSRectMBS, style-Mask as UInt32) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the frame rectangle used by a window with a given content rectangle and window style. **Notes:**

windowContentRect: The content rectangle for a window expressed in screen coordinates. windowStyle: The window style for the window. See Window Style Mask constants for a list of style mask values.

Returns the frame rectangle, expressed in screen coordinates, used by the window with windowContentRect and windowStyle. When a NSWindowMBS instance is available, you should use frameRectForContentRect instead of this method. See also:

- 32.84.46 frameRectForContentRect(windowContent as NSRectMBS) as NSRectMBS

32.84.48  GetFrame(byref left as Double, byref top as Double, byref width as Double, byref height as Double)

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Asks for the current window dimensions. **Notes:** The point 0/0 is on the left bottom position.

32.84.49  gState as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window’s graphics state object. **Notes:** This graphics state is used by default for all NSView objects in the window’s view hierarchy, but individual views can be made to use their own with the NSView method allocateGState.

32.84.50  Hide

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Hides the window.
**32.84.51  inLiveResize as boolean**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window is being resized by the user. **Notes:** Available in Mac OS X v10.6 and later.

**32.84.52  invalidateCursorRectsForView(View as NSViewMBS)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Marks as invalid the cursor rectangles of a given NSView object in the window’s view hierarchy, so they’ll be set up again when the window becomes key (or immediately if the window is key).

**32.84.53  invalidateRestorableState**

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Method that you may call to indicate that the restorable state is invalid. **Notes:** At some point in the future, encodeRestorableStateWithCoder: will be called to encode the restorable state. You should not override this method.

**32.84.54  invalidateShadow**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates the window shadow so that it is recomputed based on the current window shape.

**32.84.55  keyDown(e as NSEventMBS)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Handles a given keyboard event that may need to be interpreted as changing the key view or triggering a keyboard equivalent. **Notes:** event: The keyboard event to process.

**32.84.56  makeFirstResponder(r as NSResponderMBS) as boolean**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to make a given responder the first responder for the window. **Example:**
dim MySearchField as NSViewMBS // your control to move focus to
dim w as new NSWindowMBS(window1)
call w.makeFirstResponder(MySearchField)

Notes:

responder: The responder to set as the window’s first responder. nil makes the window its first responder.

Returns true when the operation is successful; otherwise, false.

If responder isn’t already the first responder, this method first sends a resignFirstResponder message to the object that is the first responder. If that object refuses to resign, it remains the first responder, and this method immediately returns false. If the current first responder resigns, this method sends a becomeFirstResponder message to responder. If responder does not accept first responder status, the NSWindow object becomes first responder; in this case, the method returns true even if responder refuses first responder status.

If responder is nil, this method still sends resignFirstResponder to the current first responder. If the current first responder refuses to resign, it remains the first responder and this method immediately returns false. If the current first responder returns true from resignFirstResponder, the window is made its own first responder and this method returns true.

The Application Kit framework uses this method to alter the first responder in response to mouse-down events; you can also use it to explicitly set the first responder from within your program. The responder object is typically an NSView object in the window’s view hierarchy. If this method is called explicitly, first send acceptsFirstResponder to responder, and do not call makeFirstResponder if acceptsFirstResponder returns false.

Use setInitialFirstResponder to the set the first responder to be used when the window is brought onscreen for the first time.

32.84.57  makeKeyAndOrderFront

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Moves the window to the front of the screen list, within its level, and makes it the key window; that is, it shows the window.
Notes: More or less the same as Real Studio’s show command on the window class.
32.84.58  makeKeyWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Makes the window the key window.

32.84.59  makeMainWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Makes the window the main window.

32.84.60  mergeAllWindows

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Merges all windows into one window.

**Example:**

```vbnet
dim n as NSWindowMBS = window1.NSWindowMBS
n.mergeAllWindows
```

**Notes:** Raises an exception when used on OS X 10.11 and older.

32.84.61  minFrameWidthWithTitle(WindowTitle as string, styleMask as UInt32) as Double

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the minimum width a window’s frame rectangle must have for it to display a title, with a given window style.

**Example:**

```vbnet
// shows 84.77588
MsgBox str(NSWindowMBS.minFrameWidthWithTitle(“Hello World”, 0))
```

**Notes:**

- `WindowTitle`: The title for the window.
- `windowStyle`: The window style for the window. See Window Style Mask constants for a list of style mask values.
The minimum width of the window’s frame, using windowStyle, in order to display windowTitle.

**32.84.62 miniaturize**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
This action method removes the receiver from the screen list and displays the minimized window in the Dock.

**32.84.63 moveTabToNewWindow**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Moves current tab to a new window.

**Example:**

```plaintext
dim n as NSWindowMBS = window1.NSWindowMBS
n.moveTabToNewWindow
```

**Notes:** Raises an exception when used on OS X 10.11 and older.

**32.84.64 NSDockWindowLevel as Integer**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the standard window levels in Mac OS X.

**Notes:** The level for the doc. (Deprecated. There is no replacement.)

**32.84.65 NSFloatingWindowLevel as Integer**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the standard window levels in Mac OS X.

**Notes:** Useful for floating palettes.

**32.84.66 NSMainMenuWindowLevel as Integer**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the standard window levels in Mac OS X.

**Notes:** Reserved for the application’s main menu.
32.84.67 NSModalPanelWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X. **Notes:** The level for a modal panel.

32.84.68 NSNormalWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X. **Notes:** The default level for NSWindow objects.

32.84.69 NSPopUpMenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X. **Notes:** The level for a pop-up menu.

32.84.70 NSScreenSaverWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X. **Notes:** The level for a screen saver.

32.84.71 NSStatusWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X. **Notes:** The level for a status window.

32.84.72 NSSubmenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X. **Notes:** Reserved for submenus. Synonymous with NSTornOffMenuWindowLevel, which is preferred.
32.84.73 NSTornOffMenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X. **Notes:** The level for a torn-off menu. Synonymous with NSSubmenuWindowLevel.

32.84.74 NSWindowDidBecomeKeyNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes. **Notes:** Posted whenever an NSWindow object becomes the key window.

The notification object is the NSWindow object that has become key. This notification does not contain a userInfo dictionary.

32.84.75 NSWindowDidBecomeMainNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes. **Notes:** Posted whenever an NSWindow object becomes the main window.

The notification object is the NSWindow object that has become main. This notification does not contain a userInfo dictionary.

32.84.76 NSWindowDidChangeScreenNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes. **Notes:** Posted whenever a portion of an NSWindow object’s frame moves onto or off of a screen.

The notification object is the NSWindow object that has changed screens. This notification does not contain a userInfo dictionary.

This notification is not sent in Mac OS X versions earlier than 10.4.
32.84.77  NSWindowDidChangeScreenProfileNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification strings you can use with the NSNotification* classes.

**Notes:**

Posted whenever the display profile for the screen containing the window changes.

This notification is sent only if the window returns true from displaysWhenScreenProfileChanges. This notification may be sent when a majority of the window is moved to a different screen (whose profile is also different from the previous screen) or when the ColorSync profile for the current screen changes.

The notification object is the NSWindow object whose profile changed. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.4 and later.

32.84.78  NSWindowDidDeminiaturizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification strings you can use with the NSNotification* classes.

**Notes:**

Posted whenever an NSWindow object is deminimized.

The notification object is the NSWindow object that has been deminimized. This notification does not contain a userInfo dictionary.

32.84.79  NSWindowDidEndLiveResizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification strings you can use with the NSNotification* classes.

**Notes:**

Posted after the user resizes a window.

This notification is sent only once for a series of window resize operations.
The notification object is the NSWindow object that was resized. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.6 and later.

32.84.80 NSWindowDidEndSheetNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the notification strings you can use with the NSNotification* classes. Notes: Posted whenever an NSWindow object closes an attached sheet.

The notification object is the NSWindow object that contained the sheet. This notification does not contain a userInfo dictionary.

32.84.81 NSWindowDidEnterFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the notification strings you can use with the NSNotification* classes. Notes: Posted when the window entered full screen mode.

The notification object is the NSWindow object entered full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

32.84.82 NSWindowDidEnterVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the notification strings you can use with the NSNotification* classes. Notes: Posted when the window will exit full screen mode.

The notification object is the NSWindow object that will exit full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.
32.84.83  NSWindowDidExitFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the notification strings you can use with the NSNotification* classes.

Notes:
Posted when the window will exit full screen mode.
The notification object is the NSWindow object that will exit full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

32.84.84  NSWindowDidExitVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the notification strings you can use with the NSNotification* classes.

Notes:
Posted when the window did exit version browser mode.
The notification object is the NSWindow object that did exit version browser mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

32.84.85  NSWindowDidExposeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the notification strings you can use with the NSNotification* classes.

Notes:
Posted whenever a portion of a nonretained NSWindow object is exposed, whether by being ordered in front of other windows or by other windows being removed from in front of it.

The notification object is the NSWindow object that has been exposed. The userInfo dictionary contains the following information:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSExposedRect</td>
<td>The rectangle that has been exposed (NSRect).</td>
</tr>
</tbody>
</table>
32.84.86  **NSWindowDidMiniaturizeNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.

**Notes:**

Posted whenever an NSWindow object is minimized.

The notification object is the NSWindow object that has been minimized. This notification does not contain a userInfo dictionary.

32.84.87  **NSWindowDidMoveNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.

**Notes:**

Posted whenever an NSWindow object is moved.

The notification object is the NSWindow object that has moved. This notification does not contain a userInfo dictionary.

Note: This notification is sent when the window that moved didn’t also change size. See NSWindowDidResizeNotification for more information.

32.84.88  **NSWindowDidResignKeyNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.

**Notes:**

Posted whenever an NSWindow object resigns its status as key window.

The notification object is the NSWindow object that has resigned its key window status. This notification does not contain a userInfo dictionary.

32.84.89  **NSWindowDidResignMainNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:
Posted whenever an NSWindow object resigns its status as main window.

The notification object is the NSWindow object that has resigned its main window status. This notification does not contain a userInfo dictionary.

32.84.90  **NSWindowDidResizeNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.

Notes:
Posted whenever an NSWindow object’s size changes.

The notification object is the NSWindow object whose size has changed. This notification does not contain a userInfo dictionary.

32.84.91  **NSWindowDidUpdateNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.

Notes:
Posted whenever an NSWindow object receives an update message.

The notification object is the NSWindow object that received the update message. This notification does not contain a userInfo dictionary.

32.84.92  **NSWindowWillBeginSheetNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.

Notes:
Posted whenever an NSWindow object is about to open a sheet.

The notification object is the NSWindow object that is about to open the sheet. This notification does not contain a userInfo dictionary.
32.84.93  NSWindowWillCloseNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification strings you can use with the NSNotification* classes.  
**Notes:** 
Posted whenever an NSWindow object is about to close.

The notification object is the NSWindow object that is about to close. This notification does not contain a userInfo dictionary.

32.84.94  NSWindowWillEnterFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification strings you can use with the NSNotification* classes.  
**Notes:** 
Posted when the window will enter full screen mode.  
The notification object is the NSWindow object will enter full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

32.84.95  NSWindowWillEnterVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification strings you can use with the NSNotification* classes.  
**Notes:** 
Posted when the window will enter version browser mode.  
The notification object is the NSWindow object that will enter version browser mode. This notification does not contain a userInfo dictionary.  
Available in Mac OS X v10.7 and later.

32.84.96  NSWindowWillExitFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification strings you can use with the NSNotification* classes.  
**Notes:** 
Posted when the window will exit full screen mode.  
The notification object is the NSWindow object that will exit full screen mode. This notification does not
32.84. CLASS NSWINDOWMBS

contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

32.84.97 NSWindowWillExitVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes. **Notes:**

Posted when the window will exit version browser mode.
The notification object is the NSWindow object that will exit version browser mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

32.84.98 NSWindowWillMiniaturizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes. **Notes:**

Posted whenever an NSWindow object is about to be minimized.

The notification object is the NSWindow object that is about to be minimized. This notification does not contain a userInfo dictionary.

32.84.99 NSWindowWillMoveNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes. **Notes:**

Posted whenever an NSWindow object is about to move.

The notification object is the NSWindow object that is about to move. This notification does not contain a userInfo dictionary.
32.84.100  **NSWindowWillStartLiveResizeNotification as string**

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes. **Notes:**

Posted before the user resizes a window.
This notification is sent only once for a series of window resize operations.
The notification object is the NSWindow object that is about to be live resized. This notification does not contain a userInfo dictionary.
Available in Mac OS X v10.6 and later.

32.84.101  **orderBack**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the window to the back of its level in the screen list, without changing either the key window or the main window.

32.84.102  **orderFront**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the window to the front of its level in the screen list, without changing either the key window or the main window.
32.84. CLASS NSWINDOWMBS

32.84.103 orderFrontRegardless

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the window to the front of its level, even if its application isn’t active, without changing either the key window or the main window.

**Notes:**

Normally an NSWindow object can’t be moved in front of the key window unless it and the key window are in the same application. You should rarely need to invoke this method; it’s designed to be used when applications are cooperating in such a way that an active application (with the key window) is using another application to display data.

Available in Mac OS X v10.0 and later.

32.84.104 orderOut

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the window from the screen list, which hides the window.

**Notes:**

More or less the same as Real Studio’s hide command on the window class.

If the window is the key or main window, the NSWindow object immediately behind it is made key or main in its place. Calling the orderOut method causes the window to be removed from the screen, but does not cause it to be released. See the close method for information on when a window is released.

The default animation based on the window type will be used when the window is ordered out unless it has been modified by the setAnimationBehavior method.

32.84.105 PerformClose

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method simulates the user clicking the close button by momentarily highlighting the button and then closing the window.

**Notes:**

Same as if the user clicks the close button.

So if the button is disabled or closing is not permitted by the window, it will do nothing.
32.84.106 performMiniaturize

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method simulates the user clicking the minimize button by momentarily highlighting the button, then minimizing the window. **Notes:** If the receiver doesn’t have a minimize button or can’t be minimized for some reason, the system emits the alert sound.

32.84.107 performZoom

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method simulates the user clicking the zoom box by momentarily highlighting the button and then zooming the window. **Notes:** If the receiver doesn’t have a zoom box or can’t be zoomed for some reason, the computer beeps.

32.84.108 print

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method runs the Print panel, and if the user chooses an option other than canceling, prints the window (its frame view and all subviews).

32.84.109 registerForDraggedTypes(Types() as string)

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers a give set of pasteboard types as the pasteboard types the window will accept as the destination of an image-dragging session. **Notes:**

Types: An array of the pasteboard types the window will accept as the destination of an image-dragging session.

Registering an NSWindow object for dragged types automatically makes it a candidate destination object for a dragging session. NSWindow has a default implementation for many of the methods in the NSDraggingDestination informal protocol. The default implementation forwards each message to the delegate if the delegate responds to the selector of the message. The messages forwarded this way are draggingEntered:, draggingUpdated:, draggingExited:, prepareForDragOperation:, performDragOperation:, and concludeDragOperation:.

Real Studio with Cocoa target implements the methods listed above. So this method is useful to change the allowed types for the case the framework has a bug.
32.84. **CLASS NSWINDOWMBS**

### 32.84.110 removeChildWindow(win as NSWindowMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Detaches a given child window from the window.  
**Notes:** win: The child window to detach.  
See also:
- 32.84.111 removeChildWindow(win as window)

### 32.84.111 removeChildWindow(win as window)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Detaches a given child window from the window.  
**Notes:** win: The child window to detach.  
See also:
- 32.84.110 removeChildWindow(win as NSWindowMBS)

### 32.84.112 removeFrameUsingName(name as string)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the frame data stored under a given name from the application's user defaults.

### 32.84.113 resetCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the window's cursor rectangles and the cursor rectangles of the NSView objects in its view hierarchy.  
**Notes:**  
Invokes discardCursorRects to clear the window’s cursor rectangles, then sends resetCursorRects to every NSView object in the window’s view hierarchy.  
This method is typically invoked by the NSApplication object when it detects that the key window’s cursor rectangles are invalid. In program code, it’s more efficient to invoke invalidateCursorRectsForView.

### 32.84.114 resignKeyWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked automatically when the window resigns key window status; never invoke this method directly.  
**Notes:** This method sends resignKeyWindow to the window’s first responder, sends windowDidResignKey
to the window’s delegate, and posts an NSWindowDidResignKeyNotification to the default notification center.

### 32.84.115 resignMainWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked automatically when the window resigns main window status; never invoke this method directly. **Notes:** This method sends windowDidResignMain to the window’s delegate and posts an NSWindow-DidResignMainNotification to the default notification center.

### 32.84.116 resizeFlags as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the flags field of the event record for the mouse-down event that initiated the resizing session. **Notes:** A mask indicating which of the modifier keys was held down when the mouse-down event occurred. The flags are listed in NSEvent object’s modifierFlags method description.

This method is valid only while the window is being resized.

You can use this method to constrain the direction or amount of resizing. Because of its limited validity, this method should only be invoked from within an implementation of the delegate method windowWillResize.

### 32.84.117 restoreCachedImage

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Splices the window’s cached image rectangles, if any, back into its raster image (and buffer if it has one), undoing the effect of any drawing performed within those areas since they were established using cacheImageInRect. **Notes:** You must invoke flushWindow after this method to guarantee proper redisplay. An NSWindow object automatically discards its cached image rectangles when it displays.

### 32.84.118 runToolbarCustomizationPalette

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The action method for the ”Customize Toolbar...” menu item.
32.84.119  saveFrameUsingName(s as String)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the window’s frame rectangle in the user defaults system under a given name. **Notes:** With the companion method setFrameUsingName, you can save and reset an NSWindow object’s frame over various launches of an application. The default is owned by the application and stored under the name ”NSWindow Frame frameName”. See NSUserDefaults for more information.

32.84.120  selectKeyViewFollowingView(view as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes key the view that follows the given view. **Notes:** Sends the nextValidKeyView message to referenceView and, if that message returns an NSView object, invokes makeFirstResponder with the returned object.

32.84.121  selectKeyViewPrecedingView(view as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes key the view that follows the given view. **Notes:** Sends the nextValidKeyView message to referenceView and, if that message returns an NSView object, invokes makeFirstResponder with the returned object.

32.84.122  selectNextKeyView

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method searches for a candidate next key view and, if it finds one, invokes makeFirstResponder to establish it as the first responder. **Notes:**

The candidate is one of the following (searched for in this order):

- The current first responder’s next valid key view, as returned by the nextValidKeyView method of NSView
- The object designated as the window’s initial first responder (using setInitialFirstResponder) if it returns true to an acceptsFirstResponder message
- Otherwise, the initial first responder’s next valid key view, which may end up being nil
32.84.123  selectNextTab

**Example:**

```plaintext
dim n as NSWindowMBS = window1.NSWindowMBS  
n.selectNextTab
```

**Notes:** Raises an exception when used on OS X 10.11 and older.

32.84.124  selectPreviousKeyView

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method searches for a candidate previous key view and, if it finds one, invokes makeFirstResponder to establish it as the first responder.  
**Notes:**

The candidate is one of the following (searched for in this order):

- The current first responder’s previous valid key view, as returned by the previousValidKeyView method of NSView
- The object designated as the window’s initial first responder (using setInitialFirstResponder) if it returns true to an acceptsFirstResponder message
- Otherwise, the initial first responder’s previous valid key view, which may end up being nil

32.84.125  selectPreviousTab

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects previous tab.  
**Example:**

```plaintext
dim n as NSWindowMBS = window1.NSWindowMBS  
n.selectPreviousTab
```

**Notes:** Raises an exception when used on OS X 10.11 and older.
### 32.84.126 sendEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
This action method dispatches mouse and keyboard events sent to the window by the NSApplication object.
**Notes:** Never invoke this method directly. A right mouse-down event in a window of an inactive application is not delivered to the corresponding NSWindow object. It is instead delivered to the NSApplication object through a sendEvent: message with a window number of 0.

### 32.84.127 setAutorecalculatesContentBorderThickness(flag as boolean, edge as Integer)

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the window calculates the thickness of a given border automatically.
**Notes:**
flag: If true, the window calculates the thickness of the edge automatically; if false, it does not.

edge: The border whose thickness auto-recalculation status to set:
- NSMaxYEdge: Top border.
- NSMinYEdge: Bottom border.

**Special Considerations**
Turning off a border’s auto-recalculation status sets its border thickness to 0.0.

In a non-textured window calling setAutorecalculatesContentBorderThickness passing NSMaxYEdge will raise an exception. It is only valid to set the content border thickness of the top edge in a textured window.

Requires Mac OS X 10.5.

### 32.84.128 setBottomCornerRounded(flag as boolean)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bottom corner to be round.
**Notes:** This is an undocumented function in the NSWindow class.
32.84.129  setContentBorderThickness(thickness as Double, edge as Integer)

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the thickness of a given border of the window.  
**Example:**

```lisp
dim w as NSWindowMBS = window1.NSWindowMBS
w.setContentBorderThickness(30, w.NSMinYEdge)  // bottom 30 pixel
w.setContentBorderThickness(20, w.NSMaxYEdge)  // top 30 pixel. Window must be metal for this
```

**Notes:**

- **thickness:** The thickness for edge, in points.
- **edge:** The border whose thickness to set:
  - NSMaxYEdge: Top border.
  - NSMinYEdge: Bottom border.

In a non-textured window calling setContentBorderThickness passing NSMaxYEdge will raise an exception. It is only valid to set the content border thickness of the top edge in a textured window.

The contentBorder does not include the titlebar or toolbar, so a textured window that just wants the gradient in the titlebar and toolbar should have a contentBorderThickness of 0 for NSMaxYEdge.

Requires Mac OS X 10.5.

32.84.130  setContentSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the size of the window’s content view to a given size, which is expressed in the window’s base coordinate system.  
**Notes:** This size in turn alters the size of the NSWindow object itself. Note that the window server limits window sizes to 10,000; if necessary, be sure to limit aSize relative to the frame rectangle.

32.84.131  setFrame(frameRect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the origin and size of the window’s frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.
32.84. CLASS NSWINDOWMBS

Notes:

frameRect: The frame rectangle for the window, including the title bar.

Note that the window server limits window position coordinates to 16,000 and sizes to 10,000.

See also:

- 32.84.132 setFrame(frameRect as NSRectMBS, display as boolean) 6145
- 32.84.133 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean) 6145
- 32.84.134 SetFrame(left as Double, top as Double, width as Double, height as Double) 6146

### 32.84.132  setFrame(frameRect as NSRectMBS, display as boolean)

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the origin and size of the window’s frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.

**Notes:**

The point 0/0 is on the bottom left position of the main screen.

display: Specifies whether the window redraws the views that need to be displayed. When true the window sends a displayIfNeeded message down its view hierarchy, thus redrawing all views.

See also:

- 32.84.131 setFrame(frameRect as NSRectMBS) 6144
- 32.84.133 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean) 6145
- 32.84.134 SetFrame(left as Double, top as Double, width as Double, height as Double) 6146

### 32.84.133  setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the origin and size of the window’s frame rectangle, with optional animation, according to a given frame rectangle, thereby setting its position and size onscreen.

**Notes:**

The point 0/0 is on the bottom left position of the main screen.

If animated is true, the change is animated.

See also:

- 32.84.131 setFrame(frameRect as NSRectMBS) 6144
- 32.84.132 setFrame(frameRect as NSRectMBS, display as boolean) 6145
- 32.84.134 SetFrame(left as Double, top as Double, width as Double, height as Double) 6146
32.84.134  **SetFrame(left as Double, top as Double, width as Double, height as Double)**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the origin and size of the window’s frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.  
**Notes:** The point 0/0 is on the bottom left position of the main screen.  
See also:

- 32.84.131 setFrame(frameRect as NSRectMBS)  
- 32.84.132 setFrame(frameRect as NSRectMBS, display as boolean)  
- 32.84.133 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean)

32.84.135  **setFrameAutosaveName(name as String) as boolean**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the name used to automatically save the window’s frame rectangle in the defaults system to a given name.  
**Notes:**

Returns true when the frame name is set successfully; false when frameName is being used as an autosave name by another NSWindow object in the application (in which case the window’s old name remains in effect).

If frameName isn’t the empty string (""), the window’s frame is saved as a user default (as described in saveFrameUsingName) each time the frame changes.

When the window has an autosave name, its frame data is written whenever the frame rectangle changes.

If there is a frame rectangle previously stored for frameName in the user defaults, the window’s frame is set to this frame rectangle. That is, when you call this method with a previously used frameName, the window picks up the previously saved setting. For example, if you call setFrameAutosaveName for a window that is already onscreen, this method could cause the window to move to a different screen location. For this reason, it is generally better to call this method before the window is visible on screen.

Keep in mind that a window controller may change the window’s position when it displays it if window cascading is turned on. To preclude the window controller from changing a window’s position from the one saved in the defaults system, you must send setShouldCascadeWindows(false) to the window controller.
32.84. CLASS NSWINDOWMBS

32.84.136 setFrameFromString(s as String)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the window’s frame rectangle from a given string representation. **Notes:** If the window is not resizable, this method will not resize the window. The frame is constrained according to the window’s minimum and maximum size settings. This method can cause a windowWillResize event.

32.84.137 setFrameOrigin(point as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Positions the bottom-left corner of the window’s frame rectangle at a given point in screen coordinates. **Notes:** Note that the window server limits window position coordinates to 16,000.

32.84.138 setFrameTopLeftPoint(point as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Positions the top-left corner of the window’s frame rectangle at a given point in screen coordinates. **Notes:** Note that the window server limits window position coordinates to 16,000; if necessary, adjust aPoint relative to the window’s lower-left corner to account for this limit.

32.84.139 setFrameUsingName(name as String, force as boolean = false) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the window’s frame rectangle by reading the rectangle data stored under a given name from the defaults system. **Notes:** Returns true when frameName is read and the frame is set successfully; otherwise, false. The frame is constrained according to the window’s minimum and maximum size settings. This method causes a windowWillResize event.

32.84.140 setRestorationClass

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the class to use to acquire a matching window object during subsequent launches. **Notes:**
The plugin provides a class to restore windows. See NSWindowRestoreHandlerMBS class.

The restoration class of a window is responsible for recreating not just the window but any other objects needed to manage the window. Therefore, the restoration class must be able to create (or find existing instances of) all of these objects at launch time in your application.

If you mark your windows as restorable, you must associate a restoration class with them. Available in OS X v10.7 and later.

### 32.84.141 `setTitleWithRepresentedFile(filename as folderitem)`

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a given path as the window’s title, formatting it as a file-system path, and records this path as the window’s associated filename using setRepresentedFilename.

### 32.84.142 `setTitleWithRepresentedFilename(filename as string)`

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a given path as the window’s title, formatting it as a file-system path, and records this path as the window’s associated filename using setRepresentedFilename.

### 32.84.143 `Show`

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Shows the window.

### 32.84.144 `standardWindowButton(button as Integer) as Variant`

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window button of a given window button kind in the window’s view hierarchy.

**Example:**

```vbnet
// another way to disable close button on Cocoa
dim n as NSButtonMBS = window1.NSWindowMBS.standardWindowButton(NSWindowMBS.NSWindowCloseButton)
n.isEnabled = false

// or move to to the right
dim r as NSRectMBS = n.frame
```

32.84. CLASS NSWINDOWMBS

n.frame = NSMakeRectMBS(r.x+100, r.y, r.Width, r.Height)

Notes:

button: The kind of standard window button to return.

Returns Window button in the window’s view hierarchy of the kind identified by windowButtonKind; nil when such button is not in the window’s view hierarchy.

Declared as Variant for reduced plugin dependencies.

Button constants: NSWindowCloseButton, NSWindowDocumentIconButton, NSWindowMiniaturizeButton, NSWindowToolBarButton and NSWindowZoomButton.

See also:

• 32.84.145 standardWindowButton(button as Integer, StyleMask as Integer) as Variant

32.84.145 standardWindowButton(button as Integer, StyleMask as Integer) as Variant

Notes:

button: The kind of standard window button to return.

StyleMask: The window style for which windowButtonKind is to be sized. See "Window Style Masks" for the list of allowable values.

Returns the new window button of the kind identified by windowButtonKind; nil when no such button kind exists.

The caller is responsible for adding the button to the view hierarchy and for setting the target to be the window.

Declared as Variant for reduced plugin dependencies.

Button constants: NSWindowCloseButton, NSWindowDocumentIconButton, NSWindowMiniaturizeButton, NSWindowToolBarButton and NSWindowZoomButton.

See also:

• 32.84.144 standardWindowButton(button as Integer) as Variant
**32.84.146 stringWithSavedFrame as String**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string representation of the window’s frame rectangle. **Notes:** A string representation of the window’s frame rectangle in a format that can be used with a later setFrameFromString method.

**32.84.147 tabbedWindows as NSWindowMBS()**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the entire group (stack) of windows that are all visually shown together in one virtual tabbed window and associated with this particular window. **Example:**

```plaintext
dim n as NSWindowMBS = window1.NSWindowMBS
dim windows() as NSWindowMBS = n.tabbedWindows
break // check in debugger
```

**Notes:**

Operations can then be done on each window, as necessary. For instance, iterating over each window in the group and calling performClose: will close the entire stack. The result will be nil when the window is not tabbed at all (not showing a tab bar), and non-nil with at least one object when the tab bar is shown. The order of items in the array is the same order as the tabs visually shown (leading to trailing). Raises an exception when used on OS X 10.11 and older.

**32.84.148 toggleFullScreen**

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles fullscreen mode for this window. **Example:**

```plaintext
dim w as new NSWindowMBS(window1)
// set window to have fullscreen
w.collectionBehavior = BitwiseOr(w.collectionBehavior, NSWindowMBS.NSWindowCollectionBehaviorFullScreen-Primary)

// and switch to fullscreen
w.toggleFullScreen
```

**Notes:**
Available on Mac OS X 10.7 or later. If an application supports fullscreen, it should add a menu item to the View menu with toggleFullScreen as the action. This method does not much if you don’t mark a window to be the primary fullscreen window.

### 32.84.149 toggleTabBar

**MBS** MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles tab bar.  
**Example:**
```vbs
dim n as NSWindowMBS = window1.NSWindowMBS
n.toggleTabBar
```

**Notes:** Raises an exception when used on OS X 10.11 and older.

### 32.84.150 toggleToolbarShown

**MBS** MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The action method for the ”Hide Toolbar” menu item (which alternates with ”Show Toolbar”).

### 32.84.151 toolbarview as NSViewMBS

**MBS** MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Convenience function to find the toolbar view on the window.  
**Example:**
```vbs
dim v as NSViewMBS = window1.NSWindowMBS.toolbarview
dim m as NSMenuMBS = v.Menu
dim i as NSMenuItemMBS = m.Item(0)
MsgBox i.title
```

**Notes:** Returns nil if there is no toolbar view.
32.84.152 unregisterDraggedTypes

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unregisters the window as a possible destination for dragging operations.

32.84.153 update

MBS MacBase Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the window.
**Notes:**
The NSWindow implementation of this method does nothing more than post an NSWindowDidChangeUpdateNotification notification to the default notification center. A subclass can override this method to perform specialized operations, but it should send an update message to super just before returning. For example, the NSMenu class implements this method to disable and enable menu commands.

An NSWindow object is automatically sent an update message on every pass through the event loop and before it’s displayed onscreen. You can manually cause an update message to be sent to all visible NSWindow objects through the NSApplication updateWindows method.

32.84.154 useOptimizedDrawing(value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the window is to optimize focusing and drawing when displaying its views.
**Notes:**
value: If true, the window will optimize focusing and drawing for its views; if false, it will not, in which case, the window does not preserve the Z-ordering of overlapping views when an object explicitly sends lockFocus to a view and draws directly to it, instead of using the AppKit standard display mechanism.

The optimizations may prevent sibling subviews from being displayed in the correct order which matters only if the subviews overlap. You should always set optimizedDrawing to true when there are no overlapping subviews within the window. The default is false.

32.84.155 WindowHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Window handle.
**Notes:**
Can be used with the CarbonWindowsEventsMBS class.
(for events like open and close)
32.84.156  windowNumberAtPoint(x as Double, y as Double, belowWindowWithWindowNumber as Integer = 0) as Integer

MBS MacBase Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of the frontmost window that would be hit by a mouseDown at the screen location point.

**Notes:**
belowWindowWithWindowNumber can be specified to exclude a given window along with all windows above it, and may belong to any application. If no windows are to be excluded, specify 0 for belowWindowWithWindowNumber. The windowNumber returned may correspond to a window in another application. Requires Mac OS X 10.6 or newer.

32.84.157  windowNumbersWithOptions(options as Integer = 0) as Integer()

MBS MacBase Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of integers containing windowNumbers for all visible windows satisfying options.

**Example:**
```plaintext
dim windowNumbers1() as Integer
dim windowNumbers2() as Integer
dim windowNumbers3() as Integer

// To get an array of windowNumbers visible on the current space and belonging to the calling application:
windowNumbers1 = NSWindowMBS.windowNumbersWithOptions(0)
// To get an array of windowNumbers visible on any space and belonging to any application:
windowNumbers2 = NSWindowMBS.windowNumbersWithOptions(NSWindowMBS.NSWindowNumberListAllApplications+NSWindowMBS.NSWindowNumberListAllSpaces)
// To get an array of windowNumbers visible on any space and belonging to the calling application:
windowNumbers3 = NSWindowMBS.windowNumbersWithOptions(NSWindowMBS.NSWindowNumberListAllSpaces)
```

**Notes:** In no options are specified, only visible windows belonging to the calling application and on the active space are included. If options include NSWindowNumberListAllApplications, visible windows belonging to all applications are included. If options include NSWindowNumberListAllSpaces, visible windows on all spaces are included.
32.84.158 zoom

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method toggles the size and location of the window between its standard state (provided by the application as the "best" size to display the window’s data) and its user state (a new size and location the user may have set by moving or resizing the window).

32.84.159 Properties

32.84.160 acceptsMouseMovedEvents as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver is to accept mouse-moved events.
**Notes:**
True to have the receiver accept mouse-moved events (and to distribute them to its responders); false to not accept such events.
(Read and Write property)

32.84.161 allowsAutomaticWindowTabbing as Boolean

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Allows automatic window tabbing when the value is true.
**Example:**
```
// disable automatic tabbing
NSWindowMBS.allowsAutomaticWindowTabbing = false
```

**Notes:**
By default, this will be set to true, but applications can explicitly opt out of all automatic tabbing by setting it to false, and can still adopt explicit window tabbing, if desired.
Raises an exception when used on OS X 10.11 and older.
(Read and Write property)

32.84.162 allows.ConcurrentViewDrawing as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether threading of view drawing is enabled for this window.
**Notes:**
Whether threading of view drawing should be enabled for this window. Defaults to true. When this is set to true, AppKit’s view system is allowed to perform drawRect activity for the window’s views on threads other than the main thread, for views that have canDrawConcurrently = true. When this is set to false, the window’s views will be drawn serially as on 10.5 and earlier, even though some of the views may have canDrawConcurrently = true.

Available on Mac OS X 10.6.
(Read and Write property)

### 32.84.163 allowsToolTipsWhenApplicationIsInactive as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window displays tooltips even when the application is in the background. **Notes:** Default is false. Set to true to allow a window to display tooltips even when the application is in the background. Note that, enabling tooltips in an inactive application will cause the app to do work any time the mouse passes over the window. This can degrade system performance. (Read and Write property)

### 32.84.164 alphaValue as Double

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s alpha value. **Example:**

```vbnet
if TargetCocoa then
dim w as new NSWindowMBS(window1)
w.alphaValue=0.5
else
MsgBox "this sample requires REALbasic Cocoa Target"
end if
```

**Notes:** (Read and Write property)

### 32.84.165 animationBehavior as Integer

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides for per-window control over automatic orderFront/orderOut animation behaviors added in 10.7.
Example:

```plaintext
dim w as new NSWindowMBS(window1)

w.animationBehavior = NSWindowMBS.NSWindowAnimationBehaviorDocumentWindow

Title = str(W.animationBehavior)
```

Notes:
Can be set to NSWindowAnimationBehaviorNone to disable Appkit’s automatic animations for a given
window, or to one of the other non-Default NSWindowAnimationBehavior values to override AppKit’s au-
tomatic inference of appropriate animation behavior based on the window’s apparent type.
Available on Mac OS X 10.7 or later.
(Read and Write property)

32.84.166 aspectRatio as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The window’s aspect ratio, which constrains the size of its frame rectangle to integral multiples of this ratio
when the user resizes it.
Notes: (Read and Write property)

32.84.167 Autodisplay as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Whether the window automatically displays views that need to be displayed.
Notes:
Automatic display typically occurs on each pass through the event loop.

Available in Mac OS X v10.0 and later.
(Read and Write property)

32.84.168 backgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The window background color.
Notes: (Read and Write property)
32.84.169 backingLocation as Integer

Indicates the window’s backing store location.

The location of the window’s backing store. See "Constants" for possible values. Available in Mac OS X v10.5 and later.

(Read only property)

32.84.170 backingScaleFactor as Double

Returns the backing scale factor.

Returns 2.0 for high resolution scaled display modes, and 1.0 for all other cases.

There are some scenarios where an application that is resolution-aware may want to reason on its own about the display environment it is running in.

It is important to note that this number returned by this method does not represent anything concrete, such as pixel density or physical size, since it can vary based on the configured display mode. For example, the display may be in a mirrored configuration that is still high resolution scaled, resulting in pixel geometry that may not match the native resolution of the display device.

Note: For almost all common cases, developers should avoid using the backingScaleFactor as an input to layout or drawing calculations. Developers should instead use the backing coordinate space conversion methods instead, as the resulting code will more likely work consistently and correctly under both low and high resolution operation.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.

(Read only property)

32.84.171 backingType as Integer

The window’s backing store type.

Use constants like this:
**NSBackingStoreRetained** = 0  The window uses a buffer, but draws directly to the screen where possible and to the buffer for obscured portions. You should not use this mode. It combines the limitations of NSBackingStoreNonretained with the memory use of NSBackingStoreBuffered. The original NeXTSTEP implementation was an interesting compromise that worked well with fast memory mapped framebuffers on the CPU bus something that hasn’t been in general use since around 1994. These tend to have performance problems. In Mac OS X 10.5 and later, requests for retained windows will result in the window system creating a buffered window, as that better matches actual use. Available in Mac OS X v10.0 and later.

**NSBackingStoreNonretained** = 1  The window draws directly to the screen without using any buffer. You should not use this mode. It exists primarily for use in the original Classic Blue Box. It does not support Quartz drawing, alpha blending, or opacity. Moreover, it does not support hardware acceleration, and interferes with system-wide display acceleration. If you use this mode, your application must manage visibility region clipping itself, and manage repainting on visibility changes. Available in Mac OS X v10.0 and later.

**NSBackingStoreBuffered** = 2  The window renders all drawing into a display buffer and then flushes it to the screen. You should use this mode. It supports hardware acceleration, Quartz drawing, and takes advantage of the GPU when possible. It also supports alpha channel drawing, opacity controls, using the compositor. Available in Mac OS X v10.0 and later.

(Read and Write property)

### 32.84.172  canBecomeKeyWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window can become the key window. **Notes:** Attempts to make the window the key window are abandoned if this method returns false. The NSWindow implementation returns true if the window has a title bar or a resize bar, or false otherwise. (Read only property)

### 32.84.173  canBecomeMainWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window can become the application’s main window. **Notes:** Attempts to make the window the main window are abandoned if this method returns false. The NSWindow implementation returns true if the window is visible, is not an NSPanel object, and has a title bar or a resize mechanism. Otherwise it returns false.
32.84.174 canBecomeVisibleWithoutLogin as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window can be displayed at the login window.

**Notes:**
Default: false.
Available in Mac OS X v10.5 and later.
(Read and Write property)

32.84.175 canHide as boolean

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the window can be hidden when its application becomes hidden (during execution of the NSApplication hide method).

**Notes:** (Read and Write property)

32.84.176 canStoreColor as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window has a depth limit that allows it to store color values.

**Notes:** (Read only property)

32.84.177 className as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this NSWindow class.

**Notes:** (Read only property)

32.84.178 classPath as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSView class.

**Notes:**
Useful for debugging to know what super classes the window has.
(Read only property)

### 32.84.179 collectionBehavior as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Identifies the window’s behavior in window collections.

**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)

### 32.84.180 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window’s color space.

**Notes:**
Available in Mac OS X v10.6 and later.
(Read and Write property)

### 32.84.181 contentAspectRatio as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The aspect ratio (height in relation to width) of the window’s content view, constraining the dimensions of its content rectangle to integral multiples of that ratio when the user resizes it.

**Notes:**
Available in Mac OS X v10.3 and later
(Read and Write property)

### 32.84.182 contentMaxSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum size of the window’s content view.

**Notes:**
Available in Mac OS X v10.3 and later.
(Read and Write property)
32.84. CLASS NSWINDOWNMBS

32.84.183  contentMinSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum size of the window’s content view. **Notes:** Available in Mac OS X v10.3 and later. (Read and Write property)

32.84.184  contentResizeIncrements as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window’s content-view resizing increments. **Notes:** Available in Mac OS X v10.3 and later. (Read and Write property)

32.84.185  contentView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s content view, the highest accessible NSView object in the receiver’s view hierarchy. **Notes:** (Read and Write property)

32.84.186  currentEvent as NSEventMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the event currently being processed by the application, by invoking NSApplication’s currentEvent method. **Notes:** Returns the event being processed by the application. (Read only property)

32.84.187  deepestScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the deepest screen the window is on (it may be split over several screens). **Notes:** The deepest screen the window is on; nil when the window is offscreen.
(Read only property)

### 32.84.188 depthLimit as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the depth limit of the window.  
**Notes:**  
The value returned can be examined with the Application Kit functions NSPlanarFromDepth, NSColorSpaceFromDepth, NSBitsPerSampleFromDepth, and NSBitsPerPixelFromDepth.  
(Read and Write property)

### 32.84.189 displaysWhenScreenProfileChanges as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window context should be updated when the screen profile changes or when the window moves to a different screen.  
**Notes:**  
Returns true when the window context should be updated when the screen profile changes or when the window moves to a different screen; otherwise, false.  

The default value is false.  

Available in Mac OS X v10.4 and later.  
(Read and Write property)

### 32.84.190 hasDynamicDepthLimit as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window’s depth limit can change to match the depth of the screen it’s on.  
**Notes:**  
True when the window has a dynamic depth limit; otherwise, false.  
(Read and Write property)

### 32.84.191 hasShadow as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver has a shadow.
Notes:
True when the receiver has a shadow, false when it doesn’t.
(Read and Write property)

32.84.192 Height as Double

Notes: (Read and Write property)

32.84.193 hidesOnDeactivate as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the receiver is removed from the screen when its application becomes inactive.
Notes:
True when the receiver is removed from the screen when its application is deactivated; false if it remains onscreen.
The default for NSWindow is false; the default for NSPanel is true.
(Read and Write property)

32.84.194 identifier as string

Example:
```
    dim w as new NSWindowMBS(window1)

    w.identifier = "window1"
    MsgBox w.identifier
```
Notes:
It should be set to a unique value on NSViews when they are intended to be used inside a view-based NSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a control but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a control is added to a window. Identifiers
beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ':' characters are reserved and should not be used in identifiers.

(Read and Write property)

### 32.84.195 ignoresMouseEvents as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver is transparent to mouse events. **Notes:** True when the receiver is transparent to mouse events, otherwise false. (Read and Write property)

### 32.84.196 initialFirstResponder as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The view that’s made first responder the first time the window is placed onscreen. **Notes:** (Read and Write property)

### 32.84.197 isDocumentEdited as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver’s document has been edited. **Notes:** True when the receiver’s document has been edited; false otherwise. Initially, by default, NSWindow objects are in the "not edited" state. (Read and Write property)

### 32.84.198 isExcludedFromWindowsMenu as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver’s title is omitted from the application’s Windows menu.
32.84. CLASS NSWINDOWMBS

Notes:

True to specify that the receiver is to be omitted from the application’s Windows menu; false to specify otherwise.  
(Read and Write property)

32.84.199  isFlushWindowDisabled as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Indicates whether the window’s flushing ability is disabled.  
**Notes:** (Read only property)

32.84.200  isKeyWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Indicates whether the window is the key window for the application.  
**Notes:** (Read only property)

32.84.201  isMainWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Indicates whether the window is the application’s main window.  
**Notes:** (Read only property)

32.84.202  isMiniaturized as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Whether the receiver is minimized.  
**Notes:**  
A minimized window is removed from the screen and replaced by a image, icon, or button that represents it, called the counterpart.  
(Read only property)

32.84.203  isMovableByWindowBackground as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** A Boolean value that indicates whether the receiver is movable by clicking and dragging anywhere in its
CHAPTER 32. COCOA

background.

Notes:

True when the window is movable by clicking and dragging anywhere in its background, otherwise false.

A window with a style mask of NSTexturedBackgroundWindowMask is movable by background by default. Sheets and drawers cannot be movable by window background.

Available in Mac OS X v10.2 and later.
Works in Real Studio 2011r3, but not in 2011r4.
(Read and Write property)

32.84.204  isOnActiveSpace as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Indicates whether the window is on the currently active space.
Notes:
For visible windows, this method indicates whether the window is currently visible on the active space. For offscreen windows, it indicates whether ordering the window onscreen would cause it to be on the active space.
Available in Mac OS X v10.6 and later.
(Read only property)

32.84.205  isOneShot as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Indicates whether the window device the window manages is freed when it’s removed from the screen list.
Notes: (Read and Write property)

32.84.206  isOpaque as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Whether the receiver is opaque.
Notes:
True when the receiver is opaque; false otherwise.
(Read and Write property)
32.84.207  isSheet as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window has ever run as a modal sheet.
**Notes:**
Sheets are created using the NSPanel subclass.
Available in Mac OS X v10.1 and later.
(Read only property)

32.84.208  isZoomed as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver is in a zoomed state.
**Notes:** (Read only property)

32.84.209  Left as Double

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The horizontal position of the color panel in pixel.
**Notes:** (Read and Write property)

32.84.210  Level as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window level of the receiver.
**Example:**
```ruby
dim n as NSWindowMBS = window1.NSWindowMBS
n.Level = n.NSFloatingWindowLevel
```
**Notes:** (Read and Write property)

32.84.211  maxSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum size to which the window's frame (including its title bar) can be sized.
**Notes:**
The maximum size to which the window’s frame (including its title bar) can be sized either by the user or by the setFrame... methods other than setFrame.
(Read and Write property)

32.84.212 miniwindowImage as Variant

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The custom miniaturized window image of the receiver.
**Notes:**
The miniaturized window image is the image displayed in the Dock when the window is minimized. If you did not assign a custom image to the window, this method returns nil.

Value is declares as Variant to minimize plugin dependencies, but should be NSImageMBS.
(Read and Write property)

32.84.213 miniwindowTitle as String

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The title displayed in the receiver’s minimized window.
**Notes:** (Read and Write property)

32.84.214 minSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The minimum size to which the window’s frame (including its title bar) can be sized.
**Notes:**
The minimum size to which the window’s frame (including its title bar) can be sized either by the user or by the setFrame... methods other than setFrame.
(Read and Write property)

32.84.215 Movable as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the window can be moved by clicking in its title bar or background.
**Notes:**
setMovableByWindowBackground, called with the argument true, is ignored by a window that returns false from isMovable. If a window returns false, that means it can only be dragged between spaces in F8 mode,
and its relative screen position is always preserved. Note that a resizable window may still be resized, and
the window frame may be changed programmatically. A non-movable window will not be moved or resized
by the system in response to a display reconfiguration. Applications may choose to enable application-
controlled window dragging after disabling user-initiating dragging by handling the mouseDown/mouse-
Dragged/mouseUp sequence in sendEvent in an NSWindow subclass.
Available in Mac OS X v10.6 and later.
(Read and Write property)

32.84.216 parentWindow as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The parent window to which the window is attached as a child.
**Notes:**
Available in Mac OS X v10.2 and later.
(Read and Write property)

32.84.217 preferredBackingLocation as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The preferred location for the window's backing store.
**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)

32.84.218 preservesContentDuringLiveResize as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the window tries to optimize user-initiated resize operations by preserving the content of views that
have not changed.
**Notes:**
Returns true if the window tries to optimize live resize operations by preserving the content of views that
have not moved; otherwise, false.

Discussion
When live-resize optimization is active, the window redraws only those views that moved (or do not support
this optimization) during a live resize operation.

See preservesContentDuringLiveResize in NSView for additional information on how to support this opti-
mization.
Available in Mac OS X v10.4 and later.
(Read and Write property)

### 32.84.219  `preventsApplicationTerminationWhenModal` as boolean

**MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Whether the window prevents application termination when modal.

**Notes:**
Available in Mac OS X v10.6 and later.
(Read and Write property)

### 32.84.220  `representedFile` as `folderitem`

**MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The pathname of the file the window represents.

**Notes:**  (Read and Write property)

### 32.84.221  `representedFilename` as string

**MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The pathname of the file the window represents.

**Notes:**  (Read and Write property)

### 32.84.222  `representedURL` as string

**MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The URL of the file the window represents.

**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim n as new NSWindowMBS(window1)
n.representedURL = f.URLPath
MsgBox n.representedURL
```

**Notes:**
The URL for the file the window represents.

When the URL specifies a path, the window shows an icon in its title bar, as described in Table 1.

### Title bar document icon display:

<table>
<thead>
<tr>
<th>Filepath</th>
<th>Document icon</th>
</tr>
</thead>
<tbody>
<tr>
<td>Empty</td>
<td>None.</td>
</tr>
<tr>
<td>Specifies a nonexistent file</td>
<td>Generic.</td>
</tr>
<tr>
<td>Specifies an existent file</td>
<td>Specific for the file’s type.</td>
</tr>
</tbody>
</table>

You can customize the file icon in the tile bar with the following code:

```objective-c
window.standardWindowButton(NSWindowDocumentIconButton).Image = theImage
```

When the URL identifies an existing file, the window’s title offers a pop-up menu showing the path components of the URL. (The user displays this menu by Command-clicking the title.) The behavior and contents of this menu can be controlled with `shouldPopUpDocumentPathMenu`.

Available in Mac OS X v10.5 and later.

(Read and Write property)

### 32.84.223 `resizeIncrements` as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window’s resizing increments. **Notes:** (Read and Write property)

### 32.84.224 `Restorable` as boolean

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the window configuration is preserved between application launches. **Notes:**

*value:* Specify true if you want the window to be preserved or false if you do not want it preserved.

Windows should be preserved between launch cycles to maintain interface continuity for the user. During subsequent launch cycles, the system tries to recreate the window and restore its configuration to the preserved state. Configuration data is updated as needed and saved automatically by the system.
If you enable preservation for a given window, you should also specify a restoration class for the window using the setRestorationClass method.
Available in OS X v10.7 and later.
(Read and Write property)

32.84.225  screen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the screen the window is on.
Notes:
The screen where most of the window is on; nil when the window is offscreen.
When the window is partly on one screen and partly on another, the screen where most of it lies is returned.
(Read only property)

32.84.226  sharingType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The level of access other processes have to the window’s content.
Notes:
Available in Mac OS X v10.5 and later.
(Read and Write property)

32.84.227  showsResizeIndicator as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the receiver’s resize indicator is visible
Notes:
True to show it, false to hide it.
This method does not affect whether the receiver is resizable.
(Read and Write property)

32.84.228  showsToolbarButton as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the receiver shows the toolbar control button.
Notes:
True to display the toolbar control button; false to hide the button.

If the window does not have a toolbar, this method has no effect.
(Read and Write property)

### 32.84.229 styleMask as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The receiver’s style mask, indicating what kinds of control items it displays.

**Example:**
```plaintext
dim p as new IKPictureTakerMBS
p.styleMask = BitwiseAnd(p.styleMask, & hFD) // disable close button
```

**Notes:**
See the information about the style mask in constants below. An NSWindow object’s style is set when the object is initialized. Once set, it can’t be changed.

**constants:**

- **NSBorderlessWindowMask = 0**
  The window displays none of the usual peripheral elements. Useful only for display or caching purposes.

- **NSTitledWindowMask = 1**
  The window displays a title bar.

- **NSClosableWindowMask = 2**
  The window displays a close button.

- **NSMiniaturizableWindowMask = 4**
  The window displays a minimize button.

- **NSResizableWindowMask = 8**
  The window displays a resize control.

- **NSTexturedBackgroundWindowMask = 256**
  The window displays with a metal-textured background. Additionally, the window may be moved by clicking and dragging anywhere in the window background. A bordered window with this mask gets rounded bottom corners.

(Read and Write property)

### 32.84.230 tabbingIdentifier as String

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Windows with the same tabbingIdentifier will have the ability to be tabbed together when a window is being shown.

**Example:**
dim n as NSWindowMBS = window1.NSWindowMBS
n.tabbingIdentifier = "test"
MsgBox n.tabbingIdentifier

Notes:
This allows aggregation of similar windows. By default, the tabbingIdentifier will be generated based on
inherit window properties, such as the window class name, the delegate class name, the window controller
class name, and some additional state. Windows can be explicitly made to group together by using the same
tabbingIdentifier.
Raises an exception when used on OS X 10.11 and older.
(Read and Write property)

32.84.231 tabbingMode as Integer

Example:

dim n as NSWindowMBS = window1.NSWindowMBS
n.tabbingMode = n.NSWindowTabbingModeDisallowed
MsgBox str(n.tabbingMode) // shows 2

Notes:
This should be set before a window is shown. The default value is NSWindowTabbingModeAutomatic. When the value is NSWindowTabbingModeAutomatic, the system will look at the userTabbingPreference and automatically tab windows together based on the tabbingIdentifier, when it is appropriate to do so. Raises an exception when used on OS X 10.11 and older.
(Read and Write property)

32.84.232 Title as String

Example:

if TargetCocoa then
dim w as new NSWindowMBS(window1)

MsgBox w.title
else
MsgBox "this sample requires REALbasic Cocoa Target"
end if

Notes: (Read and Write property)

32.84.233 titlebarAppearsTransparent as Boolean

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether titlebar appears transparent.
**Notes:**
When True, the titlebar doesn’t draw its background, allowing all buttons to show through, and "click through" to happen. In general, this is only useful when NSFullSizeContentViewWindowMask is set.

Available on Mac OS X 10.10 and newer.
(Read and Write property)

32.84.234 titleVisibility as Integer

**Notes:**
Can be NSWindowTitleVisible, NSWindowTitleHidden or NSWindowTitleHiddenWhenActive.
Available on Mac OS X 10.10 and newer.
(Read and Write property)

32.84.235 toolbar as Variant

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window’s toolbar.
**Notes:**
Value is a NSToolbarMBS object.
Returned as Variant to reduce plugin dependencies.
(Read and Write property)
32.84.236  Top as Double

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The vertical position of the color panel in pixel.
**Notes:**
In the Cocoa world this is the distance from the bottom of the screen.
(Read and Write property)

32.84.237  userTabbingPreference as Integer

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the user's tabbing preference as set in System Preferences.
**Example:**
MsgBox str(NSWindowMBS.userTabbingPreference)

**Notes:**
This value should be queried anytime a new window is made to see if the user wants to automatically show it in tabs.
Can be NSWindowUserTabbingPreferenceManual, NSWindowUserTabbingPreferenceAlways or NSWindowUserTabbingPreferenceInFullScreen.
Raises an exception when used on OS X 10.11 and older.
(Read only property)

32.84.238  viewsNeedDisplay as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Indicates whether any of the window's views need to be displayed.
**Notes:** (Read and Write property)

32.84.239  Visible as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the color panel is currently visible.
**Notes:**
Setting to false calls Hide and setting to true calls show.
(Read only property)
32.84.240  **Width as Double**

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The width of the color panel in pixel.  
**Notes:** (Read and Write property)

32.84.241  **windowController as NSWindowControllerMBS**

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window’s window controller.  
**Notes:** (Read and Write property)

32.84.242  **windowNumber as Integer**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the window number of the receiver’s window device.  
**Example:**

```
if TargetCocoa then
    dim w as new NSWindowMBS(window1)
    MsgBox str(w.windowNumber)
else
    MsgBox "this sample requires REALbasic Cocoa Target"
end if
```

**Notes:** (Read only property)

32.84.243  **worksWhenModal as boolean**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window is able to receive keyboard and mouse events even when some other window is being run modally.  
**Notes:**

True if the window is able to receive keyboard and mouse events even when some other window is being run modally; otherwise, false.
The NSWindow implementation of this method returns false. Only subclasses of NSPanel should override this default.
(Read only property)

**32.84.244  frameAutosaveName as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name used to automatically save the window’s frame rectangle data in the defaults system. **Notes:** (Read and Write computed property)

**32.84.245  Constants**

**32.84.246  NSBorderlessWindowMask=0**

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window. **Notes:** The window displays none of the usual peripheral elements. Useful only for display or caching purposes.

**32.84.247  NSClosableWindowMask=2**

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window. **Notes:** The window displays a close button.

**32.84.248  NSDirectSelection=0**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the direction a window is currently using to change the key view using keyViewSelectionDirection. **Notes:** The window isn’t traversing the key view loop.

**32.84.249  NSFullScreenWindowMask = 16384**

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: When set, the window will appear full screen. This mask is automatically toggled when toggleFullScreen: is called.

32.84.250  **NSFullScreenContentViewWindowMask = 32768**

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the constants you can use to specify the style when creating a window.

**Notes:**
- If set, the contentView will consume the full size of the window; it can be combined with other window style masks, but is only respected for windows with a titlebar.
- Utilizing this mask opts-in to layer-backing. Utilize the contentLayoutRect or auto-layout contentLayoutGuide to layout views underneath the titlebar/toolbar area.

32.84.251  **NSMaxXEdge = 2**

MBS MacBase Plugin, Plugin Version: 11.1. **Function:** One of the Cocoa edge constants.
**Notes:** the maximum X edge. Typically right side.

32.84.252  **NSMaxYEdge = 3**

MBS MacBase Plugin, Plugin Version: 11.1. **Function:** One of the Cocoa edge constants.
**Notes:** The maximum Y edge. Topically the top edge of a window.

32.84.253  **NSMiniaturizableWindowMask=4**

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
**Notes:** The window displays a minimize button.

32.84.254  **NSMinXEdge = 0**

MBS MacBase Plugin, Plugin Version: 11.1. **Function:** One of the Cocoa edge constants.
**Notes:** the minimum X edge. Typically left side.
32.84.255  NSMinYEdge = 1

MBS MacBase Plugin, Plugin Version: 11.1. **Function:** One of the Cocoa edge constants.  
**Notes:** Minimum Y. As coordinates are upside down in the Cocoa world, this is the bottom edge of a window.

32.84.256  NSResizableWindowMask=8

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.  
**Notes:** The window displays a resize control.

32.84.257  NSSelectingNext=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the direction a window is currently using to change the key view using keyViewSelectionDirection.  
**Notes:** The window is proceeding to the next valid key view.

32.84.258  NSSelectingPrevious=2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the direction a window is currently using to change the key view using keyViewSelectionDirection.  
**Notes:** The window is proceeding to the previous valid key view.

32.84.259  NSTexturedBackgroundWindowMask=256

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.  
**Notes:** The window displays with a metal-textured background. Additionally, the window may be moved by clicking and dragging anywhere in the window background. A bordered window with this mask gets rounded bottom corners.

32.84.260  NSTitledWindowMask=1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.  
**Notes:** The window displays a title bar.
32.84.261  NSUnifiedTitleAndToolbarWindowMask=4096

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.

32.84.262  NSUnscaledWindowMask=2048

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.

32.84.263  NSWindowAbove=1

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the window order constants to specify how a window is ordered relative to another window.  
**Notes:** Moves the window above the indicated window.

32.84.264  NSWindowAnimationBehaviorAlertPanel = 5

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.  
**Notes:** Default behavior for alert window.

32.84.265  NSWindowAnimationBehaviorDefault = 0

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.  
**Notes:** let AppKit infer animation behavior for this window

32.84.266  NSWindowAnimationBehaviorDocumentWindow = 3

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.  
**Notes:** Default behavior for document window.

32.84.267  NSWindowAnimationBehaviorNone = 2

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.  
**Notes:** suppress inferred animations (don’t animate)
32.84.268  **NSWindowAnimationBehaviorUtilityWindow = 4**

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.  
**Notes:** Default behavior for utility window.

32.84.269  **NSWindowBackingLocationDefault=0**

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constant to specify the window backing store location.  
**Notes:**  
Determined by the operating system.  
Available in Mac OS X v10.5 and later.

32.84.270  **NSWindowBackingLocationMainMemory=2**

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constant to specify the window backing store location.  
**Notes:**  
Physical memory.  
Available in Mac OS X v10.5 and later.

32.84.271  **NSWindowBackingLocationVideoMemory=1**

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constant to specify the window backing store location.  
**Notes:**  
Video memory.  
Available in Mac OS X v10.5 and later.

32.84.272  **NSWindowBelow=-1**

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the window order constants to specify how a window is ordered relative to another window.  
**Notes:** Moves the window below the indicated window.
32.84.273  **NSWindowCloseButton=0**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One constants providing a way to access standard title bar buttons.
**Notes:** The close button.

32.84.274  **NSWindowCollectionBehaviorCanJoinAllSpaces=1**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Expos and Spaces.
**Notes:**
The window appears in all spaces. The menu bar behaves this way.
Available in Mac OS X v10.5 and later.

32.84.275  **NSWindowCollectionBehaviorDefault=0**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Expos and Spaces.
**Notes:**
The window can be associated to one space at a time.
Available in Mac OS X v10.5 and later.

32.84.276  **NSWindowCollectionBehaviorFullScreenAuxiliary = 256**

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the constants for window collection behaviors.
**Notes:** Windows with this collection behavior can be shown with the fullscreen window.

32.84.277  **NSWindowCollectionBehaviorFullScreenPrimary = 128**

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the constants for window collection behaviors.
**Notes:** The frontmost window with this collection behavior will be the fullscreen window.
32.84.278   **NSWindowCollectionBehaviorIgnoresCycle=64**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Expos and Spaces.

**Notes:**
The window is not part of the window cycle for use with the Cycle Through Windows Window menu item. Available in Mac OS X v10.6 and later.

32.84.279   **NSWindowCollectionBehaviorManaged=4**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Expos and Spaces.

**Notes:**
The window participates in Spaces and Expos. This is the default behavior if windowLevel is equal to NSNormalWindowLevel.
Available in Mac OS X v10.6 and later.

32.84.280   **NSWindowCollectionBehaviorMoveToActiveSpace=2**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Expos and Spaces.

**Notes:**
Making the window active does not cause a space switch; the window switches to the active space.
Available in Mac OS X v10.5 and later.

32.84.281   **NSWindowCollectionBehaviorParticipatesInCycle=32**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Expos and Spaces.

**Notes:**
The window participates in the window cycle for use with the Cycle Through Windows Window menu item.
Available in Mac OS X v10.6 and later.

32.84.282   **NSWindowCollectionBehaviorStationary=16**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Expos and Spaces.
Notes:
The window is unaffected by Expos; it stays visible and stationary, like the desktop window. Available in Mac OS X v10.6 and later.

32.84.283  NSWindowCollectionBehaviorTransient=8

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Expos and Spaces.
**Notes:**
The window floats in Spaces and is hidden by Expos. This is the default behavior if windowLevel is not equal to NSNormalWindowLevel. Available in Mac OS X v10.6 and later.

32.84.284  NSWindowDocumentIconButton=4

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One constants providing a way to access standard title bar buttons.
**Notes:** The document icon button.

32.84.285  NSWindowDocumentVersionsButton = 6

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One constants providing a way to access standard title bar buttons.

32.84.286  NSWindowFullScreenButton = 7

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One constants providing a way to access standard title bar buttons.

32.84.287  NSWindowMiniaturizeButton=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One constants providing a way to access standard title bar buttons.
**Notes:** The minimize button.
32.84.288  **NSWindowNumberListAllApplications=1**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants used for options that may be passed to the windowNumbersWithOptions: method.

**Notes:**
The window numbers of windows visible on any space and belonging to any application.
Available in Mac OS X v10.6 and later.

If the value 0 is passed instead, then the list returned from the method contains window numbers for visible windows on the active space belonging to the calling application.

32.84.289  **NSWindowNumberListAllSpaces=16**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants used for options that may be passed to the windowNumbersWithOptions: method.

**Notes:**
The window numbers of windows visible on any space and belonging to the calling application.
Available in Mac OS X v10.6 and later.

If the value 0 is passed instead, then the list returned from the method contains window numbers for visible windows on the active space belonging to the calling application.

32.84.290  **NSWindowOut=0**

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the window order constants to specify how a window is ordered relative to another window.

**Notes:** Moves the window off the screen.

32.84.291  **NSWindowSharingNone=0**

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the following constants and the related data type represent the access levels other processes can have to a window’s content.

**Notes:**
The window’s contents cannot be read by another process.
Available in Mac OS X v10.5 and later.
32.84. CLASS NSWINDOWMBS

32.84.292 NSWindowSharingReadOnly = 1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the following constants and the related data type represent the access levels other processes can have to a window’s content.

**Notes:**
The window’s contents can be read but not modified by another process.
Available in Mac OS X v10.5 and later.

32.84.293 NSWindowSharingReadWrite = 2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the following constants and the related data type represent the access levels other processes can have to a window’s content.

**Notes:**
The window’s contents can be read and modified by another process.
Available in Mac OS X v10.5 and later.

32.84.294 NSWindowTitleHidden = 1

MBS MacBase Plugin, Plugin Version: 14.3. **Function:** One of the title visibility constants.

**Notes:** The always hidden mode hides the title and moves the toolbar up into the area previously occupied.
by the title.

32.84.298 NSWindowTitleHiddenWhenActive = 2

MBS MacBase Plugin, Plugin Version: 14.3. Function: One of the title visibility constants. Notes: This mode hides the title when the window is active, and shows it when inactive. It does not adjust toolbars.

32.84.299 NSWindowTitleVisible = 0

MBS MacBase Plugin, Plugin Version: 14.3. Function: One of the title visibility constants. Notes: The default mode has a normal window title and titlebar buttons.

32.84.300 NSWindowToolbarButton=3

MBS MacBase Plugin, Plugin Version: 9.6. Function: One constants providing a way to access standard title bar buttons. Notes: The toolbar button.

32.84.301 NSWindowUserTabbingPreferenceAlways = 1

MBS MacBase Plugin, Plugin Version: 16.5. Function: One of the tabbing preferences values.

32.84.302 NSWindowUserTabbingPreferenceInFullScreen = 2

MBS MacBase Plugin, Plugin Version: 16.5. Function: One of the tabbing preferences values.

32.84.303 NSWindowUserTabbingPreferenceManual = 0

MBS MacBase Plugin, Plugin Version: 16.5. Function: One of the tabbing preferences values.
32.84.304  NSWindowZoomButton=2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One constants providing a way to access standard title bar buttons.
**Notes:** The zoom button.
32.85 class NSWindowRestoreHandlerMBS

32.85.1 class NSWindowRestoreHandlerMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The class implementing the event to be called for window restoration.

32.85.2 Methods

32.85.3 Constructor

32.85.4 Destructor

32.85.5 SetLastError(error as NSErrorMBS)

32.85.6 SetRestoredWindow(win as NSWindowMBS)

See also:

- 32.85.7 SetRestoredWindow(win as window)

32.85.7 SetRestoredWindow(win as window)

See also:
32.85.8 Events

32.85.9 RestoreWindow(identifier as string, state as NSCoderMBS)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The following event is sent to request that a window be restored.

**Notes:**

If the receiver knows how to restore the identified window, it should invoke the completion handler with the window, possibly creating it. It is acceptable to invoke the completion handler with a pre-existing window, though you should not pass the same window to more than one completion handler. If the receiver cannot restore the identified window (for example, the window referenced a document that has been deleted), it should invoke the completion handler with a nil window. In Mac OS X 10.7, the error parameter is ignored.

The receiver is passed the identifier of the window, which allows the receiver to quickly check for known windows. For example, you might give your preferences window an identifier of “preferences” in the nib, and then check for that identifier in your implementation. The receiver is also passed the NSCoder containing the combined restorable state of the window, its delegate, the window controller, and any document. The receiver may decode information previously stored in the coder to determine what window to restore.

Please call SetRestoredWindow or SetError to pass back status to system. It is not necessary or recommended for implementations of this method to order restored windows onscreen (for example, the window may have been minimized, in which case it will not be ordered onscreen).

Please call SetError and SetRestoredWindow to provide result to system.
32.86 class NSWorkspaceMBS

32.86.1 class NSWorkspaceMBS

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: An NSWorkspace object responds to application requests to perform a variety of services. Example:

```objective-c
// get icon image
dim n as NSImageMBS = NSWorkspaceMBS.iconForFile(SpecialFolder.desktop)
// set the size we want
n.setSize 512,512
// make a copy as picture
Backdrop = n.CopyPictureWithMask
```

Notes:

- Opening, manipulating, and obtaining information about files and devices
- Tracking changes to the file system, devices, and the user database
- Launching applications

32.86.2 Methods

32.86.3 absolutePathForAppBundleWithIdentifier(bundleIdentifier as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the absolute file-system path of an application bundle. Notes:

- bundleIdentifier: The bundle identifier string. This value corresponds to the value in the CFBundleIdentifier key of the application’s Info.plist file. For example, the bundle identifier of the TextEdit application is com.apple.TextEdit.

Returns the file system path to the application bundle identified by bundleIdentifier, or "" if the bundle cannot be found.

32.86.4 activateFileViewerSelectingFiles(Files() as folderitem)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Activates the Finder, and opens one or more windows selecting the specified files.
32.86. **CLASS NSWORKSPACEMBS**

**Example:**

```vba
dim file as FolderItem = SpecialFolder.Pictures.Child("mbs.jpg") // some file

dim w as new NSWorkspaceMBS
dim files() as FolderItem

files.Append file

// show in Finder
w.activateFileViewerSelectingFiles(files)
```

**Notes:** Available in Mac OS X v10.6 and later.

### 32.86.5 `activateFileViewerSelectingURLs(URLs() as string)`

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Activates the Finder, and opens one or more windows selecting the specified files. **Notes:** Available in Mac OS X v10.6 and later.

### 32.86.6 `desktopImageOptionsForScreen(screen as NSScreenMBS) as dictionary`

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the desktop image options for the given screen. **Example:**

```vba
dim w as new NSWorkspaceMBS
dim m as NSScreenMBS = NSScreenMBS.mainScreen
dim dic as Dictionary = w.desktopImageOptionsForScreen(m)

break // check in debugger
```

**Notes:**

- `screen`: The screen for which to get the desktop image options.

Returns a dictionary containing key-value pairs. Keys can be `NSWorkspaceDesktopImageScalingKey`, `NSWorkspaceDesktopImageAllowClippingKey` or `NSWorkspaceDesktopImageFillColorKey`. Available in Mac OS X v10.6 and later.
32.86.7  desktopImageURLForScreen(screen as NSScreenMBS) as folderitem

Function: Returns the folderitem for the desktop image for the given screen.
Example:

```vBasic
dim w as new NSWorkspaceMBS
dim m as NSScreenMBS = NSScreenMBS.mainScreen
dim file as FolderItem = w.desktopImageURLForScreen(m)

MsgBox file.AbsolutePath
```

Notes:

- screen: The screen for which to get the desktop image.
- Returns the desktop image.
- Available in Mac OS X v10.6 and later.

32.86.8  fileLabelColors as NSColorMBS()

Function: Returns the corresponding array of file label colors for the file labels.
Example:

```vBasic
dim w as new NSWorkspaceMBS
dim labels() as string = w.fileLabels
dim colors() as NSColorMBS = w.fileLabelColors
dim lines() as string

dim u as Integer = UBound(Colors)
for i as Integer = 0 to u
    dim co as NSColorMBS = colors(i)
    lines.Append labels(i)+":"+str(co.colorValue)
next

MsgBox Join(lines,EndOfLine)
```

Notes:

- This array has the same number of elements as fileLabels, and the color at a given index corresponds to the label at the same index.
You can listen for notifications named NSWorkspaceDidChangeFileLabelsNotification to be notified when file labels change which may result in changes to the order of the fileLabelColors.

Available in Mac OS X v10.6 and later.

### 32.86.9 `fileLabels as string()`

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the array of file labels as strings.

**Example:**

```vbnet
dim w as new NSWorkspaceMBS
dim labels() as string = w.fileLabels

MsgBox Join(labels, EndOfLine)
```

**Notes:**

You can listen for notifications named NSWorkspaceDidChangeFileLabelsNotification to be notified when file labels change.

Available in Mac OS X v10.6 and later.

### 32.86.10 `findApplications`

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Examines all applications and updates the records of registered services and file types.

**Example:**

```vbnet
NSWorkspaceMBS.findApplications
```

### 32.86.11 `frontmostApplication as NSRunningApplicationMBS`

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets the frontmost application, which is the application that will receive key events.

**Example:**

```vbnet
dim w as new NSWorkspaceMBS
dim n as NSRunningApplicationMBS = w.frontmostApplication

MsgBox n.localizedNome
```
CHAPTER 32. COCOA

Notes: Requires Mac OS X 10.7.

32.86.12 fullPathForApplication(appname as string) as folderitem

Example:

MsgBox NSWorkspaceMBS.fullPathForApplication("textedit").ShellPath
// shows /Applications/TextEdit.app

Notes: The full path for the application, or nil if the specified application was not found.

32.86.13 hideOtherApplications

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Hides all applications other than the sender.
Example:

NSWorkspaceMBS.hideOtherApplications

Notes: The user can hide all applications except the current one by Command-Option-clicking on an application’s Dock icon.

32.86.14 iconForFile(file as folderitem) as NSImageMBS

Example:

    dim f as FolderItem
    f=SpecialFolder.Desktop.Child("test.txt")

    dim n as NSImageMBS = NSWorkspaceMBS.iconForFile(f)
    n.size = new NSSizeMBS(512,512)
    Backdrop=n.CopyPictureWithMask
Notes:
The returned image has an initial size of 32 pixels by 32 pixels.
Returns nil on any error.

32.86.15 iconForFiles(files() as folderitem) as NSImageMBS

Function: Returns an image containing the icon for the specified files.
Example:

    dim w as new NSWorkspaceMBS
    dim files() as FolderItem

    dim folder as FolderItem = SpecialFolder.Pictures

    // one file
    files.Append folder.TrueItem(2)
    canvas1.Backdrop = w.iconForFiles(files).CopyPictureWithMask

    // two files
    files.Append folder.TrueItem(3)
    canvas2.Backdrop = w.iconForFiles(files).CopyPictureWithMask

    // three files
    files.Append folder.TrueItem(4)
    canvas3.Backdrop = w.iconForFiles(files).CopyPictureWithMask

Notes:
files: An array of folderitems, each of which contains the full path to a file.

Returns the icon associated with the group of files.

If fullPaths specifies one file, that file’s icon is returned. If fullPaths specifies more than one file, an icon representing the multiple selection is returned.

32.86.16 iconForFileType(filetype as string) as NSImageMBS

Function: Returns an image containing the icon for files of the specified type.
Example:
Backdrop=NSWorkspaceMBS.iconForFileType("txt").CopyPictureWithMask

Notes:
filetype: The file type, which may be either a filename extension or an encoded HFS file type.

The returned image has an initial size of 32 pixels by 32 pixels.
Returns nil on any error.

Running this in a thread can lead to crashes.

32.86.17  isFilePackageAtPath(item as folderitem) as boolean

Function: Determines whether the specified path is a file package.
Example:

dim w as new NSWorkspaceMBS
dim file as FolderItem = SpecialFolder.Applications.Child("iTunes.app")

// shows true for iTunes
MsgBox str(w.isFilePackageAtPath(file))

Notes: Returns true if the path identifies a file package; otherwise, false if the path does not exist, is not a
directory, or is not a file package.

32.86.18  launchApplication(appname as string) as boolean

Function: Launches the specified application.
Example:

if NSWorkspaceMBS.launchApplication("Textedit") then
MsgBox "Ok"
else
MsgBox "failed"
end if
32.86. CLASS NSWORKSPACEMBS

Notes:
Returns true if the application was successfully launched or was already running; otherwise, false.

The appName parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in "Use of .app Extension".

See also:
• 32.86.19 launchApplication(appname as string, showicon as boolean, autolaunch as boolean) as boolean

32.86.19 launchApplication(appname as string, showicon as boolean, autolaunch as boolean) as boolean

Example:
if NSWorkspaceMBS.launchApplication("Textedit",false,false) then
    MsgBox "Ok"
else
    MsgBox "failed"
end if

Notes:
appName: The name of the application to open.
showIcon: If false, the application’s icon is not placed on the screen. (The icon still exists, though.)
autolaunch: If true, the autolaunch default is set as though the specified application were autolaunched at startup.

This method is provided to enable daemon-like applications that lack a normal user interface. Its use is not generally encouraged.
Returns true if the application is successfully launched or already running, and false if it can’t be launched.
See also:
• 32.86.18 launchApplication(appname as string) as boolean

32.86.20 launchApplicationAtFile(file as folderitem, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS

Notes:
file: The application folder item.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described
NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

• 32.86.21 launchApplicationAtFile(file as folder item, options as UInt32, configuration as dictionary,
byref error as NSErrorMBS) as NSRunningApplicationMBS

32.86.21 launchApplicationAtFile(file as folder item, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS

Function: Launches the app at the specified file location.
Example:

dim w as new NSWorkspaceMBS
dim file as FolderItem = SpecialFolder.Applications.Child("Address Book.app")

dim error as NSErrorMBS
dim configuration as new Dictionary
dim options as Integer

// today we start 32 bit version
configuration.Value(w.NSWorkspaceLaunchConfigurationArchitecture) = w.NSBundleExecutableArchitectureI386

// and hide all others
options = w.NSWorkspaceLaunchAndHideOthers

dim r as NSRunningApplicationMBS = w.launchApplicationAtFile(file, options, configuration, error)

if r = nil then
MsgBox "Error: " +error.localizedDescription
else
MsgBox "Started: " +r.localizedName
end if
32.86. CLASS NSWORKSPACEMBS

Notes:

file: The application folder item.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described
NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.

See also:

- 32.86.20 launchApplicationAtFile(file as folder item, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS

32.86.22 launchApplicationAtURL(URL as string, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS

Function: Launches the app at the specified URL.

Notes:

url: The application URL.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described
NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.

See also:

- 32.86.23 launchApplicationAtURL(URL as string, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS

32.86.23 launchApplicationAtURL(URL as string, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS

Function: Launches the app at the specified URL.

Notes:
url: The application URL.
options: Options to use when launching the application. See NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described
NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

- 32.86.22 launchApplicationAtURL(URL as string, options as UInt32 = 0, configuration as dictionary
  = nil) as NSRunningApplicationMBS 6201

32.86.24 launchAppWithBundleIdentifier(bundleIdentifier as string, options as
  Integer = & h00030000, AppleEventDescriptor as Variant = nil) as
  Boolean

Function: Launches the application corresponding to the specified bundleIdentifier.
Notes:

- bundleIdentifier: A bundle identifier string. This value corresponds to the value in the CFBundleIdentifier
  key of the application’s Info.plist file. For example, the bundle identifier of the TextEdit application is
- options: Options to use when launching the application. Values for this parameter are described in constants.
- descriptor: Additional options specified in an AppleEvent-style descriptor. For example, you could use this
  parameter to specify additional documents to open when the application is launched.

Returns true if the application was found and launched; otherwise, false.

32.86.25 localizedDescriptionForType(typeName as string) as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the localized description for the specified Uniform Type Identifier.
Example:

MsgBox NSWorkspaceMBS.localizedDescriptionForType("public.jpeg")
// "JPEG-Bild" in German

Notes:
32.86. **classList NSWorkspaceMBS**

The localized description is suitable for displaying to the user.
Available in Mac OS X v10.5 and later.

### 32.86.26 `menuBarOwningApplication` as `NSRunningApplicationMBS`

**Function:** Gets the menu bar owning application, which is the application that currently owns and draws the menu bar.
**Example:**

```vbnet
dim w as new NSWorkspaceMBS
dim n as NSRunningApplicationMBS = w.menuBarOwningApplication
MsgBox n.localizedDescription
```

**Notes:** Requires Mac OS X 10.7.

### 32.86.27 `mountedLocalVolumePaths` as `string()`

**Function:** Returns the mount points of all local volumes, not just the removable ones returned by `mountedRemovableMedia`.
**Example:**

```vbnet
dim w as new NSWorkspaceMBS
dim paths() as string = w.mountedLocalVolumePaths
MsgBox Join(paths, EndOfLine)
```

**Notes:** Returns an array of strings, each of which contains the full pathname of the mount point for any local volumes.

### 32.86.28 `mountedRemovableMedia` as `string()`

**Function:** Returns the full pathnames of all currently mounted removable disks.
**Example:**

```vbnet
dim w as new NSWorkspaceMBS
dim paths() as string = w.mountedRemovableMedia
```
MsgBox Join(paths, EndOfLine)

**Notes:**
Returns an array of strings, each of which contains the full pathname of a mounted removable disk.

If the computer provides an interrupt or other notification when the user inserts a disk into a drive, the Finder will mount the disk immediately. However, if no notification is given, the Finder won’t be aware that a disk needs to be mounted. On such systems, an application should invoke either mountNewRemovableMedia or checkForRemovableMedia before invoking mountedRemovableMedia. Either of these methods cause the Finder to poll the drives to see if a disk is present. If a disk has been inserted but not yet mounted, these methods will cause the Finder to mount it.

The Disk button in an Open or Save panel invokes mountedRemovableMedia and mountNewRemovableMedia as part of its operation, so most applications won’t need to invoke these methods directly.

### 32.86.29 noteFileSystemChanged

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the NSWorkspace object that the file system has changed. **Notes:**
The NSWorkspace object then gets the status of all the files and directories it is interested in and updates itself appropriately. This method is used by many objects that write or delete files.

The NSDocument and NSSavePanel objects use this method when saving a file. If you create a file directly, you should call noteFileSystemChanged so that the Finder can update the folder if it is open.

Available in Mac OS X v10.0 and later. Deprecated in Mac OS X v10.6. **See also:**

- 32.86.30 noteFileSystemChanged(path as folderitem)

### 32.86.30 noteFileSystemChanged(path as folderitem)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the NSWorkspace object that the file system changed at the specified path. **Notes:**
The NSWorkspace object then gets the status of all the files and directories it is interested in and updates itself appropriately. This method is used by many objects that write or delete files. **See also:**
32.86.31 notificationCenter as NSNotificationCenterMBS

32.86.32 NSWorkspaceActiveSpaceDidChangeNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names. **Notes:**

Posted when a Spaces change has occurred. The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary. Available in Mac OS X v10.6 and later.

32.86.33 NSWorkspaceApplicationKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This constant is supplied in the userInfo dictionary of various notifications. **Notes:**

The value corresponding to this key is an instance of NSRunningApplication that reflects the affected application. Available in Mac OS X v10.6 and later.

32.86.34 NSWorkspaceCompressOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file operation modes. **Notes:** Compress file. This operation always returns an error.

32.86.35 NSWorkspaceCopyOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file operation modes. **Example:**
dim f as FolderItem = SpecialFolder.Desktop.Child("test")
dim tag as Integer
dim files(-1) as string
dim b as Boolean
dim source, dest as FolderItem

// copies a file from one folder to another folder

source = f.Parent
files.Append f.name
dest = SpecialFolder.Pictures

b = NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceCopyOperation, source, dest, files, tag)

if b then
    MsgBox "OK"
else
    MsgBox "Failed"
end if

Notes: Copy file to destination.

32.86.36  NSWorkspaceDecompressOperation as string

32.86.37  NSWorkspaceDecryptOperation as string

32.86.38  NSWorkspaceDesktopImageAllowClippingKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the keys for the options dictionary used with SetDesktopImageURL. Notes:
The value is a boolean, which affects the interpretation of Proportional scaling types. A false value will make the image fully visible, but there may be empty space on the sides or top and bottom. A true value will cause the image to fill the entire screen, but the image may be clipped. If this is not specified, false is assumed. Non-proportional scaling types ignore this value.
Available in Mac OS X v10.6 and later.

**32.86.39 NSWorkspaceDesktopImageFillColorKey as string**

**Function:** One of the keys for the options dictionary used with SetDesktopImageURL.
**Notes:**
The value is an NSColor, which is used to fill any empty space around the image. If not specified, a default value is used. Currently, only colors that use or can be converted to use NSCalibratedRGBColorSpace are supported, and any alpha value is ignored.
Available in Mac OS X v10.6 and later.

**32.86.40 NSWorkspaceDesktopImageScalingKey as string**

**Function:** One of the keys for the options dictionary used with SetDesktopImageURL.
**Notes:**
The value is an Number containing an NSImageScaling constant as declared in NSCell. If this is not specified, NSImageScaleProportionallyUpOrDown=3 is used. NSImageScaleProportionallyDown=0 is not currently supported.
Available in Mac OS X v10.6 and later.

**32.86.41 NSWorkspaceDestroyOperation as string**

**Function:** One of the file operation modes.
**Notes:** Destroy file.

**32.86.42 NSWorkspaceDidActivateApplicationNotification as string**

**Function:** One of the notification names.
**Notes:**
Posted when the Finder is about to activate an application. The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application. Available in Mac OS X v10.6 and later.

### 32.86.43 NSWorkspaceDidChangeFileLabelsNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names. **Notes:** Posted when the Finder file labels or colors change. The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary. Available in Mac OS X v10.6 and later.

### 32.86.44 NSWorkspaceDidDeactivateApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names. **Notes:** Posted when the Finder deactivated an application. The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application. Available in Mac OS X v10.6 and later.

### 32.86.45 NSWorkspaceDidHideApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names. **Notes:** Posted when the Finder hid an application. The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application. Available in Mac OS X v10.6 and later.
**32.86.46** NSWorkspaceDidLaunchApplicationNotification as string

**Function:** One of the notification names.

**Notes:**

Posted when a new application has started up.

The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.

**32.86.47** NSWorkspaceDidMountNotification as string

**Function:** One of the notification names.

**Notes:**

Posted when a new device has been mounted.

The notification object is the shared NSWorkspace instance.

In Mac OS X v10.5 and earlier the userInfo dictionary contains a key @"NSDevicePath" that returns the path where the device was mounted, as a string.

Available in Mac OS X v10.0 and later.

**32.86.48** NSWorkspaceDidPerformFileOperationNotification as string

**Function:** One of the notification names.

**Notes:**

Posted when a file operation has been performed in the receiving application.

The notification object is the shared NSWorkspace instance. The userInfo dictionary contains a key "NSOperationNumber" with a number containing an integer indicating the type of file operation.

Available in Mac OS X v10.0 and later.

**32.86.49** NSWorkspaceDidRenameVolumeNotification as string

**Function:** One of the notification names.

**Notes:**

Posted when a volume changes its name and/or mount path. These typically change simultaneously, in which case only one notification is posted.
The notification object is the shared NSWorkspace instance. Available in Mac OS X v10.0 and later.

### 32.86.50 NSWorkspaceDidTerminateApplicationNotification as string

**Function:** One of the notification names.

**Notes:**

Posted when an application finishes executing. The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.

Available in Mac OS X v10.0 and later.

### 32.86.51 NSWorkspaceDidUnhideApplicationNotification as string

**Function:** One of the notification names.

**Notes:**

Posted when the Finder unhid an application. The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.

Available in Mac OS X v10.6 and later.

### 32.86.52 NSWorkspaceDidUnmountNotification as string

**Function:** One of the notification names.

**Notes:**

Posted when the Finder did unmount a device. This notification is delivered even if a volume was forcibly and immediately made unavailable, such as when a drive is simply unplugged.

The notification object is the shared NSWorkspace instance. The userInfo dictionary contains a key "NSDevicePath" that returns the path where the device was mounted, as a string.

Available in Mac OS X v10.0 and later.
32.86.53 NSWorkspaceDidWakeNotification as string

Function: One of the notification names.
Notes:
Posted when the machine wakes from sleep.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo
dictionary.
Available in Mac OS X v10.3 and later.

32.86.54 NSWorkspaceDuplicateOperation as string

Function: One of the file operation modes.
Notes: Duplicate file in source directory.

32.86.55 NSWorkspaceEncryptOperation as string

Function: One of the file operation modes.
Notes: Encrypt file. This operation always returns an error.

32.86.56 NSWorkspaceLaunchConfigurationAppleEvent as string

Function: One of the keys for the configuration dictionary for launchApplication* methods.
Notes:
The value is the first NSAppleEventDescriptor to send to the new application. If an instance of the appli-
cation is already running, this is sent to that application.
Available in Mac OS X v10.6 and later.

32.86.57 NSWorkspaceLaunchConfigurationArchitecture as string

Function: One of the keys for the configuration dictionary for launchApplication* methods.
Notes:
The value is a number containing an Mach-O Architecture constant. Ignored if a new instance of the appli-
cation is not launched.
Available in Mac OS X v10.6 and later.  
See NSBundleExecutableArchitecture* constants.

32.86.58  **NSWorkspaceLaunchConfigurationArguments as string**

**Function:** One of the keys for the configuration dictionary for launchApplication* methods.  
**Notes:**  
The value is an NSArray of NSStrings, passed to the new application in the argv parameter. Ignored if a new instance of the application is not launched.  
Available in Mac OS X v10.6 and later.

32.86.59  **NSWorkspaceLaunchConfigurationEnvironment as string**

**Function:** One of the keys for the configuration dictionary for launchApplication* methods.  
**Notes:**  
The value is an dictionary, mapping Strings to Strings, containing environment variables to set for the new app. Ignored if a new instance of the application is not launched.  
Available in Mac OS X v10.6 and later.

32.86.60  **NSWorkspaceLinkOperation as string**

**Function:** One of the file operation modes.  
**Example:**
```
      dim f as FolderItem = SpecialFolder.Desktop.Child("test")
    dim tag as Integer
    dim files(-1) as string
    dim b as Boolean
    dim source,dest as FolderItem

    // creates a hard link to a file in a folder
    source=f.Parent
    files.Append f.name
    dest=SpecialFolder.Pictures

    b=NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceLinkOperation, source, dest, files, tag)
```
if b then
MsgBox "OK"
else
MsgBox "Failed"
end if

Notes: Create hard link to file in destination.

32.86.61 NSWorkspaceMoveOperation as string

Function: One of the file operation modes.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test")
dim tag as Integer
dim files(-1) as string
dim b as Boolean
dim source, dest as FolderItem

// moves a file from one folder to another folder

source = f.Parent
files.Append f.name
dest = SpecialFolder.Pictures

b = NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceMoveOperation, source, dest, files, tag)

if b then
MsgBox "OK"
else
MsgBox "Failed"
end if

Notes: Move file to destination.
32.86.62  NSWorkspaceRecycleOperation as string

**Function:** One of the file operation modes.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test")
dim tag as Integer
dim files(-1) as string
dim b as Boolean
dim source, dest as FolderItem

source = f.Parent

files.Append f.name

b = NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS NSWorkspaceRecycleOperation, source, dest, files, tag)

if b then
    MsgBox "OK"
else
    MsgBox "Failed"
end if
```

**Notes:** Move file to trash. The file is moved to the trash folder on the volume containing the file using the same semantics as NSWorkspaceMoveOperation. If a file with the same name currently exists in the trash folder, the new file is renamed. If no trash folder exists on the volume containing the file, the operation fails.

32.86.63  NSWorkspaceScreensDidSleepNotification as string

**Function:** One of the notification names.

**Notes:**

Posted when the machine’s screen goes to sleep. The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Few applications are likely to be interested in this notification, but they may be useful for certain hardware-based drawing decisions, for example when using OpenGL.

Available in Mac OS X v10.6 and later.
32.86.64 NSWorkspaceScreensDidWakeNotification as string

Function: One of the notification names.

Notes:
Posted when the machine’s screens wake.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Few applications are likely to be interested in this notification, but they may be useful for certain hardware-based drawing decisions, for example when using OpenGL.

Available in Mac OS X v10.6 and later.

32.86.65 NSWorkspaceSessionDidBecomeActiveNotification as string

Function: One of the notification names.

Notes:
Posted after a user session is switched in. This allows an application to re-enable some processing when a switched out session gets switched back in, for example.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Available in Mac OS X v10.3 and later.

32.86.66 NSWorkspaceSessionDidResignActiveNotification as string

Function: One of the notification names.

Notes:
Posted before a user session is switched out. This allows an application to disable some processing when its user session is switched out, and re-enable when that session gets switched back in, for example.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

If an application is launched in an inactive session, NSWorkspaceSessionDidResignActiveNotification is sent after NSApplicationWillFinishLaunchingNotification and before sending NSApplicationDidFinishLaunchingNotification.
CHAPTER 32. COCOA

Available in Mac OS X v10.3 and later.

### 32.86.67 NSWorkspaceVolumeLocalizedNameKey as string

**Function:** One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
**Notes:**
String containing the user-visible name of the volume.
Available in Mac OS X v10.6 and later.

### 32.86.68 NSWorkspaceVolumeOldLocalizedNameKey as string

**Function:** One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
**Notes:**
String containing the old user-visible name of the volume
Available in Mac OS X v10.6 and later.

### 32.86.69 NSWorkspaceVolumeOldURLKey as string

**Function:** One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
**Notes:**
URL containing the old mount path of the volume
Available in Mac OS X v10.6 and later.

### 32.86.70 NSWorkspaceVolumeURLKey as string

**Function:** One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
**Notes:**
URL containing the mount path of the volume.
Available in Mac OS X v10.6 and later.

**32.86.71 NSWorkspaceWillLaunchApplicationNotification as string**

**Function:** One of the notification names.
**Notes:**
Posted when the Finder is about to launch an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo
dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningAp-
plication that represents the affected application.

Available in Mac OS X v10.0 and later.

**32.86.72 NSWorkspaceWillPowerOffNotification as string**

**Function:** One of the notification names.
**Notes:**
Posted when the user has requested a logout or that the machine be powered off.
The notification object is the shared NSWorkspace instance. This notification does not contain a userInfo
dictionary.
Available in Mac OS X v10.0 and later.

**32.86.73 NSWorkspaceWillSleepNotification as string**

**Function:** One of the notification names.
**Notes:**
Posted before the machine goes to sleep. An observer of this message can delay sleep for up to 30 seconds
while handling this notification.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo
dictionary.

Available in Mac OS X v10.3 and later.
### 32.86.74 NSWorkspaceWillUnmountNotification as string

**Function:** One of the notification names.

**Notes:**

Posted when the Finder is about to unmount a device.

This notification will not be delivered if a volume was forcibly and immediately made unavailable, such as when a FireWire drive is simply unplugged, because there is no chance to deliver it before the volume becomes unavailable.

The notification object is the shared NSWorkspace instance. The userInfo dictionary contains a key "NS-DevicePath" that returns the path where the device was mounted, as a string.

Available in Mac OS X v10.0 and later.

### 32.86.75 openFile(file as folderitem) as boolean

**Function:** Opens the specified file specified using the default application associated with its type.

**Example:**

```pascal
dim f as FolderItem

f=SpecialFolder.Desktop.Child("test.txt")

if NSWorkspaceMBS.openFile(f) then
    MsgBox "Ok"
else
    MsgBox "failed"
end if
```

**Notes:**

Returns true if the file was successfully opened; otherwise, false.

The sending application is deactivated before the request is sent.

See also:

- 32.86.76 openFile(file as folderitem, appname as string) as boolean
- 32.86.77 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean
32.86. CLASS NSWORKSPACEMBS

32.86.76 openFile(file as folderitem, appname as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens a file using the specified application.

**Example:**
```
dim f as FolderItem
f=SpecialFolder.Desktop.Child("test.txt")

if NSWorkspaceMBS.openFile(f,"BBEdit") then
    MsgBox "Ok"
else
    MsgBox "failed"
end if
```

**Notes:**
Returns true if the file was successfully opened; otherwise, false.

The appName parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in "Use of .app Extension". The sending application is deactivated before the request is sent.

See also:
- 32.86.75 openFile(file as folderitem) as boolean
- 32.86.77 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean

32.86.77 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the specified file and optionally deactivates the sending application.

**Example:**
```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.file")

if NSWorkspaceMBS.openFile(f,"BBEdit",true) then
    MsgBox "Ok"
else
    MsgBox "failed"
end if
```

**Notes:**
appName: The name of the application to use when opening the file.

flag: If true, the sending application is deactivated before the request is sent, allowing the opening application to become the active application.

Returns true if the file was successfully opened; otherwise, false.

The appName parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in "Use of .app Extension". If appName is nil, the default application for the file’s type is used.

See also:

- 32.86.75 openFile(file as folderitem) as boolean
- 32.86.76 openFile(file as folderitem, appname as string) as boolean

32.86.78 openURL(url as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Opens the location at the specified URL.

Example:

```swift
if NSWorkspaceMBS.openURL("http://www.apple.com") then
    MsgBox "Ok"
else
    MsgBox "failed"
end if
```

Notes: Returns true if the location was successfully opened; otherwise, false.

See also:

- 32.86.79 openURL(url as string, bundleIdentifier as string, options as Integer = & h00030000, AppleEventDescriptor as Variant = nil) as Boolean

32.86.79 openURL(url as string, bundleIdentifier as string, options as Integer = & h00030000, AppleEventDescriptor as Variant = nil) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Opens one or more files from an array of URLs.

Notes:

url: A URL for the application to open.
bundleIdentifier: A bundle identifier string or "" to use the default system bindings. This value corresponds
to the value in the CFBundleIdentifier key of the application’s Info.plist file. For example, the bundle identifier of the TextEdit application is com.apple.TextEdit.

options: Options to use when launching the application. Values for this parameter are described in constants.

descriptor: Additional options specified in an AppleEvent-style descriptor. For example, you could use this parameter to specify additional documents to open when the application is launched.

Returns true if the application was found and launched; otherwise, false.

See also:

- 32.86.78 openURL(url as string) as boolean

32.86.80 performFileOperation(operation as string, source as folderitem, destination as folderitem, files() as string, byref tag as Integer) as boolean

Notes:

operation: The file operation to perform. The possible values for this parameter are described in "Constants."

source: The full path to the directory containing the files on which to operate.

destination: The full path to the destination directory of the operation.

files: An array of folderitems specifying the names of the files and directories to be manipulated. Each string must not contain any path information other than the name of the file or directory. In other words, all of the files and directories must be located in the source directory and not in one if its subdirectories.

tag: On input, a integer variable; on return, this variable contains a negative integer if the operation fails, 0 if the operation was performed synchronously and succeeded, or a positive integer if the operation was performed asynchronously. If the value is a positive integer, the value is a tag that identifies the requested file operation.

Return Value: True if the operation succeeded; otherwise, false.

Discussion:
Some operations such as moving, copying, and linking files require a destination directory to be specified. If not, destination should be the empty string (""). Before this method returns, it posts an NSWorkspaceDidPerformFileOperationNotification to the NSWorkspace object’s notification center.
32.86.81 preferredFilenameExtensionForType(typeName as string) as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the preferred filename extension for the specified Uniform Type Identifier. **Example:**

MsgBox NSWorkspaceMBS.preferredFilenameExtensionForType("public.jpeg")
// "jpeg" in German

**Notes:** The appropriate filename extension for typeName, or "" if no extension could be determined.

32.86.82 selectFile(file as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the file in the Finder. **Example:**

dim f as FolderItem

f=SpecialFolder.Desktop.Child("test.txt")

if NSWorkspaceMBS.selectFile(f) then
MsgBox "Ok"
else
MsgBox "failed"
end if

**Notes:**
Returns true on success.

For Windows, please use WinOpenFolderAndSelectItemsMBS function.

32.86.83 setDesktopImageURL(file as folderitem, screen as NSScreenMBS, options as dictionary, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the desktop image for the given screen to the image at the specified URL. **Notes:**

file: The image file. The file must not be nil.
32.86. **CLASS NSWORKSPACEMBS**

screen: The screen to set the desktop image on.

options: The options dictionary may contain any of the Desktop Image Dictionary Keys (NSWorkspaceDesktopImageScalingKey, NSWorkspaceDesktopImageAllowClippingKey or NSWorkspaceDesktopImageFillColorKey), which control how the image is scaled on the screen.

error: A error that is returned by-reference if setting the image fails.

Returns true if the image was set as the desktop, otherwise false. If false is returned, the error parameter provides additional information.

You should not present a user interface for picking the options. Instead, choose appropriate defaults and allow the user to adjust them in the System Preference Pane.

Available in Mac OS X v10.6 and later.

32.86.84 **setIcon(image as NSImageMBS, file as folderitem, flags as Integer) as boolean**

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the icon for the file or directory at the specified path.

**Example:**

```plaintext
dim f as FolderItem
dim p as Picture
dim img as NSImageMBS

f=SpecialFolder.Desktop.Child("test.txt")

p=newPicture(128,128,32)
p.Graphics.ForeColor=rgb(0,128,0)
p.Graphics.fillrect 0,0,128,128
p.Graphics.ForeColor=rgb(255,0,0)
p.Graphics.filloval 0,0,128,128

img=new NSImageMBS(p)

if NSWorkspaceMBS.setIcon(img,f,0) then
  MsgBox "Ok. Icon may not be visible directly. Maybe you make a copy of the file to see it directly?"
else
  MsgBox "failed"
end if
```

**Notes:**
image: The image to use as the icon for the file or directory.
file: The full path of the file or directory.
flags: The icon representations to generate from the image. You specify this value by combining the appropriate NSWorkspaceIconCreationOptions constants, listed in Constants, using the C bitwise OR operator. Specify 0 if you want to generate icons in all available icon representation formats.

Returns true if the icon was set; otherwise, false.

The image can be an arbitrary image, with or without transparency. This image is automatically scaled (as needed) to generate the icon representations. The file or folder must exist and be writable by the user.

It is recommended that applications include the NSExclude10_4ElementsIconCreationOption option for compatibility with pre-Mac OS X v10.3 Finder. Icons that include the high resolution elements prevent custom icons from being displayed on earlier systems.

Before setting icon, make sure you close all Binarystream, Textoutputstream or other classes which may have the file open.
See also:

- 32.86.85 setIcon(image as NSImageMBS, path as string, flags as Integer) as boolean

32.86.85 setIcon(image as NSImageMBS, path as string, flags as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the icon for the file or directory at the specified path.

**Notes:**

image: The image to use as the icon for the file or directory.
path: The full path of the file or directory.
flags: The icon representations to generate from the image. You specify this value by combining the appropriate NSWorkspaceIconCreationOptions constants, listed in Constants, using the C bitwise OR operator. Specify 0 if you want to generate icons in all available icon representation formats.

Returns true if the icon was set; otherwise, false.

The image can be an arbitrary image, with or without transparency. This image is automatically scaled (as needed) to generate the icon representations. The file or folder must exist and be writable by the user.

It is recommended that applications include the NSExclude10_4ElementsIconCreationOption option for compatibility with pre-Mac OS X v10.3 Finder. Icons that include the high resolution elements prevent custom icons from being displayed on earlier systems.
Before setting icon, make sure you close all BinaryStream, Textoutputstream or other classes which may have the file open.

See also:

- 32.86.84 setIcon(image as NSImageMBS, file as folderitem, flags as Integer) as boolean

32.86.86 showSearchResultsForQueryString(queryString as string) as boolean

Function: Displays a Spotlight search results window in Finder for the specified query string.

Notes:
Returns true if the communication with Finder was successful, otherwise false.

Finder becomes the active application, if possible. The user can further refine the search via the Finder user interface.

Available in Mac OS X v10.6 and later.

32.86.87 typeOfFile(File as folderitem, byref error as NSErrorMBS) as string

Function: Returns the uniform type identifier of the specified file, if it can be determined.

Notes:
file: The absolute path of the file.
Error: If the Uniform Type Identifier of the file at absolutePath can’t be determined, outError contains an NSError object that describes why.

Returns a string containing the uniform type identifier of the file at absoluteFilePath. If no UTI can be determined the return value is "".

If the file at the specified path is a symbolic link, the type of the symbolic link is returned.
See also:

- 32.86.88 typeOfFile(Path as string, byref error as NSErrorMBS) as string

32.86.88 typeOfFile(Path as string, byref error as NSErrorMBS) as string

Function: Returns the uniform type identifier of the specified file, if it can be determined.

Notes:
file: The absolute path of the file.
Error: If the Uniform Type Identifier of the file at absolutePath can’t be determined, outError contains an
NSError object that describes why.

Returns a string containing the uniform type identifier of the file at absoluteFilePath. If no UTI can be
determined the return value is "".

If the file at the specified path is a symbolic link, the type of the symbolic link is returned.
See also:

- 32.86.87 typeOfFile(File as folderitem, byref error as NSErrorMBS) as string

32.86.89 unmountAndEjectDevice(item as folderitem, byref e as NSErrorMBS) as boolean

**Function:** Unmounts and ejects the device at the specified path.
**Example:**

```plaintext
dim w as new NSWorkspaceMBS
dim disk as FolderItem = Volume(VolumeCount-1)
MsgBox disk.Name

dim e as NSErrorMBS
if w.unmountAndEjectDevice(disk, e) then
    MsgBox "OK"
else
    MsgBox "Error: " + e.localizedDescription
end if
```

**Notes:**

Returns true if the volume was unmounted and ejected successfully, otherwise false, for example, if the
volume is not ejectable.
error: If the operation fails, this error contains more information about the failure.

32.86.90 URLForApplicationToOpenURL(url as string) as string

**Function:** Returns the URL to the default application that would be used to open the given URL.
**Notes:**
url: The URL of the file to open.

Returns the URL of the default application that would open the specified url. Returns "" if no application is able to open the url, or if the file url does not exist.

This is the programmatic equivalent of double clicking a document in the Finder.

### 32.86.91 URLForApplicationWithBundleIdentifier(bundleIdentifier as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the URL for the application with the specified identifier. **Notes:**

bundleIdentifier: A bundle identifier specifying an application.

Returns the URL of the application, or nil if no application has the bundle identifier.

This uses various (currently unspecified) heuristics in case multiple apps have the same bundle ID.

### 32.86.92 Constants

#### 32.86.93 NSBundleExecutableArchitectureI386 = & h00000007

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the CPU Architecture constants. **Notes:** Intel 32 bit.

#### 32.86.94 NSBundleExecutableArchitecturePPC = & h00000012

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the CPU Architecture constants. **Notes:** PPC 32 bit.

#### 32.86.95 NSBundleExecutableArchitecturePPC64 = & h01000012

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the CPU Architecture constants. **Notes:** PPC 64 bit.
32.86.96  **NSBundleExecutableArchitectureX86_64 = & h01000007**

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the CPU Architecture constants.  
**Notes:** Intel 64 bit.

32.86.97  **NSExclude10_4ElementsIconCreationOption = 4**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the possible constants you can use with SetIcon.

32.86.98  **NSExcludeQuickDrawElementsIconCreationOption = 2**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the possible constants you can use with SetIcon.

32.86.99  **NSWorkspaceLaunchAllowingClassicStartup = & h00020000**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

32.86.100  **NSWorkspaceLaunchAndHide = & h00100000**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

32.86.101  **NSWorkspaceLaunchAndHideOthers = & h00200000**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

32.86.102  **NSWorkspaceLaunchAndPrint = 2**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.
32.86.103  NSWorkspaceLaunchAsync = & h00010000

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.
32.86.104   **NSWorkspaceLaunchDefault = \& h00030000**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

32.86.105   **NSWorkspaceLaunchInhibitingBackgroundOnly = \& h00000080**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

32.86.106   **NSWorkspaceLaunchNewInstance = \& h00080000**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

32.86.107   **NSWorkspaceLaunchPreferringClassic = \& h00040000**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

32.86.108   **NSWorkspaceLaunchWithoutActivation = \& h00000200**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

32.86.109   **NSWorkspaceLaunchWithoutAddingToRecents = \& h00000100**

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.
32.87.1 control WebViewControlMBS

Function: The control for a webview.

Notes: Requires the window being composite for Carbon targets which is currently not available for modal windows in Real Studio.

32.87.2 Properties

32.87.3 Available as Boolean

Function: Whether this control can work.

Notes:
Returns true on Mac OS X 10.5 (or newer) and false on any other OS.
(Read only property)

32.87.4 View as WebViewMBS

Function: The view used with this control.

Example:

```plaintext
dim w as WebViewMBS = WebViewControlMBS1.View
w.LoadURL "http://www.apple.com"
```

Notes:

The view object is created for you in the constructor.
In version 9.6 it is a WebViewMBS object.
If you have a version declared as NSViewMBS, you need to cast to WebViewMBS yourself.
(Read only property)

32.87.5 WantsFocus as Boolean

Function: Whether this control wants to have focus.
Notes:
By default this is true.
(Read and Write property)

32.87.6 Events

32.87.7 EnableMenuItems

**Function:** The event where you can enable menu items.

32.87.8 MenuAction(HitItem as MenuItem) As Boolean

**Function:** Called when a menuitem is choosen.
**Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.87.9 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

**Function:** The mouse button was pressed inside the controls region at the location passed in to x, y.
**Notes:**
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.87.10 MouseDrag(x as Integer, y as Integer)

**Function:** This event fires continuously after the mouse button was pressed inside the Control.
**Notes:**
Mouse location is local to the control passed in to \( x, y \). As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

**32.87.11 MouseUp(\( x \) as Integer, \( y \) as Integer)**

**Function:** The mouse button was released.  
**Notes:** Use the \( x \) and \( y \) parameters to determine if the mouse button was released within the control’s boundaries.

**32.87.12 ScaleFactorChanged(\( \text{NewFactor} \) as Double)**

**Function:** The backing store scale factor has changed.  
**Notes:** Please invalidate any cached bitmaps or other relevant state.
Chapter 33

Cocoa Controls

33.1 class CanvasGesturesMBS

33.1.1 class CanvasGesturesMBS

Function: The class to catch canvas gesture events.
Notes: Please use one global instance of this class to catch the events for all canvases you track.

33.1.2 Methods

33.1.3 AddCanvas(c as Canvas)

Function: Adds a canvas to the list of canvases to track.
Notes: Please add canvas controls in Window.Open event.

33.1.4 Constructor

Function: The constructor.
33.1.5 Destructor

Function: The destructor.

33.1.6 RemoveCanvas(c as Canvas)

Function: Removes a canvas from the list.
Notes:
Please remove canvas controls in Window.Close event.
The plugin tries to remove all when a window closes automatically.

33.1.7 Properties

33.1.8 CanvasCount as Integer

Function: Number of Canvas controls registered.
Notes: (Read only property)

33.1.9 Events

33.1.10 beginGestureWithEvent(can as Canvas, e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a touch gesture.
Notes:
e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.1.11 endGestureWithEvent(can as Canvas, e as NSEventMBS) as boolean

Function: Informs the receiver that the user has ended a touch gesture.
Notes:
33.1. CLASS CANVASGESTURES

33.1.12 magnifyWithEvent(can as Canvas, e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a pinch gesture.
Notes:
e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.1.13 rotateWithEvent(can as Canvas, e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:
e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.1.14 swipeWithEvent(can as Canvas, e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a swipe gesture.
Notes:
e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.
CHAPTER 33. COCOA CONTROLS

33.2 class ComboBox

33.2.1 class ComboBox

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in ComboBox class in REALbasic.

33.2.2 Methods

33.2.3 NSComboBoxMBS as NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSComboBoxMBS object for the given control. **Notes:** This way you can manipulate Cocoa controls directly.
33.3. CLASS CONTROL

33.3 class Control

33.3.1 class Control

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in Control class in REALbasic.

33.3.2 Methods

33.3.3 CALayerMBS as CALayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Core Animation layer that the receiver uses as its backing store. **Notes:** Works only in Cocoa target. Also sets wantsLayer to true for the view to make sure it has a layer.

33.3.4 NSControlMBS as NSControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSControlMBS object for the given control. **Example:**

`BevelButton1.NSControlMBS.StringValue = "Hello"`

**Notes:** This way you can manipulate Cocoa controls directly.

33.3.5 NSViewMBS as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSViewMBS object for the given control. **Example:**

`MsgBox PushButton1.NSViewMBS.className`

**Notes:**

This way you can manipulate Cocoa controls directly.
For a pushbutton you may want to cast the NSViewMBS to NSButtonMBS to have more options.

### 33.3.6 WinClassNameMBS as string

MBS Win Plugin, Plugin Version: 14.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns internal control class name for a Windows control.
33.4 class CustomNSScrollerMBS

Function: The class for a custom scroller.
Notes: Subclass of the NSScrollerMBS class.

33.4.2 Methods

33.4.3 Constructor

Function: The constructor for a new custom NSScroller object.
See also:

- 33.4.4 Constructor(Handle as Integer) 6241
- 33.4.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6241

33.4.4 Constructor(Handle as Integer)

Function: The constructor.
See also:

- 33.4.3 Constructor 6241
- 33.4.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6241

33.4.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: The constructor for a new custom NSScroller object.
See also:

- 33.4.3 Constructor 6241
- 33.4.4 Constructor(Handle as Integer) 6241
33.4.6 Destructor

**Function:** The destructor.

33.4.7 Events

33.4.8 acceptsFirstMouse(e as NSEventMBS) as boolean

**Function:** Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.  
**Notes:**  
The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.  
Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

33.4.9 acceptsFirstResponder as boolean

**Function:** Whether to accept first responder.  
**Notes:** Return true if your control can have the focus and false if not.

33.4.10 becomeFirstResponder as boolean

**Function:** Called when the object gets focus.  
**Notes:** Return true to accept.

33.4.11 beginGestureWithEvent(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.4.12 canBecomeKeyView as boolean

**Function:** Returns whether the receiver can become key view.
**Notes:** Returns true if the receiver can become key view, false otherwise.

33.4.13 Close

**Function:** The event called when the custom view is destroyed.

33.4.14 concludeDragOperation(sender as NSDraggingInfoMBS)

**Function:** Invoked when the dragging operation is complete, signaling the receiver to perform any necessary
clean-up.
**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its
visual representation now that it has incorporated the dragged data. This message is the last message sent
from sender to the destination during a dragging session.

If the sender object’s animatesToDestination property was set to true in prepareForDragOperation, then the
drag image is still visible. At this point you should draw the final visual representation in the view. When
this method returns, the drag image is removed form the screen. If your final visual representation matches
the visual representation in the drag, this is a seamless transition.
### 33.4.15 draggingEnded(sender as NSDraggingInfoMBS)

**Function:** Implement this event to be notified when a drag operation ends in some other destination.
**Notes:**
- sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

### 33.4.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

**Function:** Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
**Notes:**
- sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

### 33.4.17 draggingExited(sender as NSDraggingInfoMBS)

**Function:** Invoked when the dragged image exits the destination’s bounds rectangle (in the case of a view
33.4. CLASS CUSTOMNSSCROLLERMB

object) or its frame rectangle (in the case of a window object).

Notes: sender: The object sending the message; use it to get details about the dragging operation.

33.4.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

Function: Invoked when the dragging session has completed.

Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

33.4.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

Function: Invoked when the drag moves on the screen.

Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

33.4.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

Function: Declares the types of operations the source allows to be performed. (required)

Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.
In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

### 33.4.21 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

**Function:** Invoked when the drag will begin.  
**Notes:**  
- session: The dragging session.  
- screenPoint: The point where the drag will begin, in screen coordinates.  

Available in OS X v10.7 and later.

### 33.4.22 draggingSourceOperationMaskForLocal(flag as boolean) as Integer

**Function:** Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image’s data.  
**Notes:**  
- (Deprecated in OS X v10.7. This method is informally deprecated. It is only called if the source does not implement the NSDraggingSource protocol methods. This method will be formally deprecated in a future OS release.)
- isLocal: True indicates that the candidate destination object (the window or view over which the dragged image is currently poised) is in the same application as the source, while a false value indicates that the destination object is in a different application.

A mask, created by combining the dragging operations listed in the NSDragOperation section of NSDraggingInfo protocol reference using the C bitwise OR operator. If the source does not permit any dragging operations, it should return NSDragOperationNone.

If not implemented, the default value is NSDragOperationCopy | NSDragOperationLink | NSDragOperationGeneric | NSDragOperationPrivate.

Available in OS X v10.0 and later. Deprecated in OS X v10.7.
33.4.23   draggingUpdated(sender as NSDraggingInfoMBS) as Integer

**Function:** Invoked periodically as the image is held within the destination area, allowing modification of
the dragging operation or mouse-pointer position.
**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-
DraggingInfo reference. The default return value (if this method is not implemented by the destination) is
the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the
drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on
the position of the mouse pointer inside of the destination view or window object. For example, you may have
several graphics or areas of text contained within the same view and wish to tailor the dragging operation,
or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the
time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examina-
tion is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is
within the bounds of two overlapping views that are both valid destinations, the uppermost view receives
these messages until the image is either released or dragged out.

33.4.24   drawArrow(g as NSGraphicsMBS, Arrow as Integer, highlight as boolean)

**Function:** Called when arrow need to be drawn.
**Notes:**

Draw the scroll button indicated by arrow, which is either NSScrollerIncrementArrow (the down or right
scroll button) or NSScrollerDecrementArrow (up or left).
If flag is true, the button is drawn highlighted; otherwise it’s drawn normally. You should never need to
invoke this method directly, but may wish to override it to customize the appearance of scroll buttons.
33.4.25  drawKnob(g as NSGraphicsMBS)

Function: Draw the knob.

33.4.26  drawKnobSlotInRect(g as NSGraphicsMBS, slotRect as NSRectMBS, highlight as boolean)

Function: Draw the knob slow in the rectangle.

33.4.27  drawParts(g as NSGraphicsMBS)

Function: Called when parts need to be drawn.

33.4.28  endGestureWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has ended a touch gesture.
Notes:
e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.4.29  ignoreModifierKeysForDraggingSession(session as NSDraggingSessionMBS) as boolean

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes:
session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.
33.4. CLASS CUSTOMNSSCROLLERMBS

33.4.30 isOpaque as boolean

Function: Whether this view is opaque.

33.4.31 keyDown(e as NSEventMBS) as boolean

Function: One of the key events.
Notes: Return true if you handled this event.

33.4.32 keyUp(e as NSEventMBS) as boolean

Function: One of the key events.
Notes: Return true if you handled this event.

33.4.33 magnifyWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a pinch gesture.
Notes:
e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.4.34 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:
theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.
The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

### 33.4.35 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.
**Notes:** Return true if you handled this event.

### 33.4.36 mouseDownCanMoveWindow as boolean

**Function:** This event is called so you can decide what happens with mouse down.
**Notes:** Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

### 33.4.37 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.
**Notes:** Return true if you handled this event.

### 33.4.38 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.
**Notes:** Return true if you handled this event.
### 33.4. CLASS CUSTOMNSSCROLLERMB

#### 33.4.39 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.  
**Notes:** Return true if you handled this event.

#### 33.4.40 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.  
**Notes:** Return true if you handled this event.

#### 33.4.41 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.  
**Notes:** Return true if you handled this event.

#### 33.4.42 Open

**Function:** The event called when the custom NSView is created.

#### 33.4.43 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.  
**Notes:** Return true if you handled this event.  
Third mouse button.

#### 33.4.44 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.
33.4.45 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Notes:
Return true if you handled this event.
Third mouse button.

33.4.46 performDragOperation(sender as NSDraggingInfoMBS) as boolean

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.
Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.
For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.
If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

33.4.47 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object’s animatesToDestination property to true in your implementation of this method.

33.4.48 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.
Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

33.4.49 resignFirstResponder as boolean

Function: Focus is going away.
Notes: Return true to accept.

33.4.50 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.4.51 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.
33.4.52  `rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean`

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.4.53  `rotateWithEvent(e as NSEventMBS) as boolean`

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:
e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.4.54  `scrollWheel(e as NSEventMBS) as boolean`

Function: Informs the subclass that the mouse’s scroll wheel has moved.
Notes:
e: An object encapsulating information about the wheel-scrolling event.
The default implementation simply passes this message to the next responder.
Return true to not pass the event.

33.4.55  `swipeWithEvent(e as NSEventMBS) as boolean`

Function: Informs the receiver that the user has begun a swipe gesture.
Notes:
e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.
33.4.56  updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

33.4.57  viewDidMoveToWindow

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

33.4.58  wantsPeriodicDraggingUpdates as boolean

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.
33.5 class CustomNSSearchFieldMBS

33.5.1 class CustomNSSearchFieldMBS

Function: The class for a custom searchfield.
Notes:
Some events will not fire as Searchfield eats them itself.
Subclass of the NSSearchFieldMBS class.

33.5.2 Methods

33.5.3 Constructor

Function: The dummy constructor doing nothing.
See also:

- 33.5.4 Constructor(Handle as Integer) 6256
- 33.5.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6256

33.5.4 Constructor(Handle as Integer)

Function: The constructor.
See also:

- 33.5.3 Constructor 6256
- 33.5.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6256

33.5.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: The constructor for a new custom NSView object.
See also:

- 33.5.3 Constructor 6256
- 33.5.4 Constructor(Handle as Integer) 6256
33.5. Destructor

Function: The destructor.

33.5.7 Events

33.5.8 acceptsFirstMouse(e as NSEventMBS) as boolean

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

33.5.9 acceptsFirstResponder as boolean

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

33.5.10 becomeFirstResponder as boolean

Function: Called when the object gets focus.
Notes: Return true to accept.

33.5.11 beginGestureWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.5.12 canBecomeKeyView as boolean

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

33.5.13 Close

Function: The event called when the custom view is destroyed.

33.5.14 concludeDragOperation(sender as NSDraggingInfoMBS)

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary
Notes: clean-up.
sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its
visual representation now that it has incorporated the dragged data. This message is the last message sent
from sender to the destination during a dragging session.

If the sender object’s animatesToDestination property was set to true in prepareForDragOperation, then the
drag image is still visible. At this point you should draw the final visual representation in the view. When
this method returns, the drag image is removed from the screen. If your final visual representation matches
the visual representation in the drag, this is a seamless transition.
33.5. **CLASS CUSTOMNSSEARCHFIELDMBS**

### 33.5.15 draggingEnded(sender as NSDraggingInfoMBS)

**Function:** Implement this event to be notified when a drag operation ends in some other destination.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

### 33.5.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

**Function:** Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

### 33.5.17 draggingExited(sender as NSDraggingInfoMBS)

**Function:** Invoked when the dragged image exits the destination’s bounds rectangle (in the case of a view
33.5.18  draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

Function: Invoked when the dragging session has completed.
Notes:
  session: The dragging session.
  screenPoint: The point where the drag ended, in screen coordinates.
  operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

33.5.19  draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

Function: Invoked when the drag moves on the screen.
Notes:
  session: The dragging session.
  screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

33.5.20  draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

Function: Declares the types of operations the source allows to be performed. (required)
Notes:
  session: The dragging session.
  context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.
In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

### 33.5.21 `draggingSessionWillBeginAtPoint` (session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

**Function:** Invoked when the drag will begin.

**Notes:**
- session: The dragging session.
- screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

### 33.5.22 `draggingSourceOperationMaskForLocal` (flag as boolean) as Integer

**Function:** Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image’s data.

**Notes:**
- (Deprecated in OS X v10.7. This method is informally deprecated. It is only called if the source does not implement the NSDraggingSource protocol methods. This method will be formally deprecated in a future OS release.)

isLocal: True indicates that the candidate destination object (the window or view over which the dragged image is currently poised) is in the same application as the source, while a false value indicates that the destination object is in a different application.

A mask, created by combining the dragging operations listed in the NSDragOperation section of NSDraggingInfo protocol reference using the C bitwise OR operator. If the source does not permit any dragging operations, it should return NSDragOperationNone.

If not implemented, the default value is NSDragOperationCopy | NSDragOperationLink | NSDragOperationGeneric | NSDragOperationPrivate.

Available in OS X v10.0 and later. Deprecated in OS X v10.7.
33.5.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

**Function:** Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

33.5.24 endGestureWithEvent(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has ended a touch gesture.

**Notes:**

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.
33.5.25 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes:

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

33.5.26 isOpaque as boolean

Function: Whether this view is opaque.

33.5.27 keyDown(e as NSEventMBS) as boolean

Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

33.5.28 keyUp(e as NSEventMBS) as boolean

Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.
33.5.29 magnifyWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a pinch gesture.
Notes:
e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.5.30 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:
theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.
The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.
The default implementation returns the default menu.

33.5.31 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.5.32 mouseDownCanMoveWindow as boolean

Function: This event is called so you can decide what happens with mouse down.
Notes:
Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

33.5.33  mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.5.34  mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.5.35  mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.5.36  mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.5.37  mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.
33.5.38 **Open**

**Function:** The event called when the custom NSSearchField is created.

33.5.39 **otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean**

**Function:** One of the mouse events.
**Notes:**
Return true if you handled this event.
Third mouse button.

33.5.40 **otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean**

**Function:** One of the mouse events.
**Notes:**
Return true if you handled this event.
Third mouse button.

33.5.41 **otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean**

**Function:** One of the mouse events.
**Notes:**
Return true if you handled this event.
Third mouse button.

33.5.42 **performDragOperation(sender as NSDraggingInfoMBS) as boolean**

**Function:** Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
**Notes:**
sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object’s animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

### 33.5.43 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

**Function:** Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Returns true if the receiver agrees to perform the drag operation and false if not.

This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.

If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object’s animatesToDestination property to true in your implementation of this method.

### 33.5.44 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.

**Notes:**

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.

Available in OS X v10.10.3 and later.

### 33.5.45 resignFirstResponder as boolean

**Function:** Focus is going away.
CHAPTER 33. COCOA CONTROLS

Notes: Return true to accept.

33.5.46 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.5.47 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.5.48 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.5.49 rotateWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:
e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.5.50 scrollWheel(e as NSEventMBS) as boolean

Function: Informs the subclass that the mouse’s scroll wheel has moved.
Notes:
33.5. CLASS CUSTOMNSSEARCHFIELDMBS

33.5.51 swipeWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a swipe gesture.
Notes:
e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.5.52 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

Function: Invoked when the dragging images should be changed.
Notes:
sender: The object sending the message; use this object to get details about the dragging operation.
While a destination may change the dragging images at any time, it is recommended to wait until this
method is called before updating the dragging images.
This allows the system to delay changing the dragging images until it is likely that the user will drop on
this destination. Otherwise, the dragging images will change too often during the drag which would be
distracting to the user.

33.5.53 viewDidMoveToWindow

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:
The default implementation does nothing; subclasses can implement this event to perform whatever actions
are necessary.
window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

33.5.54  wantsPeriodicDraggingUpdates as boolean

Function:  Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:  Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.
33.6. **CLASS CUSTOMNSTEXTFIELDCELLMBS**

33.6  **class CustomNSTextFieldCellMBS**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class to customize cells.  
**Notes:** Subclass of the NSTextFieldCellMBS class.

33.6.2  **Methods**

33.6.3  **Constructor**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

33.6.4  **superDrawWithFrame(frame as NSRectMBS, view as NSViewMBS)**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Calls drawWithFrame on super class.  
**Notes:** This is for calling in DrawWithFrame event.

33.6.5  **Events**

33.6.6  **cellSize(size as NSSizeMBS) as NSSizeMBS**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Return a custom cell size.  
**Notes:**  
If not implemented, we call through to super.cellSize.  
We provide super.cellSize in size parameter.

33.6.7  **Clone(clonedCell as NSTextFieldCellMBS) as CustomNSTextFieldCellMBS**

MBS MacCocoa Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Requests a clone of the object.  
**Notes:**
This event is called when the system needs a clone of the object. Please create a new object, keep a reference and return it.

SuperClone provides the cloned object, which we use together with the xojo object you return.

### 33.6.8 didDrawWithFrame(cellFrame as NSRectMBS, controlView as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Event called after drawWithFrame run.

### 33.6.9 drawWithFrame(cellFrame as NSRectMBS, controlView as NSViewMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Event to replace drawWithFrame. **Notes:** If false is returned or not implemented, we call super.drawWithFrame.

### 33.6.10 fieldEditorForView(controlView as NSViewMBS) as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a custom field editor for editing in the view. **Notes:** ControlView: The view containing cells that require a custom field editor.

Returns a custom field editor. The field editor must have fieldEditor set to true.

This is an override point for NSCell subclasses designed to use their own custom field editors. This message is sent to the selected cell of ControlView using the NSWindow method in fieldEditor.

Returning non-nil from this method indicates skipping the standard field editor querying processes including windowWillReturnFieldEditor delegation.

The default implementation returns nil.

### 33.6.11 imageRectForBounds(rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event for imageRectForBounds method.
33.6.12 selectWithFrame(rect as NSRectMBS, controlView as NSViewMBS, text as NSTextMBS, theDelegate as Variant, selStart as Integer, selLength as Integer) as boolean

33.6.13 setUpFieldEditorAttributes(textObj as NSTextMBS, superFieldEditor as NSTextMBS) as NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Sets up the field editor. You never invoke this method directly; by overriding it, however, you can customize the field editor. Notes: When you override this method, you should generally invoke the implementation of super and return the textObj argument. For information on field editors, see Using the Windows Field Editor.

33.6.14 titleRectForBounds(rect as NSRectMBS) as NSRectMBS

33.7  class CustomNSTextFieldMBS

33.7.1  class CustomNSTextFieldMBS

Function: The class for a custom text field.
Notes:
Some events will not fire as text field eats them itself.
Subclass of the NSTextFieldMBS class.

33.7.2  Methods

33.7.3  Constructor

Function: The dummy constructor doing nothing.
See also:

- 33.7.4 Constructor(Handle as Integer) 6274
- 33.7.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6274

33.7.4  Constructor(Handle as Integer)

Function: The constructor.
See also:

- 33.7.3 Constructor 6274
- 33.7.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6274

33.7.5  Constructor(left as Double, top as Double, width as Double, height as Double)

Function: The constructor for a new custom NSView object.
See also:

- 33.7.3 Constructor 6274
- 33.7.4 Constructor(Handle as Integer) 6274
33.7. CLASS CUSTOMNSTEXTFIELDMBS

33.7.6 Destructor

Function: The destructor.

33.7.7 Events

33.7.8 acceptsFirstMouse(e as NSEventMBS) as boolean

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

33.7.9 acceptsFirstResponder as boolean

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

33.7.10 becomeFirstResponder as boolean

Function: Called when the object gets focus.
Notes: Return true to accept.

33.7.11 beginGestureWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning. The event will be sent to the view under the touch in the key window. Available in Mac OS X v10.6 and later. Return true if you handled this event.

### 33.7.12 canBecomeKeyView as boolean

**Function:** Returns whether the receiver can become key view.

**Notes:** Returns true if the receiver can become key view, false otherwise.

### 33.7.13 Close

**Function:** The event called when the custom view is destroyed.

### 33.7.14 concludeDragOperation(sender as NSDraggingInfoMBS)

**Function:** Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object’s animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed from the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.
33.7.15  draggingEnded (sender as NSDraggingInfoMBS)

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

33.7.16  draggingEntered (sender as NSDraggingInfoMBS) as Integer

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

33.7.17  draggingExited (sender as NSDraggingInfoMBS)

Function: Invoked when the dragged image exits the destination’s bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
CHAPTER 33. COCOA CONTROLS

object) or its frame rectangle (in the case of a window object).

Notes: sender: The object sending the message; use it to get details about the dragging operation.

33.7.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

Function: Invoked when the dragging session has completed.
Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

33.7.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

Function: Invoked when the drag moves on the screen.
Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

33.7.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

Function: Declares the types of operations the source allows to be performed. (required)
Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.
In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

### 33.7.21 draggingSessionWillBeginAtPoint

```plaintext
session as NSDraggingSessionMBS, screenPoint as NSPointMBS)
```

**Function:** Invoked when the drag will begin.

**Notes:**

- **session:** The dragging session.
- **screenPoint:** The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

### 33.7.22 draggingSourceOperationMaskForLocal

```plaintext
(flag as boolean) as Integer
```

**Function:** Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image’s data.

**Notes:**

(Deprecated in OS X v10.7. This method is informally deprecated. It is only called if the source does not implement the NSDraggingSource protocol methods. This method will be formally deprecated in a future OS release.)

- **isLocal:** True indicates that the candidate destination object (the window or view over which the dragged image is currently poised) is in the same application as the source, while a false value indicates that the destination object is in a different application.

A mask, created by combining the dragging operations listed in the NSDragOperation section of NSDraggingInfo protocol reference using the C bitwise OR operator. If the source does not permit any dragging operations, it should return NSDragOperationNone.

If not implemented, the default value is NSDragOperationCopy | NSDragOperationLink | NSDragOperationGeneric | NSDragOperationPrivate.

Available in OS X v10.0 and later. Deprecated in OS X v10.7.
CHAPTER 33. COCOA CONTROLS

33.7.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

33.7.24 endGestureWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.
### 33.7.25 `ignoreModifierKeysForDraggingSession(session as NSDraggingSessionMBS) as boolean`

**Function:** Returns whether the modifier keys will be ignored for this dragging session.

**Notes:**

- session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

### 33.7.26 `isOpaque as boolean`

**Function:** Whether this view is opaque.

### 33.7.27 `keyDown(e as NSEventMBS) as boolean`

**Function:** One of the key events.

**Notes:**

- Return true if you handled this event.
- Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

### 33.7.28 `keyUp(e as NSEventMBS) as boolean`

**Function:** One of the key events.

**Notes:**

- Return true if you handled this event.
- Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.
33.7.29  `magnifyWithEvent(e as NSEventMBS) as boolean`

**Function:** Informs the receiver that the user has begun a pinch gesture.
**Notes:**
e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.7.30  `menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS`

**Function:** Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
**Notes:**
theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

33.7.31  `mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean`

**Function:** One of the mouse events.
**Notes:** Return true if you handled this event.

33.7.32  `mouseDownCanMoveWindow as boolean`

**Function:** This event is called so you can decide what happens with mouse down.
**Notes:**
Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

### 33.7.33 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.  
**Notes:** Return true if you handled this event.

### 33.7.34 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.  
**Notes:** Return true if you handled this event.

### 33.7.35 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.  
**Notes:** Return true if you handled this event.

### 33.7.36 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.  
**Notes:** Return true if you handled this event.

### 33.7.37 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.  
**Notes:** Return true if you handled this event.
CHAPTER 33. COCOA CONTROLS

33.7.38 Open

Function: The event called when the custom NSSearchField is created.

33.7.39 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes:
Return true if you handled this event.
Third mouse button.

33.7.40 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes:
Return true if you handled this event.
Third mouse button.

33.7.41 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes:
Return true if you handled this event.
Third mouse button.

33.7.42 performDragOperation(sender as NSDraggingInfoMBS) as boolean

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object’s animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

33.7.43 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object’s animatesToDestination property to true in your implementation of this method.

33.7.44 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.
Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:
This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

33.7.45 resignFirstResponder as boolean

Function: Focus is going away.
Notes: Return true to accept.

33.7.46  rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events. 
Notes: Return true if you handled this event.

33.7.47  rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events. 
Notes: Return true if you handled this event.

33.7.48  rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events. 
Notes: Return true if you handled this event.

33.7.49  rotateWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a rotation gesture. 
Notes:
e: An event object representing the rotate gesture. 
The event will be sent to the view under the touch in the key window. 
available in Mac OS X v10.6 and later. 
Return true if you handled this event.

33.7.50  scrollWheel(e as NSEventMBS) as boolean

Function: Informs the subclass that the mouse’s scroll wheel has moved. 
Notes:
33.7. **CLASS CUSTOMNSTEXTFIELDMBS**

e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder. Return true to not pass the event.

33.7.51 **swipeWithEvent(e as NSEventMBS) as boolean**

**Function:** Informs the receiver that the user has begun a swipe gesture.

**Notes:**

e: An event object representing the swipe gesture. The event will be sent to the view under the touch in the key window. Available in Mac OS X v10.6 and later. Return true if you handled this event.

33.7.52 **updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)**

**Function:** Invoked when the dragging images should be changed.

**Notes:**

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

33.7.53 **viewDidMoveToWindow**

**Function:** Informs the receiver that it has been added to a new view hierarchy.

**Notes:**

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.
window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

33.7.54  

`wantsPeriodicDraggingUpdates` as boolean

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.  
Notes:  
Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.  

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.
33.8. *CLASS CUSTOMNSTEXTVIEWMBS*

33.8  class CustomNSTextViewMBS

33.8.1  class CustomNSTextViewMBS

**Function:** The class for a custom text view.

**Notes:**
Some events will not fire as text view eats them itself.
Subclass of the NSTextViewMBS class.

33.8.2  Methods

33.8.3  Constructor

**Function:** The dummy constructor doing nothing.

See also:

- 33.8.4 Constructor(Handle as Integer) 6289
- 33.8.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6289

33.8.4  Constructor(Handle as Integer)

**Function:** The constructor.

See also:

- 33.8.3 Constructor 6289
- 33.8.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6289

33.8.5  Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** The constructor for a new custom NSView object.

See also:

- 33.8.3 Constructor 6289
- 33.8.4 Constructor(Handle as Integer) 6289
33.8.6 Destructor

Function: The destructor.

33.8.7 Events

33.8.8 acceptsFirstMouse(e as NSEventMBS) as boolean

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

33.8.9 acceptsFirstResponder as boolean

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

33.8.10 becomeFirstResponder as boolean

Function: Called when the object gets focus.
Notes: Return true to accept.

33.8.11 beginGestureWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a touch gesture.
33.8. CLASS CUSTOMNSTEXTVIEWMBS

Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.8.12 canBecomeKeyView as boolean

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

33.8.13 Close

Function: The event called when the custom view is destroyed.

33.8.14 concludeDragOperation(sender as NSDraggingInfoMBS)

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary
     clean-up.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its
visual representation now that it has incorporated the dragged data. This message is the last message sent
from sender to the destination during a dragging session.

If the sender object’s animatesToDestination property was set to true in prepareForDragOperation, then the
drag image is still visible. At this point you should draw the final visual representation in the view. When
this method returns, the drag image is removed from the screen. If your final visual representation matches
the visual representation in the drag, this is a seamless transition.
33.8.15 draggingEnded(sender as NSDraggingInfoMBS)

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

33.8.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

33.8.17 draggingExited(sender as NSDraggingInfoMBS)

Function: Invoked when the dragged image exits the destination’s bounds rectangle (in the case of a view
object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

### 33.8.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screen-
Point as NSPointMBS, operation as Integer)

**Function:** Invoked when the dragging session has completed.
**Notes:**
- session: The dragging session.
- screenPoint: The point where the drag ended, in screen coordinates.
- operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

### 33.8.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screen-
Point as NSPointMBS)

**Function:** Invoked when the drag moves on the screen.
**Notes:**
- session: The dragging session.
- screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

### 33.8.20 draggingSessionSourceOperationMaskForDraggingContext(session as NS-
DraggingSessionMBS, context as Integer) as Integer

**Function:** Declares the types of operations the source allows to be performed. (required)
**Notes:**
- session: The dragging session.
- context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.
In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

33.8.21 `draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)`

**Function:** Invoked when the drag will begin.

**Notes:**
- session: The dragging session.
- screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

33.8.22 `draggingSourceOperationMaskForLocal(flag as boolean) as Integer`

**Function:** Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image’s data.

**Notes:**
- (Deprecated in OS X v10.7. This method is informally deprecated. It is only called if the source does not implement the NSDraggingSource protocol methods. This method will be formally deprecated in a future OS release.)

- isLocal: True indicates that the candidate destination object (the window or view over which the dragged image is currently poised) is in the same application as the source, while a false value indicates that the destination object is in a different application.

- A mask, created by combining the dragging operations listed in the NSDragOperation section of NSDraggingInfo protocol reference using the C bitwise OR operator. If the source does not permit any dragging operations, it should return NSDragOperationNone.

- If not implemented, the default value is NSDragOperationCopy | NSDragOperationLink | NSDragOperationGeneric | NSDragOperationPrivate.

Available in OS X v10.0 and later. Deprecated in OS X v10.7.
### 33.8.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

**Function:** Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

### 33.8.24 endGestureWithEvent(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has ended a touch gesture.

**Notes:**

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.
33.8.25  

**ignoreModifierKeysForDraggingSession**

(session as NSDraggingSession-MBS) as boolean

**Function:** Returns whether the modifier keys will be ignored for this dragging session.

**Notes:**

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

33.8.26  

**isOpaque as boolean**

**Function:** Whether this view is opaque.

33.8.27  

**keyDown**

e as NSEventMBS) as boolean

**Function:** One of the key events.

**Notes:**

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

33.8.28  

**keyUp**

e as NSEventMBS) as boolean

**Function:** One of the key events.

**Notes:**

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.
33.8.29  magnifyWithEvent(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has begun a pinch gesture.
**Notes:**
e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.8.30  menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

**Function:** Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
**Notes:**
theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.
The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.
The default implementation returns the default menu.

33.8.31  mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.
**Notes:** Return true if you handled this event.

33.8.32  mouseDownCanMoveWindow as boolean

**Function:** This event is called so you can decide what happens with mouse down.
**Notes:**
Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

**33.8.33 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean**

Function: One of the mouse events.
Notes: Return true if you handled this event.

**33.8.34 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean**

Function: One of the mouse events.
Notes: Return true if you handled this event.

**33.8.35 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean**

Function: One of the mouse events.
Notes: Return true if you handled this event.

**33.8.36 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean**

Function: One of the mouse events.
Notes: Return true if you handled this event.

**33.8.37 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean**

Function: One of the mouse events.
Notes: Return true if you handled this event.
33.8.38  Open

Function: The event called when the custom NSSearchField is created.

33.8.39  otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes:
Return true if you handled this event.
Third mouse button.

33.8.40  otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes:
Return true if you handled this event.
Third mouse button.

33.8.41  otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes:
Return true if you handled this event.
Third mouse button.

33.8.42  performDragOperation(sender as NSDraggingInfoMBS) as boolean

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object’s animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

33.8.43 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object’s animatesToDestination property to true in your implementation of this method.

33.8.44 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

33.8.45 resignFirstResponder as boolean

33.8.46  rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.8.47  rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.8.48  rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.8.49  rotateWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:
e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.8.50  scrollWheel(e as NSEventMBS) as boolean

Function: Informs the subclass that the mouse’s scroll wheel has moved.
Notes:
e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder. Return true to not pass the event.

### 33.8.51 swipeWithEvent(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has begun a swipe gesture.

**Notes:**
- e: An event object representing the swipe gesture.
- The event will be sent to the view under the touch in the key window.
- Available in Mac OS X v10.6 and later.
- Return true if you handled this event.

### 33.8.52 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

**Function:** Invoked when the dragging images should be changed.

**Notes:**
- sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

### 33.8.53 viewDidMoveToWindow

**Function:** Informs the receiver that it has been added to a new view hierarchy.

**Notes:**
- The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.
window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

### 33.8.54  wantsPeriodicDraggingUpdates as boolean

**Function:** Asks the destination object whether it wants to receive periodic draggingUpdated messages.

**Notes:**

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.
33.9 class CustomNSTokenFieldMBS

33.9.1 class CustomNSTokenFieldMBS

Function: The class for a custom NSTokenField.
Notes: Subclass of the NSTokenFieldMBS class.

33.9.2 Methods

33.9.3 Constructor

Function: The dummy constructor doing nothing.
See also:

- 33.9.4 Constructor(Handle as Integer) 6304
- 33.9.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6304

33.9.4 Constructor(Handle as Integer)

Function: The constructor.
See also:

- 33.9.3 Constructor 6304
- 33.9.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6304

33.9.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: The constructor for a new custom NSTokenField object.
See also:

- 33.9.3 Constructor 6304
- 33.9.4 Constructor(Handle as Integer) 6304
33.9. Destructor

Function: The destructor.

33.9.7 Events

33.9.8 acceptsFirstMouse(e as NSEventMBS) as boolean

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.
Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

33.9.9 acceptsFirstResponder as boolean

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

33.9.10 becomeFirstResponder as boolean

Function: Called when the object gets focus.
Notes: Return true to accept.

33.9.11 beginGestureWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.9.12 canBecomeKeyView as boolean

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

33.9.13 Close

Function: The event called when the custom view is destroyed.

33.9.14 concludeDragOperation(sender as NSDraggingInfoMBS)

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary
clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its
visual representation now that it has incorporated the dragged data. This message is the last message sent
from sender to the destination during a dragging session.

If the sender object’s animatesToDestination property was set to true in prepareForDragOperation, then the
drag image is still visible. At this point you should draw the final visual representation in the view. When
this method returns, the drag image is removed from the screen. If your final visual representation matches
the visual representation in the drag, this is a seamless transition.
33.9. **CLASS CUSTOMNSTOKENFIELDMBS**

### 33.9.15 draggingEnded(sender as NSDraggingInfoMBS)

**Function:** Implement this event to be notified when a drag operation ends in some other destination.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

### 33.9.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

**Function:** Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

### 33.9.17 draggingExited(sender as NSDraggingInfoMBS)

**Function:** Invoked when the dragged image exits the destination’s bounds rectangle (in the case of a view
CHAPTER 33. COCOA CONTROLS

object) or its frame rectangle (in the case of a window object).

Notes: sender: The object sending the message; use it to get details about the dragging operation.

33.9.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

Function: Invoked when the dragging session has completed.

Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

33.9.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

Function: Invoked when the drag moves on the screen.

Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

33.9.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

Function: Declares the types of operations the source allows to be performed. (required)

Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.
In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

### 33.9.21 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

**Function:** Invoked when the drag will begin.  
**Notes:**

- **session:** The dragging session.  
- **screenPoint:** The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

### 33.9.22 draggingSourceOperationMaskForLocal(flag as boolean) as Integer

**Function:** Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image’s data.  
**Notes:**

(Deprecated in OS X v10.7. This method is informally deprecated. It is only called if the source does not implement the NSDraggingSource protocol methods. This method will be formally deprecated in a future OS release.)

- **isLocal:** True indicates that the candidate destination object (the window or view over which the dragged image is currently poised) is in the same application as the source, while a false value indicates that the destination object is in a different application.

A mask, created by combining the dragging operations listed in the NSDragOperation section of NSDraggingInfo protocol reference using the C bitwise OR operator. If the source does not permit any dragging operations, it should return NSDragOperationNone.

If not implemented, the default value is NSDragOperationCopy | NSDragOperationLink | NSDragOperationGeneric | NSDragOperationPrivate.

Available in OS X v10.0 and later. Deprecated in OS X v10.7.
33.9.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

**Function:** Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

33.9.24 endGestureWithEvent(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has ended a touch gesture.

**Notes:**

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.
33.9.25  ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

**Function:** Returns whether the modifier keys will be ignored for this dragging session.
**Notes:**
session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

33.9.26  isOpaque as boolean

**Function:** Whether this view is opaque.

33.9.27  keyDown(e as NSEventMBS) as boolean

**Function:** One of the key events.
**Notes:**
Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

33.9.28  keyUp(e as NSEventMBS) as boolean

**Function:** One of the key events.
**Notes:**
Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.
33.9.29 magnifyWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a pinch gesture.
Notes:
e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.9.30 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:
theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.
The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.
The default implementation returns the default menu.

33.9.31 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.9.32 mouseDownCanMoveWindow as boolean

Function: This event is called so you can decide what happens with mouse down.
Notes:
Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

### 33.9.33 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

### 33.9.34 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

### 33.9.35 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

### 33.9.36 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

### 33.9.37 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.
33.9.38 Open

**Function:** The event called when the custom NSView is created.

33.9.39 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.
**Notes:**
Return true if you handled this event.
Third mouse button.

33.9.40 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.
**Notes:**
Return true if you handled this event.
Third mouse button.

33.9.41 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

**Function:** One of the mouse events.
**Notes:**
Return true if you handled this event.
Third mouse button.

33.9.42 performDragOperation(sender as NSDraggingInfoMBS) as boolean

**Function:** Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
**Notes:**
sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object’s animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

33.9.43 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object’s animatesToDestination property to true in your implementation of this method.

33.9.44 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.
Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:
This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

33.9.45 resignFirstResponder as boolean

Function: Focus is going away.
Notes: Return true to accept.

33.9.46  rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.9.47  rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.9.48  rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

33.9.49  rotateWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:
e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.9.50  scrollWheel(e as NSEventMBS) as boolean

Function: Informs the subclass that the mouse’s scroll wheel has moved.
Notes:
e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder. Return true to not pass the event.

### 33.9.51 swipeWithEvent(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has begun a swipe gesture.

**Notes:**

e: An event object representing the receiver that the user has begun a swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

### 33.9.52 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

**Function:** Invoked when the dragging images should be changed.

**Notes:**

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this
method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on
this destination. Otherwise, the dragging images will change too often during the drag which would be
distracting to the user.

### 33.9.53 viewDidMoveToWindow

**Function:** Informs the receiver that it has been added to a new view hierarchy.

**Notes:**

The default implementation does nothing; subclasses can implement this event to perform whatever actions
are necessary.
window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

33.9.54  wantsPeriodicDraggingUpdates as boolean

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:
Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.
33.10. CLASS CUSTOMNSVIEWMBS

33.10  class CustomNSViewMBS

33.10.1  class CustomNSViewMBS

Function: The class for a custom NSView.
Notes: Subclass of the NSViewMBS class.

33.10.2  Methods

33.10.3  Constructor

Function: The dummy constructor doing nothing.
See also:

- 33.10.4 Constructor(Handle as Integer) 6319
- 33.10.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6319

33.10.4  Constructor(Handle as Integer)

Function: Creates an object based on the given CustomNSView handle.
Notes: The handle is casted to a CustomNSView and the plugin retains this handle.
See also:

- 33.10.3 Constructor 6319
- 33.10.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6319

33.10.5  Constructor(left as Double, top as Double, width as Double, height as Double)

Function: The constructor for a new custom NSView object.
See also:

- 33.10.3 Constructor 6319
- 33.10.4 Constructor(Handle as Integer) 6319
33.10.6 Destructor

Function: The destructor.

33.10.7 Events

33.10.8 acceptsFirstMouse(e as NSEventMBS) as boolean

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an  
initial mouse-down event, false if not.  
Notes:  
The receiver can either return a value unconditionally or use the location of event e to determine whether  
or not it wants the event. The default implementation ignores the event and returns false.  
Implement this event in a subclass to allow instances to respond to click-through. This allows the user to  
click on a view in an inactive window, activating the view with one click, instead of clicking first to make the  
window active and then clicking the view. Most view objects refuse a click-through attempt, so the event  
simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do  
accept them, so the user can immediately manipulate the control without having to release the mouse button.

33.10.9 acceptsFirstResponder as boolean

Function: Whether to accept first responder.  
Notes: Return true if your control can have the focus and false if not.

33.10.10 becomeFirstResponder as boolean

Function: Called when the object gets focus.  
Notes: Return true to accept.

33.10.11 beginGestureWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a touch gesture.
33.10. **CLASS CUSTOMNSVIEWMBS**

**Notes:**

e: An event object representing the gesture beginning.  
The event will be sent to the view under the touch in the key window.  
Available in Mac OS X v10.6 and later.  
Return true if you handled this event.

### 33.10.12 `canBecomeKeyView as boolean`

**Function:** Returns whether the receiver can become key view.  
**Notes:** Returns true if the receiver can become key view, false otherwise.

### 33.10.13 `Close`

**Function:** The event called when the custom view is destroyed.

### 33.10.14 `concludeDragOperation(sender as NSDraggingInfoMBS)`

**Function:** Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.  
**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous `performDragOperation` must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object’s `animatesToDestination` property was set to true in `prepareForDragOperation`, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed from the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.
33.10.15  **draggingEnded(sender as NSDraggingInfoMBS)**

**Function:** Implement this event to be notified when a drag operation ends in some other destination.
**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

33.10.16  **draggingEntered(sender as NSDraggingInfoMBS) as Integer**

**Function:** Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

33.10.17  **draggingExited(sender as NSDraggingInfoMBS)**

**Function:** Invoked when the dragged image exits the destination’s bounds rectangle (in the case of a view
object) or its frame rectangle (in the case of a window object).

Notes: sender: The object sending the message; use it to get details about the dragging operation.

### 33.10.18 draggingSessionEndedAtPoint

`draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)`

**Function:** Invoked when the dragging session has completed.

**Notes:**

- session: The dragging session.
- screenPoint: The point where the drag ended, in screen coordinates.
- operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

### 33.10.19 draggingSessionMovedToPoint

`draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)`

**Function:** Invoked when the drag moves on the screen.

**Notes:**

- session: The dragging session.
- screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

### 33.10.20 draggingSessionSourceOperationMaskForDraggingContext

`draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer`

**Function:** Declares the types of operations the source allows to be performed. (required)

**Notes:**

- session: The dragging session.
- context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.
In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

### 33.10.21 `draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)`

**Function:** Invoked when the drag will begin.  
**Notes:**  
- `session`: The dragging session.  
- `screenPoint`: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

### 33.10.22 `draggingSourceOperationMaskForLocal(flag as boolean) as Integer`

**Function:** Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image’s data.  
**Notes:**  
- `(Deprecated in OS X v10.7. This method is informally deprecated. It is only called if the source does not implement the NSDraggingSource protocol methods. This method will be formally deprecated in a future OS release.)`
  
isLocal: True indicates that the candidate destination object (the window or view over which the dragged image is currently poised) is in the same application as the source, while a false value indicates that the destination object is in a different application.

A mask, created by combining the dragging operations listed in the NSDragOperation section of NSDraggingInfo protocol reference using the C bitwise OR operator. If the source does not permit any dragging operations, it should return NSDragOperationNone.

If not implemented, the default value is NSDragOperationCopy | NSDragOperationLink | NSDragOperationGeneric | NSDragOperationPrivate.

Available in OS X v10.0 and later. Deprecated in OS X v10.7.
33.10.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

**Function:** Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

33.10.24 drawFocusRingMask(g as NSGraphicsMBS) as boolean

**Function:** Draw the focus ring mask for the view.

**Notes:**

If false is returned, the default method from NSView class runs.

This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view’s interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke colors have been set to an arbitrary fully opaque color.
Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView default implementation of this method simply fills self.bounds. Available in Mac OS X v10.7 and later.

Please use NSGraphicsMBS class for drawing.

33.10.25 DrawRect(g as NSGraphicsMBS, left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The paint event with the rectangle which needs to be redrawn.

33.10.26 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Informs the receiver that the user has ended a touch gesture. Notes: e: An event object representing the gesture end. Available in Mac OS X v10.6 and later. Return true if you handled this event.

33.10.27 focusRingMaskBounds as NSRectMBS

MBS MacControls Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns the focus ring mask bounds. Notes: Return nil to run default NSView method. Return a rectangle containing the mask in the view’s interior (bounds) coordinate space. The mask bounds allows the focus ring’s overall size and position to be determined before it is drawn. Subclasses must override this method if they require the display of a focus ring. The NSView default implementation of this method simply returns NSRectMBS.Zero. Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box.
and that noteFocusRingMaskChanged is invoked as described.

33.10.28  **ignoreModifierKeysForDraggingSession**(session as NSDraggingSession-MBS) as boolean

**Function:** Returns whether the modifier keys will be ignored for this dragging session.  
**Notes:**  
session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.  
Available in OS X v10.7 and later.

33.10.29  **isFlipped** as Boolean

**Function:** The event to return a boolean value indicating whether the view uses a flipped coordinate system.  
**Notes:**  
The default value of this property is false, which results in a non-flipped coordinate system. In a non-flipped coordinate system, the origin is in the lower-left corner of the view and positive y-values extend upward. In a flipped coordinate system, the origin is in the upper-left corner of the view and y-values extend downward. X-values always extend to the right.

If you want your view to use a flipped coordinate system, override this property and return true.

33.10.30  **isOpaque** as boolean

**Function:** Whether this view is opaque.

33.10.31  **keyDown**(e as NSEventMBS) as boolean

**Function:** One of the key events.  
**Notes:**
Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

33.10.32 keyUp(e as NSEventMBS) as boolean

Function: One of the key events.
Notes:
Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

33.10.33 magnifyWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a pinch gesture.
Notes:
e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.10.34 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:
theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.
The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.
The default implementation returns the default menu.

### 33.10.35 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events. **Notes:** Return true if you handled this event.

### 33.10.36 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called so you can decide what happens with mouse down. **Notes:** Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

### 33.10.37 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events. **Notes:** Return true if you handled this event.

### 33.10.38 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events. **Notes:** Return true if you handled this event.

### 33.10.39 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
CHAPTER 33. COCOA CONTROLS

Notes: Return true if you handled this event.

33.10.40 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
**Notes:** Return true if you handled this event.

33.10.41 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
**Notes:** Return true if you handled this event.

33.10.42 Open

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the custom NSView is created.

33.10.43 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
**Notes:**
Return true if you handled this event.
Third mouse button.

33.10.44 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
**Notes:**
Return true if you handled this event.
Third mouse button.
33.10.45  otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes:
Return true if you handled this event.
Third mouse button.

33.10.46  performDragOperation(sender as NSDraggingInfoMBS) as boolean

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.
Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.
For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.
If the sender object’s animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

33.10.47  prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your
view, set the sender object’s animatesToDestination property to true in your implementation of this method.

### 33.10.48 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Informs the current object that a pressure change occurred on a system that supports pressure sensitivity. **Notes:** This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure. Available in OS X v10.10.3 and later.

### 33.10.49 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Focus is going away. **Notes:** Return true to accept.

### 33.10.50 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events. **Notes:** Return true if you handled this event.

### 33.10.51 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events. **Notes:** Return true if you handled this event.

### 33.10.52 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
33.10.53  rotateWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:
e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.10.54  scrollWheel(e as NSEventMBS) as boolean

Function: Informs the subclass that the mouse’s scroll wheel has moved.
Notes:
e: An object encapsulating information about the wheel-scrolling event.
The default implementation simply passes this message to the next responder.
Return true to not pass the event.

33.10.55  swipeWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a swipe gesture.
Notes:
e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.10.56  updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

Function: Invoked when the dragging images should be changed.
Notes:
sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

33.10.57 viewDidMoveToWindow

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

33.10.58 wantsPeriodicDraggingUpdates as boolean

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.
33.11. CLASS DISCLOSURETRIANGLE

33.11 class DisclosureTriangle

33.11.1 class DisclosureTriangle

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in DisclosureTriangle class in REALbasic.

33.11.2 Methods

33.11.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSButtonMBS object for the given control. **Example:**

MsgBox DisclosureTriangle1.NSButtonMBS.className

**Notes:** This way you can manipulate Cocoa controls directly.
33.12 class Groupbox

33.12.1 class Groupbox

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in Groupbox class in REALbasic.

33.12.2 Methods

33.12.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSBoxMBS object for the given control. **Notes:** This way you can manipulate Cocoa controls directly.
33.13.1 class ImageWell

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in ImageWell class in REALbasic.

33.13.2 Methods

33.13.3 NSImageViewMBS as NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSImageViewMBS object for the given control. **Notes:** This way you can manipulate Cocoa controls directly.
33.14 class KeyValueCodingMBS

33.14.1 class KeyValueCodingMBS

Function: The class for key value coding and using NSSortDescriptor class.
Notes: Events are only raised if called on main thread to avoid threading trouble.

33.14.2 Methods

33.14.3 Constructor

Function: The constructor.

33.14.4 sortedArrayUsingDescriptor(values() as KeyValueCodingMBS, sortDescriptor as NSSortDescriptorMBS) as KeyValueCodingMBS()

Function: Returns a copy of the receiving array sorted as specified by a given a sort descriptor.
Notes:
sortDescriptor: The NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptor.

33.14.5 sortedArrayUsingDescriptors(values() as KeyValueCodingMBS, sortDescriptor() as NSSortDescriptorMBS) as KeyValueCodingMBS()

Function: Returns a copy of the receiving array sorted as specified by a given array of sort descriptors.
Notes:
sortDescriptors: An array of NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptors.

The first descriptor specifies the primary key path to be used in sorting the receiving arrays contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSortDe-
33.14.6 Properties

33.14.7 Description as String

**Function:** The description text property.
**Notes:** (Read only property)
See also:
- 33.14.12 Description as String

33.14.8 Handle as Integer

**Function:** The internal object handle.
**Notes:** (Read and Write property)

33.14.9 Tag as Variant

**Function:** The tag value.
**Notes:**
Store anything you need, e.g. a dictionary.
(Read and Write property)

33.14.10 valueForKey(key as String) as Variant

**Function:** Get/set the value for the property identified by a given key.
**Notes:**
key: The name of one of the receiver’s properties.
(Read and Write computed property)
See also:
- 33.14.15 valueForKey(key as string) as Variant
33.14.11 Events

33.14.12 Description as String

Function: The event when system queries description for object.
See also:

- 33.14.7 Description as String

33.14.13 setValueForKey(key as string, value as Variant)

Function: Sets the property of the receiver specified by a given key to a given value.
Notes:

value: The value for the property identified by key.
key: The name of one of the receiver’s properties.

If key identifies a to-one relationship, relate the object specified by value to the receiver, unrelating the previously related object if there was one. Given a collection object and a key that identifies a to-many relationship, relate the objects contained in the collection to the receiver, unrelating previously related objects if there were any.
The search pattern that setValueForKey uses is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
In a reference-counted environment, if the instance variable is accessed directly, value is retained.

33.14.14 setValueForUndefinedKey(key as string, value as Variant)

Function: Invoked by setValueForKey when it finds no property for a given key.
Notes:

value: The value for the key identified by key.
key: A string that is not equal to the name of any of the receiver’s properties.

Subclasses can override this method to handle the request in some other way. The default implementation raises an NSUndefinedKeyException.
33.14. CLASS KEYVALUECODINGMBS

33.14.15 valueForKey(key as string) as Variant

**Function:** Return the value for the property identified by a given key.
**Notes:**
key: The name of one of the receiver’s properties.

Returns the value for the property identified by key.

If `event` is not implemented, the search pattern that `valueForKey` uses to find the correct value to return is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
See also:

- 33.14.10 `valueForKey(key as String) as Variant`

33.14.16 valueForUndefinedKey(key as string) as Variant

**Function:** Invoked by `valueForKey` when it finds no property corresponding to a given key.
**Notes:**
key: A string that is not equal to the name of any of the receiver’s properties.

Subclasses can override this method to return an alternate value for undefined keys. The default implementation raises an `NSUndefinedKeyException`. 
33.15 class NSActionCellMBS

33.15.1 class NSActionCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: An NSActionCell defines an active area inside a control (an instance of NSControl or one of its subclasses).

Notes:
As an NSControl’s active area, an NSActionCell does three things: it usually performs display of text or an icon; it provides the NSControl with a target and an action; and it handles mouse (cursor) tracking by properly highlighting its area and sending action messages to its target based on cursor movement.

Subclass of the NSCellMBS class.

33.15.2 Methods

33.15.3 Constructor(image as NSImageMBS)

Example:

dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSActionCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath

See also:

• 33.15.4 Constructor(text as string)

33.15.4 Constructor(text as string)

Example:

dim c as new NSActionCellMBS("Hello")
MsgBox c.StringValue
33.15. CLASS NSACTIONCELLMBS

See also:

- 33.15.3 Constructor(image as NSImageMBS)
33.16  class NSBoxMBS

33.16.1  class NSBoxMBS

Function: The NSBox class implements simple views that can title themselves and draw a border around
their content.
Notes:
These objects are known as boxes. You can use box to group, visually, some number of other views.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

33.16.2  Methods

33.16.3  borderRect as NSRectMBS

Function: Returns the rectangle in which the receiver’s border is drawn.
Notes: The rectangle in which the border of the NSBox is drawn.

33.16.4  Constructor

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```dim x as new NSBoxMBS```

Notes: On success the handle property is not zero.
See also:

- 33.16.5 Constructor(Handle as Integer) 6344
- 33.16.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6345

33.16.5  Constructor(Handle as Integer)

Function: Creates an object based on the given NSView handle.
33.16. CLASS NSBOXMBS

Example:

dim t as new NSBoxMBS(0, 0, 100, 100)
dim v as new NSBoxMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)

Notes: The handle is casted to a NSBox and the plugin retains this handle.
See also:

• 33.16.4 Constructor

• 33.16.6 Constructor(left as Double, top as Double, width as Double, height as Double)

33.16.6 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new control with the given size and position.
Example:

dim left,top,width,height as Integer
// define rectangle
dim x as new NSBoxMBS(left, top, width, height)

Notes: On success the handle property is not zero.
See also:

• 33.16.4 Constructor

• 33.16.5 Constructor(Handle as Integer)

33.16.7 setFrameFromContentFrame(contentFrame as NSRectMBS)

Function: Places the receiver so its content view lies on the specified frame.
Notes: contentFrame: The rectangle specifying the frame of the box’s content view, reckoned in the coordinate system of the box’s superview. The box is marked for redisplay.
33.16.8 **setTitleWithMnemonic**(stringWithAmpersand as string)

**Function:** Sets the title of the receiver with a character denoted as an access key.

**Notes:**

Mnemonics are not supported in Mac OS X.

By default, a box’s title is "Title." The content view is not automatically resized, and the box is not marked for redisplay.

33.16.9 **sizeToFit**

**Function:** Resizes and moves the receiver’s content view so it just encloses its subviews.

**Example:**

```lisp
DIM n AS NEW NSProgressIndicatorMBS
n.sizeToFit

MsgBox n.frame.String
```

**Notes:**

The receiver is then moved and resized to wrap around the content view. The receiver’s width is constrained so its title will be fully displayed.

You should invoke this method after:

- Adding a subview (to the content view)
- Altering the size or location of such a subview
- Setting the margins around the content view

The mechanism by which the content view is moved and resized depends on whether the object responds to its own sizeToFit message: If it does respond, then that message is sent, and the content view is expected to be so modified. If the content view doesn’t respond, the box moves and resizes the content view itself.
33.16. **CLASS NSBOXMBS**

### 33.16.10 titleCell as NSCellMBS

**Function:** Returns the cell used to display the receiver's title.

### 33.16.11 titleRect as NSRectMBS

**Function:** Returns the rectangle in which the receiver's title is drawn.  
**Notes:** The rectangle in which the title is drawn.

### 33.16.12 Properties

### 33.16.13 borderColor as NSColorMBS

**Function:** Returns the color of the receiver's border when the receiver is a custom box with a simple line border.  
**Notes:** The receiver's border color. It must be a custom box that is, it has a type of NSBoxCustom and it must have a border style of NSLineBorder.  
Available in Mac OS X v10.5 and later.  
(Read and Write computed property)

### 33.16.14 borderType as Integer

**Function:** The border type to aType, which must be a valid border type.  
**Notes:**  
A constant describing the type of border. Border types are defined in NSView.h. Currently, the following border types are defined: NSNoBorder, NSLineBorder, NSBezelBorder, NSGrooveBorder.  
If the size of the new border is different from that of the old border, the content view is resized to absorb the difference, and the box is marked for redisplay.  
(Read and Write computed property)
33.16.15 borderWidth as Double

Function: The border width.
Notes:
Functional only when the receiver’s box type (boxType) is NSBoxCustom and its border type (borderType) is NSLineBorder.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)

33.16.16 boxType as Integer

Function: The box type.
Notes:
Use the NSBox* constants.
(Read and Write computed property)

33.16.17 contentView as NSViewMBS

Function: The receiver’s content view.
Notes:
On settings the NSView object is resized to fit within the box’s current content area and the box is marked for redisplay.
(Read and Write computed property)

33.16.18 contentViewMargins as NSSizeMBS

Function: The horizontal and vertical distance between the border of the receiver and its content view.
Notes:
Value: The width and height of the offset between the box’s border and content view. The horizontal value is applied (reckoned in the box’s coordinate system) fully and equally to the left and right sides of the box. The vertical value is similarly applied to the top and bottom.

Unlike changing a box’s other attributes, such as its title position or border type, changing the offsets
doesn’t automatically resize the content view. In general, you should send a sizeToFit message to the box after changing the size of its offsets. This message causes the content view to remain unchanged while the box is sized to fit around it.

(Read and Write computed property)

33.16.19  cornerRadius as Double

Function: The corner radius for the box.

Notes:

Functional only when the receiver’s box type (boxType) is NSBoxCustom and its border type (borderType) is NSLineBorder.

(Read and Write computed property)

33.16.20  fillColor as NSColorMBS

Function: The color of the receiver’s background when the receiver is a custom box with a simple line border.

Notes:

The receiver’s fill color. It must be a custom box that is, it has a type of NSBoxCustom and it must have a border style of NSLineBorder.

Available in Mac OS X v10.5 and later.

(Read and Write computed property)

33.16.21  title as string

Function: The title for the box.

Notes:

By default, a box’s title is "Title."

(Read and Write computed property)

33.16.22  titleFont as NSFontMBS

Function: The font object used to draw the receiver’s title.

Notes:
By default, the title is drawn using the small system font (obtained using smallSystemFontSize as the parameter of systemFontOfSize, both NSFont class methods). If the size of the new font is different from that of the old font, the content view is resized to absorb the difference.

(Read and Write computed property)

### 33.16.23 titlePosition as Integer

**Function:** The position of the box’s title.

**Notes:**

If the new title position changes the size of the box’s border area, the content view is resized to absorb the difference, and the box is marked as needing redisplay.

Use this constants: NSNoTitle, NSAboveTop, NSAtTop, NSBelowTop, NSAboveBottom, NSAtBottom and NSBelowBottom.

(Read and Write computed property)

### 33.16.24 Transparent as Boolean

**Function:** Whether the receiver is transparent.

**Notes:**

True makes the receiver transparent.

False makes the receiver opaque.

(Read and Write computed property)

### 33.16.25 Constants

#### 33.16.26 NSAboveBottom = 4

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position.

**Notes:** Title positioned above the box’s bottom border.

#### 33.16.27 NSAboveTop = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position.

**Notes:** Title positioned above the box’s top border.
33.16.28  **NSAtBottom = 5**

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position. **Notes:** Title positioned within the box’s bottom border.

33.16.29  **NSAtTop = 2**

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position. **Notes:** Title positioned within the box’s top border.

33.16.30  **NSBelowBottom = 6**

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position. **Notes:** Title positioned below the box’s bottom border.

33.16.31  **NSBelowTop = 3**

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position. **Notes:** Title positioned below the box’s top border.

33.16.32  **NSBoxCustom = 4**

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box’s border type, define the appearance of the box. **Notes:** Specifies that the appearance of the box is determined entirely by the by box-configuration methods, without automatically applying Apple human interface guidelines.

33.16.33  **NSBoxOldStyle = 3**

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box’s border type, define the appearance of the box. **Notes:** Specifies that the box is a Mac OS X v10.2style box.
33.16.34 NSBoxPrimary = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box’s border type, define the appearance of the box. **Notes:** Specifies the primary box appearance. This is the default box type.

33.16.35 NSBoxSecondary = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box’s border type, define the appearance of the box. **Notes:** Specifies the secondary box appearance.

33.16.36 NSBoxSeparator = 2

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box’s border type, define the appearance of the box. **Notes:** Specifies the secondary box appearance.

33.16.37 NSNoTitle = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position. **Notes:** The box has no title.
33.17. CLASS NSBUTTONCELLMBS

33.17 class NSButtonCellMBS

33.17.1 class NSButtonCellMBS

Function: The NSButtonCell class is a subclass of NSActionCell used to implement the user interfaces of
push buttons, checkboxes (switches), and radio buttons.
Notes:
It can also be used for any other region of a view that’s designed to send a message to a target when clicked.
The NSButton subclass of NSControl uses a single NSButtonCell.

The NSButtonCell class implements the user interface of NSButton.

Setting the integer, float, double, or object value of an NSButtonCell object results in a call to setState with
the value converted to integer. In the case of setObjectValue, nil is equivalent to 0, and a non-nil object
that doesn’t respond to intValue sets the state to 1. Otherwise, the state is set to the object’s intValue.
Similarly, querying the integer, float, double, or object value of an NSButtonCell returns the current state in
the requested representation. In the case of objectValue, this is an NSNumber containing true for on, false
for off, and integer value -1 for the mixed state.

For more information on the behavior of NSButtonCell, see the NSButton and NSMatrix class specifications,
and Button Programming Topics.
Subclass of the NSActionCellMBS class.

33.17.2 Methods

33.17.3 Constructor(image as NSImageMBS)

Function: Creates a new Cell object with an image.
Example:

    dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSButtonCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath

See also:
33.17.4 Constructor(text as string)

Function: Creates a new Cell object with a text.

Example:

```vbscript
dim c as new NSButtonCellMBS("Hello")
MsgBox c.StringValue
```

See also:

- 33.17.3 Constructor(image as NSImageMBS)

33.17.5 Properties

33.17.6 alternateImage as NSImageMBS

Function: The image the button displays in its alternate state and, if necessary, redraws its contents.

Notes:

Note that some button types don’t display an alternate image.

(Read and Write property)

33.17.7 alternateTitle as String

Function: The title the button displays when it’s in its alternate state.

Notes:

Note that some button types don’t display an alternate title.

(Read and Write property)

33.17.8 attributedAlternateTitle as NSAttributedStringMBS

Function: The string the button displays when it’s in its alternate state to the given attributed string.

Notes:
Note that some button types don’t display an alternate title.

Graphics attributes that are set on the cell (backgroundColor, alignment, font, etc.) are overridden when corresponding properties are set for the attributed string.
(Read and Write property)

33.17.9 attributedTitle as NSAttributedStringMBS

Function: The string the button displays when it’s in its normal state to the given attributed string and redraws the button.
Notes:
The title is always shown on buttons that don’t use their alternate contents when highlighting or displaying their alternate state.

Graphics attributes configured for the cell (backgroundColor, alignment, font, etc.) are overridden when corresponding properties are set for the attributed string.
(Read and Write property)

33.17.10 backgroundColor as NSColorMBS

Function: The background color for the button.
Notes: (Read and Write property)

33.17.11 imageDimsWhenDisabled as Boolean

Function: Whether to dim image when button is disabled.
Notes:
When disabled, the image and text of an NSButtonCell are normally dimmed with gray. Radio buttons and switches use (imageDimsWhenDisabled = false) so only their text is dimmed.
(Read and Write property)
33.17.12 imagePosition as Integer

Notes: (Read and Write property)

33.17.13 imageScaling as Integer

Notes: Available in OS X v10.5 and later.
(Read and Write property)

33.17.14 showsBorderOnlyWhileMouseInside as Boolean

Notes: (Read and Write property)

33.17.15 sound as Variant

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The sound that’s played when the user presses the receiver.
Notes: The sound is played during a mouse-down event, such as NSLeftMouseDown.
Value is a NSSoundMBS object.
(Read and Write property)
33.18. CONTROL NSBUTTONCONTROLMBS

33.18 control NSButtonControlMBS

33.18.1 control NSButtonControlMBS

Function: The Xojo control for a NSButton.
Notes:

This control embeds a special NSButton subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

33.18.2 Properties

33.18.3 AlternateTitle as String

Function: The title that the button displays when it’s in its alternate state.
Notes: (Read and Write property)

33.18.4 BezelStyle as Integer

Function: The appearance of the border, if the view has one.
Notes:

Use this constants:

NSRoundedBezelStyle = 1
NSRegularSquareBezelStyle = 2
NSThickSquareBezelStyle = 3
NSThickerSquareBezelStyle = 4
NSDisclosureBezelStyle = 5
NSShadowlessSquareBezelStyle = 6
NSCircularBezelStyle = 7
NSTexturedSquareBezelStyle = 8
NSHelpButtonBezelStyle = 9
NSSmallSquareBezelStyle = 10
NSTexturedRoundedBezelStyle = 11
NSRoundRectBezelStyle = 12
NSRecessedBezelStyle = 13
NSRoundedDisclosureBezelStyle = 14
33.18.5 ButtonType as Integer

Function: The button type.
Notes: See also NSButtonMBS.ButtonType and the constants there like NSPushOnPushOffButton.
(Read and Write property)

33.18.6 Title as String

Function: The title displayed on the button when it’s in its normal state.
Notes: (Read and Write property)

33.18.7 View as NSButtonMBS

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

33.18.8 Events

33.18.9 Action

Function: The action event.

33.18.10 BoundsChanged

Function: The event called when the bounds, but not the frame, changed.
33.18. CONTROL NSBUTTONCONTROLMBS

33.18.11 EnableMenuItems

Function: The event where you can enable menu items.

33.18.12 FrameChanged

Function: The event called when the frame changed.

33.18.13 GotFocus

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

33.18.14 LostFocus

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

33.18.15 MenuAction(HitItem as MenuItem) As Boolean

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

33.18.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
CHAPTER 33. COCOA CONTROLS

Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

33.18.17 MouseDrag(x as Integer, y as Integer)

**Function:** This event fires continuously after the mouse button was pressed inside the Control.
**Notes:**
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

33.18.18 MouseUp(x as Integer, y as Integer)

**Function:** The mouse button was released.
**Notes:** Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

33.18.19 ScaleFactorChanged(NewFactor as Double)

**Function:** The backing store scale factor has changed.
**Notes:** Please invalidate any cached bitmaps or other relevant state.
33.19. CLASS NSBUTTONMBS

33.19.1 class NSButtonMBS

**Function:** The Cocoa class for a button control.
**Notes:** Subclass of the NSControlMBS class.

33.19.2 Methods

33.19.3 Constructor

**Function:** Creates a new button with size 100/100 and position 0/0
**Example:**
```vba
dim t as new NSButtonMBS
```

**Notes:** On success the handle property is not zero.
See also:

- 33.19.4 Constructor(Handle as Integer)
- 33.19.5 Constructor(left as Double, top as Double, width as Double, height as Double)
- 33.19.6 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0)

33.19.4 Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSButton handle.
**Example:**
```vba
dim t as new NSButtonMBS(0, 0, 100, 100)
dim v as new NSButtonMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

**Notes:** The handle is casted to a NSButton and the plugin retains this handle.
See also:

- 33.19.3 Constructor
33.19.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new button with the given size and position.
Example:
```
dim x as new NSButtonMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 33.19.3 Constructor 6361
- 33.19.4 Constructor(Handle as Integer) 6361
- 33.19.6 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 6362

33.19.6 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0)

Function: Creates a new button with default settings.
Notes:
For macOS 10.12, we use the convenience functions from Apple.
For older systems, we use our own code.
Title is the title to use. Can be empty.
Image is the image to use. Can be nil.
Type is the type, e.g. NSMomentaryLightButton.
See also:

- 33.19.3 Constructor 6361
- 33.19.4 Constructor(Handle as Integer) 6361
- 33.19.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6362

33.19.7 setButtonType(buttonType as Integer)

Function: Sets how the button highlights while pressed and how it shows its state.
Use this constants:

NSMomentaryLightButton = 0
NSPushOnPushOffButton = 1
NSToggleButton = 2
NSSwitchButton = 3
NSRadioButton = 4
NSMomentaryChangeButton = 5
NSOnOffButton = 6
NSMomentaryPushInButton = 7

33.19.8 setNextState

**Function:** Sets the view to its next state.
**Notes:** If the button has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the button has two states, it toggles between them.

33.19.9 Properties

33.19.10 allowsMixedState as boolean

**Function:** A Boolean value indicating whether the button allows a mixed state.
**Notes:** (Read and Write property)

33.19.11 alternateImage as NSImageMBS

**Function:** The image that appears on the button when it’s in its alternate state.
**Notes:**
The image displayed by the button when it’s in its alternate state, or nil if there is no alternate image. Note that some button types don’t display an alternate image. Buttons don’t display images by default.
(Read and Write property)
33.19.12 alternateTitle as string

Function: The title that the button displays when it’s in its alternate state.
Notes: (Read and Write property)

33.19.13 attributedAlternateTitle as NSAttributedStringMBS

Function: The title that appears on the button when it’s in its alternate state to the given attributed string.
Notes: (Read and Write property)

33.19.14 attributedTitle as NSAttributedStringMBS

Function: The title that the button displays in its normal state as an attributed string.
Notes: (Read and Write property)

33.19.15 backgroundColor as NSColorMBS

Function: The background color.
Notes: The background color is used only when drawing borderless buttons.
(Read and Write property)

33.19.16 bezelColor as NSColorMBS

Function: The color of the button’s bezel, in appearances that support it.
Notes: (Read and Write property)

33.19.17 bezelStyle as Integer

Function: The appearance of the border, if the view has one.
Notes:
33.19. **CLASS NSBUTTONMBS**

Use this constants:

- `NSRoundedBezelStyle` = 1
- `NSRegularSquareBezelStyle` = 2
- `NSThickSquareBezelStyle` = 3
- `NSThickerSquareBezelStyle` = 4
- `NSDisclosureBezelStyle` = 5
- `NSShadowlessSquareBezelStyle` = 6
- `NCircularBezelStyle` = 7
- `NSTexturedSquareBezelStyle` = 8
- `NSHelpButtonBezelStyle` = 9
- `NSSmallSquareBezelStyle` = 10
- `NSTexturedRoundedBezelStyle` = 11
- `NSRoundRectBezelStyle` = 12
- `NSRecessedBezelStyle` = 13
- `NSRoundedDisclosureBezelStyle` = 14

(Read and Write property)

### 33.19.18 image as NSImageMBS

**Function:** The view’s image.

**Notes:**

A button’s image is displayed when the button is in its normal state, or all the time for a button that doesn’t change its contents when highlighting or displaying its alternate state.

(Read and Write property)

### 33.19.19 imageDimsWhenDisabled as Boolean

**Function:** Whether the receiver’s image appears ”dim” when the button cell is disabled.

**Notes:**

True to indicate that the button’s image should dim when the button is disabled.

By default, all button types except NSSwitchButton and NSRadioButton do dim when disabled. When NSSwitchButtons and NSRadioButtons are disabled, only the associated text dims. The default setting for this condition is reasserted whenever you set ButtonType, so be sure to specify the button cells type before you set ImageDimsWhenDisabled.

(Read and Write property)
33.19.20  imageHugsTitle as Boolean

Function: Whether image hugs title.
Notes:
Available in macOS 10.12 and newer.
(Read and Write property)

33.19.21  imagePosition as Integer

Function: The position of the button’s image relative to its title.
Notes:
Value can be:

- NSNoImage 0 The cell doesn't display an image.
- NSImageOnly 1 The cell displays an image, but not a title.
- NSImageLeft 2 The image is to the left of the title.
- NSImageRight 3 The image is to the right of the title.
- NSImageBelow 4 The image is below the title.
- NSImageAbove 5 The image is above the title.
- NSImageOverlaps 6 The image overlaps the title.

(Read and Write property)

33.19.22  imageScaling as Integer

Function: The scale factor for the receiver's image.
Notes:
These constants specify a cell's image scaling behavior.

- NSImageScaleProportionallyDown 0 If it is too large for the destination, scale the image down while preserving the aspect ratio.
- NSImageScaleAxesIndependently 1 Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of the image.
- NSImageScaleNone 2 Do not scale the image.
- NSImageScaleProportionallyUpOrDown 3 Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.
33.19. CLASS NSBUTTONMBS

Available in OS X v10.5 and later.
(Read and Write property)

33.19.23 isBordered as boolean

Function: A Boolean value indicating whether the button has a border.
Notes: (Read and Write property)

33.19.24 isTransparent as boolean

Function: A Boolean value indicating whether the button is transparent.
Notes: (Read and Write property)

33.19.25 keyEquivalent as string

Function: The key-equivalent character of the view.
Notes: (Read and Write property)

33.19.26 keyEquivalentModifierMask as Integer

Function: the controls’s keyboard equivalent modifier mask.
Example:

```dim d as NSButtonMBS // your button
d.KeyEquivalent="A"
d.KeyEquivalentModifierMask= NSShiftKeyMask+ NSCommandKeyMask+ NSAlternateKeyMask // command-option-shift```

Notes:
CHAPTER 33. COCOA CONTROLS

Constants for the mask:

NSAlphaShiftKeyMask = 65536
Set if Caps Lock key is pressed.
Available in Mac OS X v10.0 and later.

NSShiftKeyMask = 131072
Set if Shift key is pressed.
Available in Mac OS X v10.0 and later.

NSControlKeyMask = 262144
Set if Control key is pressed.
Available in Mac OS X v10.0 and later.

NSAlternateKeyMask = 524288
Set if Option or Alternate key is pressed.
Available in Mac OS X v10.0 and later.

NSCommandKeyMask = 1048576
Set if Command key is pressed.
Available in Mac OS X v10.0 and later.

NSNumericPadKeyMask = 2097152
Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrowFunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).
Available in Mac OS X v10.0 and later.

NSHelpKeyMask = 4194304
Set if the Help key is pressed.
Available in Mac OS X v10.0 and later.

NSFunctionKeyMask = 8388608
Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).
Available in Mac OS X v10.0 and later.

NSDeviceIndependentModifierFlagsMask = 16777216
Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.
Available in Mac OS X v10.4.
33.19.27 \textbf{maxAcceleratorLevel as Integer}

\textbf{Function:} Configures the maximum allowed level for an NSMultiLevelAcceleratorButton, allowed values range from \([1,5]\).
\textbf{Notes:}
Defaults to 2.
Available on Mac OS X 10.10.3.
(Read and Write property)

33.19.28 \textbf{showsBorderOnlyWhileMouseInside as boolean}

\textbf{Function:} Whether the view’s border is displayed only when the cursor is over the button.
\textbf{Notes:}
If isBordered returns false, the border is never displayed, regardless of what this method returns.
(Read and Write property)

33.19.29 \textbf{sound as Variant}

\textbf{Function:} The sound played when the user presses the button.
\textbf{Notes:}
The sound that should be played when the user presses the button. The sound is played during a mouse-down event, such as NSLeftMouseDown.
Value is NSSoundMBS object.
(Read and Write property)

33.19.30 \textbf{SpringLoaded as Boolean}

\textbf{Function:} Sends action on deep-press or extended hover while dragging.
\textbf{Notes:}
Defaults to false.
Available on Mac OS X 10.10.3.
CHAPTER 33. COCOA CONTROLS

(Read and Write property)

33.19.31 state as Integer

Function: The state of the button.
Notes:
This can be NSOnState (1), NSOffState (0), NSMixedState (-1).
(Read and Write property)

33.19.32 title as string

Function: The title displayed on the button when it’s in its normal state.
Notes: (Read and Write property)

33.19.33 Constants

33.19.34 NSCircularBezelStyle=7

MBS MacControls Plugin, Plugin Version: 7.8. Function: One of the button styles that can be specified using bezelStyle.
Notes:
A round button with room for a small icon or a single character.

This style has both regular and small variants, but the large variant is available only in gray at this time.

33.19.35 NSDisclosureBezelStyle=5

MBS MacControls Plugin, Plugin Version: 7.8. Function: One of the button styles that can be specified using bezelStyle.
Notes:
A bezel style for use with a disclosure triangle.

To create the disclosure triangle, set the button bezel style to NSDisclosureBezelStyle and the button type to NSOnOffButton.
33.19.36  **NSHelpButtonBezelStyle=9**

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.  
**Notes:** A round button with a question mark providing the standard help button look.

33.19.37  **NSInlineBezelStyle=15**

MBS MacControls Plugin, Plugin Version: 14.3. **Function:** One of the button styles that can be specified using bezelStyle.  
**Notes:** Inline Style.

33.19.38  **NSMomentaryChangeButton=5**

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.  
**Notes:** While the button is held down, the alternate image and alternate title are displayed.  
The normal image and title are displayed when the button isn’t pressed. This option is called "Momentary Change" in Interface Builder’s Button Inspector.

33.19.39  **NSMomentaryLightButton=0**

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.  
**Notes:** While the button is held down it’s shown as ”lit,” and also ”pushed in” to the screen if the button is bordered.  
This type of button is best for simply triggering actions, as it doesn’t show its state; it always displays its normal image or title. This option is called "Momentary Light" in Interface Builder’s Button Inspector.

33.19.40  **NSMomentaryPushInButton=7**

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.  
**Notes:**
While the button is held down it’s shown as "lit."

This type of button is best for simply triggering actions, as it doesn’t show its state; it always displays its normal image or title. This option is called "Momentary Push In" in Interface Builder’s Button Inspector.

33.19.41 NSOnOffButton=6

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType. 
**Notes:** The first click highlights the button; a second click returns it to the normal (unhighlighted) state.

33.19.42 NSPushOnPushOffButton=1

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType. 
**Notes:** The first click both highlights and causes the button to be "pushed in" if the button is bordered; a second click returns it to its normal state.

33.19.43 NSRadioButton=4

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType. 
**Notes:** This style is similar to NSSwitchButton, but it used to constrain a selection to a single element from several.

33.19.44 NSRecessedBezelStyle=13

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle. 
**Notes:** A bezel style that matches the recessed buttons in Mail, Finder and Safari.

33.19.45 NSRegularSquareBezelStyle=2

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle. 
**Notes:** A rectangular button with a 2 point border, designed for icons.
33.19. NSBUTTONMBS

33.19.46 NSRoundedBezelStyle=1

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.  
**Notes:** A rounded rectangle button, designed for text.

33.19.47 NSRoundedDisclosureBezelStyle=14

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.  
**Notes:** A bezel style that matches the disclosure style used in the standard Save panel.

33.19.48 NSRoundRectBezelStyle=12

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.  
**Notes:** A bezel style that matches the search buttons in Finder and Mail.

33.19.49 NSShadowlessSquareBezelStyle=6

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.  
**Notes:**  
Similar to NSRegularSquareBezelStyle, but has no shadow so you can abut the cells without overlapping shadows.  

This style would be used in a tool palette, for example.

33.19.50 NSSmallSquareBezelStyle=10

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.  
**Notes:** A simple square bezel style. Buttons using this style can be scaled to any size.
33.19.51 NSSwitchButton=3

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.
**Notes:** This style is a variant of NSToggleButton that has no border and is used to represent a checkbox.

33.19.52 NSTexturedRoundedBezelStyle=11

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
**Notes:** A textured (metal) bezel style similar in appearance to the Finder’s action (gear) button.

33.19.53 NSTexturedSquareBezelStyle=8

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
**Notes:** A bezel style appropriate for use with textured (metal) windows.

33.19.54 NSThickerSquareBezelStyle=4

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
**Notes:** A rectangular button with a 4 point border, designed for icons.

33.19.55 NSThickSquareBezelStyle=3

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
**Notes:** A rectangular button with a 3 point border, designed for icons.

33.19.56 NSToggleButton=2

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.
**Notes:** After the first click, the button displays its alternate image or title; a second click returns the button to its normal state.
33.20. CLASS NSCELLMBS

33.20 class NSCellMBS

33.20.1 class NSCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The NSCell class provides a mechanism for displaying text or images in an NSView object without the overhead of a full NSView subclass. Notes: It's used heavily by most of the NSControl classes to implement their internal workings.

33.20.2 Methods

33.20.3 acceptsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value that indicates whether the receiver accepts first responder status. Notes: The default value is true if the receiver is enabled. Subclasses may override this method to return a different value.

33.20.4 calcDrawInfo(theRect as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Recalculates the cell geometry. Notes: Objects (such as controls) that manage NSCell objects generally maintain a flag that informs them if any of their cells have been modified in such a way that the location or size of the cell should be recomputed. If so, calcSize method of NSControl is automatically invoked prior to the display of the cell, and that method invokes the calcDrawInfo method of the cell. The default implementation of this method does nothing.

33.20.5 cellSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the minimum size needed to display the receiver. Notes: Returns the size of the cell, or the size (10000, 10000) if the receiver is not a text or image cell. If the cell is an image cell but no image has been set, returns NSZeroSize. This method takes into account of the size of the image or text within a certain offset determined by the border type of the cell.
33.20.6 `cellSizeForBounds(theRect as NSRectMBS) as NSSizeMBS`

Function: Returns the minimum size needed to display the receiver, constraining it to the specified rectangle.

Notes:

- `aRect`: The size of the cell, or the size of the `aRect` parameter if the cell is not a text or image cell. If the cell is an image cell but no image has been set, returns an empty size.

This method takes into account of the size of the image or text within a certain offset determined by the border type of the cell. If the receiver is of text type, the text is resized to fit within `aRect` (as much as `aRect` is within the bounds of the cell).

33.20.7 `compare(otherCell as NSCellMBS) as Integer`

Function: Compares the string values of the receiver another cell, disregarding case.

Notes:

- `otherCell`: The cell to compare against the receiver. This parameter must be of type `NSCell`; if it is not, this method raises `NSBadComparisonException`.

This value must not be nil. If the value is nil, the behavior is undefined and may change in future versions of Mac OS X.

Returns `NSOrderedAscending` if the string value of the receiver precedes the string value of `otherCell` in lexical ordering, `NSOrderedSame` if the string values are equivalent in lexical value, and `NSOrderedDescending` if the string value of the receiver follows the string value of `otherCell` in lexical ordering.

33.20.8 `Constructor(image as NSImageMBS)`

Function: Creates a new Cell object with an image.

Example:

```
dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSCellMBS(n)
```

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
33.20. CLASS NSCELLMBS

See also:

- 33.20.9 Constructor(text as string)

33.20.9 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new Cell object with a text. **Example:**

```dim c as new NSCellMBS("Hello")
MsgBox c.StringValue```

See also:

- 33.20.8 Constructor(image as NSImageMBS)

33.20.10 defaultFocusRingType as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default type of focus ring for the receiver. **Notes:**

Use this constants:

- `NSFocusRingTypeDefault` = 0  The default focus ring type for NSView or NSCell.
- `NSFocusRingTypeNone` = 1  No focus ring. If you set the focus ring type to this value, NSView and NSCell will not draw any focus ring.
- `NSFocusRingTypeExterior` = 2  The standard Aqua focus ring.

33.20.11 defaultMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default menu for instances of the receiver. **Notes:**

Returns the default menu. The NSCell implementation of this method returns nil.

33.20.12 drawingRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rectangle within which the receiver draws itself. **Notes:**
CHAPTER 33. COCOA CONTROLS

theRect: The bounding rectangle of the receiver.
Returns the rectangle in which the receiver draws itself. This rectangle is slightly inset from the one in theRect.

33.20.13 highlightColorWithFrame(theRect as NSRectMBS, controlView as NSViewMBS) as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Redraws the receiver with the specified highlight setting.
Notes:
theRect: The bounding rectangle of the receiver.
controlView: The control that manages the cell.
Returns the color the receiver uses when drawing the selection highlight.
You should not assume that a cell would necessarily want to draw itself with the value returned from selectedControlColor. A cell may wish to draw with different a selection highlight color depending on such things as the key state of its controlView.

33.20.14 imageRectForBounds(theRect as NSRectMBS) as NSRectMBS

Notes:
theRect: The bounding rectangle of the receiver.
The rectangle in which the receiver draws its image. This rectangle is slightly offset from the one in theRect.

33.20.15 isEntryAcceptable(aString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns whether a string representing a numeric or date value is formatted in a suitable way for the cell’s entry type.
Notes: This method is being deprecated in favor of a new class of formatter objects. For more information, see NSFormatter. This documentation is provided only for developers who need to modify older applications
33.20.16 mnemonic as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the character in the receiver’s title that appears underlined for use as a mnemonic. **Notes:** A string containing the mnemonic character, or an empty string if no mnemonic character is set.

33.20.17 nextState as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s next state. **Notes:** If the receiver has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the receiver has two states, it toggles between them.

33.20.18 performClick

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Simulates a single mouse click on the receiver. **Notes:** This method performs the receiver’s action on its target. The receiver must be enabled to perform the action. If the receiver’s control view is valid, that view is used as the sender; otherwise, the value in sender is used.

The receiver of this message must be a cell of type NSActionCell. This method raises an exception if the action message cannot be successfully sent.

33.20.19 prefersTrackingUntilMouseUp as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether tracking stops when the cursor leaves the cell. **Notes:** The default implementation returns false. Subclasses may override this method to return a different value.

33.20.20 sendActionOn(mask as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the conditions on which the receiver sends action messages to its target. **Notes:** mask: A bit mask containing the conditions for sending the action. The only conditions that are actually checked are associated with the NSLeftMouseDownMask, NSLeftMouseUpMask, NSLeftMouseDragged-
CHAPTER 33. COCOA CONTROLS

Mask, and NSPeriodicMask bits.

Returns a bit mask containing the previous settings. This bit mask uses the same values as specified in the mask parameter.

You use this method during mouse tracking when the mouse button changes state, the mouse moves, or if the cell is marked to send its action continuously while tracking. Because of this, the only bits checked in mask are NSLeftMouseDownMask, NSLeftMouseUpMask, NSLeftMouseDraggedMask, and NSPeriodicMask, which are declared in the NSEvent class reference.

You can use the setContinuous method to turn on the flag corresponding to NSPeriodicMask or NSLeftMouseDraggedMask, whichever is appropriate to the given subclass of NSCell.

33.20.21 setNextState

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Changes the state of the receiver to its next state. Notes: If the receiver has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the receiver has two states, it toggles between them.

33.20.22 setTitleWithMnemonic(stringWithAmpersand as string)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Sets the title of the receiver with one character in the string denoted as an access key. Notes: stringWithAmpersand: The new title of the cell. One character in the string should be preceded by an ampersand (&) character. The character that follows becomes the mnemonic character for the title. Mnemonics are not supported in Mac OS X.

33.20.23 titleRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the rectangle in which the receiver draws its title text. Notes: If the receiver is a text-type cell, this method resizes the drawing rectangle for the title (theRect) inward by a small offset to accommodate the cell border. If the receiver is not a text-type cell, the method does nothing.
33.20. **CLASS NSCELLMBS**

### 33.20.24 `wantsNotificationForMarkedText` as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the field editor initiated by the receiver should post text change notifications. **Notes:** Returns true if the field editor initiated by the receiver should post text change notifications (NSNotificationTextDidChange) while editing marked text; otherwise, they are delayed until the marked text confirmation.

### 33.20.25 Properties

#### 33.20.26 `alignment` as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The alignment of text in the receiver. **Notes:** The alignment of text in the receiver (one of the following constants: NSLeftTextAlignment, NSRightTextAlignment, NSCenterTextAlignment, NSJustifiedTextAlignment, NSNaturalTextAlignment). The default value is NSNaturalTextAlignment. (Read and Write property)

#### 33.20.27 `allowsEditingTextAttributes` as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver allows user editing of textual attributes. **Notes:** (Read and Write property)

#### 33.20.28 `allowsMixedState` as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver supports three states. **Notes:** Value is true if the receiver supports all three states (on, off, and mixed), otherwise false (the receiver supports only the on and off states). (Read and Write property)
33.20.29 allowsUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver assumes responsibility for undo operations. **Notes:**

By default, the NSTextFieldCell class uses this feature to handle undo operations for edited text. Other controls set a value that is appropriate for their implementation.

Available in Mac OS X v10.4 and later.

(Read and Write property)

33.20.30 attributedStringValue as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the receiver’s cell as an attributed string using the receiver’s formatter object (if one exists). **Notes:**

The textual attributes are the default paragraph style, the receiver’s font and alignment, and whether the receiver is enabled and scrollable.

For Mac OS X v10.3 and later: If you use a class that responds to the selector attributedStringValue for the object value of a cell, then the cell will use that method to fetch the string to draw rather than using stringValue.

(Read and Write property)

33.20.31 backgroundStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the background style for the receiver. **Notes:**

The background describes the surface the cell is drawn onto in drawWithFrame A control typically sets this before it asks the cell to draw. A cell may draw differently based on background characteristics. For example, a tableview drawing a cell in a selected row might set cell.backgroundStyle=NSBackgroundStyleDark. A text cell might decide to render its text white as a result. A rating-style level indicator might draw its stars white instead of gray.

Available in Mac OS X v10.5 and later.

(Read and Write property)
33.20.32 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The initial writing direction used to determine the actual writing direction for text.
**Notes:**
The default value is NSWritingDirectionNatural.
The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly.
(Read and Write property)

33.20.33 Bezeled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver has a bezeled border.
**Notes:** (Read and Write property)

33.20.34 Bordered as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver has a plain border.
**Notes:** (Read and Write property)

33.20.35 className as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this NSCell class.
**Example:**
```dim c as new NSActionCellMBS("Hello")
MsgBox c.className // shows "NSActionCell"
```
**Notes:** (Read only property)

33.20.36 classPath as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSCell class.
**Example:**
dim c as new NSActionCellMBS("Hello")
MsgBox c.classPath // shows "NSActionCell:NSCell:NSObject"

Notes:
Useful for debugging to know what super classes the view has.
(Read only property)

33.20.37  Continuous as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A Boolean value that indicates whether the receiver’s cell sends its action message continuously to its target during mouse tracking.
Notes: (Read and Write property)

33.20.38  controlSize as Integer

Notes:
Can be NSRegularControlSize, NSMiniControlSize or NSSmallControlSize.
(Read and Write property)

33.20.39  controlTint as Integer

Notes:
Can be NSGraphiteControlTint, NSBlueControlTint, NSClearControlTint or NSDefaultControlTint.
(Read and Write property)

33.20.40  controlView as NSViewMBS

Notes:
The control view represents the control currently being rendered by the cell.
(Read and Write property)

33.20.41 doubleValue as Double

Notes: The value of the cell interpreted as a double-precision floating-point number. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
(Read and Write property)

33.20.42 Editable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A Boolean value that indicates whether the receiver is editable.
Notes: (Read and Write property)

33.20.43 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A Boolean value that indicates whether the receiver is enabled or disabled.
Notes: (Read and Write property)

33.20.44 floatValue as Double

Notes: Returns the value of the cell interpreted as a single-precision floating-point number. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
(Read and Write property)

33.20.45 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The font used to display text in the receiver.
Notes:
The receiver's current font, or nil if the receiver is not a text-type cell.
(Read and Write property)

33.20.46 Handle as Integer

Notes: (Read and Write property)

33.20.47 hasValidObjectValue as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value that indicates whether the receiver has a valid object value.
Notes: A valid object value is one that the receiver's formatter can "understand." Objects are always assumed to be valid unless they are rejected by the formatter.
(Read only property)

33.20.48 Highlighted as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A Boolean value that indicates whether the receiver is highlighted.
Notes: (Read and Write property)

33.20.49 image as NSImageMBS

Notes: The image displayed by the receiver, or nil if the receiver is not an image-type cell.
(Read and Write property)
33.20. CLASS NSCELLMBS

33.20.50 importsGraphics as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the text of the receiver can contain imported graphics. **Notes:**

true if the receiver’s text is in the RTFD format and supports imported graphics, otherwise false. (Read and Write property)

33.20.51 interiorBackgroundStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the interior background style for the receiver. **Notes:**

The interior background style describes the surface drawn onto in drawInteriorWithFrame:inView:. This is often the same as the backgroundStyle, but a button that draws a bezel would have a different interiorBackgroundStyle.
This is both an override point and a useful method to call. In a custom button with a custom bezel you can override this method to describe that surface. A cell that has custom interior drawing might query this method to help pick an image that looks good on the cell. Calling this method gives you some independence from changes in framework art style.
Available in Mac OS X v10.5 and later. (Read only property)

33.20.52 intValue as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s value as an integer. **Notes:**

The value of the cell interpreted as an integer. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
On Mac OS X v10.5 and later, you should use integerValue instead. (Read and Write property)

33.20.53 isOpaque as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is opaque (nontransparent). **Notes:** (Read only property)
33.20.54 keyEquivalent as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the key equivalent to clicking the cell.

**Notes:**

Subclasses can override this method to return a string with a valid character for the key equivalent. (Read only property)

33.20.55 lineBreakMode as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The line break mode currently used when drawing text.

**Notes:**

The line break mode the receiver currently uses when drawing text (one of the following constants: NSLineBreakByWordWrapping, NSLineBreakByCharWrapping, NSLineBreakByClipping, NSLineBreakByTruncatingHead, NSLineBreakByTruncatingTail, or NSLineBreakByTruncatingMiddle). Available in Mac OS X v10.4 and later. (Read and Write property)

33.20.56 menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s contextual menu.

**Notes:**

The receiver’s contextual menu, or nil if no menu is assigned. (Read and Write property)

33.20.57 mnemonicLocation as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The position of the underlined mnemonic character in the receiver’s title.

**Notes:**

A zero-based index into the receiver’s title string indicating the position of the character. If there is no mnemonic character, this method returns NSNotFound. Mnemonics are not supported in Mac OS X. (Read and Write property)
33.20. **CLASS NSCELLMBS**

33.20.58 **refusesFirstResponder as boolean**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver should not become the first responder. **Notes:** To find out whether the receiver can become first responder at this time, use the method acceptsFirstResponder. (Read and Write property)

33.20.59 **Scrollable as boolean**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver scrolls excess text past the cell's bounds. **Notes:** (Read and Write property)

33.20.60 **Selectable as boolean**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the text of the receiver can be selected. **Notes:** (Read and Write property)

33.20.61 **sendsActionOnEndEditing as boolean**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver's NSControl object sends its action message whenever the user finishes editing the cell's text. **Notes:** If this method returns true, the receiver's NSControl object sends its action message when the user does one of the following:

- Presses the Return key
- Presses the Tab key to move out of the field
- Clicks another text field

If it returns false, the cell's NSControl object sends its action message only when the user presses the Return key. (Read and Write property)
33.20.62  showsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver should draw some indication of its first responder status.

**Notes:**

The NSCell class itself does not draw a first-responder indicator. Subclasses may use the returned value to determine whether or not they should draw one, however.

(Read and Write property)

---

33.20.63  state as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s state.

**Notes:**

Cells can have two or three states. If the receiver has two states, it returns either NSOffState (the normal or unpressed state) or NSOnState (the alternate or pressed state). If it has three, it may also return NS-MixedState, indicating the feature is in effect somewhere.

To check whether the receiver uses the mixed state, use the method allowsMixedState.

Note that the value state returns may not be the same value you passed into setState.

(Read and Write property)

---

33.20.64  stringValue as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the receiver’s cell as a string.

**Notes:**

If no formatter exists and the cell’s value is a string, this method returns the value as a plain, attributed, or localized formatted string. If the value is not a string or cannot be converted to one, this method returns an empty string.

For Mac OS X v10.3 and later: If you use a class that responds to the selector attributedStringValue for the object value of a cell, the cell uses that method to fetch the string to draw rather than the stringValue method.

(Read and Write property)
33.20. CLASS NSCELLMBS

33.20.65 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tag identifying the receiver.

**Notes:**

The tag value. The NSCell implementation of this method returns 1. Tags allow you to identify particular cells. Tag values are not used internally; they are only changed by external invocations of setTag:. You typically set tag values in Interface Builder and use them at runtime in your application. When you set the tag of a control with a single cell in Interface Builder, it sets the tags of both the control and the cell to the same value as a convenience.

(Read and Write property)

33.20.66 title as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s title.

**Notes:**

Subclasses (such as NSButtonCell) may override this method to return a different value.

(Read and Write property)

33.20.67 truncatesLastVisibleLine as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver truncates and adds the ellipsis character to the last visible line if the text doesn’t fit into the cell bounds.

**Notes:**

The line break mode must be either NSLineBreakByWordWrapping or NSLineBreakByCharWrapping. Otherwise, this setting is ignored.

Available in Mac OS X v10.5 and later.

(Read and Write property)

33.20.68 type as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of the cell, changing it to a text cell, image cell, or null cell.

**Notes:**

If the cell is already the same type as the one specified in the aType parameter, this method does nothing. If aType is NSTextCellType, this method converts the receiver to a cell of that type, giving it a default title and setting the font to the system font at the default size. If aType is NSImageCellType, the cell type is
CHAPTER 33. COCOA CONTROLS

not changed until you set a new non-nil image.
(Read and Write property)

33.20.69 userInterfaceLayoutDirection as Integer

Function: The layout direction of the user interface.
Notes:
This property specifies the general user interface layout flow directions. For subclasses that have multiple vi-
sual components in a single cell instance, this property should specify the directionality or flow of components.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.6 and later.
(Read and Write property)

33.20.70 usesSingleLineMode as boolean

Notes:
If true, the cell ignores the return value from wraps, interprets NSKLineBreakByWordWrapping and NSKLine-
BreakByCharWrapping returned by lineBreakMode as NSKLineBreakByClipping, and configures the field
editor to ignore key binding commands that insert paragraph and line separators.
The field editor bound to a single line cell filters paragraph and line separator insertion from user actions.
Cells in the single line mode use the fixed baseline layout. The text baseline position is determined solely
by the control size regardless of content font style or size.
(Read and Write property)

33.20.71 wraps as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether text in the receiver wraps when its length exceeds the frame of the cell.
Notes:
If the text of the receiver is an attributed string value you must explicitly set the paragraph style line break
mode. Calling this method with the value true is equivalent to calling the setLineBreakMode: method with
the value NSLineBreakByWordWrapping.
(Read and Write property)

### 33.20.72 cellAttribute(aParameter as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the specified cell attribute.
**Notes:**

aParameter: The cell attribute whose value you want to get. Attributes include the receiver’s current state and whether it is disabled, editable, or highlighted.

Returns the value for the cell attribute specified by aParameter.
(Read and Write computed property)

### 33.20.73 focusRingType as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of focus ring currently set for the receiver.
**Notes:**

You can disable a view’s focus ring drawing by overriding this method so it always returns NSFocusRingTypeNone, or by calling setFocusRingType: with NSFocusRingTypeNone. You should only disable a view from drawing its focus ring if you want to draw your own focus ring, or if there isn’t sufficient space to display a focus ring in the default location.
Available in Mac OS X v10.3 and later.
(Read and Write computed property)

### 33.20.74 Constants

#### 33.20.75 NSAnyType = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
**Notes:**

Any value is allowed.
Deprecated in Mac OS X v10.4 and later.
**33.20.76  NSBackgroundStyleDark = 1**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants for background styles.  
**Notes:**

The background is a dark color.  
Light content contrasts well with this background.  
Available in Mac OS X v10.5 and later.

**33.20.77  NSBackgroundStyleLight = 0**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants for background styles.  
**Notes:**

The background is a light color.  
Dark content contrasts well with this background.  
Available in Mac OS X v10.5 and later.

**33.20.78  NSBackgroundStyleLowered = 3**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants for background styles.  
**Notes:**

The background is intended to appear lower than the content drawn on it.  
Content might need to be embossed.  
Available in Mac OS X v10.5 and later.

**33.20.79  NSBackgroundStyleRaised = 2**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants for background styles.  
**Example:**

```
// ask for the textfield behind the label
dim n as NSTextFieldMBS = NSTextFieldMBS(label1.NSViewMBS)

// query cell
dim c as NSTextFieldCellMBS = n.cell

// and set background style
C.backgroundStyle = NSTextFieldCellMBS.NSBackgroundStyleRaised
```

**Notes:**
33.20. **CLASS NSCELLMBS**

The background is intended to appear higher than the content drawn on it.
Content might need to be inset.
Available in Mac OS X v10.5 and later.

33.20.80 **NSBlueControlTint = 1**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s tint.
**Notes:**
Aqua control tint
Available in Mac OS X v10.3 and later.

33.20.81 **NSCellAllowsMixedState = 16**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
**Notes:** Lets the cell’s state be NSMixedState, as well as NSOffState and NSOnState.

33.20.82 **NSCellChangesContents = 14**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
**Notes:** If the cell’s state is NSMixedState or NSOnState, displays the cell’s alternate image.

33.20.83 **NSCellDisabled = 0**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
**Notes:** Does not let the user manipulate the cell.

33.20.84 **NSCellEditable = 3**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
**Notes:** Lets the user edit the cell’s contents.
33.20.85  

**NSCellHasImageHorizontal = 12**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.  

**Notes:**

Controls the position of the cell’s image: places the image on the right of any text in the cell. Together, NSCellHasImageOnLeftOrBottom, NSCellHasImageHorizontal, and NSCellHasOverlappingImage control the position of the cell’s image and text. To place the image above, set none of them. To place the image below, set NSCellHasImageOnLeftOrBottom. To place the image to the right, set NSCellHasImageHorizontal. To place the image to the left, set NSCellHasImageHorizontal and NSCellHasImageOnLeftOrBottom. To place the image directly over, set NSCellHasOverlappingImage.

33.20.86  

**NSCellHasImageOnLeftOrBottom = 13**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.  

**Notes:**

Controls the position of the cell’s image: places the image on the left of or below any text in the cell. See NSCellHasImageHorizontal for more details.

33.20.87  

**NSCellHasOverlappingImage = 11**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.  

**Notes:**

Controls the position of the cell’s image: places the image over any text in the cell. See NSCellHasImageHorizontal for more details.

33.20.88  

**NSCellHighlighted = 5**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.  

**Notes:** Draws the cell with a highlighted appearance. (Deprecated. Use Highlighted instead.)

33.20.89  

**NSCellHitContentArea = 1**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants are used by hitTestForEvent to determine the effect of an event.
33.20. CLASS NSCELLMBS

Notes:
A content area in the cell.
Available in Mac OS X v10.5 and later.

33.20.90 NSCellHitEditableTextArea = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. Function: One of the constants are used by hitTestForEvent
to determine the effect of an event.
Notes:
An editable text area of the cell.
Available in Mac OS X v10.5 and later.

33.20.91 NSCellHitNone = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. Function: One of the constants are used by hitTestForEvent
to determine the effect of an event.
Notes:
An empty area, or did not hit in the cell.
Available in Mac OS X v10.5 and later.

33.20.92 NSCellHitTrackableArea = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. Function: One of the constants are used by hitTestForEvent
to determine the effect of an event.
Notes:
A trackable area in the cell.
Available in Mac OS X v10.5 and later.

33.20.93 NSCellIsBordered = 10

MBS MacCocoa Plugin, Plugin Version: 9.6. Function: One of the constants specify how a button behaves
when pressed and how it displays its state.
Notes: Draws a border around the cell.
33.20.94 **NSCellIsInsetButton = 15**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.

**Notes:**
Insets the cell’s contents from the border.
By default, the cell’s contents are inset by 2 points. This constant is ignored if the cell is unbordered.

33.20.95 **NSCellLightsByBackground = 9**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.

**Notes:** If the cell is pushed in, changes the cell’s background color from gray to white.

33.20.96 **NSCellLightsByContents = 6**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.

**Notes:** If the cell is pushed in, displays the cell’s alternate image.

33.20.97 **NSCellLightsByGray = 7**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.

**Notes:** If the cell is pushed in, displays the cell’s image as darkened.

33.20.98 **NSCellState = 1**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.

**Notes:** The cell’s state can be NSMixedState, NSOffState, or NSOnState.

33.20.99 **NSChangeBackgroundCell = 8**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.

**Notes:** If the cell’s state is NSMixedState or NSOnState, changes the cell’s background color from gray to
white.

33.20.100 NSChangeBackgroundCellMask = 8

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state. **Notes:** Same as NSChangeGrayCellMask, but only background pixels are changed.

33.20.101 NSChangeGrayCell = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state. **Notes:** If the cell’s state is NSMixedState or NSOnState, displays the cell’s image as darkened.

33.20.102 NSChangeGrayCellMask = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state. **Notes:** The button cell swaps the "control color" (the controlColor method of NSColor) and white pixels on its background and icon.

33.20.103 NSClearControlTint = 7

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s tint. **Notes:**

Clear control tint
Available in Mac OS X v10.0 and later.

33.20.104(contentsCellMask = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state. **Notes:** The button cell displays its alternate icon and/or title.
33.20.105 NSDefaultControlTint = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s tint.

**Notes:**
The current default tint setting.
Available in Mac OS X v10.0 and later.

33.20.106 NSDoubleType = 6

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.

**Notes:**
Must be between FLT_MAX and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

33.20.107 NSFloatType = 3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.

**Notes:**
Must be between FLT_MAX and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

33.20.108 NSGraphiteControlTint = 6

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s tint.

**Notes:**
Graphite control tint
Available in Mac OS X v10.3 and later.

33.20.109 NSImageAbove = 5

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button’s image relative to its title.

**Notes:** The image is above the title.
### 33.20.110 NSImageBelow = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button’s image relative to its title.  
**Notes:** The image is below the title.

### 33.20.111 NSImageCellType = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell represents its data (as text or as an image).  
**Notes:** Cell displays images.

### 33.20.112 NSImageLeft = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button’s image relative to its title.  
**Notes:** The image is to the left of the title.

### 33.20.113 NSImageOnly = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button’s image relative to its title.  
**Notes:** The cell displays an image, but not a title.

### 33.20.114 NSImageOverlaps = 6

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button’s image relative to its title.  
**Notes:** The image overlaps the title.

### 33.20.115 NSImageRight = 3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button’s image relative to its title.  
**Notes:** The image is to the right of the title.
33.20.116  NSImageScaleAxesIndependently = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s image scaling behavior.

**Notes:**

Scale each dimension to exactly fit destination.
This setting does not preserve the aspect ratio of the image.
Available in Mac OS X v10.5 and later.

33.20.117  NSImageScaleNone = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s image scaling behavior.

**Notes:**

Do not scale the image.
Available in Mac OS X v10.5 and later.

33.20.118  NSImageScaleProportionallyDown = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s image scaling behavior.

**Notes:**

If it is too large for the destination, scale the image down while preserving the aspect ratio.
Available in Mac OS X v10.5 and later.

33.20.119  NSImageScaleProportionallyUpOrDown = 3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s image scaling behavior.

**Notes:**

Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.
Available in Mac OS X v10.5 and later.
33.20. **CLASS NSCELLMBS**

### 33.20.120 **NSIntType = 1**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.

**Notes:**
- Must be between INT_MIN and INT_MAX.
- Deprecated in Mac OS X v10.4 and later.

### 33.20.121 **NSMiniControlSize = 2**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** These constants specify a cell’s size.

**Notes:** The control has a smaller size than NSSmallControlSize.

### 33.20.122 **NSMixedState = -1**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s state and are used mostly for buttons.

**Notes:** The corresponding feature is in effect somewhere.

### 33.20.123 **NSNoCellMask = 0**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state.

**Notes:** The button cell doesn’t change.

### 33.20.124 **NSNoImage = 0**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button’s image relative to its title.

**Notes:** The cell doesn’t display an image.

### 33.20.125 **NSNullCellType = 0**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell represents its data (as text or as an image).

**Notes:** Cell displays nothing.
33.20.126 NSOffState = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s state and are used mostly for buttons.
**Notes:** The corresponding feature is in effect nowhere.

33.20.127 NSOnState = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell’s state and are used mostly for buttons.
**Notes:** The corresponding feature is in effect everywhere.

33.20.128 NSPositiveDoubleType = 7

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
**Notes:**
Must be between FLT_MIN and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

33.20.129 NSPositiveFloatType = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
**Notes:**
Must be between FLT_MIN and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

33.20.130 NSPositiveIntType = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
**Notes:**
Must be between 1 and INT_MAX.
Deprecated in Mac OS X v10.4 and later.
33.20. CLASS NSCELLMBS

33.20.131 NSPushInCell = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.  
**Notes:** Determines whether the cell’s image and text appear to be shifted down and to the right.

33.20.132 NSPushInCellMask = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state.  
**Notes:** The button cell "pushes in" if it has a border.

33.20.133 NSRegularControlSize = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** These constants specify a cell’s size.  
**Notes:** The control is sized as regular.

33.20.134 NSSmallControlSize = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** These constants specify a cell’s size.  
**Notes:**  
The control has a smaller size.  
This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

33.20.135 NSTextCellType = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell represents its data (as text or as an image).  
**Notes:** Cell displays text.
CHAPTER 33. COCOA CONTROLS

33.21  class NSClipViewMBS

33.21.1  class NSClipViewMBS

Function: An NSClipView contains and scrolls the document view displayed by an NSScrollView.

Notes: You normally don’t need to program with NSClipViews, as NSScrollView handles most of the details of their operation.

An NSClipView holds the document view of an NSScrollView, clipping the document view to its frame, handling the details of scrolling in an efficient manner, and updating the NSScrollView when the document view’s size or position changes. You don’t normally use the NSClipView class directly; it’s provided primarily as the scrolling machinery for the NSScrollView class. However, you might use the NSClipView class to implement a class similar to NSScrollView.

Interaction With NSScrollView
When using an NSClipView within an NSScrollView (the usual configuration), you should issue messages that control background drawing state to the NSScrollView, rather than messaging the NSClipView directly. This recommendation applies to the following methods:

- backgroundColor
- drawsBackground

The NSClipView methods are intended for when the NSClipView is used independently of a containing NSScrollView. In the usual case, NSScrollView should be allowed to manage the background-drawing properties of its associated NSClipView.

There is only one background-drawing state per NSScrollView/NSClipView pair. The two objects do not maintain independent and distinct drawsBackground and backgroundColor properties; rather, NSScrollView’s accessors for these properties largely defer to the associated NSClipView and allow the NSClipView to maintain the state. In Mac OS X v10.2 and earlier system versions, NSScrollView maintained a cache of the last state it set for its NSClipView. If the NSClipView was sent a setDrawsBackground message directly, the cache might not reflect the state accurately. This caching of state has been removed in Mac OS X v10.3.

It is also important to note that sending a setDrawsBackground message with a parameter of false to an NSScrollView has the added effect of sending the NSClipView a setCopiesOnScroll message with a parameter of false. The side effect of sending the setDrawsBackground message directly to the NSClipView is the appearance of “trails” (vestiges of previous drawing) in the document view as it is scrolled.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
33.21. **CLASS NSCLIPVIEWMBS**

Subclass of the NSViewMBS class.

### 33.21.2 Methods

#### 33.21.3 autoscroll(theEvent as NSEventMBS) as boolean

**Function:** Scrolls the receiver proportionally to theEvent’s distance outside of it.

**Notes:**

theEvent’s location should be expressed in the window’s base coordinate system (which it normally is), not the receiving NSClipView’s. Returns true if any scrolling is performed; otherwise returns false.

Never invoke this method directly; instead, the NSClipView’s document view should repeatedly send itself autoscroll: messages when the cursor is dragged outside the NSClipView’s frame during a modal event loop initiated by a mouse-down event. The NSView class implements autoscroll to forward the message to the receiver’s superview; thus the message is ultimately forwarded to the NSClipView.

#### 33.21.4 constrainScrollPoint(newOrigin as NSPointMBS) as NSPointMBS

**Function:** Returns a scroll point adjusted from proposedNewOrigin, if necessary, to guarantee the receiver will still lie within its document view.

**Notes:** For example, if proposedNewOrigin’s y coordinate lies to the left of the document view’s origin, then the y coordinate returned is set to that of the document view’s origin.

#### 33.21.5 Constructor

**Function:** Creates a new clipview with the given size and position.

**Example:**

```plaintext
dim x as new NSClipViewMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.

See also:

- 33.21.6 Constructor(Handle as Integer) 6408
- 33.21.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6408
33.21.6 Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSClipView handle.  
**Example:**  
```vbnet
dim t as new NSClipViewMBS(0, 0, 100, 100)
dim v as new NSClipViewMBS(t.handle)
```

**Notes:** The handle is casted to a NSClipView and the plugin retains this handle.  
See also:

- 33.21.5 Constructor  
- 33.21.7 Constructor(left as Double, top as Double, width as Double, height as Double)

33.21.7 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new NSClipView with the given size and position.  
**Example:**  
```vbnet
dim x as new NSClipViewMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.  
See also:

- 33.21.5 Constructor  
- 33.21.6 Constructor(Handle as Integer)

33.21.8 documentRect as NSRectMBS

**Function:** Returns the rectangle defining the document view’s frame, adjusted to the size of the receiver if the document view is smaller.  
**Notes:**  
In other words, this rectangle is always at least as large as the receiver itself.
The document rectangle is used in conjunction with an NSClipView’s bounds rectangle to determine values for the indicators of relative position and size between the NSClipView and its document view. For example, NSScrollView uses these rectangles to set the size and position of the knobs in its scrollers. When the document view is much larger than the NSClipView, the knob is small; when the document view is near the same size, the knob is large; and when the document view is the same size or smaller, there is no knob.

### 33.21.9 `documentVisibleRect as NSRectMBS`

**Function:** Returns the exposed rectangle of the receiver’s document view, in the document view’s own coordinate system.  
**Notes:** Note that this rectangle doesn’t reflect the effects of any clipping that may occur above the NSClipView itself. To get the portion of the document view that’s guaranteed to be visible, send it a visibleRect message.

### 33.21.10 `reflectScrolledClipView(clipView as NSClipViewMBS)`

**Function:** Adjusts the receiver’s scrollers to reflect the size and positioning of its content view.

### 33.21.11 `scrollClipView(clipview as NSClipViewMBS, toPoint as NSPointMBS)`

**Function:** Notifies the superview of a clip view that the clip view needs to reset the origin of its bounds rectangle.

### 33.21.12 `scrollToPoint(newOrigin as NSPointMBS)`

**Function:** Changes the origin of the receiver’s bounds rectangle to newOrigin.

### 33.21.13 `viewBoundsChanged(notification as NSNotificationMBS)`

**Function:** Handles an NSViewBoundsDidChangeNotification, passed in the aNotification argument, by updating a containing NSScrollView based on the new bounds.
CHAPTER 33. COCOA CONTROLS

33.21.14 viewFrameChanged(notification as NSNotificationMBS)

Function: Handles an NSViewFrameDidChangeNotification, passed in the aNotification argument, by updating a containing NSScrollView based on the new frame.

33.21.15 Properties

33.21.16 backgroundColor as NSColorMBS

Function: The color of the receiver’s background.
Notes: (Read and Write computed property)

33.21.17 copiesOnScroll as boolean

Function: Whether the receiver copies rendered images while scrolling.
Notes:
If true, the receiver copies the existing rendered image to its new location while scrolling and only draws exposed portions of its document view. If false, the receiver always forces its document view to draw itself on scrolling.
(Read and Write computed property)

33.21.18 documentCursor as NSCursorMBS

Function: The cursor object used over the receiver.
Notes: (Read and Write computed property)

33.21.19 documentView as NSViewMBS

Function: The document view.
Notes:
Gets or sets the receiver’s document view. On set removes any previous document view, and sets the origin of the receiver’s bounds rectangle to the origin of the new view’s frame rectangle.
If the receiver is contained in an NSScrollView, you should set the NSScrollView DocumentView instead, so it can perform whatever updating it needs.

In the process of setting the document view, this method registers the receiver for the notifications NSViewFrameDidChangeNotification and NSViewBoundsDidChangeNotification, adjusts the key view loop to include the new document view, and updates a parent NSScrollView’s display if needed using reflectScrolledClipView.

(Read and Write computed property)

### 33.21.20 `drawsBackground` as boolean

**Function:** Whether the receiver draws its background color.

**Notes:**
If your NSClipView is enclosed in an NSScrollView, you should set the DrawsBackground on the NSScrollView.

(Read and Write computed property)

### 33.21.21 Constants

#### 33.21.22 `NSClipViewFindBarPositionAboveContent = 1`

MBS MacControls Plugin, Plugin Version: 11.3.

**Function:** One of the constants to define the position of the find bar in relation to the scroll view.

**Notes:**
The find bar is displayed above the scroll view content.
Available in Mac OS X v10.7 and later.

#### 33.21.23 `NSClipViewFindBarPositionAboveHorizontalRuler = 0`

MBS MacControls Plugin, Plugin Version: 11.3.

**Function:** One of the constants to define the position of the find bar in relation to the scroll view.

**Notes:**
The find bar is displayed above the horizontal ruler, if visible.
Available in Mac OS X v10.7 and later.
33.21.24 **NSClipViewFindBarPositionBelowContent = 2**

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to define the position of the find bar in relation to the scroll view.

**Notes:**
The find bar is displayed below the scroll view content. Available in Mac OS X v10.7 and later.

33.21.25 **NSScrollElasticityAllowed = 2**

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to determine the elasticity behavior for an axis of the scrollview.

**Notes:**
Allow content to be scrolled past its bounds on this axis in an elastic fashion. Available in Mac OS X v10.7 and later.

33.21.26 **NSScrollElasticityAutomatic = 0**

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to determine the elasticity behavior for an axis of the scrollview.

**Notes:**
Automatically determine whether to allow elasticity on this axis. Available in Mac OS X v10.7 and later.

33.21.27 **NSScrollElasticityNone = 1**

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to determine the elasticity behavior for an axis of the scrollview.

**Notes:**
Disallow scrolling beyond document bounds on this axis. Available in Mac OS X v10.7 and later.
33.22. CLASS NSCOMBOBOXMBS

33.22 class NSComboBoxMBS

33.22.1 class NSComboBoxMBS

Function: The ComboBox control from Cocoa.
Notes:
An NSComboBox is a kind of NSControl that allows you to either enter text directly (as you would with
an NSTextField) or click the attached arrow at the right of the combo box and select from a displayed
(“pop-up”) list of items.
Subclass of the NSTextFieldMBS class.

33.22.2 Methods

33.22.3 addItemWithObjectValue(value as Variant)

Function: Adds an object to the end of the receiver’s internal item list.
Notes:
anObject: The object to add to the internal item list.
This method logs a warning if usesDataSource returns true.

33.22.4 Constructor

Function: Creates a new button with size 100/100 and position 0/0
Example:

dim t as new NSComboBoxMBS(0, 0, 100, 20)

Notes: On success the handle property is not zero.
See also:

- 33.22.5 Constructor(Handle as Integer) 6414
- 33.22.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6414
33.22.5 Constructor(Handle as Integer)

Function: Creates an object based on the given NSComboBox handle.
Example:

```vba
dim t as new NSComboBoxMBS(0, 0, 100, 100)
dim v as new NSComboBoxMBS(t.handle)
MsgBox str(v.Bounds.Width)\" x \" + str(v.Bounds.Height)
```

Notes: The handle is casted to a NSComboBox and the plugin retains this handle.
See also:
- 33.22.4 Constructor
- 33.22.6 Constructor (left as Double, top as Double, width as Double, height as Double)

33.22.6 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new combo box with the given size and position.
Example:

```vba
dim left,top,width,height as Integer
// define rectangle
dim x as new NSComboBoxMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:
- 33.22.4 Constructor
- 33.22.5 Constructor(Handle as Integer)

33.22.7 deselectItemAtIndex(index as Integer)

Function: Deselects the pop-up list item at the specified index if it’s selected.
Notes:

index: The index of the item to deselect.
If the selection does in fact change, this method posts an NSComboBoxSelectionDidChangeNotification to the default notification center.

### 33.22.8 indexOfItemWithObjectValue(value as Variant) as Integer

**Function:** Searches the receiver’s internal item list for the specified object and returns the lowest matching index.

**Notes:**
- **anObject:** The object for which to return the index.

Returns the lowest index in the internal item list whose corresponding value is equal to that of the specified object. Objects are considered equal if they have the same id or if isEqual returns true.

If none of the objects in the receiver’s internal item list are equal to anObject, indexOfItemWithObjectValue returns NSNotFound (-1).

This method logs a warning if usesDataSource returns true.

### 33.22.9 indexOfSelectedItem as Integer

**Function:** Returns the index of the last item selected from the pop-up list.

**Notes:**
- Returns the index of the last item selected from the receiver’s pop-up list or -1 if no item is selected.

Note that nothing is initially selected in a newly initialized combo box.

### 33.22.10 noteNumberOfItemsChanged

**Function:** Informs the receiver that the number of items in its data source has changed.

**Notes:**
- This method allows the receiver to update the scrollers in its displayed pop-up list without actually reloading data into the receiver. It is particularly useful for a data source that continually receives data in the background over a period of time, in which case the NSComboBox can remain responsive to the user while the data is received.
33.22.11  **numberOfItems as Integer**

**Function:** Returns the total number of items in the pop-up list.

33.22.12  **reloadData**

**Function:** Marks the receiver as needing redisplay, so that it will reload the data for visible pop-up items and draw the new values.

33.22.13  **removeAllItems**

**Function:** Removes all items from the receiver’s internal item list.  
**Notes:** This method logs a warning if usesDataSource returns true.

33.22.14  **removeItemAtIndex(index as Integer)**

**Function:** Removes the object at the specified location from the receiver’s internal item list.  
**Notes:**

index: The index of the object to remove. All items beyond index are moved up one slot to fill the gap.

The removed object receives a release message. This method raises an NSRangeException if index is beyond the end of the list and logs a warning if usesDataSource returns true.

33.22.15  **removeItemWithValue(value as Variant)**

**Function:** Removes all occurrences of the given object from the receiver’s internal item list.  
**Notes:**
anObject: The object to remove from the internal item list. Objects are considered equal if they have the same id or if isEqual: returns true.

This method logs a warning if usesDataSource returns true.

33.22.16 scrollItemAtIndexPathToTop(index as Integer)

Function: Scrolls the receiver’s pop-up list vertically so that the item at the specified index is as close to the top as possible.
Notes:
index: The index of the item to scroll to the top.

The pop-up list need not be displayed at the time this method is invoked.

33.22.17 scrollItemAtIndexPathToVisible(index as Integer)

Function: Scrolls the receiver’s pop-up list vertically so that the item at the specified index is visible.
Notes:
index: The index of the item to make visible.

The pop-up list need not be displayed at the time this method is invoked.

33.22.18 selectItemAtIndexPath(index as Integer)

Function: Selects the pop-up list row at the given index.
Notes:
index: The index of the item to select in the pop-up list.

Posts an NSComboBoxSelectionDidChangeNotification to the default notification center if the selection does in fact change. Note that this method does not alter the contents of the combo box’s text field see Setting the Combo Box’s Value for more information.
CHAPTER 33. COCOA CONTROLS

33.22.19 selectItemWithObjectValue (value as Variant)

Function: Selects the first pop-up list item that corresponds to the given object.

Notes:

anObject: The object to select in the pop-up list. Objects are considered equal if they have the same id or
if isEqual: returns true.

This method logs a warning if usesDataSource returns true. Posts an NSComboBoxSelectionDidChangeNotification to the default notification center if the selection does in fact change. Note that this method doesn’t alter the contents of the combo box’s text field; see Setting the Combo Box’s Value for more information.

33.22.20 Properties

33.22.21 completes as boolean

Function: Returns a Boolean value indicating whether the receiver tries to complete what the user types
in the text field.

Notes:

Returns true if the receiver tries to complete what the user types in the text field; otherwise false.
(Read and Write computed property)

33.22.22 hasVerticalScroller as boolean

Function: Returns a Boolean value indicating whether the receiver will display a vertical scroller.

Notes:

Returns true if the receiver will display a vertical scroller; otherwise false.

Note that the scroller will be displayed even if the pop-up list contains fewer items than will fit in the area
specified for display.
(Read and Write computed property)

33.22.23 intercellSpacing as NSSizeMBS

Function: Returns the horizontal and vertical spacing between cells in the receiver’s pop-up list.
Notes:
Returns the space between cells in the pop-up list. The default spacing is (3.0, 2.0).
(Read and Write computed property)

33.22.24 isButtonBordered as boolean

Function: Whether the combo box button is set to display a border.
Notes:
True if the button has a border; otherwise false.
Available in Mac OS X v10.3 and later
(Read and Write computed property)

33.22.25 itemHeight as Double

Function: Returns the height of each item in the receiver’s pop-up list.
Notes:
The default item height is 16.0.
(Read and Write computed property)

33.22.26 numberOfVisibleItems as Integer

Function: Returns the maximum number of items visible in the pop-up list.
Notes:
The maximum number of items visible at any one time in the pop-up list.
(Read and Write computed property)

33.22.27 usesDataSource as boolean

Function: A Boolean value indicating whether the receiver uses an external data source to populate its pop-up list.
Notes:
True if the receiver uses an external data source to populate the receiver’s pop-up list, false if it uses an internal item list.
(Read and Write computed property)
33.23   CLASS NSCONTROLMBS

33.23   class NSControlMBS

33.23.1   class NSControlMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for a NSControl.
**Notes:**
You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

33.23.2   Methods

33.23.3   calcSize

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Recomputes any internal sizing information for the receiver, if necessary.
**Notes:** This method uses the calcDrawInfo method of its cell to perform the calculations. Most controls maintain a flag that informs them if any of their cells have been modified in such a way that the location or size of the cell should be recomputed. If such a modification happens, this method is automatically invoked before the control is displayed. You should never need to invoke it yourself.

33.23.4   ConnectActionEvent

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Connects the action event.
**Notes:** If you want to use addhandler with this class and the action event, you need to call ConnectActionEvent after addhandler to actually have the plugin put things in place for handling the event.

33.23.5   Constructor

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new control with size 100/100 and position 0/0
**Example:**
```dim t as new NSControlMBS```

**Notes:** On success the handle property is not zero.
See also:
• 33.23.6 Constructor(Handle as Integer) 6422

• 33.23.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6422

### 33.23.6 Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSControl handle.

**Example:**

```vba
dim t as new NSControlMBS(0, 0, 100, 100)
dim v as new NSControlMBS(t.handle)
```

**Notes:** The handle is casted to a NSControl and the plugin retains this handle.

See also:

• 33.23.5 Constructor 6421

• 33.23.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6422

### 33.23.7 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new control with the given size and position.

**Example:**

```vba
dim x as new NSControlMBS(0, 0, 100, 20)
```

**Notes:** On success the handle property is not zero.

See also:

• 33.23.5 Constructor 6421

• 33.23.6 Constructor(Handle as Integer) 6422

### 33.23.8 currentEditor as NSTextMBS

**Function:** Returns the current field editor for the control.

**Notes:**
Returns the field editor for the current control, or nil if the receiver does not have a field editor.

When the receiver is a control displaying editable text (for example, a text field) and it is the first responder, it has a field editor, which is returned by this method. The field editor is a single NSTextView object that is shared among all the controls in a window for light text-editing needs. It is automatically instantiated when needed.

### 33.23.9 Destructor

MBS MacCocoa Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

### 33.23.10 EnableEvents

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables events after you assigned methods to them with AddHandler.

### 33.23.11 performClick

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Simulates a single mouse click on the receiver. **Notes:** This method calls the performClick method of the receiver’s cell. This method raises an exception if the action message cannot be successfully sent.

### 33.23.12 selectCell(Cell as NSCellMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the specified cell and redraws the control as needed. **Notes:** Cell: The cell to select. The cell must belong to the receiver. If the cell is already selected (or does not belong to the receiver), this method does nothing. If the cell belongs to the receiver and is not selected, this method changes its state to NSOnState and redraws the cell.
33.23.13 selectedCell as NSCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s selected cell. **Notes:** The default implementation of this method simply returns the control’s associated cell (or nil if no cell has been set). Subclasses of NSControl that manage multiple cells (such as NSMatrix and NSForm) must override this method to return the cell selected by the user.

33.23.14 selectedTag as Integer

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tag of the view’s selected cell.

33.23.15 setNeedsDisplay

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Marks the receiver as needing redisplay (assuming automatic display is enabled). **Notes:** This method also recalculates the dimensions of the control as needed.

33.23.16 sizeToFit

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resizes the receiver’s frame so that it is the minimum size needed to contain its cell. **Notes:** If you want a multiple-cell custom subclass of NSControl to size itself to fit its cells, you must override this method. This method neither redispays the receiver nor marks it as needing display. You must do this yourself with either the display or setNeedsDisplay method.

33.23.17 validateEditing

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Validates changes to any user-typed text. **Notes:** Validation sets the object value of the cell to the current contents of the cell’s editor (the NSText object used for editing), storing it as a simple string or an attributed string object based on the attributes of the editor.
### 33.23.18 Properties

#### 33.23.19 ActionSelector as String

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the selector.

**Notes:**

The new action-message selector to associate with the receiver’s cell. Specify NULL to prevent action messages from being sent to the receiver’s target. (Read and Write computed property)

#### 33.23.20 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The alignment mode of the text in the view’s cell.

**Example:**

```plaintext
dim n as NSControlMBS // your control
n.alignment=3
```

**Notes:**

One of the following constants: NSLeftTextAlignment, NSRightTextAlignment, NSCenterTextAlignment, NSJustifiedTextAlignment, or NSNaturalTextAlignment. The default value is NSNaturalTextAlignment.

**Constants:**

- **NSLeftTextAlignment** = 0
  
  Text is visually left aligned.

- **NSRightTextAlignment** = 1
  
  Text is visually right aligned.

- **NSCenterTextAlignment** = 2
  
  Text is visually center aligned.

- **NSJustifiedTextAlignment** = 3
  
  Text is justified.

- **NSNaturalTextAlignment** = 4
(Read and Write computed property)

33.23.21 attributedStringValue as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the view’s cell as an attributed string.

**Notes:**
The value of the cell interpreted as an attributed string, or an empty attributed string if the receiver has no cell.

If the control contains many cells (for example, NSMatrix), then the value of the currently selected cell is returned. If the control is in the process of editing the affected cell, then it invokes the validateEditing method before extracting and returning the value.

(Read and Write computed property)

33.23.22 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The initial writing direction used to determine the actual writing direction for text.

**Notes:**
One of the following values: NSWritingDirectionNatural, NSWritingDirectionLeftToRight, or NSWritingDirectionRightToLeft. The default value is NSWritingDirectionNatural.

The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly.

(Read and Write computed property)

33.23.23 cell as Variant

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s cell object.

**Notes:**
Cocoa controls often have a frame control and inside a Cell which implements the raw functionality. This way you can for example have a table which embeds such cell controls inside the table cells.

Use this method with great care as it can irrevocably damage the affected control; specifically, you should only use this method in initializers for subclasses of NSControl.
33.23.24 doubleValue as Double

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The double value of the control.
**Notes:** (Read and Write computed property)

33.23.25 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The font used to draw text in the receiver’s cell.
**Notes:**
If the cell is being edited, the text in the cell is redrawn in the new font, and the cell’s editor (the NSText object used globally for editing) is updated with the new font object.
(Read and Write computed property)

33.23.26 ignoresMultiClick as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the receiver ignores multiple clicks made in rapid succession.
**Example:**
```python
dim n as NSControlMBS // your control
n.ignoresMultiClick=True
```

**Notes:**
True if the view ignores multiple clicks; otherwise, false.
(Read and Write computed property)

33.23.27 integerValue as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the receiver’s cell as an Integer value.
**Notes:**
If the control contains many cells (for example, NSMatrix), then the value of the currently selected cell is returned. If the control is in the process of editing the affected cell, then it invokes the validateEditing
method before extracting and returning the value.

Available in OS X v10.5 and later.
(Read and Write computed property)

### 33.23.28 intValue as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The integer value of the control.  
**Example:**
```
dim n as new nsbuttonMBS(0,0,100,100)

n.intValue=1
MsgBox str(n.intValue) // shows 1
n.intValue=0
MsgBox str(n.intValue) // shows 0
```

**Notes:** (Read and Write computed property)

### 33.23.29 isContinuous as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver’s cell sends its action message continuously to its target during mouse tracking.  
**Notes:**
True if the action message should be sent continuously; otherwise, false.  
(Read and Write computed property)

### 33.23.30 isEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver reacts to mouse events.  
**Notes:**
True if the view responds to mouse events; otherwise, false.  
(Read and Write computed property)
33.23. CLASS NSCONTROLMBS

33.23.31 refusesFirstResponder as boolean

**Function:** Whether the receiver refuses the first responder role.  
**Notes:**  
By default, the user can advance the focus of keyboard events between controls by pressing the Tab key; when this focusor first responder status is indicated for a control (by the insertion point or, for nontext controls, a faint rectangle), the user can activate the control by pressing the Space bar.  
(Read and Write computed property)

33.23.32 stringValue as string

**Function:** The string value of the control.  
**Notes:** (Read and Write computed property)

33.23.33 tag as Integer

**Function:** The tag identifying the object.  
**Notes:**  
You can set this property to the value you need.  
(Read and Write computed property)

33.23.34 Events

33.23.35 Action

**Function:** The control’s action was triggered.  
**Notes:** For a button if it was pressed.

33.23.36 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

**Function:** Sent when a control with editable text begins an editing session.  
**Notes:**
CHAPTER 33. COCOA CONTROLS

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See TextDidEndEditing for an explanation of why you may not always get one invocation of TextDidBeginEditing for each invocation of TextDidEndEditing.

33.23.37 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

Function: Sent when the text in the receiving control changes.

Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

33.23.38 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

Function: Sent when a control with editable text ends an editing session.

Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing:
notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

### 33.23.39 textShouldBeginEditing(fieldEditor as NSTextField) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called to decide whether text editing should be allowed.

**Notes:**
Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

### 33.23.40 textShouldEndEditing(fieldEditor as NSTextField) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called to decide whether ending text editing should be allowed.

**Notes:**
Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.
33.24 control NSDatePickerControllerMBS

33.24.1 control NSDatePickerControllerMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control to put a Mac OS X date picker on a Xojo window.
Notes: This control embeds a special NSDatePicker subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlying object and set properties.

33.24.2 Properties

33.24.3 View as NSDatePickerControllerMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The reference to the underlying NSDatePicker.
Notes: (Read only property)

33.24.4 Events

33.24.5 Action

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called when user clicks on a date/time and changes something.

33.24.6 BoundsChanged

Function: The event called when the bounds, but not the frame, changed.

33.24.7 EnableMenuItems

Function: The event where you can enable menu items.
33.24.8 FrameChanged

*Function:* The event called when the frame changed.

33.24.9 GotFocus

*Function:* The control itself got focus.
*Notes:* This only fires if the control itself got focus and not a sub control.

33.24.10 LostFocus

*Function:* The control lost focus.
*Notes:* This only fires if the control itself lost focus and not a sub control.

33.24.11 MenuAction(HitItem as MenuItem) As Boolean

*Function:* Called when a menuitem is choosen.
*Notes:* This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

33.24.12 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

*Function:* The mouse button was pressed inside the controls region at the location passed in to x, y.
*Notes:*

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.

Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.
33.24.13 MouseDrag(x as Integer, y as Integer)

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the
mouse has really moved.

33.24.14 MouseUp(x as Integer, y as Integer)

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's
boundaries.

33.24.15 ScaleFactorChanged(NewFactor as Double)

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.
33.25 class NSDatePickerMBS

Function: The plugin class for a Cocoa date picker.
Notes:
NSDatePicker is a subclass of NSControl that provides a user interface for displaying and editing an NSDate object.
Subclass of the NSControlMBS class.

33.25.2 Methods

33.25.3 Constructor

Function: Creates a new date picker with size 100/100 and position 0/0
Example:
```
dim t as new NSDatePickerMBS
```

Notes: On success the handle property is not zero.

See also:
- 33.25.4 Constructor(Handle as Integer)
- 33.25.5 Constructor(left as Double, top as Double, width as Double, height as Double)

33.25.4 Constructor(Handle as Integer)

Function: Creates an object based on the given NSDatePicker handle.
Example:
```
dim t as new NSDatePickerMBS(0, 0, 100, 100)
dim v as new NSDatePickerMBS(t.handle)
MsgBox str(v.Bounds.Width) + ” x ” + str(v.Bounds.Height)
```

Notes: The handle is casted to a NSDatePicker and the plugin retains this handle.
See also:
33.25.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new date picker with the given size and position.
Example:
```vba
dim x as new NSDatePickerMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:
- 33.25.3 Constructor
- 33.25.4 Constructor(Handle as Integer)

33.25.6 Properties

33.25.7 backgroundColor as NSColorMBS

Function: The background color.
Notes:
See also drawsBackground property.
(Read and Write computed property)

33.25.8 Bezeled as Boolean

Function: Whether the receiver has a bezeled border.
Notes:
True if the receiver has a bezeled border, false otherwise.
(Read and Write computed property)
33.25.9 Bordered as Boolean

**Function:** Whether the receiver has a plain border.
**Notes:**
True if the receiver has a plain border, false otherwise.
(Read and Write computed property)

33.25.10 calendar as NSCalendarMBS

**Function:** The calendar.
**Notes:** (Read and Write computed property)

33.25.11 datePickerElements as Integer

**Function:** A bitmask that indicates which visual elements of the date picker are currently shown, and which won’t be usable because they are hidden.
**Notes:** (Read and Write computed property)

33.25.12 datePickerMode as Integer

**Function:** The date picker mode.
**Notes:** (Read and Write computed property)

33.25.13 datePickerStyle as Integer

**Function:** The date picker style.
**Notes:** (Read and Write computed property)

33.25.14 dateValue as date

**Function:** The current date value.
CHAPTER 33. COCOA CONTROLS

Notes: (Read and Write computed property)

33.25.15 drawsBackground as Boolean

Function: Whether the receiver draws the background.
Notes:
True if the receiver draws the background, false otherwise.
(Read and Write computed property)

33.25.16 locale as NSLocaleMBS

Function: The locale.
Notes: (Read and Write computed property)

33.25.17 maxDate as date

Function: The maximum date.
Notes:
nil indicates no maximum date.
(Read and Write computed property)

33.25.18 minDate as date

Function: The minimum date.
Notes:
nil indicates no minimum date.
(Read and Write computed property)

33.25.19 textColor as NSColorMBS

Function: The text color.
33.25. **CLASS NSDATEPICKERMBS**

Notes: (Read and Write computed property)

### 33.25.20 timeInterval as Double

**Function:** The time interval that represents the date range.

**Notes:**
The time interval that represents the receiver’s date range. The date range begins at the date returned by dateValue. This method returns 0 when the receiver is not in the NSRangeDateMode mode.

(Read and Write computed property)

### 33.25.21 timeZone as NSTimeZoneMBS

**Function:** The time zone.

**Notes:** (Read and Write computed property)

### 33.25.22 Constants

### 33.25.23 NSClockAndCalendarDatePickerStyle = 1

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** A constants for a date picker style.

**Notes:** Provide a visual clock and calendar style interface.

### 33.25.24 NSEraDatePickerElementFlag = & h100

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.

**Notes:**
Display and allow editing of the era of the date, if applicable.
This flag has been declared for possible future use, and does not yet have any effect.

### 33.25.25 NSHourMinuteDatePickerElementFlag = & hC

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.
CHAPTER 33. COCOA CONTROLS

Notes: Display and allow editing of the hour and minute elements of the date.

33.25.26 **NSHourMinuteSecondDatePickerElementFlag = & hE**

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.

Notes: Display and allow editing of the hour, minute and second elements of the date.

33.25.27 **NSRangeDateMode = 1**

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants to define whether the control provides a single date, or a range of dates.

Notes: Allow selection of a range of dates. (First implemented in Mac OS X v 10.5.)

33.25.28 **NSSingleDateMode = 0**

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants to define whether the control provides a single date, or a range of dates.

Notes: Allow selection of a single date.

33.25.29 **NSTextFieldAndStepperDatePickerStyle = 0**

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** A constants for a date picker style.

Notes: Provide a text field and stepper style interface.

33.25.30 **NSTextFieldDatePickerStyle = 2**

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** A constants for a date picker style.

Notes: Provide a text field interface.

33.25.31 **NSTimeZoneDatePickerElementFlag = & h10**

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.

Notes:
Display and allow editing of the time zone.
This flag has been declared for possible future use, and does not yet have any effect.

### 33.25.32 NSYearMonthDatePickerElementFlag = & hC0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.
**Notes:** Display and allow editing of the year and month elements of the date.

### 33.25.33 NSYearMonthDayDatePickerElementFlag = & hE0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.
**Notes:** Display and allow editing of the year, month and day elements of the date.
33.26 class NSImageCellMBS

33.26.1 class NSImageCellMBS

**Function:** An NSImageCell object displays a single image (encapsulated in an NSImage object) in a frame.

**Notes:**
This class provides methods for choosing the frame and for aligning and scaling the image to fit the frame.

The object value of an NSImageCell object must be an NSImage object, so if you use the setObjectValue: method of NSCell, be sure to supply an NSImage object as an argument. Because an NSImage object does not need to be converted for display, do not use the NSCell methods relating to formatters.

An NSImageCell object is usually associated with some kind of control object an NSImageView, an NSMatrix, or an NSTableView.

Subclass of the NSCellMBS class.

33.26.2 Methods

33.26.3 Constructor(image as NSImageMBS)

**Function:** Creates a new Cell object with an image.

**Example:**
```
Dim pic As Picture = LogoMBS(500)
Dim n As NSImageMBS = New NSImageMBS(pic)
Dim c As New NSImageCellMBS(n)
```

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath

See also:
- 33.26.4 Constructor(text as string)

33.26.4 Constructor(text as string)

**Function:** Creates a new Cell object with a text.

**Example:**
33.26. **CLASS NSIMAGECELLMBS**

```ruby
dim c as new NSImageCellMBS("Hello")
MsgBox c.StringValue
```

See also:

- 33.26.3 Constructor(image as NSImageMBS)

33.26.5 Properties

33.26.6 `imageAlignment` as Integer

**Function:** The alignment of the receiver’s image relative to its frame.
**Notes:**
For a list of possible values, see NSImageAlign* constants. The default value is NSImageAlignCenter.
(Read and Write property)

33.26.7 `imageFrameStyle` as Integer

**Function:** The style of the frame that borders the image.
**Notes:**
Value is one of the frame style constants. For a list of frame styles, see NSImageFrame* constants.
(Read and Write property)

33.26.8 `imageScaling` as Integer

**Function:** The scaling mode used to fit the receiver’s image into the frame.
**Notes:**
Value is one of the image scaling constants. For a list of possible values, see NSScale* constants.
(Read and Write property)
33.26.9 Constants

33.26.10 NSImageAlignBottom = 5

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
**Notes:** Align the image with the bottom edge of the cell.

33.26.11 NSImageAlignBottomLeft = 6

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
**Notes:** Align the image with the bottom and left edges of the cell.

33.26.12 NSImageAlignBottomRight = 7

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
**Notes:** Align the image with the bottom and right edges of the cell.

33.26.13 NSImageAlignCenter = 0

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
**Notes:** Center the image in the cell.

33.26.14 NSImageAlignLeft = 4

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
**Notes:** Align the image with the left edge of the cell.

33.26.15 NSImageAlignRight = 8

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
33.26. CLASS NSIMAGECELLMBS

Notes: Position the image along the right edge of the cell.

33.26.16  NSImageAlignTop = 1

MBS MacCocoa Plugin, Plugin Version: 10.0. Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Position the image along the top edge of the cell.

33.26.17  NSImageAlignTopLeft = 2

MBS MacCocoa Plugin, Plugin Version: 10.0. Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the top and left edges of the cell.

33.26.18  NSImageAlignTopRight = 3

MBS MacCocoa Plugin, Plugin Version: 10.0. Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the top and right edges of the cell.

33.26.19  NSImageFrameButton = 4

MBS MacCocoa Plugin, Plugin Version: 10.0. Function: One of the frame constants for the image-FrameStyle property.
Notes: A convex bezel that makes the image stand out in relief, like a button.

33.26.20  NSImageFrameGrayBezel = 2

MBS MacCocoa Plugin, Plugin Version: 10.0. Function: One of the frame constants for the image-FrameStyle property.
Notes: A gray, concave bezel that makes the image look sunken.

33.26.21  NSImageFrameGroove = 3

MBS MacCocoa Plugin, Plugin Version: 10.0. Function: One of the frame constants for the image-FrameStyle property.
Notes: A thin groove that looks etched around the image

33.26.22  **NSImageFrameNone = 0**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the image-FrameStyle property.
**Notes:** An invisible frame

33.26.23  **NSImageFramePhoto = 1**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the image-FrameStyle property.
**Notes:** A thin black outline and a dropped shadow

33.26.24  **NSScaleNone = 2**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

33.26.25  **NSScaleProportionally = 0**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

33.26.26  **NSScaleToFit = 1**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.
33.27. CLASS NSIMAGEVIEWMBS

33.27  class NSImageViewMBS

33.27.1  class NSImageViewMBS

**Function:** An NSImageView object displays a single image from an NSImage object in a frame and can optionally allow a user to drag an image to it.

**Example:**

```
ImageWell1.NSImageViewMBS.alphaValue = 0.5
```

**Notes:**

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSControlMBS class.

33.27.2  Methods

33.27.3  Constructor

**Function:** Creates a new imageview with size 100/100 and position 0/0

**Example:**

```
dim t as new NSImageViewMBS
```

**Notes:** On success the handle property is not zero.

See also:

- 33.27.4 Constructor(Handle as Integer)
- 33.27.5 Constructor(left as Double, top as Double, width as Double, height as Double)

33.27.4  Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSImageView handle.

**Example:**

```
dim t as new NSImageViewMBS(0, 0, 100, 100)
dim v as new NSImageViewMBS(t.handle)
```
CHAPTER 33. COCOA CONTROLS

MsgBox str(v.Bounds.Width)+” x ”+str(v.Bounds.Height)

Notes: The handle is casted to a NSImageView and the plugin retains this handle. See also:

- 33.27.3 Constructor
- 33.27.5 Constructor(left as Double, top as Double, width as Double, height as Double)

33.27.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new image view with the given size and position.
Example:

dim x as new NSImageViewMBS(0, 0, 100, 100)

Notes: On success the handle property is not zero. See also:

- 33.27.3 Constructor
- 33.27.4 Constructor(Handle as Integer)

33.27.6 Properties

33.27.7 allowsCutCopyPaste as Boolean

Function: Whether the receiver allows the user to cut, copy and paste the image contents.
Notes:

True if the user can cut, copy, and paste the image contents; otherwise, false to prevent the use of pasteboard operations.
(Read and Write computed property)

33.27.8 animates as Boolean

Function: A Boolean value indicating whether the receiver automatically plays animated images.
Notes:
33.27. CLASS NSIMAGEVIEWMBS

True if the receiver automatically plays animated images; otherwise, false. The default value is true for NSImageView objects you create programmatically. For NSImageView objects loaded from a nib file, the control takes the value set in Interface Builder.

The timing and looping characteristics of the animation are taken from the image data. If this method returns false, the receiver displays the first frame of the animation only.
(Read and Write computed property)

33.27.9 image as NSImageMBS

Function: Returns the NSImage object displayed by the receiver.
Notes: (Read and Write computed property)

33.27.10 imageAlignment as Integer

Function: The alignment of the receiver’s image relative to its frame.
Notes:
For a list of possible values, see NSImageAlign* constants. The default value is NSImageAlignCenter.
(Read and Write computed property)

33.27.11 imageFrameStyle as Integer

Function: The style of the frame that borders the image.
Example:
ImageWell1.NSImageViewMBS.imageFrameStyle = NSImageViewMBS.NSImageFramePhoto

Notes:
Value is one of the frame style constants. For a list of frame styles, see NSImageFrame* constants.
(Read and Write computed property)
33.27.12 imageScaling as Integer

Function: The scaling mode used to fit the receiver’s image into the frame.
Example:
ImageWell1.NSImageViewMBS.imageScaling = NSImageViewMBS.NSScaleNone

Notes:
Value is one of the image scaling constants. For a list of possible values, see NSScale* constants.
(Read and Write computed property)

33.27.13 isEditable as Boolean

Function: Whether the user can drag a new image into the frame.
Notes:
True if the user can drag an image into the receiver’s frame; otherwise, false.
(Read and Write computed property)

33.27.14 Constants

33.27.15 NSImageAlignBottom = 5

MBS MacControls Plugin, Plugin Version: 10.0. Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom edge of the cell.

33.27.16 NSImageAlignBottomLeft = 6

MBS MacControls Plugin, Plugin Version: 10.0. Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom and left edges of the cell.
33.27.17 NSImageAlignBottomRight = 7

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.  
**Notes:** Align the image with the bottom and right edges of the cell.

33.27.18 NSImageAlignCenter = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.  
**Notes:** Center the image in the cell.

33.27.19 NSImageAlignLeft = 4

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.  
**Notes:** Align the image with the left edge of the cell.

33.27.20 NSImageAlignRight = 8

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.  
**Notes:** Position the image along the right edge of the cell.

33.27.21 NSImageAlignTop = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.  
**Notes:** Position the image along the top edge of the cell.

33.27.22 NSImageAlignTopLeft = 2

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.  
**Notes:** Align the image with the top and left edges of the cell.
33.27.23 NSImageAlignTopRight = 3

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property. **Notes:** Align the image with the top and right edges of the cell.

33.27.24 NSImageFrameButton = 4

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property. **Notes:** A convex bezel that makes the image stand out in relief, like a button

33.27.25 NSImageFrameGrayBezel = 2

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property. **Notes:** A gray, concave bezel that makes the image look sunken

33.27.26 NSImageFrameGroove = 3

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property. **Example:**

ImageWell1.NSImageViewMBS.imageFrameStyle = NSImageViewMBS.NSImageFrameGroove

**Notes:** A thin groove that looks etched around the image

33.27.27 NSImageFrameNone = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property. **Notes:** An invisible frame
33.27.28  NSImageFramePhoto = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the image-FrameStyle property.
**Notes:** A thin black outline and a dropped shadow

33.27.29  NSScaleNone = 2

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

33.27.30  NSScaleProportionally = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

33.27.31  NSScaleToFit = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.
33.28 class NSMenuItemCellMBS

33.28.1 class NSMenuItemCellMBS

Function: NSMenuItemCell is a class that handles the measurement and display of a single menu item in its encompassing frame.
Notes:
Instances of NSMenuItemCell work in conjunction with an NSMenuView object to control the overall appearance of the menu.
Subclass of the NSButtonCellMBS class.

33.28.2 Methods

33.28.3 calcSize

Function: Calculates the minimum required width and height of the receivers menu item.
Notes:
The calculated values are cached for future use. This method also calculates the sizes of individual components of the cells menu item and caches those values.
This method is invoked automatically when necessary. You should not need to invoke it directly.

33.28.4 Constructor(image as NSImageMBS)

Function: The private constructor.
Notes: Don’t use it.
See also:
- 33.28.5 Constructor(text as string) 6454

33.28.5 Constructor(text as string)

Function: The constructor.
See also:
- 33.28.4 Constructor(image as NSImageMBS) 6454
33.28. **CLASS NSMENUITEMCELLMBS**

### 33.28.6 Properties

#### 33.28.7 menuItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** The menu item object associated with the cell.  
**Notes:** (Read and Write property)

#### 33.28.8 needsDisplay as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** A Boolean value indicating whether the menu item needs to be displayed.  
**Notes:**  
Set this property to true when you want the menu item to be drawn.  
(Read and Write property)

#### 33.28.9 needsSizing as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** A Boolean value indicating whether the size of the menu needs to be calculated.  
**Notes:**  
When the value of this property is true, the next attempt to obtain size information about the menu cause the calcSize method to be called. When the value of the property is false, the size information is obtained from the currently cached values.  
Subclasses that drastically change the way a menu item is drawn can change the value of this property to update the menu item information. Other parts of your application should not need to change this property directly. The cell checks this value of this property as necessary when the content of its menu item changes.  
(Read and Write property)

#### 33.28.10 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** The integer tag of the selected menu item.  
**Notes:**  
If no item is selected, the value in this property is 0.  
(Read and Write property)
33.29 control NSOutlineControlMBS

33.29.1 control NSOutlineControlMBS

Function: The control for a NSOutlineView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

33.29.2 Properties

33.29.3 AcceptTabs as Boolean

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

33.29.4 allowsColumnReordering as Boolean

Function: A Boolean value indicating whether the table view allows the user to rearrange columns by dragging their headers.
Notes: The default value of this property is true, which allows the user to rearrange the table views columns. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

33.29.5 allowsColumnResizing as Boolean

Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging between their headers.
Notes: The default of this property is true, which allows the user to resize the table views columns. You can resize columns programmatically regardless of this setting.
(Read and Write property)
33.29. CONTROL NSOUTLINECONTROLMBS

33.29.6 allowsColumnSelection as Boolean

Function: A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.
Notes:
The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.
(Read and Write property)

33.29.7 allowsEmptySelection as Boolean

Function: A Boolean value indicating whether the table view allows the user to select zero columns or rows.
Notes:
The default is true, which allows the user to select zero columns or rows.
(Read and Write property)

33.29.8 allowsMultipleSelection as Boolean

Function: A Boolean value indicating whether the table view allows the user to select more than one column or row at a time.
Notes:
The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.
(Read and Write property)

33.29.9 autohidesScrollers as Boolean

Function: A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.
Notes:
The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn’t extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
33.29.10 hasHorizontalScroller as Boolean

Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes: When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed. The default value of this property is false.
(Read and Write property)

33.29.11 hasVerticalScroller as Boolean

Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes: When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed. The default value of this property is false.
(Read and Write property)

33.29.12 ScrollView as NSScrollViewMBS

Function: The scroll view used in this control.
Notes: (Read only property)

33.29.13 View as NSOutlineViewMBS

Function: The outline view used in this control.
Notes: (Read only property)
See also:

- 33.29.90 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS 6482
33.29.14 Events

33.29.15 acceptDrop(info as NSDraggingInfoMBS, item as NSOutlineViewItemMBS, index as Integer) as Boolean

Function: Returns a Boolean value that indicates whether a drop operation was successful.
Notes:
info: An object that contains more information about this dragging operation.
item: The parent of the item over which the cursor was placed when the mouse button was released.
index: The index of the child of item over which the cursor was placed when the mouse button was released.

Return true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can get the data for the drop operation from info using the draggingPasteboard method. The return value indicates success or failure of the drag operation to the system.

33.29.16 BoundsChanged

Function: The event called when the bounds, but not the frame, changed.

33.29.17 childOfItem(index as Integer, item as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

Function: Returns the child item at the specified index of a given item.
Notes:
index: The index of the child item from item to return.
item: An item in the data source.

Return the child item at index of item. If item is nil, returns the appropriate child item of the root object.

Children of a given parent item are accessed sequentially. In order for the collapsed state of the outline view to remain consistent when it is reloaded you must always return the same object for a specified child and item.

Do not call reloadData from this method.
This event is called very frequently, so it must be efficient.

### 33.29.18 ColumnDidMove(notification as NSNotificationMBS, OldColumn as Integer, NewColumn as Integer)

**Function:** Invoked whenever the user moves a column in the outline view.

### 33.29.19 ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

**Function:** Invoked whenever the user resizes a column in the outline view.

### 33.29.20 concludeDragOperation(info as NSDraggingInfoMBS)

**Function:** Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.  
**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object’s animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed from the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.
33.29. CONTROL NSOUTLINECONTROLMBS

33.29.21  dataCell(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSCellMBS

Function: Returns the cell to use in a given column for a given item.
Notes:
tableColumn: The table column for which the cell is required. This value may be nil.
item: The item for which the cell is required.

Return the cell to use in column tableColumn for item item, or nil. The cell must properly implement copyWithZone (since it may be copied by by the outline view).

You can return a different data cell for any particular combination of table column and item, or a cell that will be used for the entire row (a full-width cell). If tableColumn is non-nil, you should return a cell. Typically, you should default to returning the result from [tableColumn dataCellForRow:row].
When each row (identified by the item) is being drawn, this method is first called with a nil value for tableColumn. At this time, you can return a cell that is used to draw the entire row, acting like a group. If you do return a cell for the nil table column, your implementations of the other corresponding data source and delegate methods must be prepared to be invoked with a nil value for tableColumn. If do not return a cell for the nil table column, the method is called once for each column in the outline view, as usual.

33.29.22  didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

Function: Implemented to know when a new row view is added to the table.
Notes:
rowView: The new row view.
row: The row to which the view was added.

This event is for NSView-based outline views. At this point, you can choose to add in extra views or modify any properties on rowView.

33.29.23  didClickTableColumn(tableColumn as NSTableColumnMBS)

Function: Sent at the time the mouse button subsequently goes up in outlineView and tableColumn has been clicked without having been dragged anywhere.
33.29.24 **didDragTableColumn**(tableColumn as NSTableColumnMBS)

**Function:** Sent at the time the mouse button goes up in outlineView and tableColumn has been dragged during the time the mouse button was down.

33.29.25 **didRemoveRowView**(rowView as NSTableRowViewMBS, row as Integer)

**Function:** Implemented to know when a row view is removed from the table

**Notes:**
- rowView: The row view that was removed.
- row: The number of the row that was removed due to being moved offscreen, or -1 if the row was removed from the table so it is no longer valid.

The removed rowView may be reused by the table, so any additionally inserted views should be removed at this point.

33.29.26 **didTile**

**Function:** The tableview did tile.

**Notes:** The internal tile function properly sizes the table view and its header view and marks it as needing display.

33.29.27 **DoubleClick**

**Function:** The mouse made a double click.

33.29.28 **draggingEnded**(info as NSDraggingInfoMBS)

**Function:** Implement this event to be notified when a drag operation ends in some other destination.

**Notes:**
- sender: The object sending the message; use it to get details about the dragging operation.
- This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.
33.29.29 draggingExited(info as NSDraggingInfoMBS)

**Function:** Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

33.29.30 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

**Function:** Implement this method to know when the given dragging session has ended.

**Notes:**

session: The dragging session that ended.

screenPoint: The point onscreen at which the drag ended.

operation: A mask specifying the types of drag operations permitted by the dragging source.

You can implement this optional delegate method to know when the dragging source operation ended at a specific location, such as the trash (by checking for an operation of NSDragOperationDelete).
33.29.31  draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, draggedItems() as NSOutlineViewItemMBS)

Function: Implement this method know when the given dragging session is about to begin and potentially modify the dragging session.
Notes:
session: The dragging session that is about to begin.
screenPoint: The point onscreen at which the drag is to begin.
draggedItems: A array of items to be dragged, excluding items for which pasteboardWriterForItem returns nil.

The draggedItems array directly matches the pasteboard writer array used to begin the dragging session with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be used in acceptDrop when enumerating the NSDraggingInfo protocol’s pasteboard classes.

33.29.32  EnableMenuItems

Function: The event where you can enable menu items.

33.29.33  FrameChanged

Function: The event called when the frame changed.

33.29.34  GotFocus

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.
### 33.29.35 heightOfRowByItem(item as NSOutlineViewItemMBS) as Double

**Function:** Returns the height in points of the row containing item.

**Notes:**
- item: The row item.

Return the height of the row.

Values returned by this method should not include intercell spacing and must be greater than 0. Implement this event to support an outline view with varying row heights.

For large tables in particular, you should make sure that this method is efficient. NSOutlineView may cache the values this method returns, so if you would like to change a row’s height make sure to invalidate the row height by calling `noteHeightOfRowsWithIndexesChanged`. NSOutlineView automatically invalidates its entire row height cache in `reloadData` and `noteNumberOfRowsChanged`.

If you call `viewAtColumn` or `rowViewAtRow` within your implementation of this method, an exception is thrown.

To avoid the possibility of a hang due to unexpected recursion, don’t call geometry-calculating methods such as `bounds`, `rectOfColumn`, or any `NSTableView` method that calls `tile` within your implementation of this method.

### 33.29.36 isGroupItem(item as NSOutlineViewItemMBS) as Boolean

**Function:** Returns a Boolean that indicates whether a given row should be drawn in the group row style.

**Notes:**
- item: An item in the outline view.

Return true to indicate a particular row should have the ”group row” style drawn for that row, otherwise false.

If the cell in that row is an instance of `NSTextFieldCell` and contains only a string value, the group row style attributes are automatically applied for that cell.
CHAPTER 33. COCOA CONTROLS

33.29.37 isItemExpandable(item as NSOutlineViewItemMBS) as Boolean

Function: Returns a Boolean value that indicates whether the a given item is expandable.
Notes:
item: An item in the data source.

Returns true if item can be expanded to display its children, otherwise NO.

This method may be called quite often, so it must be efficient.

Do not call reloadData from this method.

33.29.38 ItemDidCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

Function: Invoked when the did collapse notification is posted that is, whenever the user collapses an item in the outline view.

33.29.39 ItemDidExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

Function: Invoked when notification is posted that is, whenever the user expands an item in the outline view.

33.29.40 itemForPersistentObject(PersistentObject as Variant) as NSOutlineViewItemMBS

Function: Invoked by outlineView to return the item for the archived object.
Notes:
object: An archived representation of an item in outlineView’s data source.

Return the unarchived item corresponding to object. If the item is an archived object, this method may return the object.
When the outline view is restoring the saved expanded items, this method is called for each expanded item, to translate the archived object to an outline view item.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

### 33.29.41 ItemWillCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

**Function:** Invoked when notification is posted that is, whenever the user is about to collapse an item in the outline view.

### 33.29.42 ItemWillExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

**Function:** Invoked when notification is posted that is, whenever the user is about to expand an item in the outline view.

### 33.29.43 LeftMouseDown(e as NSEventMBS) as Boolean

**Function:** Informs the receiver that the user has pressed the left mouse button.

**Notes:** This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

### 33.29.44 LeftMouseDragged(e as NSEventMBS) as Boolean

**Function:** Informs the receiver that the user has moved the mouse with the left button pressed.

**Notes:** This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.
33.29.45 **LeftMouseUp(e as NSEventMBS) as Boolean**

**Function:** Informs the receiver that the user has released the left mouse button.

**Notes:** This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.29.46 **LostFocus**

**Function:** The control lost focus.

**Notes:** This only fires if the control itself lost focus and not a sub control.

33.29.47 **MenuAction(HitItem as MenuItem) as Boolean**

**Function:** Called when a menuitem is choosen.

**Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

33.29.48 **MouseDown(x as Integer, y as Integer, Modifiers as Integer) as Boolean**

**Function:** The mouse button was pressed inside the controls region at the location passed in to x, y.

**Notes:**

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.

Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.
33.29.49  `mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)`

**Function:** Event sent whenever the mouse button is clicked in outlineView while the cursor is in a column header tableColumn.

33.29.50  `MouseDrag(x as Integer, y as Integer)`

**Function:** This event fires continuously after the mouse button was pressed inside the Control.
**Notes:**
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

33.29.51  `MouseUp(x as Integer, y as Integer)`

**Function:** The mouse button was released.
**Notes:** Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

33.29.52  `namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedItems() as NSOutlineViewItemMBS) as string()`

**Function:** Returns an array of filenames for the created files that the receiver promises to create.
**Notes:**
dropDestination: The drop location where the files are created.
items: The items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

For more information on file promise dragging, see documentation on the NSDraggingSource protocol and `namesOfPromisedFilesDroppedAtDestination`. 
CHAPTER 33. COCOA CONTROLS

33.29.53  nextTypeSelectMatchFromItem(startItem as NSOutlineViewItemMBS, endItem as NSOutlineViewItemMBS, searchString as String) as NSOutlineViewItemMBS

Function: Returns the first item that matches the searchString from within the range of startItem to endItem.
Notes:

startItem: The first item to search.
endItem: The item before which to stop searching. It is possible for endItem to be less than startItem if the search will wrap.
searchString: The string for which to search.

Returns the first item from within the range of startItem to endItem that matches the searchString, or nil if there is no match.

Implement this method if you want to control how type selection works. You should include startItem as a possible match, but do not include endItem.
It is not necessary to implement this event in order to support type select.

33.29.54  numberOfChildrenOfItem(item as NSOutlineViewItemMBS) as Integer

Function: Returns the number of child items encompassed by a given item.
Notes:

item: An item in the data source.

Returns the number of child items encompassed by item. If item is nil, this method should return the number of children for the top-level item.

The numberOfChildrenOfItem method is called very frequently, so it must be efficient.

Do not call reloadData from this method.
33.29. CONTROL NSOUTLINECONTROLMBS

33.29.55 objectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Variant

Function: Invoked by outlineView to return the data object associated with the specified item.
Notes:

tableColumn: A column in outlineView.
item: An item in the data source in the specified tableColumn of the view.

Returns the item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

33.29.56 OtherMouseDown(e as NSEventMBS) as Boolean

Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.29.57 OtherMouseDragged(e as NSEventMBS) as Boolean

Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.29.58 OtherMouseUp(e as NSEventMBS) as Boolean

Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.
CHAPTER 33. COCOA CONTROLS

33.29.59 pasteboardWriterForItem(item as NSOutlineViewItemMBS) as NSPasteboardItemMBS

**Function:** Implement this method to enable the table to be an NSDraggingSource that supports dragging multiple items.
**Notes:**

item: The item for which to return a pasteboard writer.

Returns a NSPasteboardItem object.

If this method is implemented, then writeItems is not called.

33.29.60 persistentObjectForItem(item as NSOutlineViewItemMBS) as Variant

**Function:** Invoked by outlineView to return an archived object for item.
**Notes:**

item: The item for which to return an archived object.

Returns an archived representation of item. If the item is an archived object, this method may return the item.

When the outline view is saving the expanded items, this method is called for each expanded item, to translate the outline view item to an archived object.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

33.29.61 RightMouseDown(e as NSEventMBS) as Boolean

**Function:** Informs the view that the user has pressed the right mouse button.
**Notes:** This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.
33.29. **CONTROL NSOUTLINECONTROLMBS**

33.29.62 **RightMouseDragged(e as NSEventMBS) as Boolean**

**Function:** Informs the receiver that the user has moved the mouse with the right button pressed.
**Notes:** This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.29.63 **RightMouseUp(e as NSEventMBS) as Boolean**

**Function:** Informs the receiver that the user has released the right mouse button.
**Notes:** This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.29.64 **rowViewForItem(item as NSOutlineViewItemMBS) as NSTableRowViewMBS**

**Function:** Implement this method to return a custom NSTableRowView for a particular item.
**Notes:**
item: The item displayed by the returned table row view.

Return an instance or subclass of NSTableRowView. If nil is returned, a NSTableRowView instance is created and used.

This method, if implemented, is only invoked for NSView-based outline views.

33.29.65 **ScaleFactorChanged(NewFactor as Double)**

**Function:** The backing store scale factor has changed.
**Notes:** Please invalidate any cached bitmaps or other relevant state.

33.29.66 **SelectionDidChange(notification as NSNotificationMBS)**

**Function:** Invoked when the selection did change notification is posted (that is, immediately after the outline views selection has changed).
### 33.29.67 selectionIndexesForProposedSelection

**MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.**

**Function:** Invoked to allow the delegate to modify the proposed selection.

**Notes:**

- `proposedSelectionIndexes`: An index set containing the indexes of the proposed selection.
- Return an `NSIndexSet` instance containing the indexes of the new selection. Return `proposedSelectionIndexes` if the proposed selection is acceptable, or the value of the table views existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of `willDisplayOutlineCell`.

If not implemented or returns `nil`, the plugin will return `proposedSelectionIndexes`.

### 33.29.68 SelectionIsChanging

**MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.**

**Function:** Invoked when notification is posted—that is, whenever the outline views selection changes.

### 33.29.69 selectionShouldChangeInOutlineView as Boolean

**MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns a Boolean value that indicates whether the outline view should change its selection.

**Notes:**

- Return `true` to permit outlineView to change its selection (typically a row being edited), `false` to deny permission.

For example, if the user is editing a cell and enters an improper value, the delegate can prevent the user from selecting or editing any other cells until a proper value has been entered into the original cell. You can implement this method for complex validation of edited rows based on the values of any of their cells.
33.29.70  setObjectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, value as Variant)

**Function:** Set the data object for a given item in a given column.
**Notes:**
- object: The new value for the item.
- tableColumn: A column in outlineView.
- item: An item in the data source in the specified tableColumn of the view.

The item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

33.29.71  shouldCollapseAutoExpandedItemsForDeposited(deposited as Boolean, superResult as Boolean) as Boolean

**Function:** Returns a Boolean value that indicates whether auto-expanded items should return to their original collapsed state.
**Notes:**
- deposited: If true, the drop terminated successfully; if false the drop failed.

Return true if auto-expanded items should return to their original collapsed state; otherwise false.

Implement this event to provide custom behavior. If the target of a drop is not auto-expanded (by hovering long enough) the drop target still gets expanded after a successful drop unless this method returns true. The default implementation returns false after a successful drop.
This method is called in a variety of situations. For example, it is called shortly after the acceptDrop method is called and also if the drag exits the outline view (exiting the view is treated the same as a failed drop). The return value of the acceptDrop method determines the incoming value of the deposited parameter.

33.29.72  shouldCollapseItem(item as NSOutlineViewItemMBS) as Boolean

**Function:** Returns a Boolean value that indicates whether the outline view should collapse a given item.
**Notes:**
- item: The item that should collapse.
Return true to permit outlineView to collapse item, false to deny permission.

You can implement this method to disallow collapsing of specific items. For example, if the first row of your outline view should not be collapsed, your delegate method could contain this line of code:

```
return rowForItem(item) <> 0
```

### 33.29.73 shouldEdit(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

**Function:** Returns a Boolean value that indicates whether the outline view should allow editing of a given item in a given table column.

**Notes:**
- `tableColumn`: The table column.
- `item`: The item.

Returns true to permit outlineView to edit the cell specified by `tableColumn` and `item`, false to deny permission.

If this method returns true, the cell may still not be editable for example, if you have set up a custom NSTextFieldCell as a data cell, it must return true for `isEditable` to allow editing.

You can implement this method to disallow editing of specific cells.

### 33.29.74 shouldExpandItem(item as NSOutlineViewItemMBS) as Boolean

**Function:** Returns a Boolean value that indicates whether the outline view should expand a given item.

**Notes:**
- `item`: The item that should expand.

Returns true to permit outlineView to expand item, false to deny permission.

You can implement this method to disallow expanding of specific items.
33.29.75 shouldReorderColumn(columnIndex as Integer, newColumnIndex as Integer) as Boolean

**Function:** Sent to the delegate to allow or prohibit the specified column to be dragged to a new location.
**Notes:**
- columnIndex: The index of the column being dragged.
- newColumnIndex: The proposed target index of the column.

Returns true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.
If this method is not implemented, all columns are considered reorderable.

33.29.76 shouldSelectItem(item as NSOutlineViewItemMBS) as Boolean

**Function:** Returns a Boolean value that indicates whether the outline view should select a given item.
**Notes:**
- item: The item.

Return true to permit outlineView to select item, false to deny permission.

You implement this event to disallow selection of particular items.
For better performance and finer grain control over the selection, use dataCell.

33.29.77 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as Boolean

**Function:** Returns a Boolean value that indicates whether the outline view should select a given table column.
**Notes:**
- tableColumn: The table column.
Return true to permit outlineView to select tableColumn, false to deny permission.

You can implement this method to disallow selection of specific columns.

33.29.78  shouldShowCellExpansion(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

Function: Invoked to allow the delegate to control cell expansion for a specific column and item.
Notes:

tableColumn: A table column in the outline view.
item: An item in the outline view.

Returns true to allow an expansion tooltip to appear in the column tableColumn for item item, otherwise false.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

33.29.79  shouldShowOutlineCellForItem(item as NSOutlineViewItemMBS) as Boolean

Function: Returns whether the specified item should display the outline cell (the disclosure triangle).
Notes:

item: An item in the outline view.

Returns true if the outline cell should be displayed, otherwise false.

Returning false causes frameOfOutlineCellAtRow to return NSZeroRect, hiding the cell. In addition, the row will not be collapsible by keyboard shortcuts. This method is called only for expandable rows.
33.29. **CONTROL NSOUTLINECONTROLMBS**

### 33.29.80 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

**Function**: Returns a Boolean value that indicates whether a given cell should be tracked.

**Notes**:
- cell: The cell used to display item in column tableColumn
- tableColumn: A table column in the outline view.
- item: An item in the outline view.

Returns true if the cell should be tracked for the item in column tableColumn, otherwise false.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked (and vice-versa). For example, this allows you to have a button cell in a table which does not change the selection, but can still be clicked on and tracked.

### 33.29.81 shouldTypeSelectForEvent(e as NSEventMBS, searchString as String) as Boolean

**Function**: Returns a Boolean value that indicates whether type select should proceed for a given event and search string.

**Notes**:
- e: The event that caused the message to be sent.
- searchString: The string for which searching is to proceed. The search string is nil if no type select has begun.

Return true if type select should proceed, otherwise false.

Generally, this method will be called from keyDown and the event will be a key event.

### 33.29.82 sizeToFitWidthOfColumn(Column as Integer) as Double

**Function**: Invoked to allow the delegate to provide custom sizing behavior when a columns resize divider is double clicked.

**Notes**:
- column: The index of the column.

Returns the width of the specified column.
By default, NSOutlineView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.
For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

33.29.83 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

Function: Invoked by an outline view to notify the data source that the descriptors changed and the data may need to be resorted.
Notes:
oldDescriptors: An array that contains the previous descriptors.
The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source does not itself manage them, you can get outlineView’s current sort descriptors by sending it a sortDescriptors message.

33.29.84 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextFieldMBS) as Boolean

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

33.29.85 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextFieldMBS) as Boolean

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.
33.29. CONTROL NSOUTLINECONTROLMBS

33.29.86 toolTipForCell(cell as NSCellMBS, byref rect as NSRectMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, mouseLocation as NSPointMBS) as String

Function: When the cursor pauses over a given cell, the value returned from this method is displayed in a tooltip.

Notes:

- cell: The cell for which to generate a tooltip.
- rect: The proposed active area of the tooltip. To control the default active area, you can modify the rect parameter. By default, rect is computed as cell.drawingRectForBounds(cellFrame).
- tc: The table column that contains cell.
- item: The item for which to display a tooltip.
- mouseLocation: The current mouse location in view coordinates.

If you don't want a tooltip at that location, return nil or the empty string.

33.29.87 typeSelectString(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as String

Function: Returns the string that is used for type selection for a given column and item.

Notes:

- tableColumn: A table column in the outline view.
- item: An item in the outline view.

Return the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil for that row and/or column to not be searched.

Implement this method if you want to control the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil to specify that the given row and/or column should not be searched. By default, all cells with text in them are searched.

The default value when this delegate method is not implemented is:
outlineView.preparedCellAtColumn(tableColumn, outlineView.rowForItem(item)).stringValue
and you can return this value from the event if you wish.
33.29.88 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

Function: Implement this method to enable the table to update dragging items as they are dragged over the view.
Notes: draggingInfo: The dragging info object.

33.29.89 validateDrop(info as NSDraggingInfoMBS, proposedItem as NSOutlineViewItemMBS, proposedChildIndex as Integer) as Integer

Function: Used by an outline view to determine a valid drop target.
Notes:
info: An object that contains more information about this dragging operation.
item: The proposed parent.
index: The proposed child location.

Returns a value that indicates which dragging operation the data source will perform.

Based on the mouse position, the outline view will suggest a proposed drop location. The data source may retarget a drop if desired by calling setDropItem and returning something other than NSDragOperationNone. You may choose to retarget for various reasons (for example, for better visual feedback when inserting into a sorted position). Implementation of this method is optional.

33.29.90 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS

Function: Implemented to return the view used to display the specified item and column.
Notes:
tableColumn: The table column, or nil if the row is a group row.
item: The item displayed by the returned view.

Return the view to display the specified column and row. Returning nil is acceptable, in which case a view is not shown at that location.

This method is required if you wish to use NSView objects instead of NSCell objects for the cells within an outline view. Cells and views cannot be mixed within the same outline view. It is recommended that the implementation of this method first call the NSTableView method make-
ViewWithIdentifier passing, respectively, the tableColumn parameters identifier and self as the owner to attempt to reuse a view that is no longer visible. The frame of the view returned by this method is not important, and is automatically set by the outline view.

The view’s properties should be properly set up before returning the result.

When using Cocoa bindings, this method is optional if at least one identifier has been associated with the table view at design time. If this method is not implemented, the outline view automatically calls makeViewWithIdentifier with the tableColumn parameters identifier and the outline views delegate as parameters, to attempt to reuse a previous view or automatically unarchive a prototype associated with the table view.

The autoresizingMask of the returned view is automatically set to NSViewHeightSizable to resize properly on row height changes.

See also:

- 33.29.13 View as NSOutlineViewMBS

### 33.29.91 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

**Function:** Informs the delegate that the cell specified by the column and item will be displayed.

**Notes:**

cell: The cell.
tableColumn: The table column.
item: The item.

You can implement this method to modify cell to provide further setup for the cell in tableColumn and item. It is not safe to do drawing inside this method you should only set up state for cell.

### 33.29.92 willDisplayOutlineCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

**Function:** Informs the delegate that an outline view is about to display a cell used to draw the expansion symbol.

**Notes:**

cell: The cell.
tableColumn: The table column.
item: The item.

Informs the event that outlineView is about to display cell an expandable cell (a cell that has the expansion symbol) for the column and item specified by tableColumn and item. The delegate can modify cell to alter its display attributes.

This method is not invoked when outlineView is about to display a non-expandable cell.
**33.29.93   willTile**

**Function:** The tableview will tile.

**Notes:** The internal tile function properly sizes the table view and its header view and marks it as needing display.

---

**33.29.94   writeItems(items() as NSOutlineViewItemMBS, pasteboard as NSPasteboardMBS) as Boolean**

**Function:** Returns a Boolean value that indicates whether a drag operation is allowed.

**Notes:**

items: An array of the items participating in the drag.
pasteboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, otherwise false.

Invoked by outlineView after it has been determined that a drag should begin, but before the drag has been started.

To refuse the drag, return false. To start a drag, return true and place the drag data onto the pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the outline view once this call returns with true.
33.30. CLASS NSOUTLINEVIEWITEMMBS

33.30 class NSOutlineViewItemMBS

33.30.1 class NSOutlineViewItemMBS

Function: The class to subclass for your items.

33.30.2 Methods

33.30.3 Constructor

Function: The constructor.

33.30.4 sortedArrayUsingDescriptor(values() as NSOutlineViewItemMBS, sort-Descriptor as NSSortDescriptorMBS) as NSOutlineViewItemMBS()

Function: Returns a copy of the receiving array sorted as specified by a given a sort descriptor.  
Notes: sortDescriptor: The NSSortDescriptor objects.  
Returns a copy of the receiving array sorted as specified by sortDescriptor.

33.30.5 sortedArrayUsingDescriptors(values() as NSOutlineViewItemMBS, sort-Descriptor() as NSSortDescriptorMBS) as NSOutlineViewItemMBS()

Function: Returns a copy of the receiving array sorted as specified by a given array of sort descriptors.  
Notes: sortDescriptors: An array of NSSortDescriptor objects.  
Returns a copy of the receiving array sorted as specified by sortDescriptors.

The first descriptor specifies the primary key path to be used in sorting the receiving arrays contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSortDescriptor for additional information.
33.30.6 Properties

33.30.7 Description as String

Function: The description text property.
Notes: (Read only property)
See also:
• 33.30.11 Description as String

33.30.8 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

33.30.9 valueForKey(key as String) as Variant

Function: Get/set the value for the property identified by a given key.
Notes:
key: The name of one of the receiver’s properties.
(Read and Write computed property)
See also:
• 33.30.14 valueForKey(key as string) as Variant

33.30.10 Events

33.30.11 Description as String

Function: The event when system queries description for object.
See also:
• 33.30.7 Description as String
33.30. **CLASS NSOUTLINEVIEWITEMMBS**

### 33.30.12 `setValueForKey(key as string, value as Variant)`

**Function:** Sets the property of the receiver specified by a given key to a given value.

**Notes:**

- **value:** The value for the property identified by key.
- **key:** The name of one of the receiver's properties.

If key identifies a to-one relationship, relate the object specified by value to the receiver, unrelating the previously related object if there was one. Given a collection object and a key that identifies a to-many relationship, relate the objects contained in the collection to the receiver, unrelating previously related objects if there were any.

The search pattern that `setValueForKey` uses is described in Accessor Search Patterns in Key-Value Coding Programming Guide.

In a reference-counted environment, if the instance variable is accessed directly, value is retained.

### 33.30.13 `setValueForUndefinedKey(key as string, value as Variant)`

**Function:** Invoked by `setValueForKey` when it finds no property for a given key.

**Notes:**

- **value:** The value for the key identified by key.
- **key:** A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to handle the request in some other way. The default implementation raises an `NSUndefinedKeyException`.

### 33.30.14 `valueForKey(key as string) as Variant`

**Function:** Return the value for the property identified by a given key.

**Notes:**

- **key:** The name of one of the receiver's properties.

Returns the value for the property identified by key.

If event is not implemented, the search pattern that `valueForKey` uses to find the correct value to return is described in Accessor Search Patterns in Key-Value Coding Programming Guide.

See also:
33.30.15 `valueForKey(key as String) as Variant`

**Function:** Invoked by valueForKey when it finds no property corresponding to a given key.

**Notes:**
- key: A string that is not equal to the name of any of the receiver’s properties.

Subclasses can override this method to return an alternate value for undefined keys. The default implementation raises an NSUndefinedKeyException.
33.31 class NSOutlineViewMBS

33.31.1 class NSOutlineViewMBS

**Function:** The class for a hierarchical list.

**Notes:**

NSOutlineView is a subclass of NSTableView that uses a row-and-column format to display hierarchical data that can be expanded and collapsed, such as directories and files in a file system. A user can expand and collapse rows, edit values, and resize and rearrange columns.

Like a table view, an outline view does not store its own data, instead it retrieves data values as needed from a data source to which it has a weak reference.

MBS Plugin provides all events in NSOutlineControlMBS control.

An outline view has the following features:

- A user can expand and collapse rows.
- Each item in the outline view must be unique. In order for the collapsed state to remain consistent between reloads the item’s pointer must remain the same and the item must maintain isEqual: sameness.
- The view gets data from a data source (see NSOutlineControlMBS).
- The view retrieves only the data that needs to be displayed.

Subclass of the NSTableViewMBS class.

33.31.2 Methods

33.31.3 child(index as Integer, toItem as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

**Function:** Returns the specified child of an item.

**Notes:**

index: The index of the child item in the parent.

item: The parent item whose child item you want to retrieve.
Returns the child item or nil if the item could not be found.

You can call this method on an outline view with either a static or dynamic data source. For an outline view whose contents are dynamic, this method may call out to the child event of the associated data source.

### 33.31.4 childIndexForItem(item as NSOutlineViewItemMBS) as Integer

**MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the child index of the specified item within its parent.

**Notes:** The performance of this method is O(1) at best and O(n) at worst.

### 33.31.5 collapseItem(item as NSOutlineViewItemMBS)

**MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Collapses a given item.

**Notes:**
- If item is not expanded or not expandable, does nothing
- If collapsing takes place, posts item collapse notification.

See also:

- 33.31.6 collapseItem(item as NSOutlineViewItemMBS, collapseChildren as Boolean)

### 33.31.6 collapseItem(item as NSOutlineViewItemMBS, collapseChildren as Boolean)

**MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Collapses a given item and, optionally, its children.

**Notes:**
- item: An item in the receiver.
- Starting in OS X version 10.5, passing 'nil' will collapse each item under the root in the outline view.
- collapseChildren: If true, recursively collapses item and its children. If NO, collapses item only (identical to collapseItem:).

For example, this method is invoked with the collapseChildren parameter set to true when a user Option-clicks the disclosure triangle for an item in the outline view (to collapse the item and all its contained items). For each item collapsed, posts an item collapsed notification.

See also:

- 33.31.5 collapseItem(item as NSOutlineViewItemMBS)
33.31. **CLASS NSOUTLINEVIEWMBS**   

### 33.31.7 Constructor

**Function:** Creates a new outline view with size 100/100 and position 0/0  
**Example:**

```vba
dim t as new NSOutlineViewMBS
```

**Notes:** On success the handle property is not zero.  
See also:

- 33.31.8 Constructor(Handle as Integer)  
- 33.31.9 Constructor(left as Double, top as Double, width as Double, height as Double)

### 33.31.8 Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSOutlineView handle.  
**Example:**

```vba
dim t as new NSOutlineViewMBS(0, 0, 100, 100)
dim v as new NSOutlineViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

**Notes:** The handle is casted to a NSOutlineViewMBS and the plugin retains this handle.  
See also:

- 33.31.7 Constructor  
- 33.31.9 Constructor(left as Double, top as Double, width as Double, height as Double)

### 33.31.9 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new outline view with the given size and position.  
**Example:**

```vba
dim x as new NSOutlineViewMBS(0, 0, 100, 100)
```
6492

CHAPTER 33. COCOA CONTROLS

Notes: On success the handle property is not zero.
See also:

- 33.31.7 Constructor

- 33.31.8 Constructor(Handle as Integer)

33.31.10 expandItem(item as NSOutlineViewItemMBS)

Function: Expands a given item.
Notes:
If item is not expandable or is already expanded, does nothing.
If expanding takes place, posts an item expanded notification.
See also:

- 33.31.11 expandItem(item as NSOutlineViewItemMBS, expandChildren as Boolean)

33.31.11 expandItem(item as NSOutlineViewItemMBS, expandChildren as Boolean)

Function: Expands a specified item and, optionally, its children.
Notes:
item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will expand each item under the root in the outline view.

expandChildren: If true, recursively expands item and its children. If false, expands item only (identical to expandItem).

For example, this method is invoked with the expandChildren parameter set to YES when a user Option-clicks the disclosure triangle for an item in the outline view (to expand the item and all its contained items). For each item expanded, posts an item expanded notification.
See also:

- 33.31.10 expandItem(item as NSOutlineViewItemMBS)

33.31.12 frameOfOutlineCellAtRow(row as Integer) as NSRectMBS

Function: Returns the frame of the outline cell for a given row.
Notes:
33.31. CLASS NSOUTLINEVIEWMBS

row: The index of the row for which to return the frame.

Returns the frame of the outline cell for the row at index row, considering the current indentation and the value in the indentationMarkerFollowsCell property. If the row at index row is not an expandable row, returns NSZeroRect.

You can override this method in a subclass to return a custom frame for the outline button cell. If your override returns an empty rect, no outline cell is drawn for that row. You might do that, for example, so that the disclosure triangle will not be shown for a row that should never be expanded.

33.31.13 insertItemsAtIndexes(indexes as NSIndexSetMBS, Parent as NSOutlineViewItemMBS, animationOptions as Integer)

Function: Inserts new items at the given indexes in the given parent with the specified optional animations. 
Notes: 
indexes: Indexes at which to insert items. 
pARENT: The parent for the items, or nil if the parent is the root. 
animationOptions: Animated slide effects used when inserting items. 

This method parallels the insertRowsAtIndexes method of NSTableView and is used in a way similar to the insertObjects method of NSMutableArray. The method does nothing if parent is not expanded. The actual item values are determined by the data sources child event (which is called only after endUpdates to ensure data source integrity).

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block; new insertions move previously inserted new items, just like modifying an array. Inserting an index beyond what is available throws an exception.

33.31.14 insertRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

Function: Private method to block you from calling this method in NSTableViewMBS.
CHAPTER 33. COCOA CONTROLS

33.31.15 isExpandable(item as NSOutlineViewItemMBS) as Boolean

Function: Returns a Boolean value that indicates whether a given item is expandable.
Notes: True if item is expandable that is, item can contain other items, otherwise false.

33.31.16 isItemExpanded(item as NSOutlineViewItemMBS) as Boolean

Function: Returns a Boolean value that indicates whether a given item is expanded.
Notes: True if item is expanded, otherwise false.

33.31.17 itemAtRow(row as Integer) as NSOutlineViewItemMBS

Function: Returns the item associated with a given row.
Notes: row: The index of a row in the receiver.
Returns the item associated with row.

33.31.18 levelForItem(item as NSOutlineViewItemMBS) as Integer

Function: Returns the indentation level for a given item.
Notes: The indentation level for item. If item is nil (which is the root item), returns -1.
The levels are zero-based that is, the first level of displayed items is level 0.

33.31.19 levelForRow(row as Integer) as Integer

Function: Returns the indentation level for a given row.
Notes: The indentation level for row. For an invalid row, returns -1.
The levels are zero-based that is, the first level of displayed items is level 0.
33.31.20  moveItemAtIndex(oldIndex as Integer, oldParent as NSOutlineViewItemMBS, newIndex as Integer, newParent as NSOutlineViewItemMBS)

Function: Moves an item at a given index in the given parent to a new index in a new parent.
Notes:
fromIndex: Index of the item to be moved.
oldParent: The parent of the item to be moved.
toIndex: Index in the new parent to which the item is moved.
newParent: The parent of the item after it is moved.

This method parallels the moveRowAtIndex method of NSTableView. The newParent can be the same as oldParent to reorder an item within the same parent.

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block. Moving from an invalid index, or to an invalid index, throws an exception.

33.31.21  moveRowAtIndex(oldIndex as Integer, newIndex as Integer)

Function: Private method to block you from calling this method in NSTableViewMBS.

33.31.22  NSOutlineViewColumnDidMoveNotification as String

Function: Posted whenever a column is moved by user action in an NSOutlineView object.
Notes:
The notification object is the NSOutlineView object in which a column moved. The userInfo dictionary contains the following information:

NSOldColumn: An NSNumber object containing the integer value of the columns original index
NSNewColumn: An NSNumber object containing the integer value of the columns present index
33.31.23 **NSOutlineViewColumnDidResizeNotification as String**

**Function:** Posted whenever a column is resized in an NSOutlineView object.  
**Notes:**  
The notification object is the NSOutlineView object in which a column was resized. The userInfo dictionary contains the following information:

NSTableColumn: The column that was resized.  
NSOldWidth: An NSNumber object containing the columns original width

33.31.24 **NSOutlineViewDisclosureButtonKey as String**

**Function:** These key is used by the outline view to create disclosure buttons that collapse and expand items.  
**Notes:** The normal triangle disclosure button.

33.31.25 **NSOutlineViewItemDidCollapseNotification as String**

**Function:** Posted whenever an item is collapsed in an NSOutlineView object.  
**Notes:**  
The notification object is the NSOutlineView object in which an item was collapsed. A collapsed items children lose their status as being selected. The userInfo dictionary contains the following information:

NSObject: The item that was collapsed (an id)

33.31.26 **NSOutlineViewItemDidExpandNotification as String**

**Function:** Posted whenever an item is expanded in an NSOutlineView object.  
**Notes:**  
The notification object is the NSOutlineView object in which an item was expanded. The userInfo dictionary contains the following information:

NSObject: The item that was expanded (an id)
33.31. **CLASS NSOUTLINEVIEWMBS**

33.31.27  **NSOutlineViewItemWillCollapseNotification as String**

**Function:** Posted before an item is collapsed (after the user clicks the arrow but before the item is collapsed).

**Notes:**

The notification object is the NSOutlineView object that contains the item about to be collapsed. A collapsed items children will lose their status as being selected. The userInfo dictionary contains the following information:

NSObject: The item about to be collapsed (an id)

33.31.28  **NSOutlineViewItemWillExpandNotification as String**

**Function:** Posted before an item is expanded (after the user clicks the arrow but before the item is collapsed).

**Notes:**

The notification object is the outline view that contains an item about to be expanded. The userInfo dictionary contains the following information:

NSObject: The item that is to be expanded (an id)

33.31.29  **NSOutlineViewSelectionDidChangeNotification as String**

**Function:** Posted after the outline view's selection changes.

**Notes:** The notification object is the outline view whose selection changed. This notification does not contain a userInfo dictionary.

33.31.30  **NSOutlineViewSelectionIsChangingNotification as String**

**Function:** Posted as the outline views selection changes (while the mouse button is still down).

**Notes:** The notification object is the outline view whose selection is changing. This notification does not contain a userInfo dictionary.
33.31.31  **NSOutlineViewShowHideButtonKey as String**

**Function:** These key is used by the outline view to create disclosure buttons that collapse and expand items.
**Notes:** The Show/Hide button.

33.31.32  **numberOfChildrenOfItem(item as NSOutlineViewItemMBS) as Integer**

**Function:** Returns the number of children for the specified parent item.
**Notes:**
*item:* The parent item.

Returns the number of children associated with the parent.

You can call this method on an outline view with either a static or dynamic data source. For an outline view whose contents are dynamic, this method may call out to the numberOfChildrenOfItem event of the associated data source.

33.31.33  **parentForItem(item as NSOutlineViewItemMBS) as NSOutlineViewItemMBS**

**Function:** Returns the parent for a given item.
**Notes:**
*item:* The item for which to return the parent.

Returns the parent for item, or nil if the parent is the root.

33.31.34  **reloadItem(item as NSOutlineViewItemMBS)**

**Function:** Reloads and redispalyes the data for the given item.
**Notes:**
Reloading the cell views associated with item occurs only in apps that link against macOS 10.12 and later. This method may cause the outline view to change its selection without calling the SelectionDidChange...
33.31.  CLASS NSOUTLINEVIEWMBS

event.
See also:

- 33.31.35 reloadItem(item as NSOutlineViewItemMBS, reloadChildren as Boolean)

33.31.35  reloadItem(item as NSOutlineViewItemMBS, reloadChildren as Boolean)

Function: Reloads a given item and, optionally, its children.
Notes:

item: An item in the receiver. Starting in OS X version 10.5, passing 'nil' will reload everything under the root in the outline view.

reloadChildren: If true, recursively reloads item and its children. If false, reloads item only (identical to reloadItem).

It is not necessary, or efficient, to reload children if the item is not expanded.
See also:

- 33.31.34 reloadItem(item as NSOutlineViewItemMBS)

33.31.36  removeItemsAtIndexes(indexes as NSIndexSetMBS, Parent as NSOutlineViewItemMBS, animationOptions as Integer)

Function: Removes items at the given indexes in the given parent with the specified optional animations.
Notes:

indexes: Indexes of the items to be removed.
parent: The parent of the items to be removed.
animationOptions: Animated slide effects used when removing items.

This method parallels the removeRowsAtIndexes method of NSTableView and is used in a way similar to the removeObjectsAtIndexes method of NSMutableArray. The method does nothing if parent is not expanded. If any of the child items is expanded, then all of its child rows are also be removed.

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block; changes work just like modifying an array. Removing an item at an index beyond what is available throws an exception.
33.31.37 **removeRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)**

**Function:** Private method to block you from calling this method in NSTableViewMBS.

33.31.38 **rowForItem(item as NSOutlineViewItemMBS) as Integer**

**Function:** Returns the row associated with a given item.
**Notes:** The row associated with item, or -1 if item is nil or cannot be found.

33.31.39 **setDropItem(item as NSOutlineViewItemMBS, dropChildIndex as Integer)**

**Function:** Used to retarget a proposed drop.
**Notes:**
item: The target item.
index: The drop index.

For example, to specify a drop on someOutlineItem, you specify item as someOutlineItem and index as NSOutlineViewDropOnItemIndex. To specify a drop between child 2 and 3 of someOutlineItem, you specify item as someOutlineItem and index as 3 (children are a zero-based index). To specify a drop on an un-expandable someOutlineItem, you specify item as someOutlineItem and index as NSOutlineViewDropOnItemIndex.

33.31.40 **Properties**

33.31.41 **autoresizesOutlineColumn as Boolean**

**Function:** A Boolean value that indicates whether the outline view resizes its outline column when the user expands or collapses items.
**Notes:**
The outline column contains the cells with the expansion symbols and is generally the first column. The default value of this property is true, which causes the outline column to be resized.
The outline column is resized based on how many indentation levels are exposed or hidden. For example, if expanding a row exposes a single indentation level, the outline column width is increased by one indenta-
33.31.42 autoseaveExpandedItems as Boolean

Function: A Boolean value indicating whether the expanded items are automatically saved across launches of the app.
Notes:
When the value of this property is true, the outline view saves the state of its expanded items and restores that state the next time the user launches the app. (If the outline views autoseaveName property is nil, or if you have not implemented the itemForPersistentObject and persistentObjectForItem events, this setting is ignored and outline information is not saved.) The configuration data is saved separately for each user and for each app. The default value of this property is NO.
You can have separate settings for the autoseaveExpandedItems and autoseaveTableColumns properties, so you could, for example, save expanded item information, but not table column positions.
(Read and Write property)

33.31.43 indentationMarkerFollowsCell as Boolean

Function: A Boolean value indicating whether the indentation marker symbol displayed in the outline column should be indented along with the cell contents.
Notes:
When the value of this property is true, the indentation marker is indented along with the cell contents. When the value is false, the marker is always displayed left-justified in the column. The default value of this property is true.
(Read and Write property)

33.31.44 indentationPerLevel as Double

Function: The per-level indentation, measured in points.
Notes: (Read and Write property)

33.31.45 outlinetableColumn as NSTableColumnMBS

Function: The table column in which hierarchical data is displayed.
Notes:
Each level of hierarchical data is indented by the amount specified by the indentationPerLevel property (the
default is 16.0), and decorated with the indentation marker (disclosure triangle) on rows that are expandable.
Outline table column data is archived with the rest of the outline views state information.
Attempts to set the value of this property to nil are silently ignored.
(Read and Write property)

33.31.46  **stronglyReferencesItems as Boolean**

**Function:** A Boolean value that indicates whether the outline view retains and releases the objects returned
from its data source.
**Notes:**
For Xojo applications we highly recommend to keep all items in arrays in Xojo, so they are not released by
Xojo too early!

When the value of this property is true, the outline view retains and releases the objects returned to it from
dataSource. When the value is NO, the outline view treats the objects as opaque items and assumes that
the client has a retain on them. The default value is YES for applications linked on macOS 10.12 and later,
and false for applications linked on earlier versions of macOS. If you require the legacy behavior and your
app links in macOS 10.12 or later, the value of this property must be explicitly set to NO in code, because
it is not encoded in the nib. In general, this is required if the items themselves create a retain cycle.
(Read and Write property)

33.31.47  **userInterfaceLayoutDirection as Integer**

**Function:** The user interface layout direction.
**Notes:**
When set to NSUserInterfaceLayoutDirectionRightToLeft, the outline view displays the disclosure triangle
to the right of the cell instead of the left. The default value is NSUserInterfaceLayoutDirectionLeftToRight.
(Read and Write property)

33.31.48  **Constants**

33.31.49  **NSOutlineViewDropOnItemIndex = -1**

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** May be used as a valid child index of a drop
target item.
Notes: In this case, the drop will happen directly on the target item.
33.32 class NSPathComponentCellMBS

33.32.1 class NSPathComponentCellMBS

Function: The NSPathComponentCell class displays a component of a path.
Notes: An NSPathCell object manages a collection of NSPathComponentCell objects, in conjunction with an NSPathControl object, to represent a path. Subclass of the NSTextFieldCellMBS class.

33.32.2 Methods

33.32.3 Constructor(text as string)

33.32.4 Properties

33.32.5 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The value of the portion of the path from the root through the component represented by the receiver. Notes: (Read and Write computed property)

33.32.6 Image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The image displayed for this component cell. Notes: Generally, a 16-by-16point image fits best when the path style is NSPathStyleStandard or NSPathStylePopUp, and a 14-by-14point image is best when the path style is NSPathStyleNavigationBar. Available in Mac OS X v10.5 and later. (Read and Write computed property)
33.32. URL as string

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the portion of the path from the root through the component represented by the receiver. **Notes:** (Read and Write computed property)
33.33 class NSPathControlMBS

33.33.1 class NSPathControlMBS

Function: NSPathControl is a subclass of NSControl that represents a file system path or virtual path.
Notes:

The NSPathControl class uses NSPathCell to implement its user interface. NSPathControl provides cover methods for most NSPathCell methods; the cover method simply invokes the corresponding cell method. See also NSPathComponentCell, which represents individual components of the path, and two associated protocols: NSPathCellDelegate and NSPathControlDelegate.

NSPathControl has three styles represented by the NSPathStyle enumeration constants NSPathStyleStandard, NSPathStyleNavigationBar, and NSPathStylePopUp. The represented path can be a file system path or any other type of path leading through a sequence of nodes or components, as defined by the programmer.

NSPathControl automatically supports drag and drop, which can be further customized via delegate methods. To accept drag and drop, NSPathControl calls registerForDraggedTypes: with NSFilenamesPboardType and NSURLPboardType. When the URL value in the NSPathControl object changes because of an automatic drag and drop operation or the user selecting a new path via the open panel, the action is sent. On Mac OS X v10.5 the value returned by clickedPathComponentCell is nil, on Mac OS X v10.6 and later, clickedPathComponentCell returns the clicked cell.

Subclass of the NSControlMBS class.

33.33.2 Methods

33.33.3 clickedPathComponentCell as NSPathComponentCellMBS

Function: Returns component cell that was clicked.
Notes:

The value returned is generally valid only when the action or double action is being sent.
Note: In Mac OS X 10.5 and earlier the returned value was nil if no cell had been clicked. In Mac OS X 10.6, the folder of the cell that the user selected is returned instead.

33.33.4 Constructor

Function: Creates a new path control with size 100/100 and position 0/0
Example:
33.33. CLASS NSPATHCONTROLMBS 6507

dim t as new NSPathControlMBS

Notes: On success the handle property is not zero.
See also:

- 33.33.5 Constructor(Handle as Integer) 6507
- 33.33.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6507

33.33.5 Constructor(Handle as Integer)

Function: Creates an object based on the given NSPathControl handle.
Example:

dim t as new NSPathControlMBS(0, 0, 100, 100)
dim v as new NSPathControlMBS(t.handle)

Notes: The handle is casted to a NSPathControl and the plugin retains this handle.
See also:

- 33.33.4 Constructor 6506
- 33.33.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6507

33.33.6 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new path control with the given size and position.
Example:

dim x as new NSPathControlMBS(0, 0, 100, 100)

Notes: On success the handle property is not zero.
See also:

- 33.33.4 Constructor 6506
- 33.33.5 Constructor(Handle as Integer) 6507
33.33.7  pathComponentCells as NSPathComponentCellMBS()

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the NSPathComponentCell objects currently being displayed. **Notes:** Available in Mac OS X v10.5 and later.

33.33.8  setDraggingSourceOperationMask(mask as Integer, local as boolean)

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Configures the default value returned from draggingSourceOperationMaskForLocal. **Notes:**

mask: The types of drag operations allowed.
isLocal: If true, mask applies when the drag destination object is in the same application as the receiver; if false, mask applies when the destination object is outside the receiver’s application.

By default, draggingSourceOperationMaskForLocal returns NSDragOperationEvery when isLocal is true and NSDragOperationNone when isLocal is false.

Available in Mac OS X v10.5 and later.

33.33.9  setPathComponentCells(cells() as NSPathComponentCellMBS)

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of NSPathComponentCell objects currently being displayed. **Notes:**

cells: An array of NSPathComponentCell objects.

Each item in the array must be an instance of NSPathComponentCell or a subclass thereof. You cannot set this value to nil, but you can set it to an empty array.

Available in Mac OS X v10.5 and later.

33.33.10  Properties

33.33.11  backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background color.
33.33. Notes:

By default, the background is set to a light blue color for NSPathStyleStandard and nil for the other styles. You can use NSColorMBS.clearColor to make the background transparent. Available in Mac OS X v10.5 and later.

(Read and Write computed property)

33.33.12  File as folderitem

Function: The path property.

Notes:

When setting, an array of NSPathComponentCell objects is automatically set based on the path in url. If url is a file URL (returns true from isFileURL), the images are automatically filled with file icons, if the path exists. The URL value itself is stored in the objectValue property of the cell.

See also URL property.

(Read and Write computed property)

33.33.13  menu as NSMenuMBS

Function: The menu used for the path control’s cells.

Notes:

Available in Mac OS X v10.6 and later.

(Read and Write computed property)

33.33.14  pathStyle as Integer

Function: The path style.

Notes:

Either NSPathStyleStandard or NSPathStylePopUp.

(Read and Write computed property)
33.33.15 **URL as string**

**Function:** The path property. 
**Notes:**
When setting, an array of NSPathComponentCell objects is automatically set based on the path in url. If url is a file URL (returns true from isFileURL), the images are automatically filled with file icons, if the path exists. The URL value itself is stored in the objectValue property of the cell.

See also File property. 
(Read and Write computed property)

33.33.16 **Events**

33.33.17 **DoubleClick**

**Function:** Called on a double click.

33.33.18 **Constants**

33.33.19 **NSPathStyleNavigationBar = 1**

MBS MacCocoa Plugin, Plugin Version: 12.0. 
**Function:** One of the path style constants. 
**Notes:**
The navigation bar display style and behavior. Similar to the NSPathStyleStandard with the navigation bar drawing style. Also known as the breadcrumb style. 
Available in Mac OS X v10.5 and later.

33.33.20 **NSPathStylePopUp = 2**

MBS MacCocoa Plugin, Plugin Version: 12.0. 
**Function:** One of the path style constants. 
**Notes:**
The pop-up display style and behavior. Only the last path component is displayed with an icon image and component name. The full path is shown when the user clicks on the cell. If the cell is editable, a Choose item is included to enable selecting a different path. 
Available in Mac OS X v10.5 and later.
33.33.21  NSPathStyleStandard = 0

MBS MacCocoa Plugin, Plugin Version: 12.0. **Function:** One of the path style constants.

**Notes:**

The standard display style and behavior. All path component cells are displayed with an icon image and component name. If the path can not fully be displayed, the middle parts are truncated as required. Available in Mac OS X v10.5 and later.
33.34 class NSPopUpButtonCellMBS

33.34.1 class NSPopUpButtonCellMBS

**Function:** The NSPopUpButtonCell class defines the visual appearance of pop-up buttons that display pop-up or pull-down menus.

**Notes:**

Pop-up menus present the user with a set of choices, much the way radio buttons do, but using much less space. Pull-down menus also provide a set of choices but present the information in a slightly different way, usually to provide a set of commands from which the user can choose.

The NSPopUpButtonCellMBS class implements the user interface for the NSPopUpButtonMBS class. Changes made to a menu (such as adding, removing, or changing the items) are not apparent while the menu is being displayed or interacted with.

Subclass of the NSMenuItemCellMBS class.

33.34.2 Methods

33.34.3 addItemsWithTitles(itemTitles() as string)

**Function:** Adds multiple items to the end of the menu.

**Notes:**

itemTitles: An array of strings containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

The new menu items use the pop-up buttons default action and target, but you can change these using the.setAction: and setTarget: methods of the corresponding NSMenuItem object.

If you want to move an item, its better to invoke removeItemWithTitle: explicitly and then call this method. After adding the items, this method uses the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Because this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the receiver’s menu instead.
### 33.34.4 addItemWithTitle(title as string)

**Function:** Adds an item with the specified title to the end of the menu.

**Notes:**

- title: The title of the new menu item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

The menu item uses the pop-up buttons default action and target, but you can change these using the `setAction:` and `setTarget:` methods of the corresponding `NSMenuItemMBS` object. Because this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the button’s menu instead.

### 33.34.5 Constructor(image as NSImageMBS)

**Function:** The private constructor.

See also:

- 33.34.6 Constructor(text as string, pullsDown as boolean)

### 33.34.6 Constructor(text as string, pullsDown as boolean)

**Function:** Returns an `NSPopUpButtonCell` object initialized with the specified title.

See also:

- 33.34.5 Constructor(image as NSImageMBS)

### 33.34.7 dismissPopUp

**Function:** Dismisses the pop-up buttons menu by ordering its window out.

**Notes:**

If the pop-up button was not displaying its menu, this method does nothing.

You normally do not call this method explicitly. It is called by the Application Kit automatically to dismiss the menu for the pop-up button.
33.34.8  indexOfItem(item as NSMenuItemMBS) as Integer

Function: Returns the index of the specified menu item.
Notes:

item: The menu item whose index you want.

Returns the index of the item or -1 if no such item was found.

33.34.9  indexOfItemWithTag(tag as Integer) as Integer

Function: Returns the index of the menu item with the specified tag.
Notes:

tag: The tag of the menu item you want.

Returns the index of the item or -1 if no item with the specified tag was found.

Tags are values your application assigns to an object to identify it. You can assign tags to menu items using the tag property of NSMenuItemMBS.

33.34.10  indexOfItemWithTitle(title as String) as Integer

Function: Returns the index of the item with the specified title.
Notes:

title: The title of the item you want. You must not pass nil for this parameter.

Returns the index of the item or -1 if no item with the specified title was found.

33.34.11  insertItemWithTitle(title as string, atIndex as Integer)

Function: Inserts an item at the specified position in the menu.
Notes:

title: The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added
33.34. **CLASS NSPOPUPBUTTONCELLMBS**

index: The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu. The value in index must represent a valid position in the array. The menu item at index and all those that follow it are shifted down one slot to make room for the new menu item. This method assigns the pop-up buttons default action and target to the new menu item. This triggers the action event of the NSActionCellMBS.

Because this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the button’s menu instead.

### 33.34.12 `itemArray as NSMenuItemMBS()`

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of NSMenuItemMBS objects that represent the items in the menu.

### 33.34.13 `itemAtIndex(Index as Integer) as NSMenuItemMBS`  

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu item at the specified index. **Notes:** index: The index of the item you want. The specified index must refer to an existing menu item. Returns the menu item, or nil if no item exists at the specified index.

### 33.34.14 `itemTitleAtIndex(Index as Integer) as String`  

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the title of the item at the specified index. **Notes:** index: The index of the item you want. Returns the title of the item, or an empty string if no item exists at the specified index.
CHAPTER 33. COCOA CONTROLS

33.34.15 itemTitles as String()

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of strings containing the titles of every item in the menu. **Notes:** The titles appear in the order in which the items appear in the menu. If the menu contains separator items, the array contains an empty string (""") for each separator item.

33.34.16 itemWithTitle(title as String) as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu item with the specified title. **Notes:**
title: The title of the menu item you want.

Returns the menu item, or nil if no item with the specified title exists in the menu.

33.34.17 removeAllItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all items in the receivers item menu.

33.34.18 removeItemAtIndex(Index as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the item at the specified index. **Notes:**

index: The zero-based index indicating which item to remove. Specifying 0 removes the item at the top of the menu. The index must be valid and non-negative.

33.34.19 removeItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the item with the specified title from the menu. **Notes:**
title: The title of the item you want to remove. If no menu item exists with the specified title, this method triggers an assertion.
33.34.20 `selectItem(item as NSMenuItemMBS)`

**Function:** Selects the specified menu item.

**Notes:**

item: The menu item to select, or nil if you want to deselect all menu items.

By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. To disassociate the current selection from the state of menu items, set the `altersStateOfSelectedItem` property to NO.

33.34.21 `selectItemAtIndex(Index as Integer)`

**Function:** Selects the item in the menu at the specified index.

**Notes:**

index: The index of the item you want to select, or -1 if you want to deselect all menu items.

By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. To disassociate the current selection from the state of menu items, set the `altersStateOfSelectedItem` property to false.

Subclassers can override this method to catch all select calls.

33.34.22 `selectItemWithTag(tag as Integer) as boolean`

**Function:** Selects the menu item with the specified tag.

**Notes:**

tag: The tag of the item you want to select.

Returns true if the item was successfully selected; otherwise, false.

If no item with the specified tag is found, this method returns false and leaves the menu state unchanged. You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the tag property of `NSMenuItemMBS`.
33.34.23 selectItemWithTitle(title as string)

**Function:** Selects the item with the specified title.
**Notes:**
- title: The title of the item to select. If you specify nil, an empty string, or a string that does not match the title of a menu item, this method deselects the currently selected item.

By default, selecting or deselecting a menu item changes its state. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to false.

33.34.24 setTitle(title as string)

**Function:** Sets the string displayed in the receiver when the user isn’t pressing the mouse button.
**Notes:**
- title: The string to display.

For pull-down menus that get their titles from a menu item, this method simply sets the pop-up button cells menu item to the first item in the menu. For pop-up menus, if a menu item whose title matches aString exists, this method makes that menu item the current selection; otherwise, it creates a new menu item with the title aString, adds it to the pop-up menu, and selects it.

33.34.25 synchronizeTitleAndSelectedItem

**Function:** Synchronizes the the pop-up buttons displayed item with the currently selected menu item.
**Notes:**
- If no item is currently selected, this method synchronizes the pop-up buttons displayed item with the first menu item. If the pop-up button cell does not get its displayed item from a menu item, this method does nothing.
- For pull-down menus, this method sets the displayed item to the title first menu item.
- If the pop-up buttons menu does not contain any menu items, this method sets the pop-up buttons displayed item to nil, resulting in nothing being displayed in the control.
33.34.26 Properties

33.34.27 altersStateOfSelectedItem as Boolean

**Function:** A Boolean value that indicates if the pop-up button links the state of the selected menu item to the current selection.  
**Notes:**  
When the value of this property is true (which is the default value), the state of the selected item is set to NSOnState. When the value of this property is false, the items in the menu are left alone. When you change the value of this property, the state of the currently selected item is updated appropriately.  
Note that this property affects only pop-up buttons (it is ignored for pull-down menus).  
(Read and Write property)

33.34.28 arrowPosition as Integer

**Function:** The position of the arrow displayed on the button.  
**Notes:**  
When the value of this property is NSPopUpNoArrow, the control displays no arrow. NSPopUpArrowAtCenter displays the arrow centered horizontally within the cell and NSPopUpArrowAtBottom displays the arrow at the edge of the cell. This property is used with preferredEdge to determine the exact location and orientation of the arrow.  
This property applies to only bezel style and borderless pop-up buttons.  
(Read and Write property)

33.34.29 autoenablesItems as Boolean

**Function:** A Boolean value that indicates if the button automatically enables and disables its items every time a user event occurs.  
**Notes:**  
When the value of this property is true, the button automatically enables and disables items. The default value is true. For more information about enabling and disabling menu items, see NSMenuValidation.  
(Read and Write property)

33.34.30 indexOfSelectedItem as Integer

**Function:** The index of the item last selected by the user.
Chapter 33. Cocoa Controls

Notes:
The value of this property is the index of the selected item, or -1 if no item is selected.
(Read only property)

33.34.31 lastItem as NSMenuItemMBS

Notes: (Read only property)

33.34.32 menu as NSMenuMBS

Notes: (Read and Write property)

33.34.33 numberOfItems as Integer

Notes: (Read only property)

33.34.34 preferredEdge as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The edge of the cell from which the menu should pop out when screen conditions are restrictive.
Notes:
At display time, if attaching the menu to the preferred edge would cause part of the menu to be obscured, the pop-up button may use a different edge. If no preferred edge is set, the pop-up button uses the bottom edge by default, which is NSMaxYEdge for flipped views or NSMinYEdge for unflipped views. Additional values for this property include NSMinXEdge and NSMaxXEdge.
The exact location of the arrow is determined by examining the value of this property and arrowPosition.

If the arrow position is NSPopUpArrowAtCenter, the arrow stays in the center of the button and the value of this property determines which edge the arrow points to: NSMinXEdge points to the left, NSMaxYEdge points to the top, NSMaxXEdge points to the right, and NSMinYEdge points to the bottom.
If the arrow position is NSPopUpArrowAtBottom, the value of this property determines which edge at which the arrow is placed: NSMinXEdge places the arrow at the center of the left side, pointing to the left, NSMinYEdge places the arrow at bottom right corner, pointing up, NSMaxXEdge places the arrow at the center of the right side, pointing to the right, and NSMaxYEdge places the arrow at the bottom right corner, pointing down.

(Read and Write property)

### 33.34.35 pullsDown as Boolean

**Function:** A Boolean value that indicates the behavior of the buttons menu.

**Notes:**
When the value of this property is true, the menu behaves like a pull-down menu; when the value is false, it behaves like a pop-up menu. If you use this property to change the menu type from a pop-up menu to a pull-down menu, and the cell alters the state of its selected items, the state of the currently selected item is set to NSOffState before the menu type is changed.

(Read and Write property)

### 33.34.36 selectedItem as NSMenuItemMBS

**Function:** The menu item last selected by the user.

**Notes:**
The value of this property is the menu item that is currently selected, or nil if no item is selected. The last selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menus selected item to be its first item.

(Read only property)

### 33.34.37 titleOfSelectedltem as String

**Function:** The title of the item last selected by the user.

**Notes:**
The value of this property is the title of the selected menu item, or an empty string if no item is selected.

(Read only property)
33.34.38 usesItemFromMenu as Boolean

**Function:** A Boolean value that indicates if the control uses an item from the menu for its own title.  
**Notes:**
When the value of this property is true, a pull-down menu uses the title of the first menu item, and a pop-up menu uses the title of the currently selected menu (if no menu item is selected, the pop-up button displays no item and is drawn empty). When the value is false, the menu item set with menuItem (NSMenuItemMBS) is always displayed. The default value is true.  
(Read and Write property)

33.34.39 Constants

33.34.40 NSPopUpArrowAtBottom = 2

**Function:** One of the arrowPosition constants.  
**Notes:** Arrow is drawn at the edge of the button, pointing toward the preferredEdge.

33.34.41 NSPopUpArrowAtCenter = 1

**Function:** One of the arrowPosition constants.  
**Notes:** Arrow is centered vertically, pointing toward the preferredEdge.

33.34.42 NSPopUpNoArrow = 0

**Function:** One of the arrowPosition constants.  
**Notes:** Does not display any arrow in the control.
33.35. CONTROL NSPOPUPBUTTONCONTROLMBS

33.35 control NSPopUpButtonControlMBS

33.35.1 control NSPopUpButtonControlMBS

Function: The Xojo control for a NSPopUpButtonControl.
Notes:
This control embeds a special NSPopUpButtonControl subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.

33.35.2 Properties

33.35.3 View as NSPopUpButtonMBS

Function: The view used in the control.
Notes:
Use this object to set more options on the control.
(Read only property)

33.35.4 Events

33.35.5 Action

Function: The action event.

33.35.6 BoundsChanged

Function: The event called when the bounds, but not the frame, changed.

33.35.7 EnableMenuItems

Function: The event where you can enable menu items.
33.35.8 FrameChanged

Function: The event called when the frame changed.

33.35.9 GotFocus

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

33.35.10 LostFocus

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

33.35.11 MenuAction(HitItem as MenuItem) As Boolean

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

33.35.12 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes:
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.
33.35.13 MouseDrag(x as Integer, y as Integer)

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

33.35.14 MouseUp(x as Integer, y as Integer)

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

33.35.15 ScaleFactorChanged(NewFactor as Double)

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.
class NSPopUpButtonMBS

33.36.1 class NSPopUpButtonMBS

**Function:** An NSPopUpButton object controls a pop-up menu or a pull-down menu from which a user can select an item.

**Example:**

```vbnet
' get cocoa view for the popupmenu
dim p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

' find a menu entry
dim it as NSMenuItemMBS = p.itemAtIndex(0)

' get a picture
dim pic as Picture = LogoMBS(500)
dim img as New NSImageMBS(pic)
img.setSize 16,16

' and assign icon
it.image = img
```

**Notes:**

The NSPopUpButton class defines objects that implement the pop-up and pull-down menus of the graphical user interface.

An NSPopUpButton object uses an NSPopUpButtonCell object to implement its user interface.

Note that while a menu is tracking, adding, removing, or changing items on the menu is not reflected.
Subclass of the NSButtonMBS class.

33.36.2 Methods

33.36.3 addItemsWithTitles(titles() as string)

**Function:** Adds multiple items to the end of the menu.

**Notes:**

temTitles: An array of strings containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed.
33.36. CLASS NSPOPUPBUTTONMBS

and the new one is added.

If you want to move an item, it’s better to invoke removeItemWithTitle: explicitly and then send this method. After adding the items, this method uses the synchronizeTitleAndSelected method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. Add items directly to the receiver’s menu instead.

33.36.4 addItemWithTitle(title as string)

Function: Adds an item with the specified title to the end of the menu.
Notes:
title: The title of the menu-item entry. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

If you want to move an item, it’s better to invoke removeItemWithTitle explicitly and then send this method. After adding the item, this method calls the synchronizeTitleAndSelected method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver’s menu instead.

33.36.5 Constructor

Function: Creates a new button with size 100/100 and position 0/0
Example:

\[
\text{dim t as new NSPopUpButtonMBS}
\]

Notes: On success the handle property is not zero.
See also:

- 33.36.6 Constructor(Handle as Integer) 6528
- 33.36.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6528
- 33.36.8 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 6528
33.36.6 Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSPopUpButton handle.  
**Example:**

```vba
Dim t As New NSPopUpButtonMBS(0, 0, 100, 100)  
Dim v As New NSPopUpButtonMBS(t.handle)
```

**MsgBox** `str(v.Bounds.Width)+" x "+str(v.Bounds.Height)`

**Notes:** The handle is casted to a NSPopUpButton and the plugin retains this handle.  
See also:

- 33.36.5 Constructor 6527
- 33.36.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6528
- 33.36.8 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 6528

33.36.7 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new popup button with the given size and position.  
**Example:**

```vba
Dim x As New NSPopUpButtonMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.  
See also:

- 33.36.5 Constructor 6527
- 33.36.6 Constructor(Handle as Integer) 6528
- 33.36.8 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 6528

33.36.8 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean)

**Function:** Creates an NSPopUpButton object initialized to the specified dimensions.
33.36. CLASS NSPOPUPBUTTONMBS

Notes:

left, top, width, height: The frame rectangle for the button, specified in the parent view’s coordinate system.

pullsDown: true if you want the receiver to display a pull-down menu; otherwise, false if you want it to display a pop-up menu.

See also:

- 33.36.5 Constructor
- 33.36.6 Constructor(Handle as Integer)
- 33.36.7 Constructor(left as Double, top as Double, width as Double, height as Double)

33.36.9 indexOfItem(item as NSMenuItemMBS) as Integer

Function: Returns the index of the specified menu item.

Notes:

item: The menu item whose index you want.

Returns the index of the item or -1 if no such item was found.
This method invokes the method of the same name of its NSPopUpButtonCell object.

33.36.10 indexOfItemWithTag(tag as Integer) as Integer

Function: Returns the index of the menu item with the specified tag.

Notes:

tag: The tag of the menu item you want.

Returns the index of the item or -1 if no item with the specified tag was found.

This method invokes the method of the same name of its NSPopUpButtonCell object.

33.36.11 indexOfItemWithTitle(title as string) as Integer

Function: Returns the index of the item with the specified title.

Notes:
title: The title of the item you want.

Returns the index of the item or -1 if no item with the specified title was found.

### 33.36.12 `indexOfSelectedItem` as Integer

**Function:** Returns the index of the item last selected by the user.
**Notes:** The index of the selected item, or -1 if no item is selected.

### 33.36.13 `insertWithTitle(title as string, atIndex as Integer)`

**Function:** Inserts an item at the specified position in the menu.
**Notes:**
- **title:** The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.
- **index:** The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu.

If you want to move an item, it’s better to invoke `removeWithTitle` explicitly and then send this method. After adding the item, this method uses the `synchronizeTitleAndSelectedItem` method to make sure the item displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver’s menu instead.

### 33.36.14 `itemAtIndex(index as Integer)` as NSMenuItemMBS

**Function:** Returns the menu item at the specified index.
**Notes:**
- **index:** The index of the item you want.

Returns the menu item, or nil if no item exists at the specified index.
33.36. **CLASS NSPOPUPBUTTONMBS**

33.36.15  **itemWithTitle(title as string) as NSMenuItemMBS**

**Function:** Returns the menu item with the specified title.
**Notes:**

- title: The title of the menu item you want.

The menu item, or nil if no item with the specified title exists in the menu.

33.36.16  **lastItem as NSMenuItemMBS**

**Function:** Returns the last item in the menu.

33.36.17  **removeAllItems**

**Function:** Removes all items in the receiver’s item menu.
**Notes:** After removing the items, this method uses the synchronizeTitleAndSelectedItem method to refresh the menu.

33.36.18  **removeItemAtIndex(index as Integer)**

**Function:** Removes the item at the specified index.
**Notes:**

- index: The zero-based index indicating which item to remove. Specifying 0 removes the item at the top of the menu.

After removing the item, this method uses the synchronizeTitleAndSelectedItem method to make sure the title displayed matches the currently selected item.

33.36.19  **removeItemWithTitle(title as string)**

**Function:** Removes the item with the specified title from the menu.
**Notes:**
title: The title of the item you want to remove. If no menu item exists with the specified title, this method triggers an assertion.

This method removes the first item it finds with the specified name. This method then uses synchronizeTitleAndSelectedItem to refresh the menu.

### 33.36.20 `selectItem(item as NSMenuItemMBS)`

**Function:** Selects the specified menu item.
**Notes:** item: The menu item to select, or nil if you want to deselect all menu items.

### 33.36.21 `selectItemAtIndex(index as Integer)`

**Function:** Selects the item in the menu at the specified index.
**Notes:** index: The index of the item you want to select, or -1 you want to deselect all menu items.

### 33.36.22 `selectWithTag(tag as Integer) as boolean`

**Function:** Selects the menu item with the specified tag.
**Notes:**

tag: The tag of the item you want to select.

Returns true if the item was successfully selected; otherwise, false.

If no item with the specified tag is found, this method returns false and leaves the menu state unchanged.

You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the setTag: method of NSMenuItem.

Available in Mac OS X v10.4 and later.
33.36. **CLASS NSPOPUPBUTTONMBS**

33.36.23  **selectItemWithTitle(title as string)**

**Function:** Selects the item with the specified title.

**Notes:** title: The title of the item to select. If you specify an empty string, or a string that does not match the title of a menu item, this method deselects the currently selected item.

33.36.24  **setTitle(title as string)**

**Function:** Sets the string displayed in the receiver when the user isn’t pressing the mouse button.

**Notes:** If the receiver displays a pop-up menu, this method changes the current item to be the item with the specified title, adding a new item by that name if one does not already exist. If the receiver displays a pull-down list, this method sets its title to the specified string.

33.36.25  **synchronizeTitleAndSelectedItem**

**Function:** Ensures that the item being displayed by the receiver agrees with the selected item.

**Notes:** If there’s no selected item, this method selects the first item in the item menu and sets the receiver’s item to match. For pull-down menus, this method makes sure that the first item is being displayed (the NSPopUpButtonCell object must be set to use the selected menu item, which happens by default).

33.36.26  **titleOfSelectedItem as string**

**Function:** Returns the title of the item last selected by the user.

**Notes:** Returns the title of the selected menu item, or an empty string if no item is selected.

33.36.27  **Properties**

33.36.28  **arrowPosition as Integer**

**Function:** The position of the arrow displayed.

**Notes:**

If you specify NSPopUpNoArrow, the receiver displays no arrow. NSPopUpArrowAtCenter displays the arrow centered horizontally within the cell. NSPopUpArrowAtBottom displays the arrow at the edge of the cell. This method works with setPreferredEdge: to determine the exact location and orientation of the
arrow. For more information, see setPreferredEdge:

This method is ignored unless the receiver is a pull-down list with a beveled border.
(Read and Write property)

### 33.36.29 autoenablesItems as boolean

**Function:** Whether the receiver automatically enables and disables its items every time a user event occurs.
**Notes:**
true if the receiver automatically enables and disables items; otherwise, false. The default value is true.
(Read and Write property)

### 33.36.30 menu as NSMenuMBS

**Function:** Returns the pop-up button’s associated menu.
**Notes:** (Read and Write property)

### 33.36.31 numberOfItems as Integer

**Function:** Returns the number of items in the menu.
**Notes:** (Read only property)

### 33.36.32 pullsDown as boolean

**Function:** A Boolean value indicating the behavior of the control’s menu.
**Notes:**
True if the menu behaves like a pull-down menu; otherwise, false if it behaves like a pop-up menu.
(Read and Write property)
33.36. **CLASS NSPOPUPBUTTONMBS**

### 33.36.33 `selectedItem as NSMenuItemMBS`

**Function:** Returns the menu item last selected by the user.

**Notes:**

Returns the menu item that is currently selected, or nil if no item is selected.

The last selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menu's selected item to be its first item.  
(Read and Write computed property)

### 33.36.34 Constants

#### 33.36.35 `NSPopUpArrowAtBottom = 2`

MBS MacControls Plugin, Plugin Version: 14.3. **Function:** One of the constants for the arrow positions.  
**Notes:** Arrow is drawn at the edge of the button, pointing toward the preferredEdge.

#### 33.36.36 `NSPopUpArrowAtCenter = 1`

MBS MacControls Plugin, Plugin Version: 14.3. **Function:** One of the constants for the arrow positions.  
**Notes:** Arrow is centered vertically, pointing toward the preferredEdge.

#### 33.36.37 `NSPopUpNoArrow = 0`

MBS MacControls Plugin, Plugin Version: 14.3. **Function:** One of the constants for the arrow positions.  
**Notes:** Does not display any arrow in the receiver.
33.37 class NSProgressIndicatorMBS

33.37.1 class NSProgressIndicatorMBS

**Function:** The NSProgressIndicator class lets an application display a progress indicator to show that a lengthy task is under way.

**Notes:**

Some progress indicators are indeterminate and do nothing more than spin to show that the application is busy. Others are determinate and show the percentage of the task that has been completed.

This also eliminates the hung appearance if you move the window or open a menu. Unlike the RB progress controls that pause when you do these things, the Cocoa version continues to update.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

33.37.2 Methods

33.37.3 Constructor

**Function:** Creates a new progress indicator with size 100/100 and position 0/0

**Example:**

```vba
dim t as new NSProgressIndicatorMBS
```

**Notes:** On success the handle property is not zero.

See also:

- 33.37.4 Constructor(Handle as Integer) 6536
- 33.37.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6537

33.37.4 Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSProgressIndicator handle.

**Example:**

```vba
dim t as new NSProgressIndicatorMBS(0, 0, 100, 100)
dim v as new NSProgressIndicatorMBS(t.handle)
```
33.37. CLASS NSPROGRESSINDICATORMBS

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)

Notes: The handle is cast to a NSProgressIndicator and the plugin retains this handle.
See also:

• 33.37.3 Constructor 6536
• 33.37.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6537

33.37.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new progress indicator with the given size and position.
Example:

dim x as new NSProgressIndicatorMBS(0, 0, 100, 100)

Notes: On success the handle property is not zero.
See also:

• 33.37.3 Constructor 6536
• 33.37.4 Constructor(Handle as Integer) 6536

33.37.6 incrementBy(delta as Double)

Function: Advances the progress bar of a determinate progress indicator by the specified amount.
Notes: The amount by which to increment the progress bar. For example, if you want to advance a progress bar from 0.0 to 100.0 in 20 steps, you would invoke incrementBy 20 times with a delta value of 5.0.

33.37.7 sizeToFit

Function: This action method resizes the receiver to an appropriate size depending on what style returns.
Notes: Use this after you set style to re-size the receiver.
CHAPTER 33. COCOA CONTROLS

33.37.8 startAnimation

Function: Starts the animation of an indeterminate progress indicator.
Notes: Does nothing for a determinate progress indicator.

33.37.9 stopAnimation

Function: Stops the animation of an indeterminate progress indicator.
Notes: Does nothing for a determinate progress indicator.

33.37.10 Properties

33.37.11 controlSize as Integer

Function: The size of the receiver.
Notes: (Read and Write computed property)

33.37.12 controlTint as Integer

Function: The receiver’s control tint.
Notes: (Read and Write computed property)

33.37.13 doubleValue as Double

Function: A value that indicates the current extent of the progress bar of a determinate progress indicator.
Notes:
The value representing the current extent of a determinate progress bar. For example, a determinate progress indicator goes from 0.0 to 100.0 by default. If the progress bar has advanced halfway across the view, the value returned by doubleValue would be 50.0. An indeterminate progress indicator does not use this value.
(Read and Write computed property)
33.37. **CLASS NSPROGRESSINDICATORMBS**

33.37.14 *isBezeled* as boolean

**Function:** A Boolean value indicating whether the receiver’s frame has a bezel.

**Notes:**
True if the receiver’s frame has a three-dimensional bezel; otherwise, false.
(Read and Write computed property)

33.37.15 *isDisplayedWhenStopped* as boolean

**Function:** A Boolean value indicating whether the receiver shows itself even when it’s not animating.

**Notes:**
True if the progress indicator shows itself even when it’s not animating. By default, this returns true if style is NSProgressIndicatorBarStyle and false if style isNSProgressIndicatorSpinningStyle.
(Read and Write computed property)

33.37.16 *isIndeterminate* as boolean

**Function:** Whether the receiver is indeterminate.

**Notes:**
This method only has an effect if style returns NSProgressIndicatorBarStyle. If style returns NSProgressIndicatorSpinningStyle, the indicator is always indeterminate, regardless of what you pass to this method.
(Read and Write computed property)

33.37.17 *maxValue* as Double

**Function:** The maximum value for the receiver.

**Notes:**
The maximum value of the progress indicator. An indeterminate progress indicator does not use this value.
(Read and Write computed property)
33.37.18 minValue as Double

Function: The minimum value for the receiver.

Notes:
An indeterminate progress indicator does not use this value.
(Read and Write computed property)

33.37.19 style as Integer

Function: The style of the progress indicator (bar or spinning).

Notes:
Either NSProgressIndicatorBarStyle or NSProgressIndicatorSpinningStyle.
(Read and Write computed property)

33.37.20 usesThreadedAnimation as boolean

Function: A hint as to whether the receiver should implement animation of the progress indicator in a separate thread.

Notes:
Value is true to indicate that animation of the progress indicator should occur in a separate thread; otherwise, false. This value is only a hint and may be ignored.

If the application becomes multithreaded as a result of an invocation of this method, the application’s performance could become noticeably slower.
(Read and Write computed property)

33.37.21 Constants

33.37.22 NSBlueControlTint=1

MBS MacControls Plugin, Plugin Version: 8.4. Function: One of the constants to specify a the control tint.

Notes: Aqua control tint
33.37.23  **NSClearControlTint=7**

MBS MacControls Plugin, Plugin Version: 8.4. **Function**: One of the constants to specify a the control tint.
**Notes**: Clear control tint

33.37.24  **NSDefaultControlTint=0**

MBS MacControls Plugin, Plugin Version: 8.4. **Function**: One of the constants to specify a the control tint.
**Notes**: The current default tint setting

33.37.25  **NSGraphiteControlTint=6**

MBS MacControls Plugin, Plugin Version: 8.4. **Function**: One of the constants to specify a the control tint.
**Notes**: Graphite control tint

33.37.26  **NSMiniControlSize=2**

MBS MacControls Plugin, Plugin Version: 8.4. **Function**: One of the values for the ControlSize property.
**Notes**: The control has a smaller size than NSSmallControlSize.

33.37.27  **NSProgressIndicatorBarStyle=0**

MBS MacControls Plugin, Plugin Version: 8.4. **Function**: One of the constants for the style property. 
**Notes**: A rectangular indicator that can be determinate or indeterminate.

33.37.28  **NSProgressIndicatorPreferredAquaThickness=12**

MBS MacControls Plugin, Plugin Version: 8.4. **Function**: One of the constants to specify the height of a progress indicator.
33.37.29  **NSProgressIndicatorPreferredLargeThickness=18**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the height of a progress indicator.

33.37.30  **NSProgressIndicatorPreferredSmallThickness=10**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the height of a progress indicator.

33.37.31  **NSProgressIndicatorPreferredThickness=14**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the height of a progress indicator.

33.37.32  **NSProgressIndicatorSpinningStyle=1**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants for the style property. **Notes:** A small square indicator that can be indeterminate only.

33.37.33  **NSRegularControlSize=0**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property. **Notes:** The control is sized as regular.

33.37.34  **NSSmallControlSize=1**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property. **Notes:** This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.
33.38. **CLASS NSSCROLLERMBS**

33.38  **class NSScrollerMBS**

33.38.1  **class NSScrollerMBS**

**Function:** An NSScroller object controls scrolling of a document view within an NSScrollView’s clip view (or potentially another kind of container view).

**Notes:**

It typically displays a pair of buttons that the user can click to scroll by a small amount (called a line increment or decrement) and Alt-click to scroll by a large amount (called a page increment or decrement), plus a slot containing a knob that the user can drag directly to the desired location. The knob indicates both the position within the document view and, by varying in size within the slot, the amount visible relative to the size of the document view. You can configure whether an NSScroller object uses scroll buttons, but it always draws the knob when there’s room for it.

Don’t use an NSScroller when an NSSlider would be better. A slider represents a range of values for something in the application and lets the user choose a setting. A scroller represents the relative position of the visible portion of a view and lets the user choose which portion to view.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSControlMBS class.

33.38.2  **Methods**

33.38.3  **checkSpaceForParts**

**Function:** Checks to see if there is enough room in the receiver to display the knob and buttons.

**Notes:** usableParts returns the state calculated by this method. You should never need to invoke this method; it’s invoked automatically whenever the NSScroller’s size changes.

33.38.4  **Constructor**

**Function:** Creates a new scroller with size 100/100 and position 0/0

**Example:**

```
dim t as new NSScrollerMBS
```

**Notes:** On success the handle property is not zero.
33.38.5 Constructor(Handle as Integer)

Function: Creates an object based on the given NSScroller handle.
Example:
```pascal
    dim t as new NSScrollerMBS(0, 0, 100, 100)
    dim v as new NSScrollerMBS(t.handle)
    MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSScroller and the plugin retains this handle.
See also:
- 33.38.4 Constructor
- 33.38.6 Constructor(left as Double, top as Double, width as Double, height as Double)

33.38.6 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new scroller with the given size and position.
Example:
```pascal
    dim x as new NSScrollerMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:
- 33.38.4 Constructor
- 33.38.5 Constructor(Handle as Integer)

33.38.7 drawArrow(Arrow as Integer, highlight as boolean)

Function: Draws the scroll button indicated by arrow, which is either NSScrollerIncrementArrow (the
33.38. **CLASS NSSCROLLERMBS**

down or right scroll button) or NSScrollerDecrementArrow (up or left).

**Notes:**

If flag is true, the button is drawn highlighted; otherwise it’s drawn normally. You should never need to invoke this method directly, but may wish to override it to customize the appearance of scroll buttons. Calling this method on CustomNSScrollerMBS objects does not trigger the drawArrow event.

### 33.38.8 drawKnob

**Function:** Draws the knob.

**Notes:**

You should never need to invoke this method directly, but may wish to override it to customize the appearance of the knob. Calling this method on CustomNSScrollerMBS objects does not trigger the drawKnob event.

### 33.38.9 drawKnobSlotInRect(slotRect as NSRectMBS, highlight as boolean)

**Function:** Draws the knob slow in the rectangle.

**Notes:** Calling this method on CustomNSScrollerMBS objects does not trigger the drawKnobSlotInRect event.

### 33.38.10 drawParts

**Function:** Caches images for the scroll buttons and knob.

**Notes:**

It’s invoked only once when the NSScroller is created. You may want to override this method if you alter the look of the NSScroller, but you should never invoke it directly.

Calling this method on CustomNSScrollerMBS objects does not trigger the drawParts event.

### 33.38.11 highlight(flag as boolean)

**Function:** Highlights or unhighlights the scroll button the user clicked.

**Notes:** The receiver invokes this method while tracking the mouse; you should not invoke it directly. If flag
is true, the appropriate part is drawn highlighted; otherwise it’s drawn normally.

### 33.38.12 hitPart as Integer

**Function:** Returns a part code indicating the manner in which the scrolling should be performed.

**Notes:** This method is typically invoked by an NSScrollView to determine how to scroll its document view when it receives an action message from the NSScroller.

### 33.38.13 isCompatibleWithOverlayScrollers as boolean

**Function:** Returns a Boolean value that indicates whether the class is compatible with overlay scroller style and behavior.

**Notes:**

Returns true if the class is compatible with overlay scroller style and behavior, otherwise false. The plugin implements this so you can query the value.

### 33.38.14 NSPreferredScrollerStyleDidChangeNotification as string

**Function:** A notification name.

**Notes:**

Posted if the preferred scroller style changes.
Available in Mac OS X v10.7 and later.

### 33.38.15 preferredScrollerStyle as Integer

**Function:** Returns the style of scrollers that applications should use wherever possible.

**Notes:**

The preferred scroller style is determined by the Appearance preference panel’s ”Show scroll bars” setting for the current user, and when the user’s preference is set to ”Automatically based on input device” by the set of built-in and connected pointing devices and the user’s scroll capability preference settings for them. The preferred scroller style may therefore change over time, and applications should be prepared to adapt their user interfaces to the new scroller style if needed.
In most cases, updating to a new scroller style is automatic: When the preferred scroller style changes, AppKit notifies all NSScrollView instances, sending setScrollerStyle to each with the new style, which causes each scroll view to automatically re-tile (update its layout) to adapt to the new scroller style. Some NSScrollView instances may refuse the new scroller style setting if they cannot accommodate it for compatibility reasons (the presence of accessory views or legacy scroller subclasses prevent use of overlay scrollers), but most instances will switch to the specified new preferred scroller style.

If you need to be notified of changes to the preferred scroller style, you can register to receive NSPreferredScrollerStyleDidChangeNotification notifications.

Available in Mac OS X v10.7 and later.

### 33.38.16 rectForPart(part as Integer) as NSRectMBS

**Function:** Returns the rectangle occupied by aPart, which for this method is interpreted literally rather than as an indicator of scrolling direction.

**Notes:**

Note the interpretations of NSScrollerDecrementPage and NSScrollerIncrementPage. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

Returns NSRectMBS.Zero if the part requested isn’t present on the receiver.

### 33.38.17 scrollerWidth as Double

**Function:** Returns the width of "normal-sized" instances.

**Notes:** NSScrollView uses this value to lay out its components. Subclasses that use a different width should override this method.

### 33.38.18 scrollerWidthForControlSize(controlsize as Integer) as Double

**Function:** Returns the width of the scroller based on controlSize.
**33.38.19 setFloatValue(aFloat as Double, proportion as Double)**

**Function:** Sets the position of the knob to aFloat, which is a value from 0.0 (indicating the top or left end) to 1.0 (the bottom or right end).

**Notes:**

Also sets the proportion of the knob slot filled by the knob to knobProp, also a value from 0.0 (minimal size) to 1.0 (fills the slot).

Available in Mac OS X v10.0 and later.
Depreciated in Mac OS X v10.5.

**33.38.20 testPart(p as NSPointMBS) as Integer**

**Function:** Returns the part that would be hit by a mouse-down event at p (expressed in the window’s coordinate system).

**Notes:** Note the interpretations of NSScrollerDecrementPage and NSScrollerIncrementPage. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

**33.38.21 trackKnob(theEvent as NSEventMBS)**

**Function:** Tracks the knob and sends action messages to the receiver’s target.

**Notes:** This method is invoked automatically when the receiver receives theEvent mouse-down event in the knob; you should not invoke it directly.

**33.38.22 trackScrollButtons(theEvent as NSEventMBS)**

**Function:** Tracks the scroll buttons and sends action messages to the receiver’s target.

**Notes:** This method is invoked automatically when the receiver receives theEvent mouse-down event in a scroll button; you should not invoke this method directly.
33.38. **CLASS NSSCROLLERMB**

33.38.23 **usableParts** as Integer

**Function:** Returns a value indicating which parts of the receiver are displayed and usable.

33.38.24 **Properties**

33.38.25 **arrowsPosition** as Integer

**Function:** The location of the scroll buttons within the receiver.
**Notes:**
Can be NSScrollerArrowsMaxEnd, NSScrollerArrowsMinEnd, NSScrollerArrowsDefaultSetting or NSScrollerArrowsNone.
(Read and Write computed property)

33.38.26 **controlSize** as Integer

**Function:** The size of the receiver.
**Notes:**
Can be NSRegularControlSize, NSMiniControlSize or NSSmallControlSize.
(Read and Write computed property)

33.38.27 **controlTint** as Integer

**Function:** The receiver’s control tint.
**Notes:**
Can be NSGraphiteControlTint, NSBlueControlTint, NSClearControlTint or NSDefaultControlTint.
(Read and Write computed property)

33.38.28 **knobProportion** as Double

**Function:** The portion of the knob slot the knob should fill, as a floating-point value from 0.0 (minimal size) to 1.0 (fills the slot).
**Notes:**
Can be set on Mac OS X 10.5 directly.
(Read and Write computed property)

### 33.38.29 knobStyle as Integer

**Function:** The knob style.
**Notes:**
The value of this property does not affect legacy scrollers. NSScrollerKnobStyleDefault is appropriate for a wide range of content, but in some cases choosing an alternative knob style may enhance visibility of the scroller knob atop some kinds of content.

Available in Mac OS X v10.7 and later.

use constants: NSScrollerKnobStyleDefault, NSScrollerKnobStyleDark or NSScrollerKnobStyleLight.
(Read and Write computed property)

### 33.38.30 scrollerStyle as Integer

**Function:** The scroller style.
**Notes:**
or a scroller that’s managed by an NSScrollView object, the setter is automatically invoked by the scroll view with the appropriate setting, according to the user’s Appearance preference settings and possibly what pointing device(s) are present (see preferredScrollerStyle).

Available in Mac OS X v10.7 and later.
(Read and Write computed property)

### 33.38.31 Constants

#### 33.38.32 NSAllScrollerParts = 2

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify which parts of the scroller are visible.
**Notes:** Scroller has at least a knob, possibly also scroll buttons.
33.38. **CLASS NSSCROLLERMBS**

33.38.33 **NSBlueControlTint = 1**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
**Notes:** Aqua control tint

33.38.34 **NSClearControlTint = 7**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
**Notes:** Clear control tint

33.38.35 **NSDefaultControlTint = 0**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
**Notes:** The current default tint setting

33.38.36 **NSGraphiteControlTint = 6**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
**Notes:** Graphite control tint

33.38.37 **NSMiniControlSize = 2**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property.
**Notes:** The control has a smaller size than NSSmallControlSize.

33.38.38 **NSNoScrollerParts = 0**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify which parts of the scroller are visible.
**Notes:** Scroller has neither a knob nor scroll buttons, only the knob slot.
33.38.39 NSOnlyScrollerArrows = 1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify which parts of the scroller are visible.  
**Notes:** Scroller has only scroll buttons, no knob.

33.38.40 NSRegularControlSize = 0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property.  
**Notes:** The control is sized as regular.

33.38.41 NSScrollerArrowsDefaultSetting = 0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify where the scroller’s buttons appear with the arrowsPosition property.  
**Notes:** Contains the information from the AppleScrollBarVariant default value.

33.38.42 NSScrollerArrowsMaxEnd = 0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify where the scroller’s buttons appear with the arrowsPosition property.  
**Notes:** Buttons at bottom or right. This constant has been deprecated.

33.38.43 NSScrollerArrowsMinEnd = 1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify where the scroller’s buttons appear with the arrowsPosition property.  
**Notes:** Buttons at top or left. This has been deprecated.

33.38.44 NSScrollerArrowsNone = 2

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify where the scroller’s buttons appear with the arrowsPosition property.  
**Notes:** No buttons.
33.38.45  **NSScrollerDecrementArrow = 1**

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants describe the two scroller buttons and are used by drawArrow.  
**Notes:** The down or right scroll button.

33.38.46  **NSScrollerDecrementLine = 4**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.  
**Notes:** Up or left by a small amount.

33.38.47  **NSScrollerDecrementPage = 1**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.  
**Notes:** Up or left by a large amount.

33.38.48  **NSScrollerIncrementArrow = 0**

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants describe the two scroller buttons and are used by drawArrow.  
**Notes:** The up or left scroll button.

33.38.49  **NSScrollerIncrementLine = 5**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.  
**Notes:** Down or right by a small amount.

33.38.50  **NSScrollerIncrementPage = 3**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.  
**Notes:** Down or right by a large amount.
33.38.51 NSScrollerKnob = 2

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.  
**Notes:** Directly to the NSScroller’s value, as given by floatValue.

33.38.52 NSScrollerKnobSlot = 6

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.  
**Notes:** Directly to the NSScroller’s value, as given by floatValue.

33.38.53 NSScrollerKnobStyleDark = 1

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the knob style constants.  
**Notes:**
- Specifies a dark knob.
- This style is particularly good against a light background.
- Available in Mac OS X v10.7 and later.

33.38.54 NSScrollerKnobStyleDefault = 0

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the knob style constants.  
**Notes:**
- Specifies a dark knob with a light border.
- This is the default style; it is good against any background.
- Available in Mac OS X v10.7 and later.

33.38.55 NSScrollerKnobStyleLight = 2

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the knob style constants.  
**Notes:**
- Specifies a light knob.
- This style is particularly good against a dark background.
- Available in Mac OS X v10.7 and later.
33.38. **CLASS NSSCROLLERMBS**

33.38.56 **NSScrollerNoPart = 0**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.
**Notes:** Don’t scroll at all.

33.38.57 **NSScrollerStyleLegacy = 0**

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to specify the scroller style.
**Notes:**
Specifies legacy-style scrollers as prior to Mac OS X v10.7.
Available in Mac OS X v10.7 and later.

33.38.58 **NSScrollerStyleOverlay = 1**

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to specify the scroller style.
**Notes:**
Specifies overlay-style scrollers in Mac OS X v10.7 and later.
Available in Mac OS X v10.7 and later.

33.38.59 **NSSmallControlSize = 1**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property.
**Notes:** This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.
33.39  class NSScrollViewMBS

33.39.1  class NSScrollViewMBS

Function: The Cocoa class for a view which has scrollbars.
Notes:
Embed another view inside it to add scrolling.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

33.39.2  Methods

33.39.3  Constructor

Function: Creates a new scrollview with size 100/100 and position 0/0
Example:
```vba
dim t as new NSScrollViewMBS
```

Notes: On success the handle property is not zero.
See also:
- 33.39.4 Constructor(Handle as Integer) 6556
- 33.39.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6557

33.39.4  Constructor(Handle as Integer)

Function: Creates an object based on the given NSScrollView handle.
Example:
```vba
dim t as new NSScrollViewMBS(0, 0, 100, 100)
dim v as new NSScrollViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```
33.39. **CLASS NSSCROLLVIEWMBS**

**Notes:** The handle is casted to a NSScrollView and the plugin retains this handle.

See also:

- 33.39.3 Constructor
- 33.39.5 Constructor(left as Double, top as Double, width as Double, height as Double)

### 33.39.5 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new scrollview with the given size and position.

**Example:**

```dim x as new NSScrollViewMBS(0, 0, 100, 100)```

**Notes:** On success the handle property is not zero.

See also:

- 33.39.3 Constructor
- 33.39.4 Constructor(Handle as Integer)

### 33.39.6 flashScrollers

**Function:** Flash the overlay scroll bars.

**Notes:**

This method is only to scroll views that use overlay scrollers.

This method can be invoked to cause the overlay scroller knobs to be momentarily shown. This may be desirable when changing a document view’s size or swapping new content into the view, or to give the user a sense of the current position within the scrollable range at each step of an incremental search or similar operation.

Available in Mac OS X v10.7 and later.

### 33.39.7 reflectScrolledClipView(clipView as NSClipViewMBS)

**Function:** Adjusts the receiver’s scrollers to reflect the size and positioning of its content view.

**Notes:**
ClipView: The clip view being adjusted to. If aClipView is any view object other than the receiver’s content view, the method does nothing.

This method is invoked automatically during scrolling and when an NSClipView object’s relationship to its document view changes; you should rarely need to invoke it yourself, but may wish to override it for custom updating or other behavior. If you override this method, be sure to call the superclass implementation. If you do not, other controls (such as the current scrollers) may not be updated properly.

Available in Mac OS X v10.0 and later.

33.39.8 tile

Function: Lays out the components of the receiver: the content view, the scrollers, and the ruler views.
Notes: You rarely need to invoke this method, but subclasses may override it to manage additional components.

33.39.9 Properties

33.39.10 autohidesScrollers as boolean

Function: True when autohiding is set for scroll bars in the scrollview.
Notes: (Read and Write property)

33.39.11 backgroundColor as NSColorMBS

Function: The background color.
Notes: (Read and Write property)

33.39.12 borderType as Integer

Function: The border type.
Notes:
Specifies the appearance of the style of the scroll view’s border. See NSBorderType for a list of possible values.
Use constants NSNoBorder = 0, NSLineBorder = 1, NSBezelBorder = 2 or NSGrooveBorder = 3.
(Read and Write property)

### 33.39.13 `contentSize` as NSSizeMBS

**Function:** Returns the size of the receiver’s content view.
**Notes:** (Read only property)

### 33.39.14 `contentView` as NSClipViewMBS

**Function:** The content view.
**Notes:**
If view has a document view, this method also sets the receiver’s document view to be the document view of view. The original content view retains its document view.
(Read and Write property)

### 33.39.15 `documentCursor` as NSCursorMBS

**Function:** The cursor used when the cursor is over the content view.
**Notes:** (Read and Write property)

### 33.39.16 `documentView` as NSViewMBS

**Function:** The view the receiver scrolls within its content view.
**Notes:** (Read and Write property)

### 33.39.17 `documentVisibleRect` as NSRectMBS

**Function:** Returns the portion of the document view, in its own coordinate system, visible through the receiver’s content view.
**Notes:** (Read only property)
33.39.18  drawsBackground as boolean

**Function:** A Boolean value that indicates whether the scrollview draws its background.
**Notes:** (Read and Write property)

33.39.19  hasHorizontalRuler as boolean

**Function:** True if the receiver maintains a horizontal ruler view, false if it doesn’t.
**Notes:** (Read and Write property)

33.39.20  hasHorizontalScroller as boolean

**Function:** Whether the receiver keeps a horizontal scroller
**Notes:** (Read and Write property)

33.39.21  hasVerticalRuler as boolean

**Function:** Determines whether the scrollview keeps a vertical ruler object.
**Notes:** (Read and Write property)

33.39.22  hasVerticalScroller as boolean

**Function:** True if the scrollview displays a vertical scroller, false if it doesn’t.
**Notes:** (Read and Write property)

33.39.23  horizontalLineScroll as Double

**Function:** The amount by which the receiver scrolls itself horizontally when scrolling line by line to aFloat, expressed in the content view’s coordinate system.
**Notes:**
This amount is the amount used when the user clicks the scroll arrows on the horizontal scroll bar without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this amount to the height of a single line of text in the default font.
(Read and Write property)

33.39.24  **horizontalPageScroll** as Double

**Function:** The amount of the document view kept visible when scrolling horizontally page by page, expressed in the content view’s coordinate system.
**Notes:**
This amount is used when the user clicks the scroll arrows on the horizontal scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.
(Read and Write property)

33.39.25  **horizontalScrollElasticity** as Integer

**Function:** The scroll view’s horizontal elasticity mode.
**Notes:**
A scroll view can scroll its contents past its bounds to achieve an elastic effect.

When set to NSScrollElasticityAutomatic, scrolling the horizontal axis beyond its document bounds only occurs if the document width is greater than the view width or, the vertical scroller is hidden and the horizontal scroller is visible.

The default value is NSScrollElasticityAutomatic.

Available in Mac OS X v10.7 and later.
(Read and Write property)
33.39.26  horizontalScroller as NSScrollerMBS

Function: The receiver’s horizontal scroller, regardless of whether the receiver is currently displaying it, or
nil if the receiver has none.
Notes: (Read and Write property)

33.39.27  lineScroll as Double

Function: The horizontal and vertical line scroll amounts to aFloat.
Notes:
The line scroll is the amount by which the receiver scrolls itself when scrolling line by line, expressed in the
content view’s coordinate system. It’s used when the user clicks the scroll arrows without holding down a
modifier key. When displaying text in an NSScrollView, for example, you might set this value to the height
of a single line of text in the default font.

As part of its implementation, this method sets VerticalLineScroll and HorizontalLineScroll.
(Read and Write property)

33.39.28  pageScroll as Double

Function: The vertical page scroll amount: the amount of the document view kept visible when scrolling
vertically page by page, expressed in the content view’s coordinate system.
Notes:
This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the
Option key. As part of its implementation, this method calls verticalPageScroll.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to
orient to the new display. It differs from the line scroll amount, which indicates how far the document view
moves. The page scroll amount is the amount common to the content view before and after the document
view is scrolled by one page.

Note that a scroll view can have two different page scroll amounts: verticalPageScroll and horizontalPage-
Scroll. Use this method only if you can be sure they’re both the same.
(Read and Write property)
33.39. CLASS NSSCROLLVIEWMBS

33.39.29 rulersVisible as boolean

Function: Whether rulers should be visible.
Notes: (Read and Write property)

33.39.30 scrollerKnobStyle as Integer

Function: The knob style of scroll views that use the overlay scroller style.
Notes:
Applicable only to scroll views that use overlay scrollers.
Available in Mac OS X v10.7 and later.
(Read and Write property)

33.39.31 scrollerStyle as Integer

Function: The scroller style used by the scroll view.
Notes:
This setting is automatically set at runtime, based on the user’s preference setting and, if relevant, the set of connected pointing devices and their configured scroll capabilities, as determined by the NSScroller method preferredScrollerStyle.

Setting an scroll view’s scroller style sets the style of both the horizontal and vertical scrollers. If the scroll view subsequently creates or is assigned a new horizontal or vertical scroller, they will be assigned the same scroller style that was assigned to the scroll view.

Available in Mac OS X v10.7 and later.
(Read and Write property)

33.39.32 scrollsDynamically as boolean

Function: True if the scrollview redraws its document view while tracking the knob, false if it redraws only when the scrollern knob is released.
Notes:
NSScrollView scrolls dynamically by default.
(Read and Write property)
33.39.33  usesPredominantAxisScrolling as boolean

Function: Whether the scroll view uses a predominant scrolling axis for content.
Notes:
Whether the scroll view supports a predominant scrolling direction. true if there is a predominant scrolling
direction; otherwise false.

Some content is scrollable in both the horizontal and vertical axes, but is predominantly scrolled one axis at
a time. Other content (such as a drawing canvas) should scroll freely in both axes.

Traditionally this is not an issue with scroll wheels since they can only scroll in one direction at a time.
With scroll balls and touch surfaces, it becomes more difficult to determine the user’s intention.

This property helps a scroll view determine the user’s intention by specifying if there is a predominant
scrolling axis for content.

The default value is true.

Available in Mac OS X v10.7 and later.
(Read and Write property)

33.39.34  verticalLineScroll as Double

Function: The amount by which the view scrolls itself vertically when scrolling line by line to aFloat,
expressed in the content view’s coordinate system.
Notes:
This value is the amount used when the user clicks the scroll arrows on the vertical scroll bar without holding
down a modifier key. When displaying text in an NSScrollView, for example, you might set this value to the
height of a single line of text in the default font.
(Read and Write property)

33.39.35  verticalPageScroll as Double

Function: The amount of the document view kept visible when scrolling vertically page by page to aFloat,
expressed in the content view’s coordinate system.

**Notes:**

This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page. Thus, setting the page scroll amount to 0.0 implies that the entire visible portion of the document view is replaced when a page scroll occurs.

(Read and Write property)

### 33.39.36 verticalScrollElasticity as Integer

**Function:** The scroll view’s vertical elasticity mode.

**Notes:**

A scroll view can scroll its contents past its bounds to achieve an elastic effect.

When set to NSScrollElasticityAutomatic, scrolling the vertical axis beyond its document bounds occurs if any of the following are true: the vertical scroller is visible, the content height is greater than view height, or the horizontal scroller hidden.

Available in Mac OS X v10.7 and later.

(Read and Write property)

### 33.39.37 verticalScroller as NSScrollerMBS

**Function:** The receiver’s vertical scroller, regardless of whether the receiver is currently displaying it, or nil if the receiver has none.

**Notes:** (Read and Write property)

### 33.39.38 Constants

### 33.39.39 NSScrollElasticityAllowed = 2

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants used to determine the elasticity behavior for an axis of the scrollview.
Notes:
Allow content to be scrolled past its bounds on this axis in an elastic fashion.
Available in Mac OS X v10.7 and later.

33.39.40 NSScrollElasticityAutomatic = 0

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants used to determine the elasticity behavior for an axis of the scrollview.
Notes:
Automatically determine whether to allow elasticity on this axis.
Available in Mac OS X v10.7 and later.

33.39.41 NSScrollElasticityNone = 1

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants used to determine the elasticity behavior for an axis of the scrollview.
Notes:
Disallow scrolling beyond document bounds on this axis.
Available in Mac OS X v10.7 and later.

33.39.42 NSScrollViewFindBarPositionAboveContent = 1

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants used to define the position of the find bar in relation to the scroll view.
Notes:
The find bar is displayed above the scroll view content.
Available in Mac OS X v10.7 and later.

33.39.43 NSScrollViewFindBarPositionAboveHorizontalRuler = 0

MBS MacControls Plugin, Plugin Version: 11.3. Function: One of the constants used to define the position of the find bar in relation to the scroll view.
Notes:
The find bar is displayed above the horizontal ruler, if visible.
Available in Mac OS X v10.7 and later.
NSScrollViewFindBarPositionBelowContent = 2

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants used to define the position of the find bar in relation to the scroll view.

**Notes:**

The find bar is displayed below the scroll view content.
Available in Mac OS X v10.7 and later.
33.40 control NSSearchFieldControlMBS

33.40.1 control NSSearchFieldControlMBS

**Function:** The Xojo control for a NSSearchField.

**Notes:**

This control embeds a special NSSearchField subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlying object and set properties.

33.40.2 Properties

33.40.3 View as NSSearchFieldMBS

**Function:** The view used in the control.

**Notes:**

Use this object to set more options on the control.
(Read only property)

33.40.4 Events

33.40.5 Action

**Function:** The Xojo control for a NSSearchField.

**Notes:**

This control embeds a special NSSearchField subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlying object and set properties.

33.40.6 BoundsChanged

**Function:** The event called when the bounds, but not the frame, changed.
33.40. **CONTROL NSSEARCHFIELDCONTROLMBS**

33.40.7 **EnableMenuItems**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event where you can enable menu items.

33.40.8 **FrameChanged**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

33.40.9 **GotFocus**

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus. **Notes:** This only fires if the control itself got focus and not a sub control.

33.40.10 **LostFocus**

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus. **Notes:** This only fires if the control itself lost focus and not a sub control.

33.40.11 **MenuAction(HitItem as MenuItem) As Boolean**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen. **Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

33.40.12 **MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was pressed inside the controls region at the location passed in to x, y. **Notes:** The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

### 33.40.13 MouseDrag(x as Integer, y as Integer)

**Function:** This event fires continuously after the mouse button was pressed inside the Control.

**Notes:**
- Mouse location is local to the control passed in to x, y.
- As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

### 33.40.14 MouseUp(x as Integer, y as Integer)

**Function:** The mouse button was released.

**Notes:** Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

### 33.40.15 ScaleFactorChanged(NewFactor as Double)

**Function:** The backing store scale factor has changed.

**Notes:** Please invalidate any cached bitmaps or other relevant state.

### 33.40.16 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

**Function:** Sent when a control with editable text begins an editing session.

**Notes:**
33.40. CONTROL NSSEARCHFIELDCONTROLMBS

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

33.40.17 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

Function: Sent when the text in the receiving control changes.
Notes:
Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

33.40.18 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

Function: Sent when a control with editable text ends an editing session.
Notes:
Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

33.40.19 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

Function: The event called to decide whether text editing should be allowed.
CHAPTER 33. COCOA CONTROLS

Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

33.40.20 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.
33.41.  CLASS NSSEARCHFIELDMBS

33.41  class NSSearchFieldMBS

33.41.1  class NSSearchFieldMBS

**Function:** An NSSearchField object implements a text field control that is optimized for performing text-based searches.

**Example:**

```lisp
// create searchfield
dim n as new NSSearchFieldMBS(0,0,100,20)

// set placeholder
dim x as NSTextFieldCellMBS = n.cell
x.placeholderString = "Test"
```

**Notes:**

The control provides a customized text field for entering search data, a search button, a cancel button, and a pop-up icon menu for listing recent search strings and custom search categories.

An NSSearchField object wraps an NSSearchFieldCell object. Access to most search field attributes occurs through the cell, which provides a more comprehensive programmatic interface for manipulating the search field. You can use an NSSearchField object though to manipulate some aspects of the search field. For additional information about search fields and how to manipulate them, see the NSSearchFieldCell class.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSTextFieldMBS class.

33.41.2  Methods

33.41.3  Constructor

**Function:** Creates a new search field with size 100/100 and position 0/0

**Example:**

```lisp
dim t as new NSSearchFieldMBS
```

**Notes:** On success the handle property is not zero.

See also:
33.41.4 Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSSearchField handle.  
**Example:**

```vbnet
dim t as new NSSearchFieldMBS(0, 0, 100, 100)
dim v as new NSSearchFieldMBS(t.handle)
```

**Notes:** The handle is casted to a NSSearchField and the plugin retains this handle.  
See also:

- 33.41.3 Constructor  
- 33.41.5 Constructor(left as Double, top as Double, width as Double, height as Double)

33.41.5 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new search field with the given size and position.  
**Example:**

```vbnet
dim x as new NSSearchFieldMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.  
See also:

- 33.41.3 Constructor  
- 33.41.4 Constructor(Handle as Integer)

33.41.6 recentSearches as string()

**Function:** Returns the list of recent search strings for the control.  
**Notes:** An array of strings, each of which contains a search string either displayed in the search menu or
from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty.

### 33.41.7 `setRecentSearches(values() as string)`

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the list of recent search strings to list in the pop-up icon menu of the receiver. **Notes:** You might use this method to set the recent list of searches from an archived copy.

### 33.41.8 Properties

#### 33.41.9 `maximumRecents as Integer`

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum number of search strings that can appear in the search menu. **Notes:**

The maximum number of search strings that can appear in the menu. This value can be between 0 and 254. Specifying a value less than 0 sets the value to the default, which is 10. Specifying a value greater than 254 sets the maximum to 254.

When the limit is exceeded, the oldest search string on the menu is dropped.  
(Read and Write computed property)

#### 33.41.10 `recentsAutosaveName as string`

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The key under which the prior list of recent search strings has been archived. **Notes:**

The autosave name, which is used as a key in the standard user defaults to save the recent searches. The default value is "", which causes searches not to be autosaved.  
(Read and Write computed property)

#### 33.41.11 `searchMenuTemplate as NSMenuMBS`

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The menu template object used to dynamically construct the search pop-up icon menu. **Notes:**
The receiver looks for the tag constants described in Menu tags to determine how to populate the menu with items related to recent searches. (See constants)

To modify the actual menu shown, please use NSMenuItemMBS.validateMenuItem event. There you can for example set the state of the menu item shown. The SearchField makes a copy of the NSMenuItem, so the menuitem where the event is called, is not the one shown. It’s the one passes as parameter.
(Read and Write computed property)

### 33.41.12 sendsSearchStringImmediately as boolean

**Function:** Whether the cell sends its action message to the target immediately upon notification of any changes to the search field text or after a brief pause.  
**Notes:**
True to send the cell’s action immediately upon notification of any changes to the search field; otherwise, false if you want the cell to pause briefly before sending its action message. Pausing gives the user the opportunity to type more text into the search field before initiating the search.
(Read and Write computed property)

### 33.41.13 sendsWholeSearchString as boolean

**Function:** Whether the receiver sends the search action message when the user clicks the search button (or presses return) or after each keystroke.  
**Notes:**
True to send the action message all at once when the user clicks the search button or presses return; otherwise, False to send the search string after each keystroke.
(Read and Write computed property)

### 33.41.14 Constants

#### 33.41.15 NSSearchFieldClearRecentsMenuItemTag = 1002

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the tag values for the search menu template.  
**Notes:**  
Identifies the menu item for clearing the current set of recent string searches in the menu. This item is hidden if there are no recent strings.
33.41.16  **NSSearchFieldNoRecentsMenuItemTag = 1003**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the tag values for the search menu template.  
**Notes:**
Identifies the menu item that describes a lack of recent search strings (for example, "No recent searches"). This item is hidden if there have been recent searches.

33.41.17  **NSSearchFieldRecentsMenuItemTag = 1001**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the tag values for the search menu template.  
**Notes:** Identifies where recent search strings should appear in the "recents" menu group.

33.41.18  **NSSearchFieldRecentsTitleMenuItemTag = 1000**

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the tag values for the search menu template.  
**Notes:**
Identifies the menu item that is the title of the menu group for recent search strings.  
This item is hidden if there are no recent strings.  
You may use this tagged item for separator characters that also do not appear if there are no recent strings to display.
33.42 control NSSecureTextFieldControlMBS

33.42.1 control NSSecureTextFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The Xojo control for a NSSecureTextField.
Notes:
This control embeds a special NSSecureTextField subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

33.42.2 Properties

33.42.3 echosBullets as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver echoes a bullet character rather than each character typed.
Example:
```
dim t as NSSecureTextFieldControlMBS // your textfield
t.echosBullets = true
```

Notes:
If true, bullets are echoed. If false, the cursor is moved for each character typed, but nothing is displayed.
(Read and Write property)

33.42.4 View as NSSecureTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used in the control.
Notes:
Use this object to set more options on the control.
(Read only property)
33.42.5 Events

33.42.6 Action

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control’s action was triggered.  
**Notes:** The text changed.

33.42.7 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the bounds, but not the frame, changed.

33.42.8 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event where you can enable menu items.

33.42.9 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

33.42.10 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus.  
**Notes:** This only fires if the control itself got focus and not a sub control.

33.42.11 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus.  
**Notes:** This only fires if the control itself lost focus and not a sub control.
**33.42.12 MenuAction(HitItem as MenuItem) As Boolean**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen. **Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

---

**33.42.13 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was pressed inside the controls region at the location passed in to x, y. **Notes:**
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control. Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

---

**33.42.14 MouseDrag(x as Integer, y as Integer)**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event fires continuously after the mouse button was pressed inside the Control. **Notes:**
Mouse location is local to the control passed in to x, y. As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

---

**33.42.15 MouseUp(x as Integer, y as Integer)**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was released. **Notes:** Use the x and y parameters to determine if the mouse button was released within the control's boundaries.
33.42. **SCALEFACTORCHANGED**

**33.42.16 ScaleFactorChanged(NewFactor as Double)**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The backing store scale factor has changed. 
**Notes:** Please invalidate any cached bitmaps or other relevant state.

**33.42.17 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationCenter)**

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a control with editable text begins an editing session. 
**Notes:** 
Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification. 
This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

**33.42.18 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationCenter)**

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the text in the receiving control changes. 
**Notes:** 
Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification. 
This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

**33.42.19 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationCenter)**

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a control with editable text ends an editing session. 
**Notes:**
Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

33.42.20 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes:
Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

33.42.21 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes:
Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.
33.43. CLASS NSSECURETEXTFIELDMBS

33.43 class NSSecureTextFieldMBS

33.43.1 class NSSecureTextFieldMBS

Function: NSSecureTextFieldMBS is a subclass of NSTextField that hides its text from display or other access via the user interface.

Notes:
It’s suitable for use as a password-entry object or for any item in which a secure value must be kept.

NSSecureTextField uses NSSecureTextFieldCell to implement its user interface.
Subclass of the NSTextFieldMBS class.

33.43.2 Methods

33.43.3 Constructor

Function: Creates a new secure text field with size 100/100 and position 0/0

Example:

```vbs
dim t as new NSSecureTextFieldMBS
```

Notes: On success the handle property is not zero.

See also:

- 33.43.4 Constructor(Handle as Integer)
- 33.43.5 Constructor(left as Double, top as Double, width as Double, height as Double)

33.43.4 Constructor(Handle as Integer)

Function: Creates an object based on the given NSSecureTextField handle.

Example:

```vbs
dim t as new NSSecureTextFieldMBS(0, 0, 100, 100)
dim v as new NSSecureTextFieldMBS(t.handle)
MsgBox str(v.Bounds.Width)+” x “+str(v.Bounds.Height)
```
Notes: The handle is casted to a NSSecureTextField and the plugin retains this handle. See also:

- 33.43.3 Constructor
- 33.43.5 Constructor(left as Double, top as Double, width as Double, height as Double)

### 33.43.5 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new secure text field with the given size and position.
**Example:**
```plaintext
dim x as new NSSecureTextFieldMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero. See also:

- 33.43.3 Constructor
- 33.43.4 Constructor(Handle as Integer)

### 33.43.6 Properties

#### 33.43.7 echosBullets as boolean

**Function:** Whether the receiver echoes a bullet character rather than each character typed.
**Example:**
```plaintext
dim t as NSSecureTextFieldMBS // your textfield
t.echosBullets = true
```

Notes:
If true, bullets are echoed. If false, the cursor is moved for each character typed, but nothing is displayed. (Read and Write computed property)
class NSSegmentedControlMBS

Function: The plugin class for a Cocoa NSSegmentedControl.

Notes:

An NSSegmentedControl object implements a horizontal button made of multiple segments.

The NSSegmentedControl class uses an NSSegmentedCell class to implement much of the control’s functionality. Most methods in NSSegmentedControl are simply "cover methods" that call the corresponding method in NSSegmentedCell. The methods of NSSegmentedCell that do not have covers relate to accessing and setting values for tags and tool tips; programatically setting the key segment; and establishing the mode of the control.

The features of a segmented control include:

- Each segment can have an image, text (label), menu, tooltip, and tag
- Either the whole control or individual segments can be enabled or disabled
- There are three tracking modes for segments: select one mode (also known as radio button mode and illustrated by Finder’s view mode selection control), momentary mode (as illustrated by Safari’s toolbar buttons), or select any mode (where any combination of buttons may be on or off)
- Each segment can be either a fixed width or autosized to fit the contents
- If a segment has text and is marked as autosizing, then the text may be truncated so that the control completely fits
- If an image is too large to fit in a segment, it is clipped
- Full keyboard control of the user interface

Subclass of the NSControlMBS class.

33.44.2 Methods

33.44.3 Constructor

Function: Creates a new path control with size 100/100 and position 0/0

Example:
dim t as new NSSegmentedControlMBS

Notes: On success the handle property is not zero.
See also:

- 33.44.4 Constructor(Handle as Integer) 6586
- 33.44.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6586

33.44.4 Constructor(Handle as Integer)

Function: Creates an object based on the given NSPathControl handle.
Example:

dim t as new NSSegmentedControlMBS(0, 0, 100, 100)
dim v as new NSSegmentedControlMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x " +str(v.Bounds.Height)

Notes: The handle is casted to a NSSegmentedControl and the plugin retains this handle.
See also:

- 33.44.3 Constructor 6585
- 33.44.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6586

33.44.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new path control with the given size and position.
Example:

dim x as new NSSegmentedControlMBS(0, 0, 100, 100)

Notes: On success the handle property is not zero.
See also:

- 33.44.3 Constructor 6585
- 33.44.4 Constructor(Handle as Integer) 6586
33.44.6 makeNextSegmentKey

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the next segment.  
**Notes:** The next segment is the one to the right of the currently selected segment. For the last segment, the selection wraps back to the beginning of the control.

33.44.7 makePreviousSegmentKey

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the previous segment.  
**Notes:** The previous segment is the one to the left of the currently selected segment. For the first segment, the selection wraps around to the last segment of the control.

33.44.8 selectSegmentWithTag(Tag as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the segment with the specified tag.  
**Notes:**

- tag: The tag associated with the desired segment.  
- True if the segment was selected successfully; otherwise, false.

Typically, you use Interface Builder to specify the tag for each segment. You may also set this value programmatically using the setTag:forSegment: method of NSSegmentedCell.

33.44.9 Properties

33.44.10 cellTrackingMode as Integer

MBS MacCocoa Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The tracking mode used for the segments of the receiver.  
**Notes:**

- Possible values for trackingMode are described in NSSegmentSwitchTracking. The default value is NSSegmentSwitchTrackingSelectOne.

This property was named only trackingMode in 15.1 and older plugins.  
(Read and Write property)
**33.44.11 doubleValueForSelectedSegment as Double**

**Function:** Query the double value for selected segment.  
**Notes:**
This message is valid only for trackingMode = NSSegmentSwitchTrackingMomentaryAccelerator and provides the double value for the selected segment.  
Available on Mac OS X 10.10.3.  
(Read only property)

**33.44.12 segmentCount as Integer**

**Function:** Returns the number of segments in the receiver.  
**Notes:** (Read and Write property)

**33.44.13 segmentStyle as Integer**

**Function:** The visual style used to display the receiver.  
**Notes:**
See style constants.  
Available in Mac OS X v10.5 and later.  
(Read and Write property)

**33.44.14 selectedSegment as Integer**

**Function:** The index of the selected segment of the receiver.  
**Notes:**
The index of the currently selected segment or -1 if no segment is selected. If the receiver allows multiple selections, this method returns the most recently selected segment.  
(Read and Write property)

**33.44.15 springLoaded as Boolean**

**Function:** Sends action on deep-press or extended hover while dragging.
33.44.16  trackingMode as Integer

Function: The type of tracking behavior the control exhibits.
Notes: An NSSegmentSwitchTracking value specifies how the control responds when the user presses a keyboard key or clicks, force clicks (applies pressure in a pressure-sensitive system), releases pressure, and so on.

see NSSegmentSwitchTracking* constants.
Available on Mac OS X 10.10.3 and newer.
(Read and Write property)

33.44.17  imageForSegment(segment as Integer) as NSImageMBS

Function: The image for the specified segment.
Notes: image: The image to apply to the segment or nil if you want to clear the existing image. Images are not scaled to fit inside a segment. If the image is larger than the available space, it is clipped.
segment: The index of the segment whose image you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

33.44.18  imageScalingForSegment(segment as Integer) as Integer

Function: The scaling mode used to display the specified segment’s image.
Notes: scaling: One of the image scaling constants. For a list of possible values, see constants.
segment: The index of the segment whose enabled state you want to get. This method raises an NSRangeException if the index is out of bounds.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)
33.44.19  isEnabledForSegment(segment as Integer) as Boolean

Function: The enabled state of the specified segment.

Notes:
True to enable the segment; otherwise, false to disable it.
segment: The index of the segment you want to enable or disable. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

33.44.20  isSelectedForSegment(segment as Integer) as Boolean

Function: The selection state of the specified segment.

Notes:
True if you want to select the segment; otherwise, false.
segment: The index of the segment whose selection state you want to set. This method raises an NSRangeException if the index is out of bounds.
If the receiver allows only a single selection, this method deselects any other selected segments.
(Read and Write computed property)

33.44.21  labelForSegment(segment as Integer) as string

Function: The label for the specified segment.

Notes:
label: The label you want to display in the segment. If the width of the string is greater than the width of the segment, the string’s text is truncated during drawing.
segment: The index of the segment whose label you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

33.44.22  menuForSegment(segment as Integer) as NSMenuMBS

Function: The menu for the specified segment.

Notes:
menu: The menu you want to add to the segment or nil to clear the current menu. This menu is displayed when the user clicks and holds the mouse button while the mouse is over the segment.

segment: The index of the segment whose menu you want to set. This method raises an NSRangeException if the index is out of bounds.

Adding a menu to a segment allows that segment to be used as a pop-up button.
(Read and Write computed property)

### 33.44.23 tagForSegment(segment as Integer) as Integer

**Function:** The tag value for the segment.

**Notes:**

segment: The index of the segment whose width you want to get. This method raises an NSRangeException if the index is out of bounds.

The tag is an integer you define to identify your items.
(Read and Write computed property)

### 33.44.24 ToolTipForSegment(segment as Integer) as string

**Function:** The tool tip for the specified segment.

**Notes:**

segment: The index of the segment whose tool tip you want to set. This method raises an NSRangeException if the index is out of bounds.

Tool tips are currently not displayed. Apple may change that in the future.
(Read and Write computed property)

### 33.44.25 widthForSegment(segment as Integer) as Double

**Function:** The width of the specified segment.

**Notes:**

width: The width of the segment, measured in points. Specify the value 0 if you want the segment to be sized to fit the available space automatically.

segment: The index of the segment whose width you want to set. This method raises an NSRangeException
if the index is out of bounds.
(Read and Write computed property)

33.44.26 Constants

33.44.27 NSImageScaleAxesIndependently = 1

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants specify a cell’s image scaling behavior.

**Notes:**

Scale each dimension to exactly fit destination.
This setting does not preserve the aspect ratio of the image.
Available in Mac OS X v10.5 and later.

33.44.28 NSImageScaleNone = 2

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants specify a cell’s image scaling behavior.

**Notes:**

Do not scale the image.
Available in Mac OS X v10.5 and later.

33.44.29 NSImageScaleProportionallyDown = 0

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants specify a cell’s image scaling behavior.

**Notes:**

If it is too large for the destination, scale the image down while preserving the aspect ratio.
Available in Mac OS X v10.5 and later.

33.44.30 NSImageScaleProportionallyUpOrDown = 3

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants specify a cell’s image scaling behavior.

**Notes:**

Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.
33.44. CLASS NSSEGMENTEDCONTROLMBS

Available in Mac OS X v10.5 and later.

33.44.31 NSSegmentStyleAutomatic = 0

MBS MacCocoa Plugin, Plugin Version: 12.1. Function: One of the constants to specify the visual style used to display the segmented control.
Notes:
The appearance of the segmented control is automatically determined based on the type of window in which the control is displayed and the position within the window.
Available in Mac OS X v10.5 and later.

33.44.32 NSSegmentStyleRounded = 1

MBS MacCocoa Plugin, Plugin Version: 12.1. Function: One of the constants to specify the visual style used to display the segmented control.
Notes:
The control is displayed using the rounded style.
Available in Mac OS X v10.5 and later.

33.44.33 NSSegmentStyleRoundRect = 2

MBS MacCocoa Plugin, Plugin Version: 12.1. Function: One of the constants to specify the visual style used to display the segmented control.
Notes:
The control is displayed using the round rect style.
Available in Mac OS X v10.5 and later.

33.44.34 NSSegmentStyleSmallSquare = 6

MBS MacCocoa Plugin, Plugin Version: 12.1. Function: One of the constants to specify the visual style used to display the segmented control.
Notes:
The control is displayed using the small square style.
Available in Mac OS X v10.5 and later.
33.44.35 NSSegmentStyleTexturedSquare = 4

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants to specify the visual style used to display the segmented control.
**Notes:**
The control is displayed using the textured square style.
Available in Mac OS X v10.5 and later.

33.44.36 NSSegmentSwitchTrackingMomentary = 2

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants for switch tracking.
**Notes:** A segment is selected only when tracking.

33.44.37 NSSegmentSwitchTrackingMomentaryAccelerator = 3

MBS MacCocoa Plugin, Plugin Version: 15.2. **Function:** One of the constants for switch tracking.
**Notes:** accelerator behavior, only selected while tracking.

33.44.38 NSSegmentSwitchTrackingSelectAny = 1

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants for switch tracking.
**Notes:** Any segment can be selected.

33.44.39 NSSegmentSwitchTrackingSelectOne = 0

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants for switch tracking.
**Notes:** Only one segment may be selected.
### 33.45. CLASS NSSLIDERMBS

#### 33.45 class NSSliderMBS

**Function:** An NSSlider object displays a range of values for something in the application.

**Notes:**

Sliders can be vertical or horizontal bars or circular dials. An indicator, or knob, notes the current setting. The user can move the knob in the slider’s bar or rotate the knob in a circular slider to change the setting.

The NSSlider class uses the NSSliderCell class to implement its user interface.

Subclass of the NSControlMBS class.

#### 33.45.2 Methods

#### 33.45.3 acceptsFirstMouse(event as NSEventMBS) as boolean

**Function:** Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.

**Notes:**

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

#### 33.45.4 closestTickMarkValueToValue(value as Double) as Double

**Function:** Returns the value of the tick mark closest to the specified value.
### 33.45.5 Constructor

**Function:** Creates a new slider with size 100/100 and position 0/0

**Example:**

```vbnet
dim t as new NSSliderMBS
```

**Notes:** On success the handle property is not zero.

See also:

- 33.45.6 Constructor(Handle as Integer) 6596
- 33.45.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6596

### 33.45.6 Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSSlider handle.

**Example:**

```vbnet
dim t as new NSSliderMBS(0, 0, 100, 100)
dim v as new NSSliderMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

**Notes:** The handle is casted to a NSSlider and the plugin retains this handle.

See also:

- 33.45.5 Constructor 6596
- 33.45.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6596

### 33.45.7 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new slider with the given size and position.

**Example:**

```vbnet
dim x as new NSSliderMBS(0, 0, 100, 100)
```
33.45. CLASS NSSLIDERMBS

Notes: On success the handle property is not zero.
See also:

- 33.45.5 Constructor
- 33.45.6 Constructor(Handle as Integer)

33.45.8 indexOfTickMarkAtPoint(p as NSPointMBS) as Integer

Function: Returns the index of the tick mark closest to the location of the receiver represented by the given point.
Notes:
Returns the index of the tick mark closest to the location specified by point. If point is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns NSNotFound.
In its implementation of this method, the receiving NSSlider instance simply invokes the method of the same name of its NSSliderCell instance. This method invokes rectOfTickMarkAtIndex: for each tick mark on the slider until it finds a tick mark containing the point.
See also:

- 33.45.9 indexOfTickMarkAtPoint(x as Double, y as Double) as Integer

33.45.9 indexOfTickMarkAtPoint(x as Double, y as Double) as Integer

Function: Returns the index of the tick mark closest to the location of the receiver represented by the given point.
Notes: The index of the tick mark closest to the location specified by point. If point is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns NSNotFound (& h7fffffff).
See also:

- 33.45.8 indexOfTickMarkAtPoint(p as NSPointMBS) as Integer

33.45.10 isVertical as Integer

Function: Returns an integer indicating the orientation (horizontal or vertical) of the slider.
Notes: 1 if the receiver is vertical, 0 if it’s horizontal, and 1 if the orientation can’t be determined (for example, if the slider hasn’t been displayed yet). A slider is defined as vertical if its height is greater than its width.
33.45.11  *rectOfTickMarkAtIndex(index as Integer) as NSRectMBS*

**Function:** Returns the bounding rectangle of the tick mark at the given index.
**Notes:** If no tick mark is associated with index, the method raises NSRangeException.

33.45.12  *tickMarkValueAtIndex(index as Integer) as Double*

**Function:** Returns the receiver's value represented by the tick mark at the specified index.

33.45.13  Properties

33.45.14  *allowsTickMarkValuesOnly as boolean*

**Function:** A Boolean value indicating whether the receiver fixes its values to those values represented by its tick marks.
**Notes:**
True if the slider fixes its values to the values represented by its tick marks; otherwise, false.
(Read and Write computed property)

33.45.15  *altIncrementValue as Double*

**Function:** The amount by which the receiver changes its value when the user Optiondrags the slider knob.
**Notes:**
The amount by which the value changes when the user drags the slider knob with the Option key held down. Unless you assign a value to AltIncrementValue, altIncrementValue returns 1.0, and the receiver behaves no differently with the Option key down than with it up.
(Read and Write computed property)

33.45.16  *image as NSImageMBS*

**Function:** This method has been deprecated. Returns nil.
**Notes:**
The slider may scale and distort barImage to fit inside the bar.

The knob may cover part of the image. If you want the image to be visible all the time, you’re better off placing it near the slider.

This method has been deprecated by Apple.
(Read and Write computed property)

### 33.45.17 knobThickness as Double

**Function:** The knob’s thickness, in pixels.
**Notes:**
The thickness of the slider knob. The thickness is defined to be the extent of the knob along the long dimension of the bar. In a vertical slider, then, a knob’s thickness is its height; in a horizontal slider, a knob’s thickness is its width.
(Read and Write computed property)

### 33.45.18 maxValue as Double

**Function:** The maximum value the receiver can send to its target.
**Notes:**
The slider’s maximum value. A horizontal slider sends its maximum value when the knob is at the right end of the bar; a vertical slider sends it when the knob is at the top.
(Read and Write computed property)

### 33.45.19 minValue as Double

**Function:** the minimum value the receiver can send to its target.
**Notes:**
The slider’s minimum value. A vertical slider sends its minimum value when its knob is at the bottom; a horizontal slider, when its knob is all the way to the left.
(Read and Write computed property)
CHAPTER 33. COCOA CONTROLS

33.45.20  **numberOfTickMarks as Integer**

**Function:** The number of tick marks associated with the receiver.
**Notes:**
The number of the slider’s tick marks. The tick marks assigned to the minimum and maximum values are included.
(Read and Write computed property)

33.45.21  **sliderType as Integer**

**Function:** The slider type.
**Notes:**
Either NSLinearSlider or NSCircularSlider.
(Read and Write computed property)

33.45.22  **tickMarkPosition as Integer**

**Function:** How the receiver’s tick marks are aligned with it.
**Notes:**
A constant indicating the position of the tick marks. Possible values are NSTickMarkBelow, NSTickMarkAbove, NSTickMarkLeft, and NSTickMarkRight (the last two are for vertical sliders). The default alignments are NSTickMarkBelow and NSTickMarkLeft.
(Read and Write computed property)

33.45.23  **title as string**

**Function:** The receiver’s title.
**Notes:**
The default title is the empty string.
(Read and Write computed property)
33.45.24  titleCell as NSCellMBS

Function: Sets the cell used to draw the receiver’s title.
Notes:
You only need to invoke this method if the default title cell, NSTextFieldCell, doesn’t suit your needs that is, you want to display the title in a manner that NSTextFieldCell doesn’t permit. When you do choose to override the default, titleCell should be an instance of a subclass of NSTextFieldCell.

This method has been deprecated by Apple.
(Read and Write computed property)

33.45.25  titleColor as NSColorMBS

Function: Sets the color used to draw the receiver’s title.
Notes:
This method has been deprecated by Apple.
(Read and Write computed property)

33.45.26  titleFont as NSFontMBS

Function: Sets the font used to draw the receiver’s title.
Notes:
This method has been deprecated by Apple.
(Read and Write computed property)

33.45.27  Constants

33.45.28  NSCircularSlider = 1

MBS MacControls Plugin, Plugin Version: 8.4. Function: One of the slider type constants.
Notes: A circular slider; that is, a dial.
33.45.29  **NSLinearSlider=0**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the slider type constants.  
**Notes:** A bar-shaped slider.

33.45.30  **NSTickMarkAbove=1**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the tickMarkPosition property.  
**Notes:** Tick marks above (for horizontal sliders).

33.45.31  **NSTickMarkBelow=0**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the tickMarkPosition property.  
**Notes:** Tick marks below (for horizontal sliders); the default for horizontal sliders.

33.45.32  **NSTickMarkLeft=1**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the tickMarkPosition property.  
**Notes:** Tick marks to the left (for vertical sliders); the default for vertical sliders.

33.45.33  **NSTickMarkRight=0**

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the tickMarkPosition property.  
**Notes:** Tick marks to the right (for vertical sliders).
33.46. class NSStepperMBS

33.46.1. class NSStepperMBS

Function: A stepper consists of two small arrows that can increment and decrement a value that appears beside it, such as a date or time.
Notes: The illustration below shows a stepper to the right of a text field, which would show the stepper’s value. Subclass of the NSControlMBS class.

33.46.2. Methods

33.46.3. Constructor

Function: Creates a new stepper with size 100/100 and position 0/0
Example:

```vbnet
dim t as new NSStepperMBS
```

Notes: On success the handle property is not zero.
See also:

- 33.46.4 Constructor(Handle as Integer) 6603
- 33.46.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6604

33.46.4. Constructor(Handle as Integer)

Function: Creates an object based on the given NSStepper handle.
Example:

```vbnet
dim t as new NSStepperMBS(0, 0, 100, 100)
dim v as new NSStepperMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSStepper and the plugin retains this handle.
See also:
33.46.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new stepper with the given size and position.
Example:

```
dim x as new NSStepperMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 33.46.3 Constructor
- 33.46.4 Constructor(Handle as Integer)

33.46.6 Properties

33.46.7 autorepeat as boolean

Function: A Boolean value indicating how the receiver responds to mouse events.
Notes:
True if the first mouse down does one increment (or decrement) and, after a delay of 0.5 seconds, increments (or decrements) at a rate of ten times per second. False if the receiver does one increment (decrement) on a mouse up. The default is true.
(Read and Write computed property)

33.46.8 increment as Double

Function: The amount by which the receiver will change per increment (decrement).
Notes: (Read and Write computed property)
33.46.9  maxValue as Double

Function: The maximum value.
Notes: (Read and Write computed property)

33.46.10  minValue as Double

Function: The minimum value.
Notes: (Read and Write computed property)

33.46.11  valueWraps as boolean

Function: Whether the receiver wraps around the minimum and maximum values.
Notes:
If true, then when incrementing or decrementing, the value wraps around to the minimum or maximum. If valueWraps is false, the value stays pinned at the minimum or maximum.

For example for an angle where 359 increases to 0.
(Read and Write computed property)
33.47 class NSTableColumnMBS

33.47.1 class NSTableColumnMBS

Function: An NSTableColumn stores the display characteristics and attribute identifier for a column in an NSTableView.

Notes: The NSTableColumn determines the width and width limits, resizability, and editability of its column in the NSTableView. It also stores two NSCell objects: the header cell, which is used to draw the column header, and the data cell, used to draw the values for each row. You can control the display of the column by setting the subclasses of NSCell used and by setting the font and other display characteristics for these NSCells. For example, you can use the default NSTextFieldCell for displaying string values or substitute an NSImageCell to display pictures.

33.47.2 Methods

33.47.3 Constructor(identifier as string)

Function: Initializes a NSTableColumn with identifier as its identifier and with an NSTextFieldCell as its data cell.

33.47.4 dataCellForRow(row as Integer) as NSCellMBS

Function: Returns the NSCell object used by the NSTableView to draw values for the receiver.

Notes: NSTableView always calls this method. By default, this method just calls dataCell. Subclassers can override if they need to potentially use different cells for different rows. Subclasses should expect this method to be invoked with row equal to 1 in cases where no actual row is involved but the table view needs to get some generic cell info.

33.47.5 sizeToFit

Function: Resizes the receiver to fit the width of its header cell.

Notes: If the maximum width is less than the width of the header, the maximum is increased to the header's width. Similarly, if the minimum width is greater than the width of the header, the minimum is reduced to the header's width. Marks the NSTableView as needing display if the width actually changes.
33.47. CLASS NSTABLECOLUMNMBS

33.47.6 Properties

33.47.7 dataCell as NSCellMBS

Function: The NSCell object used by the NSTableView to draw values for the receiver.
Notes:
You can use this property to control the font, alignment, and other text attributes for an NSTableColumn. You can also assign a cell to display things other than text for example, an NSImageCell to display images.
(Read and Write property)

33.47.8 Editable as boolean

Function: Controls whether the user can edit cells in the receiver by double-clicking them.
Notes:
If value is true a double click initiates editing; if flag is false it merely sends the double-click event to the NSTableView. You can initiate editing programmatically regardless of this setting with NSTableView’s editColumn() method.
(Read and Write property)

33.47.9 headerCell as NSTableHeaderCellMBS

Function: The NSCell used to draw the receiver’s header to a cell.
Notes: (Read and Write property)

33.47.10 headerToolTip as string

Function: The tooltip string that is displayed when the cursor pauses over the header cell of the receiver.
Notes: (Read and Write property)

33.47.11 Hidden as boolean

Function: Whether the column is hidden.
33.47.12 **identifier as string**

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The object used by the data source to identify the attribute corresponding to the receiver. **Notes:** (Read and Write property)

33.47.13 **maxWidth as Double**

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The maximum width. **Notes:** Setting this value will also adjusting the current width if it’s greater than this value. (Read and Write property)

33.47.14 **minWidth as Double**

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The minimum width. **Notes:** Setting this value will also adjusting the current width if it’s less than this value. (Read and Write property)

33.47.15 **Resizable as boolean**

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this column can be resized. **Notes:** (Read and Write property)

33.47.16 **resizingMask as Integer**

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Defines the resizing mode for this column. **Notes:**
33.47. CLASS NSTABLECOLUMNMBS

Use kNoResizing, kAutoresizingMask and kUserResizingMask constants.
(Read and Write property)

33.47.17 sortDescriptorPrototype as NSSortDescriptorMBS

Function: The table columns sort descriptor prototype.
Notes: A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector that defines how to sort.
(Read and Write property)

33.47.18 tableView as NSTableViewMBS

Function: The owner tableview.
Notes: (Read and Write property)

33.47.19 title as String

Function: The title of the table columns header.
Notes: (Read and Write property)

33.47.20 width as Double

Function: The width of the column.
Notes: (Read and Write property)

33.47.21 Constants

33.47.22 NSTableColumnAutoresizingMask=1

MBS MacControls Plugin, Plugin Version: 9.6. Function: One of the constants specify the resizing modes available for the table column.
Notes:
Allows the table column to resize automatically in response to resizing the tableview. Enabling this option is the same as enabling the "Live Resizable" option in Interface Builder. The resizing behavior for the table view is set using the NSTableView method setColumnAutoresizingStyle:. Available in Mac OS X v10.4 and later.

### 33.47.23 NSTableColumnNoResizing=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the resizing modes available for the table column.  
**Notes:**  
Prevents the table column from resizing.  
Available in Mac OS X v10.4 and later.

### 33.47.24 NSTableColumnUserResizingMask=2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the resizing modes available for the table column.  
**Notes:**  
Allows the table column to be resized explicitly by the user. Enabling this option is the same as enabling the "User Resizable" option in Interface Builder.  
Available in Mac OS X v10.4 and later.
33.48. CONTROL NSTABLECONTROLMBS

33.48 control NSTableControlMBS

33.48.1 control NSTableControlMBS

Function: The control for a NSTableView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

33.48.2 Properties

33.48.3 AcceptTabs as Boolean

Function: Whether the control should accept tab keys.
Notes:
If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch
to next control.
(Read and Write property)

33.48.4 allowsColumnReordering as Boolean

Function: A Boolean value indicating whether the table view allows the user to rearrange columns by
dragging their headers.
Notes:
The default value of this property is true, which allows the user to rearrange the table views columns. You
can rearrange columns programmatically regardless of this setting.
(Read and Write property)

33.48.5 allowsColumnResizing as Boolean

Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging
between their headers.
Notes:
The default of this property is true, which allows the user to resize the table views columns. You can resize
columns programmatically regardless of this setting.
(Read and Write property)
33.48.6 allowsColumnSelection as Boolean

**Function:** A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.

**Notes:**
The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.

(Read and Write property)

33.48.7 allowsEmptySelection as Boolean

**Function:** A Boolean value indicating whether the table view allows the user to select zero columns or rows.

**Notes:**
The default is true, which allows the user to select zero columns or rows.

(Read and Write property)

33.48.8 allowsMultipleSelection as Boolean

**Function:** A Boolean value indicating whether the table view allows the user to select more than one column or row at a time.

**Notes:**
The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.

(Read and Write property)

33.48.9 autohidesScrollers as Boolean

**Function:** A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.

**Notes:**
The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn’t extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
33.48.10  disableCellEvents as Boolean

Function: Whether to disable cell based events.
Notes:
The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable cells and use only views.
(Read and Write property)

33.48.11  disableViewEvents as Boolean

Function: Whether to disable view based events.
Notes:
The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable views and use only cells.
(Read and Write property)

33.48.12  hasHorizontalScroller as Boolean

Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes:
When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed.
The default value of this property is false.
(Read and Write property)

33.48.13  hasVerticalScroller as Boolean

Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes:
When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed.
CHAPTER 33. COCOA CONTROLS

The default value of this property is false. (Read and Write property)

33.48.14 ScrollView as NSScrollViewMBS

Function: The scroll view used in this control.
Notes: (Read only property)

33.48.15 View as NSTableViewMBS

Function: The table view used in this control.
Notes: (Read only property)
See also:
• 33.48.78 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS

33.48.16 Events

33.48.17 acceptDrop(info as NSDraggingInfoMBS, row as Integer, dropOperation as Integer) as boolean

Function: Called by TableView when the mouse button is released over a table view that previously
decided to allow a drop.
Notes:
info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation.

Returns true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this
method. You can use the draggingPasteboard method to get the data for the drop operation from info.
To accept a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To
accept a drop below the last row, row would be TableView.numberOfRows and operation would be NSTa-
bleViewDropAbove.
33.48.18  BoundsChanged

Function: The event called when the bounds, but not the frame, changed.

33.48.19  ColumnDidMove(notification as NSNotificationMBS, oldColumn as Integer, newColumn as Integer)

Function: This event informs the delegate that a column was moved by user action in the table view.

33.48.20  ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

Function: This event informs you that a column was resized in the table view.

33.48.21  dataCell(tableColumn as NSTableColumnMBS, row as Int64) as NSCellMBS

Function: Optional return a different cells for each row.
Notes:
A different data cell can be returned for any particular tableColumn and row, or a cell that will be used for the entire row (a full width cell). The returned cell should properly implement copyWithZone:, since the cell may be copied by NSTableView. If the tableColumn is non-nil, and nil is returned, then the table will use the default cell from tableColumn.dataCellForRow(Row).

When each row is being drawn, this method will first be called with a nil tableColumn. At this time, you can return a cell that will be used to draw the entire row, acting like a group. If you do return a cell for the 'nil' tableColumn, be prepared to have the other corresponding datasource and delegate methods to be called with a 'nil' tableColumn value. If don’t return a cell, the method will be called once for each tableColumn in the tableView, as usual.

33.48.22  didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

Function: Tells the delegate that a row view was added at the specified row.
Notes:
rowView: The row view.
row: The index of the row.

At this point, the delegate can add extra views, or modify the properties of rowView.

This method is only valid for NSView-based table views.

33.48.23 didClickTableColumn(tableColumn as NSTableColumnMBS)

Function: Called if a table column was clicked on.

33.48.24 didDragTableColumn(tableColumn as NSTableColumnMBS)

Function: Sent at the time the mouse button goes up in tableView and tableColumn has been dragged
during the time the mouse button was down.
Notes:
tableColumn: The table column.

The behavior of this method on Mac OS X v10.5 is different from prior versions. On Mac OS X v 10.5 the
dragged column is sent to the subclass. In earlier versions the table column that is currently located at the
dragged column’s original index is sent.

33.48.25 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

Function: Tells the delegate that a row view was removed from the table at the specified row.
Notes:
rowView: The row view.
row: The index of the row.

If row equals -1, the row is being deleted from the table and is no longer a valid row; otherwise row is a valid
row that is being removed by being moved off screen.

This method is only valid for NSView-based table views.
33.48.26 didTile

Function: The tableview did tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

33.48.27 DoubleClick

Function: The mouse made a double click.

33.48.28 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

Function: Implement this method to determine when a dragging session has ended.
Notes:
  session: The dragging session.
  screenPoint: The ending drag location in screen coordinates.
  operation: The drag operation. See NSDragOperation for supported values.

This delegate method can be used to determine when the dragging source operation ended at a specific location, such as the trash, by checking for an operation of NSDragOperationDelete.

33.48.29 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, rowIndexes as NSIndexSetMBS)

Function: Implement this method to determine when a dragging session will begin.
Notes:
  session: The dragging session.
  screenPoint: The initial drag location in screen coordinates.
  rowIndexes: The indexes of the rows to be dragged, excluding rows that were not dragged due to pasteboardItemForRow returning nil.
Implement this method to know when the dragging session is about to begin and to potentially modify the
dragging session.
The dragged item order will directly match the pasteboard writer array used to begin the dragging session
with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be
used in acceptDrop when enumerating the NSDraggingInfo pasteboard classes.

33.48.30 EnableMenuItems

Function: The event where you can enable menu items.

33.48.31 FrameChanged

Function: The event called when the frame changed.

33.48.32 GotFocus

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

33.48.33 heightOfRow(row as Int64) as Double

Function: Implement this event to support a table with varying row heights.
Notes: The height returned by this method should not include intercell spacing and must be greater than
zero. Performance Considerations: For large tables in particular, you should make sure that this method is
efficient. NSTableView may cache the values this method returns, but this should NOT be depended on, as all
values may not be cached. To signal a row height change, call noteHeightOfRowsWithIndexesChanged. For
a given row, the same row height should always be returned until noteHeightOfRowsWithIndexesChanged
is called, otherwise unpredictable results will happen. NSTableView automatically invalidates its entire row
height cache in reloadData, and noteNumberOfRowsChanged.

33.48.34 isGroupRow(row as Int64) as boolean

Function: Invoked to allow the delegate to indicate that a specified row is a group row.
33.48. CONTROL NSTABLECONTROLMBS

Notes:
row: The row index.

Return true if the specified row should have the group row style drawn, false otherwise.

If the cell in row is an NSTextFieldCell and contains only a string, the group row style attributes will automatically be applied to the cell.

Group rows in view-based table views can be made to visually float’ by setting the tableview method setFloatsGroupRows to true.

Note: When configured as a source list style table view, rows identified as group rows draw with a specific style unique for source lists.
Available in Mac OS X v10.5 and later.

33.48.35 LeftMouseDown(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has pressed the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.48.36 LeftMouseDragged(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.48.37 LeftMouseUp(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has released the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.
33.48.38  LostFocus

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

33.48.39  MenuAction(HitItem as MenuItem) As Boolean

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or
false to give others a chance.

33.48.40  MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes:
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative
to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

33.48.41  mouseDownInTheHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

Function: Sent to the subclass whenever the mouse button is clicked in the table view’s header column.
Notes: tableColumn: The table column.

33.48.42  MouseDrag(x as Integer, y as Integer)

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

33.48.43 MouseUp(x as Integer, y as Integer)

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

33.48.44 namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedRowsWithIndexes as NSIndexSetMBS) as string()

Function: Returns an array of filenames that represent the indexSet rows for a drag to dropDestination.
Notes:
dropDestination: The drop location where the files are created.
indexSet: The indexes of the items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

This method is called when a destination has accepted a promise drag.
For more information on file promise dragging, see documentation on the NSDraggingSource protocol and namesOfPromisedFilesDroppedAtDestination:.

33.48.45 nextTypeSelectMatchFromRow(startRow as Int64, endRow as Int64, searchString as string) as Int64

Function: Invoked to allow the subclass to modify how type selection works.
Notes:
startRow: The starting row of the search range.
endRow: The ending row of the search range.
searchString: A string containing the typed selection.

Return the first row in the range of startRow through endRow (excluding endRow itself) that matches se-
lectionString. Return -1 if no match is found.

It is possible for endRow to be less than startRow if the search will wrap.
Available in Mac OS X v10.5 and later.

### 33.48.46 numberOfRowsInTableView as Integer

**Function:** Called when the table view needs to know the number of rows.
**Notes:** numberOfRowsInTableView is called very frequently, so it must be efficient.

### 33.48.47 objectValue(column as NSTableColumnMBS, row as Integer) as Variant

**Function:** Called when a value is required for a given cell.
**Notes:** Please implement your own arrays to store values.

### 33.48.48 OtherMouseDown(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has pressed a mouse button other than the left or right one.
**Notes:** This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

### 33.48.49 OtherMouseDragged(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
**Notes:** This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

### 33.48.50 OtherMouseUp(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has released a mouse button other than the left or right but-
33.48. CONTROL NSTABLECONTROLMBS

Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.48.51 pasteboardItemForRow(row as Integer) as NSPasteboardItemMBS

Function: Called to allow the table to support multiple item dragging.
Notes:
row: The row.

Returns an instance of NSPasteboardItem. Returning nil excludes the row from being dragged.

This method is required for multi-image dragging.
If this method is implemented, then writeRowsWithIndexes will not be called.

33.48.52 RightMouseDown(e as NSEventMBS) as boolean

Function: Informs the view that the user has pressed the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.48.53 RightMouseDragged(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has moved the mouse with the right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

33.48.54 RightMouseUp(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has released the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.
33.48.55  rowActionsForRow(row as Integer, edge as Integer) as NSTableViewRowActionMBS()

**Function:** Asks the control to provide an array of row actions to be attached to the specified edge of a table row and displayed when the user swipes horizontally across the row.
**Notes:**
- row: The index of the target row.
- edge: The edge (NSTableRowActionEdgeLeading or NSTableRowActionEdgeTrailing) for which row actions are requested. This is based on the direction in which the user swiped on the row. Swiping to the right results in an edge value of leading. Swiping to the left results in an edge value of trailing.

Returns an array of row actions (of class NSTableViewRowActionMBS) to be enabled on the specified edge of the table row.

Implement this method if your table row supports actions that are displayed when the user swipes horizontally across the row. For example, your table view could use this method to implement a swipe left to delete function in your table rows. When called, this method receives the table view, the index of the row the user swiped, and an edge of type NSTableRowActionEdge. The method should return an array of any row actions of class NSTableViewRowAction that are supported for the specified edge. If no row actions are available, an empty array should be returned.

If this method isn't implemented, then the table row displays no actions when the user swipes horizontally away from the specified edge.

33.48.56  rowViewForRow(row as Integer) as NSTableRowViewMBS

**Function:** Asks the delegate for a view to display the specified row.
**Notes:**
- row: The row index.

Return an instance or subclass of NSTableRowView. If nil is returned, an NSTableRowView instance will be created and used.

You can implement this event to return a custom NSTableRowView for row.
The reuse queue can be used in the same way as documented in tableView:view:row:. The returned view will have attributes properly set to it before its added to the tableView.

This method is only valid for NSView-based table views.
33.48. CONTROL NSTABLECONTROLMBS

33.48.57  ScaleFactorChanged(NewFactor as Double)

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

33.48.58  SelectionDidChange(notification as NSNotificationMBS)

Function: This event informs you that the table view’s selection has changed.

33.48.59  selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

Function: Invoked to allow the delegate to modify the proposed selection.
Notes:

proposedSelectionIndexes: An index set containing the indexes of the proposed selection.

Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view’s existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of shouldSelectRow.
Available in Mac OS X v10.5 and later.

33.48.60  SelectionIsChanging(notification as NSNotificationMBS)

Function: This event informs you that the table view’s selection is in the process of changing (typically because the user is dragging the mouse across a number of rows).
### 33.48.61 selectionShouldChangeInTableView as boolean

**Function:** Returns whether the selection should change.

**Notes:**

Return true to allow the table view to change its selection (typically a row being edited), false to deny selection change.

The user can select and edit different cells within the same row, but can’t select another row unless the delegate approves. The subclass can implement this method for complex validation of edited rows based on the values of any of their cells.

### 33.48.62 setObjectValue(value as Variant, column as NSTableColumnMBS, row as Integer)

**Function:** Called when a cell value is saved to the datasource.

### 33.48.63 shouldEditTableColumn(tableColumn as NSTableColumnMBS, row as Int64) as boolean

**Function:** Returns whether the cell at the specified row and column can be edited.

**Notes:**

TableColumn: The table column.
rowIndex: The row index.

Return true to allow editing the cell, false to deny editing.

The subclass can implement this method to disallow editing of specific cells.

Note: This method is only valid for cell-based table views.

### 33.48.64 shouldReorderColumn(columnIndex as Int64, newColumnIndex as Int64) as boolean

**Function:** Sent to the subclass to allow or prohibit the specified column to be dragged to a new location.

**Notes:**

columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Return true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.

If this method is not implemented, all columns are considered reorderable. Available in Mac OS X v10.6 and later.

33.48.65 shouldSelectRow(row as Int64) as boolean

Function: Returns whether the table view should allow selection of the specified row.
Notes:

rowIndex: The row index.

Return true to permit selection of the row, false to deny selection.

The delegate can implement this method to disallow selection of particular rows. For better performance and finer-grain control over the selection, use selectionIndexesForProposedSelection.

33.48.66 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as boolean

Function: Returns whether the specified table column can be selected.
Notes:

TableColumn: The table column.

Return true to permit selection, otherwise false.

The subclass can implement this event to disallow selection of particular columns.
33.48.67 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, row as Int64) as Boolean

Function: Invoked to allow the subclass to control cell expansion for a specific row and column.

Notes:
TableColumn: The table column.
row: The row index.

Return true if the tooltip cell should expand, false otherwise.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

33.48.68 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64) as Boolean

Function: Invoked to allow the subclass to control the tracking behavior for a specific cell.

Notes:
cell: The cell to track.
tableColumn: The table column.
row: A row in tableView.

Returns true if the cell should track, false otherwise.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked, and vice-versa.

For example, this allows you to have an NSButtonCell in a table which does not change the selection, but can still be clicked on and tracked.

Note: This method is only valid for cell-based table views.
33.48.69  `shouldTypeSelectForEvent(e as NSEventMBS, searchString as string)` as Boolean

**Function:** Invoked to allow the subclass to control type select for a specific event.

**Notes:**

- `event`: The event.
- `searchString`: The search string or nil if no type select has began.

Return true to allow type select for event, false otherwise.

Typically, this is called from the table view keyDown implementation and the event will be a key event. Available in Mac OS X v10.5 and later.

33.48.70  `sizeToFitWidthOfColumn(column as Int64)` as Double

**Function:** Invoked to allow the subclass to provide custom sizing behavior when a column’s resize divider is double clicked.

**Notes:**

- `column`: The index of the column.

Returns the width of the specified column.

By default, NSTableView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.

For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

Available in Mac OS X v10.6 and later.
33.48.71  sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

Function: Called by TableView to indicate that sorting may need to be done.
Notes: The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source doesn’t manage them itself, you can get the current sort descriptors by calling TableView.sortDescriptors function.

33.48.72  textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextFieldMBS) as boolean

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

33.48.73  textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextFieldMBS) as boolean

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

33.48.74  toolTipForCell(cell as NSCellMBS, r as NSRectMBS, tableColumn as NSTableColumnMBS, row as Int64, mouseLocation as NSPointMBS) as string

Function: Returns a string that is displayed as a tooltip for the specified cell in the column and row.
Notes:
Cell: The cell.
r: The proposed active area of the tooltip. You can modify rect to provide an alternative active area.
TableColumn: The table column.
row: The row index.
mouseLocation: The mouse location.

Return a string containing the tooltip. Return empty string if no tooltip is desired.

By default, rect is computed as cell.drawingRectForBounds(cellFrame).
Available in Mac OS X v10.4 and later.
**33.48.75 typeSelectString**(tableColumn as NSTableColumnMBS, row as Int64) as string

**Function:** Invoked to allow the subclass to provide an alternate text value used for type selection for a specified row and column.

**Notes:**
- tableColumn: The table column.
- row: The row index.

Returns a string that is used in type select comparison for row and tableColumn. Return "" if the row or tableColumn should not be searched.

Implement this method to change the string value that is searched for based on what is displayed. By default, all cells with text in them are searched.

If this event is not implemented the string value is the cell string value.

Implementation of this event is optional.

Available in Mac OS X v10.5 and later.

---

**33.48.76 updateDraggingItemsForDrag**(draggingInfo as NSDraggingInfoMBS)

**Function:** Implement this method to allow the table to update dragging items as they are dragged over a view.

**Notes:**
- The dragging information.

Required for multi-image dragging. Typically this will involve invoking enumerateDraggingItemsWithOptions on the draggingInfo parameter value and setting the draggingItem objects imageComponentsProvider to a proper image based on the content.

For view-based table views, you can use the NSTableCellView method draggingImageComponents. For cell-based tables, use the NSCell method draggingImageComponentsWithFrame.
33.48.77 validateDrop(info as NSDraggingInfoMBS, proposedRow as Integer, dropOperation as Integer) as Integer

Function: Used by aTableView to determine a valid drop target.

Notes:

info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation proposed.

Returns the dragging operation the data source will perform.

The data source may retarget a drop by calling setDropRow and returning something other than NSDrag-OperationNone. A data source might retarget for various reasons, such as to provide better visual feedback when inserting into a sorted position.

To propose a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To propose a drop below the last row, row would be TableView.numberOfRows and operation would be NSTa-bleViewDropAbove.

33.48.78 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS

Function: Asks the delegate for a view to display the specified row and column.

Notes:

see also

See also:
• 33.48.15 View as NSTableViewMBS

33.48.79 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64)

Function: Informs you that the tableview will display the specified cell at the row in the column.

Notes:

Cell: The cell to be displayed.
TableColumn: The table column.
row: The row index.
The event can modify the display attributes of cell to alter the appearance of the cell.

Because cell is reused for every row in tableColumn, the event must set the display attributes both when drawing special cells and when drawing normal cells.

Note: The implementation of this method must not draw portions of the cell. It should only alter the state of the passed in cell.

33.48.80 willTile

Function: The tableview will tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

33.48.81 writeRowsWithIndexes(rowIndexes as NSIndexSetMBS, pboard as NSPasteboardMBS) as boolean

Function: Returns a Boolean value that indicates whether a drag operation is allowed.
Notes:
rowIndexes: An index set of row numbers that will be participating in the drag.
pboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, false otherwise.

Called by TableView after it has been determined that a drag should begin, but before the drag has been started.
To refuse the drag, return false. To start a drag, return true and place the drag data onto pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the table view once this call returns with true.
33.49 class NSTableDataSourceMBS

33.49.1 class NSTableDataSourceMBS

**Function:** The class for a data source of a NSTableView.

**Notes:**
A listbox stores the data itself, but the NSTableView is just a view.
so you need to handle the storage of the table view yourself by subclassing this class and filling the events.

33.49.2 Events

33.49.3 Close

**Function:** The event is called when the datasource is destroyed.

33.49.4 numberOfRowsInTableView as Integer

**Function:** Called when the table view needs to know the number of rows.
**Notes:** numberOfRowsInTableView is called very frequently, so it must be efficient.

33.49.5 objectValue(column as NSTableColumnMBS, row as Integer) as Variant

**Function:** Called when a value is required for a given cell.
**Notes:** Please implement your own arrays to store values.

33.49.6 setObjectValue(value as Variant, column as NSTableColumnMBS, row as Integer)

**Function:** Called when a cell value is saved to the datasource.
33.49.7 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

Function: Called by TableView to indicate that sorting may need to be done.
Notes: The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source doesn't manage them itself, you can get the current sort descriptors by calling TableView.sortDescriptors function.
CHAPTER 33. COCOA CONTROLS

33.50 class NSTableHeaderViewMBS

33.50.1 class NSTableHeaderViewMBS

Function: An NSTableHeaderView is used by an NSTableHeaderView to draw its column headers.  
Notes:  
See the NSTableViewMBS class specification for more information on how it’s used.

Subclasses of NSTableHeaderView can override drawInteriorWithFrame, editWithFrame, and highlightWithFrame to change the way headers appear. See the NSCell class specification, and the following description, for information on these methods. (This works in Cocoa, but does not yet work in the plugin. If you need, send in a feature request.)

Subclass of the NSTextFieldCellMBS class.

33.50.2 Methods

33.50.3 drawSortIndicatorWithFrame(cellFrame as NSRectMBS, inView as NSViewMBS, ascending as boolean, priority as Integer)

Function: Draws a sorting indicator given a cellFrame contained inside controlView.  
Notes:  
If priority is 0, this is the primary sort indicator. If ascending is true, a "ˆ" indicator will be drawn. Override this method to customize the sorting user interface.  
Available in Mac OS X v10.3 and later.

33.50.4 sortIndicatorRectForBounds(r as NSRectMBS) as NSRectMBS

Function: Returns the location to display the sorting indicator given rectangle.  
Notes: Available in Mac OS X v10.3 and later.
33.51. CLASS NSTABLEHEADERVIEWMBS

33.51 class NSTableHeaderViewMBS

33.51.1 class NSTableHeaderViewMBS

**Function:** An NSTableHeaderView is used by an NSTableView to draw headers over its columns and to handle mouse events in those headers.

**Notes:**

NSTableHeaderView uses NSTableHeaderCell to implement its user interface.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

33.51.2 Methods

33.51.3 columnAtPoint(point as NSPointMBS) as Integer

**Function:** Returns the index of the column whose header lies under aPoint in the receiver, or 1 if no such column is found.

**Notes:** point: is expressed in the receiver’s coordinate system.

33.51.4 Constructor

**Function:** Creates a new table header view with size 100/100 and position 0/0

**Example:**

```dim t as new NSTableHeaderViewMBS```

**Notes:** On success the handle property is not zero.

See also:

- 33.51.5 Constructor(Handle as Integer)
- 33.51.6 Constructor(left as Double, top as Double, width as Double, height as Double)
33.51.5 Constructor(Handle as Integer)

**Function:** Creates an object based on the given NSTableHeaderView handle.
**Example:**
```vbnet
dim t as new NSTableHeaderViewMBS(0, 0, 100, 100)
dim v as new NSTableHeaderViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+” x “+str(v.Bounds.Height)
```

**Notes:** The handle is casted to a NSTableHeaderView and the plugin retains this handle.
See also:
- 33.51.4 Constructor 6637
- 33.51.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6638

33.51.6 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new table header view with the given size and position.
**Example:**
```vbnet
dim x as new NSTableHeaderViewMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.
See also:
- 33.51.4 Constructor 6637
- 33.51.5 Constructor(Handle as Integer) 6638

33.51.7 draggedColumn as Integer

**Function:** If the user is dragging a column in the receiver, returns the index of that column.
**Notes:** Otherwise returns 1.
33.51.8  draggedDistance as Double

Function: If the user is dragging a column in the receiver, returns the column’s horizontal distance from its original position.
Notes: Otherwise the return value is meaningless.

33.51.9  headerRectOfColumn(Column as Integer) as NSRectMBS

Function: Returns the rectangle containing the header tile for the column at columnIndex.
Notes: Raises an NSInternalInconsistencyException if columnIndex is out of bounds.

33.51.10 resizedColumn as Integer

Function: If the user is resizing a column in the receiver, returns the index of that column.
Notes: Otherwise returns 1.

33.51.11 Properties

33.51.12 tableView as NSTableViewMBS

Function: The owner tableview.
Notes: (Read and Write computed property)
33.52 class NSTableViewRowViewMBS

33.52.1 class NSTableViewRowViewMBS

Function: The NSTableViewRowView class is the view shown for a row in an NSTableView.

Notes:
It is responsible for displaying attributes associated with the row, including the selection highlight, and group row look.
Subclass of the NSViewMBS class.

33.52.2 Methods

33.52.3 Constructor

Function: The constructor.

33.52.4 Properties

33.52.5 backgroundColor as NSColorMBS

Function: The background color of the row.

Notes:
The property defaults to the table views backgroundColor, unless usesAlternatingRowBackgroundColors is set to true. In that case, the colors alternate, and are automatically updated as required by insertions and deletions.
The value of the background color can be customized in the NSTableViewMBS.didAddRowView event. The property is animatable.
(Read and Write property)

33.52.6 emphasized as Boolean

Function: Determines whether the row will draw with the alternate or secondary color (unless overridden).

Notes:
When emphasized is true, the view will draw with the alternateSelectedControlColor defined by NSColor.
When false it will use the secondarySelectedControlColor defined by NSColor.
33.52.7 Floating as Boolean

Function: Specifies whether the row is drawn using the floating style.

Notes:
Floating is a temporary attribute that is set when a particular group row is actually floating above other rows. The state may change dynamically based on the position of the group row. Drawing may be different for rows that are currently 'floating'.

(Read and Write property)

33.52.8 groupRowStyle as Boolean

Function: Specifies whether this row view is a group row.

Notes:
When true this row is a group row and will draw appropriately.

(Read and Write property)

33.52.9 NextRowSelected as Boolean

Function: Whether next row is selected.

Notes: (Read and Write property)

33.52.10 PreviousRowSelected as Boolean

Function: Whether the previous row is selected.

Notes: (Read and Write property)

33.52.11 selected as Boolean

Function: Determines whether the row is selected.

Notes:
True if selected, otherwise false.
(Read and Write property)

### 33.52.12 `selectionHighlightStyle` as Integer

**Function:** Specifies the selection highlight style.

**Notes:**
The possible values are specified in `NSTableViewSelectionHighlightStyle` in `NSTableView`.
(Read and Write property)
33.53. CLASS NSTABLEVIEWMBS

33.53 class NSTableViewMBS

33.53.1 class NSTableViewMBS

Function: An NSTableView object displays record-oriented data in a table and allows the user to edit
values and resize and rearrange columns.
Notes:
You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

33.53.2 Methods

33.53.3 addTableColumn(column as NSTableColumnMBS)

Function: Adds a given column as the last column of the receiver.

33.53.4 beginUpdates

Function: Begins a group of updates for the table view.
Notes:
For NSView-based table views, multiple row changesthat is, insertions, deletions, and movesare animated
simultaneously by surrounding calls to those method calls with beginUpdates and endUpdates. These meth-
ods are nestable.
The selected rows are maintained during the series of insertions, deletions, moves, and scrolling. If a selected
row is deleted, a selection changed notification occurs after removeRowsAtIndexes is called.
It is not necessary to call beginUpdates and endUpdates if only one insertion, deletion, or move is occurring
and the table view is an NSView-based table view. When using an NSCell-based table view, you must
surround any insertion, deletion, or move in an update block for animations to occur.
The main reason for doing a batch update of changes to a table view is to avoid having the table animate
unnecessarily.
Note that these methods should be called to reflect changes in your model; they do not make any underlying
model changes.

For NSCell-based table views, it is required to call beginUpdates if you want to animate the insertRowsAtIn-
dexes, removeRowsAtIndexes, and moveRowAtIndex.
**33.53.5 canDragRowsWithIndexes(rowIndexes as NSIndexSetMBS, mouseDownPoint as NSPointMBS) as Boolean**

Function: Returns a Boolean value indicating whether the table view allows dragging the rows at with the drag initiated at the specified point.  
Notes:  
rowIndexes: The row indexes to drag.  
mouseDownPoint: The location where the drag was initiated.

Returns no to disallow the drag.

**33.53.6 columnAtPoint(p as NSPointMBS) as Integer**

Function: Returns the index of the column a given point lies in.  
Notes: Returns the index of the column aPoint lies in, or 1 if aPoint lies outside the receiver’s bounds.  
See also:  
• 33.53.7 columnAtPoint(x as Double, y as Double) as Integer

**33.53.7 columnAtPoint(x as Double, y as Double) as Integer**

Function: Returns the index of the column a given point lies in.  
Notes: Returns the index of the column aPoint lies in, or 1 if aPoint lies outside the receiver’s bounds.  
See also:  
• 43.2.33 columnAtPoint(p as NSPointMBS) as Integer

**33.53.8 columnForView(view as NSViewMBS) as Integer**

Function: Returns the column index for the specified view.  
Notes:  
view: The view for which to retrieve the column.

Returns the index of the column containing view in the tableColumns array. This method returns -1 if the view is not in the table view. This method may also return -1 if the row containing the view is being animated away, such as during the deletion of a row.
This method is typically called in the action method of an NSButton (or NSControl) to find out what row (and column) the action should be performed on. The implementation is O(n) where n is the number of visible rows, so this method should generally not be called within a loop.

### 33.53.9 columnIndexesInRect(rect as NSRectMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the indexes of the receiver’s columns that intersect the specified rectangle. **Notes:** Available in Mac OS X v10.5 and later.

### 33.53.10 columnWithIdentifier(identifier as string) as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the first column in the receiver whose identifier is equal to a given identifier. **Notes:** Returns the index of the first column in the receiver whose identifier is equal to anObject (when compared using isEqual:) or 1 if no columns are found with the specified identifier.

### 33.53.11 Constructor

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new table view with size 100/100 and position 0/0 **Example:**
```
dim t as new NSTableViewMBS
```

**Notes:** On success the handle property is not zero. See also:
- 33.53.12 Constructor(Handle as Integer) 6645
- 33.53.13 Constructor(left as Double, top as Double, width as Double, height as Double) 6646

### 33.53.12 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSTableView handle. **Example:**
```
```
dim t as new NSTableViewMBS(0, 0, 100, 100)
dim v as new NSTableViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+” x ”+str(v.Bounds.Height)

Notes: The handle is casted to a NTableView and the plugin retains this handle.
See also:

• 33.53.11 Constructor 6645
• 33.53.13 Constructor(left as Double, top as Double, width as Double, height as Double) 6646

33.53.13 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new table view with the given size and position.
Example:

dim x as new NSTableViewMBS(0, 0, 100, 100)

Notes: On success the handle property is not zero.
See also:

• 33.53.11 Constructor 6645
• 33.53.12 Constructor(Handle as Integer) 6645

33.53.14 deselectAll

Function: Deselects all selected rows or columns if empty selection is allowed; otherwise does nothing.

33.53.15 deselectColumn(column as Integer)

Function: Deselects the column at a given index if it’s selected.
Notes: Column is from 0 to numberOfColumns-1.
33.53.16  deselectRow(row as Integer)

Function: Deselects the row at a given index if it’s selected.
Notes: Deselects the row at rowIndex if it’s selected, regardless of whether empty selection is allowed.

33.53.17  Destructor

Function: The destructor.
Notes: REALbasic calls this destructor automatically.

33.53.18  dragImageForRowsWithIndexes(dragRows as NSIndexSetMBS, tableColumns() as NSTableColumnMBS, theEvent as NSEventMBS, byref dragImageOffset as NSPointMBS) as NSImageMBS

Function: Computes and returns an image to use for dragging.
Notes:
dragRows: An index set containing the row indexes that should be in the image.
tableColumns: An array of table columns that should be in the image.
theEvent: The event that initiated the drag.
dragImageOffset: An in/out parameter specifying the offset of the cursor in the image, the default value is NSZeroPoint. Returning NSZeroPoint causes the cursor to be centered.

Returns an NSImage containing a custom image for the specified rows and columns participating in the drag.

33.53.19  edit(column as Integer, row as Integer, selectit as boolean)

Function: Edits the cell at columnIndex and rowIndex, selecting its entire contents if flag is true.
Notes:
This method is invoked automatically in response to user actions; you should rarely need to invoke it directly.

This method scrolls the receiver so that the cell is visible, sets up the field editor, and sends selectWithFrame() and editWithFrame() to the field editor’s NSCell object with the NSTableView as the text delegate.

The row at rowIndex must be selected prior to calling editColumn:row:withEvent:select:, or an exception
will be raised.

33.53.20  **endUpdates**

**Function:** Ends the group of updates for the table view.
**Notes:** Ends the group of updates for the table view. This method, like beginUpdates, is nestable. See beginUpdates for details.

33.53.21  **frameOfCellAtColumnRow(column as Integer, row as Integer) as NSRectMBS**

**Function:** Returns a rectangle locating the cell that lies at the intersection of the specified column and row.
**Notes:**

- `column`: The index in the tableColumns array of the column containing the cell whose rectangle you want.
- `row`: The index of the row containing the cell whose rectangle you want.

Returns a rectangle locating the cell that lies at the intersection of `columnIndex` and `rowIndex`. This method returns NSRectMBS.Zero if `columnIndex` or `rowIndex` is greater than the number of columns or rows in the table view.

You can use this method to update a single cell more efficiently than sending the table view a reloadData message using reloadData function. The result of this method is used in a drawWithFrame:inView: message to the table column’s data cell. You can subclass and override this method to customize the frame of a particular cell. However, never return a frame larger than the default implementation returns. The default frame is computed to have a height equal to the rectOfRow: for `rowIndex`, minus the half intercellSpacing height on the top and half on the bottom. The width of frame is equal to the with of the table column minus half the intercellSpacing width on the left, and half on the right.

33.53.22  **hiddenRowIndexes as NSIndexSetMBS**

**Function:** The indexes of all hidden table rows.
**Notes:** The value of this property is an index set containing the indexes of any hidden table rows. Table rows may be hidden by invoking the hideRowsAtIndexes method. Some drag-and-drop operations also result in hidden rows.
33.53.23  hideRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

Function: Hides the specified table rows.
Notes:
indexes: An index set containing indexes of the rows to be hidden.
rowAnimation: An animation effect to be applied when the rows are hidden.

Use this method when you no longer want the data to be visible to the user, but you dont want to permanently remove the data. Hidden table rows have a height of zero and cannot be selected by the user. However, if a selected table row is hidden, it will remain selected. Hiding a table row causes the didRemoveRowView delegate method to be invoked.

33.53.24  insertRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

Function: Inserts the rows using the specified animation.
Notes:
indexes: The final positions of the new rows to be inserted.
animationOptions: The animation displayed during the insert. See NSTableViewAnimationOptions for the possible values that can be combined using the bitwise OR operator.

The numberOfRows in the table view is automatically increased by the count of indexes. Calling this method multiple times within the same beginUpdates and endUpdates block is allowed, and changes are processed incrementally.

NSCell-based table views must first call beginUpdates before calling this method.

33.53.25  isColumnSelected(column as Integer) as boolean

Function: Returns a Boolean value that indicates whether the column at a given index is selected.
Notes: column is from 0 to to numberOfRowsColumns.
33.53.26  **isRowSelected(row as Integer) as boolean**

**Function:** Returns a Boolean value that indicates whether the row at a given index is selected.
**Notes:** row is from 0 to numberOfRows.

33.53.27  **moveColumn(column as Integer, toIndex as Integer)**

**Function:** Moves the column and heading at a given index to a new given index.
**Notes:**
- columnIndex: The current index of the column to move.
- newIndex: The new index for the moved column.

This method raises the ColumnDidMove event.

33.53.28  **moveRowAtIndex(oldIndex as Integer, newIndex as Integer)**

**Function:** Moves the specified row to the new row location using animation.
**Notes:**
- oldIndex: Initial row index.
- newIndex: New row index.

This is similar to removing a row at oldIndex and inserting it at newIndex, except the same view is used and simply has its position updated to the new location. Changes happen incrementally as they are sent to the table, so as soon as this method is called the row can be considered moved. However the underlying view is not moved until endUpdates has been called. This method can be called multiple times within the same beginUpdates and endUpdates block.

NSCell-based table views must first call beginUpdates before calling this method.

33.53.29  **noteHeightOfRowsWithIndexesChanged(indexSet as NSIndexSetMBS)**

**Function:** Informs the table view that the rows specified in indexSet have changed height.
**Notes:**
indexSet: Index set of rows that have changed their height.

If you implement heightForRow event this method immediately retiles the table view using the row heights the event provides.

For NSView-based tables, this method will animate. To turn off the animation, create an NSAnimationContext grouping and set the duration to 0. Then call this method and end the grouping.

For NSCell-based tables, this method normally doesn’t animate. However, it will animate if you call it inside a beginUpdates/endUpdates block.

33.53.30 noteNumberOfRowsChanged

Informs the receiver that the number of records in its data source has changed.

This method allows the receiver to update the scrollers in its scroll view without actually reloading data into the receiver. It’s useful for a data source that continually receives data in the background over a period of time, in which case the table view can remain responsive to the user while the data is received.

33.53.31 rectOfColumn(column as Integer) as NSRectMBS

Returns the rectangle containing the column at at a given index.

The rectangle containing the column at columnIndex. Returns NSRectMBS.Zero (an empty rectangle) if columnIndex lies outside the range of valid column indices for the receiver.

You can use this method to update a single column more efficiently than sending the table view a reloadData message.

aTableView.setNeedsDisplayInRect(aTableView.rectOfColumn(column))

33.53.32 rectOfRow(row as Integer) as NSRectMBS

Returns the rectangle containing the row at rowIndex. Returns NSRectMBS.Zero (an empty rectangle) if rowIndex lies outside the range of valid row indices for the receiver.
33.53.33 reloadData

**Function:** Marks the receiver as needing redisplay, so it will reload the data for visible cells and draw the new values.
**Notes:** This method forces redraw of all the visible cells in the receiver. If you want to update the value in a single cell, column, or row, it is more efficient to use frameOfCellAtColumn(), rectOfColumn(), or rectOfRow() in conjunction with setNeedsDisplayInRect(). If you just want to update the scroller, use noteNumberOfRowsChanged; if the height of a set of rows changes, use noteHeightOfRowsWithIndexesChanged().
See also:
- 33.53.34 reloadData(rowIndexes as NSIndexSetMBS, columnIndexes as NSIndexSetMBS)

33.53.34 reloadData(rowIndexes as NSIndexSetMBS, columnIndexes as NSIndexSetMBS)

**Function:** Reloads the data for only the specified rows and columns.
**Notes:**
rowIndexes: The indexes of the rows to update.
columnIndexes: The indexes of the columns to update.
For cells that are visible, the appropriate dataSource and delegate methods are called and the cells are redrawn.
For tables that support variable row heights, the row height is not re-queried from the delegate; it is your responsibility to invoke noteHeightOfRowsWithIndexesChanged if a row height change is required.
For NSView-based table views, this method drops the view-cells in the table row, but not the NSTableRowView instances.
See also:
- 33.53.33 reloadData

33.53.35 removeRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

**Function:** Removes the rows using the specified animation.
**Notes:**
indexes: An index set containing the rows to remove.
animationOptions: The animation displayed during the insert. See NSTableViewAnimationOptions for the possible values that can be combined using the bitwise OR operator.

This method deletes from the table the rows represented at indexes and automatically decreases numberOfRows by the count of indexes.
The row indexes should be with respect to the current state displayed in the table view, and not the final state, because the specified rows do not exist in the final state.
Calling this method multiple times within the same beginUpdates and endUpdates block is allowed, and changes are processed incrementally.
Changes are processed incrementally as the insertRowsAtIndexes, removeRowsAtIndexes, and the moveRowAtIndex methods are called. It is acceptable to delete row 0 multiple times, as long as there is still a row available.

NSCell-based table views must first call beginUpdates before calling this method.

33.53.36 removeTableColumn(column as NSTableColumnMBS)
Function: Removes a given column from the receiver.

33.53.37 rowAtPoint(p as NSPointMBS) as Integer
Function: Returns the index of the row a given point lies in.
Notes: Returns the index of the row aPoint lies in, or 1 if aPoint lies outside the receiver’s bounds.
See also:

• 33.53.38 rowAtPoint(x as Double, y as Double) as Integer

33.53.38 rowAtPoint(x as Double, y as Double) as Integer
Function: Returns the index of the row a given point lies in.
Notes: Returns the index of the row aPoint lies in, or 1 if aPoint lies outside the receiver’s bounds.
See also:

• 33.53.37 rowAtPoint(p as NSPointMBS) as Integer
**33.53.39 rowForView(view as NSViewMBS) as Integer**

**Function:** Returns the index of the row for the specified view.

**Notes:**

view: The view for which to retrieve the row.

Returns the index of the row containing to view. This method returns -1 if the view is not in the table view. This method may also return -1 if the row containing the view is being animated away, such as during the deletion of a row.

This method is typically called in the action method for an NSButton (or NSControl) to find out what row (and column) the action should be performed on.

The implementation is O(n) where n is the number of visible rows, so this method should generally not be called within a loop.

---

**33.53.40 rowsInRect(rect as NSRectMBS) as NSRangeMBS**

**Function:** Returns a range of indexes for the rows that lie wholly or partially within the vertical boundaries of the specified rectangle.

**Notes:**

Rect: A rectangle in the coordinate system of the table view.

Returns a range of indexes for the table views rows that lie wholly or partially within the horizontal boundaries of aRect. If the width or height of aRect is 0, this method returns an NSRange whose length is 0.

The location of the range is the index of the first row in the rectangle, and the length is the number of rows that lie in the rectangle.

---

**33.53.41 rowViewAtRow(row as Integer, makeIfNecessary as Boolean) as NSViewMBS**

**Function:** Returns a row view at the specified index, creating one if necessary.

**Notes:**

row: The row index.
makeIfNecessary: True if a view is required, NO if you want to update properties on a view, if one is available.

Returns an instance, or subclass, of NSTableRowView. Returning nil is also valid if makeIfNecessary is false.
and the view did not exist.

This method first attempts to return a currently displayed view in the visible area. If there is no visible view, and makeIfNecessary is true, a prepared temporary view is returned. If makeIfNecessary is false, and the view is not visible, nil is returned.

In general, makeIfNecessary should be true if you require a resulting view, and false if you want to update properties on a view only if it is available (generally this means it is visible).

An exception is thrown if row falls outside of the number of rows in the table (numberOfRows). The returned result should generally not be held onto for longer than the current run loop cycle. Its better to call rowViewAtRow whenever a view is required.

### 33.53.42 scrollColumnToVisible(column as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scrolls the receiver and header view horizontally in an enclosing NSClipView so the column specified by columnIndex is visible.

### 33.53.43 scrollRowToVisible(row as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scrolls the receiver vertically in an enclosing NSClipView so the row specified by rowIndex is visible.

### 33.53.44 ScrollToLine(Line as Integer, Animated as Boolean)

MBS MacControls Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scrolls to line.

**Notes:**
- If animated is true, the scroll is animated.
- The line is centered in the middle of the viewable area if possible.

### 33.53.45 selectAll

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects all rows or all columns, according to whether rows or columns were most recently selected.

**Notes:** If the table allows multiple selection, this action method selects all rows or all columns, according to whether rows or columns were most recently selected. If nothing has been recently selected, this method selects all rows. If this table doesn’t allow multiple selection, this method does nothing.
33.53.46  **selectColumnIndexes(indexes as NSIndexSetMBS, extend as boolean)**

**Function:** Sets the column selection using indexes.
**Notes:** If the extend flag is false the selected columns are specified by indexes. If extend is true, the columns indicated by indexes are added to the collection of already selected columns, providing multiple selection.

33.53.47  **selectedColumnIndexes as NSIndexSetMBS**

**Function:** Returns an index set containing the indexes of the selected columns.
**Notes:** Returns an index set containing the indexes of the selected columns.

33.53.48  **selectedRowIndexes as NSIndexSetMBS**

**Function:** Returns an index set containing the indexes of the selected rows.
**Notes:** Available in Mac OS X v10.3 and later.

33.53.49  **selectRowIndexes(indexes as NSIndexSetMBS, extend as boolean)**

**Function:** Sets the row selection using indexes.
**Notes:**
If the extend flag is false the selected rows are specified by indexes. If extend is true, the rows indicated by indexes are added to the collection of already selected rows, providing multiple selection.

Available in Mac OS X v10.3 and later.

33.53.50  **setDraggingSourceOperationMask(mask as Integer, isLocal as Boolean)**

**Function:** Sets the default operation mask returned by draggingSourceOperationMaskForLocal to mask.
**Notes:**
mask: The drag operation mask. See NSDragOperation for the supported values.
isLocal: True if the destination is the same application, otherwise false. In either case the specified mask value is archived and used.
33.53. **CLASS NSTABLEVIEWMBS**

### 33.53.51 setDropRow(row as Integer, dropOperation as Integer)

**Function:** Retargets the proposed drop operation.

**Notes:**

- **row:** The target row index.
- **dropOperation:** The drop operation. Supported values are specified by NSTableViewDropOperation.

For example, to specify a drop on the second row, specify row as 1, and operation as NSTableViewDropOn. To specify a drop below the last row, specify row as `[self numberOfRows]` and operation as NSTableViewDropAbove. Passing a value of 1 for row and NSTableViewDropOn as the operation causes the entire table view to be highlighted rather than a specific row. This is useful if the data displayed by the table view does not allow the user to drop items at a specific row location.

### 33.53.52 setSortDescriptor(sortDescriptor as NSSortDescriptorMBS)

**Function:** Sets the receiver’s sort descriptors.

**Notes:**

A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector defining how to sort.

The array of sort descriptors is archived. Sort descriptors persist along with other column information if an autosave name is set.

Calling setSortDescriptors may have the side effect of invoking the data source method tableViewSortDescriptorsDidChange.

### 33.53.53 setSortDescriptors(sortDescriptors() as NSSortDescriptorMBS)

**Function:** Sets the receiver’s sort descriptors.

**Notes:**

A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector defining how to sort.

The array of sort descriptors is archived. Sort descriptors persist along with other column information if an autosave name is set.
Calling `setSortDescriptors` may have the side effect of invoking the data source method `tableViewSortDescriptorsDidChange`.

33.53.54  `sizeLastColumnToFit`

**Function:** Resizes the last column if there's room so the receiver fits exactly within its enclosing clip view.

33.53.55  `sizeToFit`

**Function:** Changes the width of columns in the receiver so all columns are visible.
**Notes:** All columns are resized to the same size, up to a column’s maximum size. This method then invokes `tile`.

33.53.56  `sortDescriptors` as `NSSortDescriptorMBS()`

**Function:** Returns the receiver’s sort descriptors.

33.53.57  `tableColumns` as `NSTableColumnMBS()`

**Function:** Returns an array containing the NSTableColumn objects in the receiver.
**Notes:** The array returned by `tableColumns` contains all receiver’s columns, including those that are hidden.

33.53.58  `tableColumnWithIdentifier(identifier as string)` as `NSTableColumnMBS`

**Function:** Returns the NSTableColumn object for the first column whose identifier is equal to a given object.
**Notes:** Returns the NSTableColumn object for the first column whose identifier is equal to anObject, as compared using `isEqual:`, or nil if no columns are found with the specified identifier.
33.53.59 tile

**Function:** Properly sizes the receiver and its header view and marks it as needing display.
**Notes:** Also resets cursor rectangles for the header view and line scroll amounts for the NSScrollView object.

33.53.60 unhideRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

**Function:** Unhides the specified table rows.
**Notes:**
indexes: An index set containing indexes of the hidden rows to be shown again.
rowAnimation: An animation effect to be applied when the rows are hidden.

Unhiding a table row causes the didAddRowView event to be invoked.

33.53.61 viewAtColumn(column as Integer, row as Integer, makeIfNecessary as Boolean) as NSViewMBS

**Function:** Returns a view at the specified row and column indexes, creating one if necessary.
**Notes:**
column: The index of the column in the tableColumns array.
row: The row index.
makeIfNecessary: true if a view is required, false if you want to update properties on a view, if one is available.

Returns an instance of NSView.

This method first attempts to return an available view, which is generally in the visible area. If there is no available view, and makeIfNecessary is true, a prepared temporary view is returned. If makeIfNecessary is false, and the view is not available, nil will be returned.
In general, makeIfNecessary should be true if you require a resulting view, and false if you only want to update properties on a view only if it is available (generally this means it is visible).
An exception will be thrown if row is not within the numberOfRows. The returned result should generally not be held onto for longer than the current run loop cycle. Instead they should re-query the table view for the row view.
33.53.62 Properties

33.53.63 allowsColumnReordering as boolean

Function: Controls whether the user can drag column headers to reorder columns. 
Notes: 
The default is true. You can rearrange columns programmatically regardless of this setting. 
(Read and Write property)

33.53.64 allowsColumnResizing as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: A Boolean value that indicates whether the receiver allows the user to resize columns by dragging between their headers. 
Notes: (Read and Write property)

33.53.65 allowsColumnSelection as boolean

Function: Controls whether the user can select an entire column by clicking its header. 
Notes: 
The default is false. You can select columns programmatically regardless of this setting. 
(Read and Write property)

33.53.66 allowsEmptySelection as boolean

Function: Controls whether the receiver allows zero rows or columns to be selected. 
Notes: 
Unlike with the other settings that affect selection behavior, you cannot set an empty selection programmatically if empty selection is disallowed. 
(Read and Write property)

33.53.67 allowsMultipleSelection as boolean

Function: Controls whether the user can select more than one row or column at a time.
Notes:
The default is false. You can select multiple columns or rows programmatically regardless of this setting. (Read and Write property)

### 33.53.68 `allowsTypeSelect` as boolean

**Function:** Whether the receiver allows the user to type characters to select rows.
**Notes:**
Available in Mac OS X v10.5 and later. (Read and Write property)

### 33.53.69 `autosaveName` as string

**Function:** The name under which table information is automatically saved.
**Notes:**
The table information is saved separately for each user and for each application that user uses.

Note that even when a table view has an autosave name, it may not be saving table information automatically. (Read and Write property)

### 33.53.70 `autosaveTableColumns` as boolean

**Function:** Whether the order and width of this table view’s columns are automatically saved.
**Notes:**
If flag is different from the current value, this method also reads in the saved information and sets the table options to match.

The table information is saved separately for each user and for each application that user uses. Note that if autosaveName returns nil, this setting is ignored and table information isn’t saved. (Read and Write property)
33.53.71  **backgroundColor as NSColorMBS**

**Function:** The color used to draw the background of the receiver.
**Notes:**
The default background color is light gray.
(Read and Write property)

33.53.72  **clickedColumn as Integer**

**Function:** Returns the index of the column the user clicked to trigger an action message.
**Notes:**
The index of the column the user clicked to trigger an action message. Returns 1 if the user clicked in an area of the table view not occupied by columns.
Index is zero based.
(Read only property)

33.53.73  **clickedRow as Integer**

**Function:** Returns the index of the row the user clicked to trigger an action message.
**Notes:**
The index of the row the user clicked to trigger an action message. Returns 1 if the user clicked in an area of the table view not occupied by table rows.
Index is zero based.
(Read only property)

33.53.74  **columnAutoresizingStyle as Integer**

**Function:** The table’s column autoresizing style.
**Notes:**
Use the following constants:
NSTableViewMBS.kFirstColumnOnlyAutoresizingStyle
NSTableViewMBS.kUniformColumnAutoresizingStyle
NSTableViewMBS.kSequentialColumnAutoresizingStyle
NSTableViewMBS.kReverseSequentialColumnAutoresizingStyle
NSTableViewMBS.kNoColumnAutoresizing
NSTableViewMBS.kLastColumnOnlyAutoresizingStyle

Available in Mac OS X v10.4 and later.
(Read and Write property)

33.53.75 cornerView as NSViewMBS

Function: The view used to draw the area to the right of the column headers and above the vertical scroller of the enclosing scroll view.
Notes: This is by default a simple view that merely fills in its frame, but you can replace it with a custom view using this property.
(Read and Write property)

33.53.76 dataSource as NSTableDataSourceMBS

Function: The object that provides the data displayed in the table view.
Notes: (Read and Write property)

33.53.77 draggingDestinationFeedbackStyle as Integer

Function: The feedback style displayed when the user drags over the table view.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

33.53.78 editedColumn as Integer

Function: Returns the index of the column being edited.
Notes:
First column has index zero.
If sent during editColumn(), the index of the row being edited; otherwise 1.
(Read only property)

33.53.79 editedRow as Integer

Function: Returns the index of the row being edited.
Notes:
The first row index is zero.
If sent during editColumn(), the index of the row being edited; otherwise 1.
(Read only property)

33.53.80 effectiveRowSizeStyle as Integer

Function: Returns the effective row size style for the table.
Notes:
If the rowSizeStyle is NSTableViewRowSizeStyleDefault, then this method returns the default size for this table.
The default size is currently set in the System Preferences by the users.
Available in OS X v10.7 and later.
(Read only property)

33.53.81 floatsGroupRows as Boolean

Function: A Boolean value indicating whether the table view draws grouped rows as if they are floating.
Notes:
Group rows are rows for which the table view delegates isGroupRow method returns true. These rows can be displayed as if they are floating in a view-based table view.
The default value of this property is true.
(Read and Write property)
33.53.82 focusedColumn as Integer

Function: The currently focused column.
Notes:
Returns the index of the column, or -1 if there is no focused column.
The focus interaction will always be on the selectedRow of the table. If the selectedRow is a full width cell, then focusedColumn will return 1 when focused.
Available in Mac OS X v10.6 and later.
(Read and Write property)

33.53.83 gridColor as NSColorMBS

Function: The color used to draw grid lines.
Notes:
The default color is gray.
(Read and Write property)

33.53.84 gridStyleMask as Integer

Function: The receiver’s grid style mask.
Notes:
use the constants:

kGridNone = 0,
kSolidVerticalGridLineMask = 1
kSolidHorizontalGridLineMask = 2

(Read and Write property)

33.53.85 headerView as NSTableHeaderViewMBS

Function: The NSTableHeaderView object used to draw headers over columns.
Notes:
The NSTableHeaderView object used to draw headers over columns, or nil if the receiver has no header view (Read and Write property)

33.53.86  **highlightedtableColumn as NSTableColumnMBS**

**Function:** The table column highlighted in the receiver.
**Notes:**
A highlightable column header can be used in conjunction with row selection to highlight a particular column of the table. An example of this is how the Mail application indicates the currently sorted column. (Read and Write property)

33.53.87  **intercellSpacing as NSSizeMBS**

**Function:** The horizontal and vertical spacing between cells.
**Notes:**
The default spacing is (3.0, 2.0). (Read and Write property)

33.53.88  **numberOfColumns as Integer**

**Function:** Returns the number of columns in the receiver.
**Notes:**
The value returned includes table columns that are currently hidden. (Read only property)

33.53.89  **numberOfRows as Integer**

**Function:** Returns the number of rows in the receiver.
**Notes:**
Typically you should not ask the table view how many rows it has; instead you should interrogate the table view’s data source. (Read only property)
33.53. CLASS NSTABLEVIEWMBS

33.53.90  numberOfSelectedColumns as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of selected columns.  
**Notes:** (Read only property)

33.53.91  numberOfSelectedRows as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of selected rows.  
**Notes:** (Read only property)

33.53.92  rowActionsVisible as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether a table rows actions are visible.  
**Notes:**  
This property contains a Boolean value indicating whether a table rows actions are visible or not the user has swiped the row to reveal the row actions. Set the value of this property to false to hide any visible row actions. Setting the value of this property to true is not supported, and will result in an exception.  
(Read and Write property)

33.53.93  rowHeight as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the height of each row in the receiver.  
**Notes:**  
The default row height is 16.0.  
(Read and Write property)

33.53.94  rowSizeStyle as Integer

MBS MacControls Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The row size used by the tableview: small, medium, large, or on a custom row by row basis.  
**Notes:**  
The row size style can be modified on a row by row basis by invoking the event heightOfRow, if implemented.
The `rowSizeStyle` defaults to `NSTableViewRowSizeStyleCustom`. `NSTableViewRowSizeStyleCustom` indicates to use the `rowHeight` of the table, instead of the pre-determined system values.

Generally, `rowSizeStyle` should always be `NSTableViewRowSizeStyleCustom` except for "source lists". To implement variable row heights, set the value to `NSTableViewRowSizeStyleCustom` and implement `tableView:heightOfRow:` in the delegate.

Available in OS X v10.7 and later.
(Read and Write property)

### 33.53.95 `selectedColumn` as Integer

**Function:** Returns the index of the last column selected or added to the selection.
**Notes:**
Returns the index of the last column selected or added to the selection, or 1 if no column is selected.
(Read only property)

### 33.53.96 `selectedIndex` as Integer

**Function:** Returns the index of the last row selected or added to the selection.
**Notes:**
Returns the index of the last row selected or added to the selection, or 1 if no row is selected.
(Read only property)

### 33.53.97 `selectionHighlightStyle` as Integer

**Function:** The selection highlight style used by the receiver to indicate row and column selection.
**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)
33.53. CLASS NSTABLEVIEWMBS

33.53.98  usesAlternatingRowBackgroundColors as boolean

Function: A Boolean value that indicates whether the receiver uses the standard alternating row colors for
its background.
Notes:
Available in Mac OS X v10.3 and later.
(Read and Write property)

33.53.99  usesStaticContents as Boolean

Function: A Boolean value indicating whether the table uses static data.
Notes:
A static table does not rely on a data source to provide the number of rows. A static table views contents
are set at design time and can be changed programmatically as needed. Typically, you do not change the
contents of a static table view after setting them.
In Xcode, any rows you add to a static table are saved in the corresponding nib or storyboard file and
loaded with the rest of the table at runtime. You can add table rows programmatically to a static table
view using the insertRowsAtIndexes method. When adding rows programmatically, your table view delegate
must implement the view method to provide the corresponding view for any new rows. You can also remove
rows at any time using the removeRowsAtIndexes method.

A table with static contents must be an NSView-based table view.

Available in macOS 10.10 or later.
(Read and Write property)

33.53.100  verticalMotionCanBeginDrag as boolean

Function: Whether vertical motion is treated as a drag or selection change to flag.
Notes:
If flag is false then vertical motion will not start a drag. The default is true.

Note that horizontal motion is always a valid motion to begin a drag. Most often, you would want to disable
vertical dragging when it’s expected that horizontal dragging is the natural motion.
(Read and Write property)
33.53.101  indicatorImageInTableColumn(column as NSTableColumnMBS) as NSImageMBS

Function: The indicator image of a given table column.
Notes:
An indicator image is an arbitrary (small) image that is rendered on the right side of the column header. An example of its use is in Mail to indicate the sorting direction of the currently sorted column in a mailbox.
(Read and Write computed property)

33.53.102  Events

33.53.103  ColumnDidMove(notification as NSNotificationMBS, oldColumn as Integer, newColumn as Integer)

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event informs the delegate that a column was moved by user action in the table view.

33.53.104  ColumnDidResize(notification as NSNotificationMBS, column as NSTableColumnMBS, index as Integer)

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event informs you that a column was resized in the table view.
**33.53. CLASS NSTABLEVIEWMBS**

**33.53.105 dataCell(tableColumn as NSTableColumnMBS, row as Int64) as NSCellMBS**

**Function:** Optional return a different cells for each row.

**Notes:**

A different data cell can be returned for any particular tableColumn and row, or a cell that will be used for the entire row (a full width cell). The returned cell should properly implement copyWithZone:, since the cell may be copied by NSTableView. If the tableColumn is non-nil, and nil is returned, then the table will use the default cell from tableColumn.dataCellForRow(Row).

When each row is being drawn, this method will first be called with a nil tableColumn. At this time, you can return a cell that will be used to draw the entire row, acting like a group. If you do return a cell for the 'nil' tableColumn, be prepared to have the other corresponding datasource and delegate methods to be called with a 'nil' tableColumn value. If don’t return a cell, the method will be called once for each tableColumn in the tableView, as usual.

**33.53.106 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)**

**Function:** Tells the delegate that a row view was added at the specified row.

**Notes:**

rowView: The row view.
row: The index of the row.

At this point, the delegate can add extra views, or modify the properties of rowView.

This method is only valid for NSView-based table views.

**33.53.107 didClickTableColumn(tableColumn as NSTableColumnMBS)**

**Function:** Called if a table column was clicked on.

**33.53.108 didDragTableColumn(tableColumn as NSTableColumnMBS)**

**Function:** Sent at the time the mouse button goes up in tableView and tableColumn has been dragged
during the time the mouse button was down.

**Notes:**

tableColumn: The table column.

The behavior of this method on Mac OS X v10.5 is different from prior versions. On Mac OS X v 10.5 the dragged column is sent to the subclass. In earlier versions the table column that is currently located at the dragged column’s original index is sent.

### 33.53.109 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

**Function:** Tells the delegate that a row view was removed from the table at the specified row.

**Notes:**

rowView: The row view.
row: The index of the row.

If row equals -1, the row is being deleted from the table and is no longer a valid row; otherwise row is a valid row that is being removed by being moved off screen.

This method is only valid for NSView-based table views.

### 33.53.110 DoubleClick

**Function:** A double click was recognized.

### 33.53.111 heightOfRow(row as Int64) as Double

**Function:** Implement this event to support a table with varying row heights.

**Notes:** The height returned by this method should not include intercell spacing and must be greater than zero. Performance Considerations: For large tables in particular, you should make sure that this method is efficient. NSTableView may cache the values this method returns, but this should NOT be depended on, as all values may not be cached. To signal a row height change, call noteHeightOfRowsWithIndexesChanged. For a given row, the same row height should always be returned until noteHeightOfRowsWithIndexesChanged is called, otherwise unpredictable results will happen. NSTableView automatically invalidates its entire row height cache in reloadData, and noteNumberOfRowsChanged.
### 33.53.112 isGroupRow(row as Int64) as boolean

**Function:** Invoked to allow the delegate to indicate that a specified row is a group row.

**Notes:**
- **row:** The row index.

Return true if the specified row should have the group row style drawn, false otherwise.

If the cell in row is an NSTextFieldCell and contains only a string, the group row style attributes will automatically be applied to the cell.

Group rows in view-based table views can be made to visually float’ by setting the tableview method setFloatsGroupRows to true.

Note: When configured as a source list style table view, rows identified as group rows draw with a specific style unique for source lists.
Available in Mac OS X v10.5 and later.

### 33.53.113 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnNMBS)

**Function:** Sent to the subclass whenever the mouse button is clicked in the table view’s header column.

**Notes:**
- **tableColumn:** The table column.

### 33.53.114 nextTypeSelectMatchFromRow(startRow as Int64, endRow as Int64, searchString as string) as Int64

**Function:** Invoked to allow the subclass to modify how type selection works.

**Notes:**
- **startRow:** The starting row of the search range.
- **endRow:** The ending row of the search range.
- **searchString:** A string containing the typed selection.

Return the first row in the range of startRow through endRow (excluding endRow itself) that matches searchString. Return -1 if no match is found.
It is possible for endRow to be less than startRow if the search will wrap.
Available in Mac OS X v10.5 and later.

33.53.115 rowViewForRow(row as Integer) as NSTableRowViewMBS

Function: Asks the delegate for a view to display the specified row.
Notes:
row: The row index.

Return an instance or subclass of NSTableRowView. If nil is returned, an NSTableRowView instance will be created and used.

You can implement this event to return a custom NSTableRowView for row.
The reuse queue can be used in the same way as documented in tableView:view:row:. The returned view will have attributes properly set to it before its added to the tableView.

This method is only valid for NSView-based table views.

33.53.116 SelectionDidChange(notification as NSNotificationMBS)

Function: This event informs you that the table view’s selection has changed.

33.53.117 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

Function: Invoked to allow the delegate to modify the proposed selection.
Notes:
proposedSelectionIndexes: An index set containing the indexes of the proposed selection.

Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view’s existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if
a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of shouldSelectRow.
Available in Mac OS X v10.5 and later.

### 33.53.118 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event informs you that the table view’s selection is in the process of changing (typically because the user is dragging the mouse across a number of rows).

### 33.53.119 selectionShouldChangeInTableView as boolean

Notes:
Return true to allow the table view to change its selection (typically a row being edited), false to deny selection change.

The user can select and edit different cells within the same row, but can’t select another row unless the delegate approves. The subclass can implement this method for complex validation of edited rows based on the values of any of their cells.

### 33.53.120 shouldEditTableColumn(tableColumn as NSTableColumnMBS, row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns whether the cell at the specified row and column can be edited.
Notes:
TableColumn: The table column.
rowIndex: The row index.
Return true to allow editing the cell, false to deny editing.

The subclass can implement this method to disallow editing of specific cells.
Note: This method is only valid for cell-based table views.
33.53.121 shouldReorderColumn(columnIndex as Int64, newColumnIndex as Int64) as boolean

Function: Sent to the subclass to allow or prohibit the specified column to be dragged to a new location.
Notes:
columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Return true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.

If this method is not implemented, all columns are considered reorderable.
Available in Mac OS X v10.6 and later.

33.53.122 shouldSelectRow(row as Int64) as boolean

Function: Returns whether the table view should allow selection of the specified row.
Notes:
rowIndex: The row index.

Return true to permit selection of the row, false to deny selection.

The delegate can implement this method to disallow selection of particular rows.
For better performance and finer-grain control over the selection, use selectionIndexesForProposedSelection.

33.53.123 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as boolean

Function: Returns whether the specified table column can be selected.
Notes:
33.53. CLASS NSTABLEVIEWMBS

TableColumn: The table column.

Return true to permit selection, otherwise false.

The subclass can implement this event to disallow selection of particular columns.

33.53.124 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, row as Int64) as Boolean

Function: Invoked to allow the subclass to control cell expansion for a specific row and column.
Notes:
TableColumn: The table column.
row: The row index.

Return true if the tooltip cell should expand, false otherwise.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

33.53.125 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64) as Boolean

Function: Invoked to allow the subclass to control the tracking behavior for a specific cell.
Notes:
cell: The cell to track.
tableColumn: The table column.
row: A row in tableView.

Returns true if the cell should track, false otherwise.
Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked, and vice-versa.

For example, this allows you to have an NSButtonCell in a table which does not change the selection, but can still be clicked on and tracked.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

**33.53.126 shouldTypeSelectForEvent(e asNSEventMBS, searchString as string) as Boolean**

**Function:** Invoked to allow the subclass to control type select for a specific event.

**Notes:**
- event: The event.
- searchString: The search string or nil if no type select has began.

Return true to allow type select for event, false otherwise.

Typically, this is called from the table view keyDown implementation and the event will be a key event.

Available in Mac OS X v10.5 and later.

**33.53.127 sizeToFitWidthOfColumn(column as Int64) as Double**

**Function:** Invoked to allow the subclass to provide custom sizing behavior when a column’s resize divider is double clicked.

**Notes:**
- column: The index of the column.

Returns the width of the specified column.

By default, NSTableView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.

For accurate results and performance, it is recommended that this method is implemented when using large
tables. By default, large tables use a monte carlo simulation instead of iterating every row.

Available in Mac OS X v10.6 and later.

### 33.53.128 textShouldBeginEditing

```
control as NSControlMBS, fieldEditor as NSTextFieldMBS) as boolean
```

**Function:** The event called to decide whether text editing should be allowed.

**Notes:** Return true to allow.

### 33.53.129 textShouldEndEditing

```
control as NSControlMBS, fieldEditor as NSTextFieldMBS) as boolean
```

**Function:** The event called to decide whether ending text editing should be allowed.

**Notes:** Return true to allow.

### 33.53.130 toolTipForCell

```
cell as NSCellMBS, r as NSRectMBS, tableColumn as NSTableColumnMBS, row as Int64, mouseLocation as NSPointMBS) as string
```

**Function:** Returns a string that is displayed as a tooltip for the specified cell in the column and row.

**Notes:**

- Cell: The cell.
- r: The proposed active area of the tooltip. You can modify rect to provide an alternative active area.
- TableColumn: The table column.
- row: The row index.
- mouseLocation: The mouse location.

Return a string containing the tooltip. Return empty string if no tooltip is desired.

By default, rect is computed as cell.drawingRectForBounds(cellFrame).

Available in Mac OS X v10.4 and later.
33.53.131  typeSelectString(tableColumn as NSTableColumnMBS, row as Int64) as string

Function: Invoked to allow the subclass to provide an alternate text value used for type selection for a specified row and column.
Notes:

tableColumn: The table column.
row: The row index.

Returns a string that is used in type select comparison for row and tableColumn. Return "" if the row or tableColumn should not be searched.

Implement this method to change the string value that is searched for based on what is displayed. By default, all cells with text in them are searched.

If this event is not implemented the string value is the cell string value. Implementation of this event is optional.

Available in Mac OS X v10.5 and later.

33.53.132  view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS

Function: Asks the delegate for a view to display the specified row and column.
Notes:

see also

33.53.133  willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64)

Function: Informs you that the tableview will display the specified cell at the row in the column.
Notes:

Cell: The cell to be displayed.
TableColumn: The table column.
row: The row index.
The event can modify the display attributes of cell to alter the appearance of the cell.

Because cell is reused for every row in tableColumn, the event must set the display attributes both when drawing special cells and when drawing normal cells.

Note: The implementation of this method must not draw portions of the cell. It should only alter the state of the passed in cell.

### Constants

**33.53.135 NSTableViewRowActionEdgeLeading = 0**

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** One of the constants to define table row edges on which row actions are attached. **Notes:** Denotes the leading, or left, edge of an table row view.

**33.53.136 NSTableViewRowActionEdgeTrailing = 1**

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** One of the constants to define table row edges on which row actions are attached. **Notes:** Denotes the trailing, or right, edge of an table row view.

**33.53.137 NSTableViewAnimationEffectFade = 1**

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows. **Notes:** Use a fade for row or column removal. The effect can be combined with any of the slide constants.

**33.53.138 NSTableViewAnimationEffectGap = 2**

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows. **Notes:** Creates a gap for newly inserted rows. This is useful for drag and drop animations that animate to a newly opened gap and should be used in the acceptDrop event.
33.53.139  `NSTableViewAnimationEffectNone = 0`

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
**Notes:** Use no animation effects.

33.53.140  `NSTableViewAnimationSlideDown = & h20`

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
**Notes:** Animates a row insertion or removal by sliding downward.

33.53.141  `NSTableViewAnimationSlideLeft = & h30`

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
**Notes:** Animates a row insertion by sliding from the left. Animates a row removal by sliding towards the left.

33.53.142  `NSTableViewAnimationSlideRight = & h40`

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
**Notes:** Animates a row insertion by sliding from the right. Animates a row removal by sliding towards the right.

33.53.143  `NSTableViewAnimationSlideUp = & h10`

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
**Notes:** Animates a row insertion or removal by sliding upward.

33.53.144  `NSTableViewDashedHorizontalGridLineMask=8`

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** One of the constants to specify grid styles.
**Notes:** Specifies that the horizontal grid lines should be drawn dashed.
33.53.145 NSTableViewDraggingDestinationFeedbackStyleGap=2

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** One of the dragging styles. **Notes:** Provides a gap insertion when dragging over the table. Note that this style is only officially supported for View Based TableViews, but may partially work in Cell Based TableViews. The decision to use the gap style (compared to another style) can be made in draggingSessionWillBeginAtPoint, or it can dynamically be changed.

33.53.146 NSTableViewDraggingDestinationFeedbackStyleNone=-1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the drag styles displayed by the table view. **Notes:** Provides no feedback when the user drags over the table view. This option exists to allow subclasses to implement their dragging destination highlighting, or to make it not show anything all.

Available in Mac OS X v10.6 and later.

33.53.147 NSTableViewDraggingDestinationFeedbackStyleRegular=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the drag styles displayed by the table view. **Notes:** Draws a solid round-rect background on drop target rows, and an insertion marker between rows. This style should be used in most cases.

Available in Mac OS X v10.6 and later.

33.53.148 NSTableViewDraggingDestinationFeedbackStyleSourceList=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the drag styles displayed by the table view. **Notes:** Draws an outline on drop target rows, and an insertion marker between rows. This style will automatically be set for source lists when the table’s setSelectionHighlightStyle: is set to NSTableViewSelectionHighlightStyleSourceList. This is the standard look for Source Lists, but may be used in other areas as needed.
33.53.149 NSTableViewDropAbove=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify drop operations. **Notes:**

Specifies that the drop should occur above the specified row.

For example, given a table with n rows (numbered with row 0 at the top visually), a row of n1 and operation of NSTableViewDropOn would specify a drop on the last row. To specify a drop below the last row, you use a row of n and NSTableViewDropAbove for the operation.

33.53.150 NSTableViewDropOn=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify drop operations. **Notes:**

Specifies that the drop should occur on the specified row.

For example, given a table with n rows (numbered with row 0 at the top visually), a row of n1 and operation of NSTableViewDropOn would specify a drop on the last row. To specify a drop below the last row, you use a row of n and NSTableViewDropAbove for the operation.

33.53.151 NSTableViewFirstColumnOnlyAutoresizingStyle=5

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style. **Notes:**

Autoresize only the first table column.

When that table column can no longer be resized, stop autoresizing. Normally you should use one of the sequential autoresizing modes instead.

Available in Mac OS X v10.4 and later.
33.53.152 NSTableViewGridNone=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants for the grid styles. **Notes:** Specifies that no grid lines should be displayed.

33.53.153 NSTableViewLastColumnOnlyAutoresizingStyle=4

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style. **Notes:** Autoresize only the last table column.

When that table column can no longer be resized, stop autoresizing. Normally you should use one of the sequential autoresizing modes instead.

Available in Mac OS X v10.4 and later.

33.53.154 NSTableViewNoColumnAutoresizing=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style. **Notes:** Disable table column autoresizing. Available in Mac OS X v10.4 and later.

33.53.155 NSTableViewReverseSequentialColumnAutoSizeingStyle=3

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style. **Notes:** Autoresize each table column sequentially, from the first auto-resizable column to the last auto-resizable column; proceed to the next column when the current column has reached its minimum or maximum size.

Available in Mac OS X v10.4 and later.
33.53.156 NSTableViewRowSizeStyleCustom = 0

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.

**Notes:**

The table will use the rowHeight or invoke the delegate method tableView:heightOfRow:, if implemented. The cell layout is not changed.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRow-SizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class’ property rowSizeStyle.

33.53.157 NSTableViewRowSizeStyleDefault = -1

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.

**Notes:**

The table will use the system default layout size: small, medium or large.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRow-SizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class’ property rowSizeStyle.

33.53.158 NSTableViewRowSizeStyleLarge = 3

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.

**Notes:**

The table will use a row height specified for a small table. It is required that the size be fully tested and supported if NSTableViewRowSizeStyleCustom is not used.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRow-SizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class’ property rowSizeStyle.

33.53.159 NSTableViewRowSizeStyleMedium = 2

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.

**Notes:**

The table will use a row height specified for a medium table. It is required that the size be fully tested and supported if NSTableViewRowSizeStyleCustom is not used.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

### 33.53.160 NSTableViewRowSizeStyleSmall = 1

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.  
**Notes:**
The table will use a row height specified for a small table. It is required that the size be fully tested and supported if NSTableViewRowSizeStyleCustom is not used. 
Available in OS X v10.7 and later. 
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

### 33.53.161 NSTableViewSelectionHighlightStyleNone=-1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the selection highlight styles.  
**Notes:**
Displays no highlight style at all. 
Available in Mac OS X v10.6 and later.

### 33.53.162 NSTableViewSelectionHighlightStyleRegular=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants for the selectionHighlightStyle property.  
**Notes:**
The regular highlight style of NSTableView. On Mac OS X v10.5 a light blue (returned by sending NSColor a alternateSelectedControlColor message) or light gray color (returned by sending NSColor a secondarySelectedControlColor message).

Available in Mac OS X v10.5 and later.
33.53.163 NSTableViewSelectionHighlightStyleSourceList=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants for the selectionHighlightStyle property.
**Notes:**

The source list style of NSTableView. On 10.5, a light blue gradient is used to highlight selected rows.

Note: When using this style, cell subclasses that implement drawsBackground must set the value to false. Otherwise, the cells will draw over the tableview’s highlighting.

33.53.164 NSTableViewSequentialColumnAutoresizingStyle=2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style.
**Notes:**

Autoresize each table column sequentially, from the last auto-resizable column to the first auto-resizable column; proceed to the next column when the current column has reached its minimum or maximum size.

Available in Mac OS X v10.4 and later.

33.53.165 NSTableViewSolidHorizontalGridLineMask=2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify grid styles.
**Notes:**

Specifies that horizontal grid lines should be displayed.

Available in Mac OS X v10.3 and later.

You can combine NSTableViewSolidVerticalGridLineMask and NSTableViewSolidHorizontalGridLineMask with bitwiseor.

33.53.166 NSTableViewSolidVerticalGridLineMask=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify grid styles.
**Notes:**

Specifies that vertical grid lines should be displayed.
You can combine NSTableViewSolidVerticalGridLineMask and NSTableViewSolidHorizontalGridLineMask with bitwise or.

### 33.53.167 NSTableViewUniformColumnAutoresizingStyle=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style.  
**Notes:**  
Autoresize all columns by distributing space equally, simultaneously.  
Available in Mac OS X v10.4 and later.
33.54 class NSTableViewRowActionMBS

33.54.1 class NSTableViewRowActionMBS

Function: An NSTableViewRowAction object defines a single action to present when the user swipes horizontally on a table row.

Notes: In an editable table, performing a horizontal swipe on a row reveals a button to delete the row by default. This class lets you define one or more custom actions to display for a given row in your table. Each instance of this class represents a single action to perform and includes the text, formatting information, and behavior for the corresponding button.

To add custom actions to your table views rows, implement the rowActionsForRow event in your table views delegate object. In that method, create and return an array of actions for the specified row. The table handles the remaining work of displaying the action buttons and executing the appropriate handler block when the user clicks the button.

33.54.2 Methods

33.54.3 available as boolean

Function: Check whether this class is available.

Notes: Returns true on macOS 10.11.

33.54.4 Constructor(Style as Integer, Title as String)

Function: Creates and returns a new table view row action object.

Notes: style: The style characteristics to apply to the button. Use this value to apply default appearance characteristics to the button. These characteristics visually communicate, such as by color, information about what the button does. For example, specify a style of NSTableViewRowActionStyleDestructive to indicate an action is destructive to the underlying data. For a list of possible style values, see NSTableViewRowActionStyle.

title: The string to display in the button. Specify a string localized for the users current language.

Returns a new table row action object that you can return from your table views event.
The style you specify cannot be changed later. You can change the title of the action button. You can also configure other appearance-related properties of the button using the properties of this class.
You can assign the same row action object to multiple rows of your table.

### 33.54.5 Properties

#### 33.54.6 BackgroundColor as NSColorMBS

**Function:** The background color of the action button.
**Notes:**
Use this property to specify the background color for your button. If you do not specify a value for this property, AppKit assigns a default color based on the value in the style property. Generally, this color is red for destructive actions and blue for nondestructive actions.
(Read and Write property)

#### 33.54.7 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

#### 33.54.8 Image as NSImageMBS

**Function:** The image.
**Notes:** Available in macOS 10.12 or later.
(Read and Write property)

#### 33.54.9 Style as Integer

**Function:** The style applied to the action button.
**Notes:** The value of this property is set at creation time and cannot be changed later.
(Read only property)
33.54.10 Title as String

Function: The title of the action button.
Notes: (Read and Write property)

33.54.11 Events

33.54.12 Action(row as Integer)

Function: Called when action is invoked.
Notes: The event to execute when the user clicks the button associated with this action. When the user selects the action represented by this object, AppKit executes your event on the apps main thread.

33.54.13 Constants

33.54.14 NSTableViewRowActionStyleDestructive = 1

Notes: Apply a style that indicates that the action might change or delete data. This style changes the value of the backgroundColor property to an appropriate value to reflect the destructive action. After creating the action object, you can change the background color as needed. Destructive actions require a longer swipe to activate, and trigger an animation when a table row is deleted.

33.54.15 NSTableViewRowActionStyleRegular = 0

Notes: Apply the default style to the button. This style does not apply any special coloring to the button.
33.55. **CLASS NSTABVIEWITEMMBS**

### 33.55 class NSTabViewItemMBS

#### 33.55.1 class NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for items on the tabview.

**Notes:** An NSTabViewItem is a convenient way for presenting information in multiple pages. A tab view is usually distinguished by a row of tabs that give the visual appearance of folder tabs. When the user clicks a tab, the tab view displays a view page provided by your application. A tab view keeps a zero-based array of NSTabViewItems, one for each tab in the view.

#### 33.55.2 Methods

#### 33.55.3 Constructor(identifier as Variant)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new tabview item with the identifier.

#### 33.55.4 Properties

#### 33.55.5 color as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color of the tab view item.

**Notes:**

May not be used by the control.

(Read and Write property)

#### 33.55.6 Enabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The enabled state of the tab view item.

**Example:**

```vbnet
dim n as NSTabViewMBS = TabPanel1.NSTabViewMBS
dim t as NSTabViewItemMBS = n.tabViewItemAtIndex(0)
t.Enabled = false
```
33.55.7 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal reference to the NSTabViewItem object. Notes: (Read and Write property)

33.55.8 identifier as Variant

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The identifier for this item. Notes: (Read and Write property)

33.55.9 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The image for the tab panel item. Notes: Available in Mac OS X 10.10. (Read and Write property)

33.55.10 initialFirstResponder as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The initial first responder for the view associated with the receiver. Notes: Sets the initial first responder for the view associated with the receiver (the view that is displayed when a user clicks on the tab) to view. (Read and Write property)

33.55.11 label as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The label text for the receiver. Notes: (Read and Write property)
33.55.12 tabState as Integer

**Function:** Returns the current display state of the tab associated with the receiver.  
**Notes:**  
The possible values are NSSelectedTab, NSBackgroundTab, or NSPressedTab. Your application does not directly set the tab state.  
(Read only property)

33.55.13 tabView as NSTabViewMBS

**Function:** Returns the parent tab view for the receiver.  
**Notes:**  
Note that this is the tab view itself, not the view displayed when a user clicks the tab.

A tab view item normally learns about its parent tab view when it is inserted into the view’s array of items. The NSTabView methods addTabViewItem and insertTabViewItem set the tab view for the added or inserted item.  
(Read only property)

33.55.14 toolTip as string

**Function:** The tooltip displayed for the tab view item.  
**Notes:** (Read and Write property)

33.55.15 view as NSViewMBS

**Function:** The view associated with the receiver to view.  
**Notes:**  
This is the view displayed when a user clicks the tab. When you set a new view, the old view is released.  
(Read and Write property)
33.55.16 Constants

33.55.17 NSBackgroundTab = 1

MBS MacCocoa Plugin, Plugin Version: 10.0. Function: One of the constants describing the current display state of a tab.
Notes: A tab that’s not being displayed.

33.55.18 NSPressedTab = 2

MBS MacCocoa Plugin, Plugin Version: 10.0. Function: One of the constants describing the current display state of a tab.
Notes: A tab that the user is in the process of clicking. That is, the user has pressed the mouse button while the cursor is over the tab but has not released the mouse button.

33.55.19 NSSelectedTab = 0

MBS MacCocoa Plugin, Plugin Version: 10.0. Function: One of the constants describing the current display state of a tab.
Notes: The tab that’s being displayed.
33.56. class NSTabViewMBS

33.56.1 class NSTabViewMBS

Function: The Cocoa tabpanel control.
Notes:

AnNSTabViewobject provides a convenient way to present information in multiple pages. The view contains a row of tabs that give the appearance of folder tabs, as shown in the following figure. The user selects the desired page by clicking the appropriate tab or using the arrow keys to move between pages. Each page displays a view hierarchy provided by your application.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

33.56.2 Methods

33.56.3 addTabViewItem(tabViewItem as NSTabViewItemMBS)

Function: Adds the tab item specified by tabViewItem.
Notes:

tabViewItem: The tab view item to be added.

The item is added at the end of the array of tab items, so the new tab appears on the right side of the view.

33.56.4 Constructor

Function: Creates a new tab view with size 100/100 and position 0/0
Example:

dim t as new NSTabViewMBS

Notes: On success the handle property is not zero.
See also:

- 33.56.5 Constructor(Handle as Integer) 6698
- 33.56.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6698
33.56.5 Constructor(Handle as Integer)

Function: Creates an object based on the given NSTabView handle.
Example:

```vbscript
dim t as new NSTabViewMBS(0, 0, 100, 100)
dim v as new NSTabViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+” x ”+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTabView and the plugin retains this handle. See also:
- 33.56.4 Constructor
- 33.56.6 Constructor(left as Double, top as Double, width as Double, height as Double)

33.56.6 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new tab view with the given size and position.
Example:

```vbscript
dim x as new NSTabViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero. See also:
- 33.56.4 Constructor
- 33.56.5 Constructor(Handle as Integer)

33.56.7 contentRect as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the rectangle describing the content area of the receiver.
Notes: This area does not include the space required for the receiver’s tabs or borders (if any).
### 33.56.8 indexOfTabViewItem(tabViewItem as NSTabViewItemMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the specified item in the tab view.  
**Notes:** The zero-based index of tabViewItem, or [NSNotFound] if the item is not found.

### 33.56.9 indexOfTabViewItemWithIdentifier(identifier as Variant) as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the item that matches the specified identifier. identifier, or NSNotFound (-1) if the item is not found.  
**Notes:** Returns nil on any error.

### 33.56.10 insertTabViewItem(tabViewItem as NSTabViewItemMBS, atIndex as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts tabViewItem into the receiver’s array of tab view items at index.  
**Notes:**  
- tabViewItem: The tab view item to be added.  
- index: The index at which to insert the tab view item. The index parameter is zero-based.

### 33.56.11 minimumSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the minimum size necessary for the receiver to display tabs in a useful way.  
**Notes:** You can use the value returned by this method to limit how much a user can resize a tab view.

### 33.56.12 numberOfTabViewItems as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of items in the receiver’s array of tab view items.
33.56.13 removeTabViewItem(tabViewItem as NSTabViewItemMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the item specified by tabViewItem from the receiver’s array of tab view items.

33.56.14 selectedTabViewItem as NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the specified tab view item.

33.56.15 selectFirstTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method selects the first tab view item.

33.56.16 selectLastTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method selects the last tab view item.

33.56.17 selectNextTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method selects the next tab view item in the sequence. **Notes:** If the currently visible item is the last item in the sequence, this method does nothing, and the last page remains displayed.

33.56.18 selectPreviousTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method selects the previous tab view item in the sequence. **Notes:** If the currently visible item is the first item in the sequence, this method does nothing, and the first page remains displayed.
33.56.19  selectTabViewItem(tabViewItem as NSTabViewItemMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the tab view item for the currently selected tab. Notes: Returns the currently selected tab view item, or nil if no item is selected.

33.56.20  selectTabViewItemAtIndex(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Selects the tab view item specified by index. Notes: The index parameter is base 0.

33.56.21  selectTabViewItemWithIdentifier(identifier as Variant)

33.56.22  tabViewItemAtIndex(index as Integer) as NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the tab view item at index in the tab view’s array of items. Notes: index: The index at which to insert the tab view item. The index parameter is zero-based.

Returns the tab view item at the specified index.

33.56.23  tabViewItemAtPoint(x as Double, y as Double) as NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the tab view item at the specified point. Notes: Returns the tab view item under the hit point, or nil if no tab view item is under that location. You can use this method to find a tab view item based on a user’s mouse click.
33.56.24  **tabViewItems** as NSTabViewItemMBS()

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s array of tab view items. **Notes:** A tab view keeps an array containing one tab view item for each tab in the view.

33.56.25  **Properties**

33.56.26  **allowsTruncatedLabels** as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether if the receiver allows truncating for labels that don’t fit on a tab. **Notes:** Value is true if the receiver allows truncating for labels that don’t fit on a tab, otherwise false.

The default is true.
When truncating is allowed, the tab view inserts an ellipsis, if necessary, to fit a label in the tab.
(Read and Write computed property)

33.56.27  **controlSize** as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size of the receiver. **Notes:** Use NSRegularControlSize, NSSmallControlSize or NSMiniControlSize.
(Read and Write computed property)

33.56.28  **controlTint** as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tab view’s control tint. **Notes:** Use NSDefaultControlTint, NSBlueControlTint, NSGraphiteControlTint or NSClearControlTint.
(Read and Write computed property)
33.56. **drawsBackground as boolean**

**Function:** Whether if the receiver draws a background color when the tab view type is NSNoTabsNoBorder.  
**Notes:**  
True if the receiver draws a background color when the tab view type is NSNoTabsNoBorder, otherwise false.  
If the receiver uses bezeled edges or a line border, the appropriate background color for that border is used.  
(Read and Write computed property)

33.56.30 **font as NSFontMBS**

**Function:** The font for tab label text.  
**Notes:**  
Tab height is adjusted automatically to accommodate a new font size. If the view allows truncating, tab labels are truncated as needed.  
(Read and Write computed property)

33.56.31 **tabViewType as Integer**

**Function:** The tab type for the receiver.  
**Notes:**  
Use constants: NSTopTabsBezelBorder, NSLeftTabsBezelBorder, NSBottomTabsBezelBorder, NSRightTabsBezelBorder, NSNoTabsBezelBorder, NSNoTabsLineBorder or NSNoTabsNoBorder.  
(Read and Write computed property)

33.56.32 **Constants**

33.56.33 **NSBlueControlTint=1**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify a the control tint.  
**Notes:** Aqua control tint
33.56.34 **NSBottomTabsBezelBorder = 2**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view’s type as used by tabViewType.
**Notes:** Tabs are on the bottom of the view with a bezeled border.

33.56.35 **NSClearControlTint=7**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify a the control tint.
**Notes:** Clear control tint

33.56.36 **NSDefaultControlTint=0**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify a the control tint.
**Notes:** The current default tint setting

33.56.37 **NSGraphiteControlTint=6**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify a the control tint.
**Notes:** Graphite control tint

33.56.38 **NSLeftTabsBezelBorder = 1**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view’s type as used by tabViewType.
**Notes:** Tabs are on the left of the view with a bezeled border.

33.56.39 **NSMiniControlSize=2**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the values for the ControlSize property.
**Notes:** The control has a smaller size than NSSmallControlSize.

33.56.40 **NSNoTabsBezelBorder = 4**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view’s type as used by tabViewType.
Notes: The view does not include tabs and has a bezeled border.

33.56.41  **NSNoTabsLineBorder = 5**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType. **Notes:** The view does not include tabs and has a lined border.

33.56.42  **NSNoTabsNoBorder = 6**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType. **Notes:** The view does not include tabs and has no border.

33.56.43  **NSRegularControlSize=0**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the values for the ControlSize property. **Notes:** The control is sized as regular.

33.56.44  **NSRightTabsBezelBorder = 3**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType. **Notes:** Tabs are on the right of the view with a bezeled border.

33.56.45  **NSSmallControlSize=1**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the values for the ControlSize property. **Notes:** This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

33.56.46  **NSTopTabsBezelBorder = 0**

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType.
Notes: The view includes tabs on the top of the view and has a bezeled border (the default).
33.57. CLASS NSTextFieldCellMBS

33.57 class NSTextFieldCellMBS

33.57.1 class NSTextFieldCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text field class for using as NSCell.

**Example:**

```swift
// ask for the textfield behind the label
dim n as NSTextFieldMBS = NSTextFieldMBS(label1.NSViewMBS)

// query cell
dim c as NSTextFieldCellMBS = n.cell

// and set background style
c.backgroundStyle = NSTextFieldCellMBS.NSBackgroundStyleRaised
```

**Notes:**

The NSTextFieldCell class adds to the text display capabilities of the NSCell class by allowing you to set the color of both the text and its background. You can also specify whether the cell draws its background at all.

All of the methods declared by this class are also declared by the NSTextField class, which uses NSTextField-Cell objects to draw and edit text. These NSTextField cover methods call the corresponding NSTextFieldCell methods.

Placeholder strings, set using PlaceholderString or PlaceholderAttributedString, now appear in the text field cell if the actual string is "". They are drawn in grey on the cell.

Subclass of the NSActionCellMBS class.

33.57.2 Methods

33.57.3 allowedInputSourceLocales as string()

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.

**Notes:** Available in Mac OS X v10.5 and later.
33.57.4 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new Cell object with a text. **Example:**

```dim c as new NSTextFieldCellMBS("Hello")
MsgBox c.StringValue```

33.57.5 setAllowedInputSourceLocales(Identifiers() as string)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus. **Notes:**

You can use the meta-locale identifier, NSAllRomanInputSourcesLocaleIdentifier, to specify input sources that are limited for Roman script editing.

Available in Mac OS X v10.5 and later.

33.57.6 setUpFieldEditorAttributes(textobj as NSTextMBS) as NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets up the field editor. You never invoke this method directly; by overriding it, however, you can customize the field editor.

33.57.7 setWantsNotificationForMarkedText(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Directs the cell’s associated field editor to post text change notifications. **Notes:**

If true, the field editor posts text change notifications (NSTextDidChangeNotification) while editing marked text; if false, notifications are delayed until the marked text confirmation.

Available in Mac OS X v10.5 and later.
33.57.8 Properties

33.57.9 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The color of the background the receiver draws behind the text. Notes: (Read and Write property)

33.57.10 bezelStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The receiver’s bezel style. Notes: To set the bezel style, you must have already set Bezeled to true. (Read and Write property)

33.57.11 drawsBackground as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A Boolean value that indicates whether the receiver draws its background color. Notes: In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields. (Read and Write property)

33.57.12 placeholderAttributedString as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The placeholder of the cell as an attributed string. Notes: Note that invoking this successfully will clear out any plain text string set by PlaceholderString.

Available in Mac OS X v10.3 and later. (Read and Write property)
33.57.13 **placeholderString as string**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The placeholder of the cell as a plain text string. **Notes:**

Note that invoking this successfully will clear out any attributed string set by setPlaceholderAttributedString.

(Read and Write property)

33.57.14 **textColor as NSColorMBS**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color used to draw the receiver’s text. **Notes:** (Read and Write property)

33.57.15 **Constants**

33.57.16 **NSTextFieldRoundedBezel=1**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the bezel style of the text field cell. **Notes:**

Corners are rounded.
Available in Mac OS X v10.2 and later.

33.57.17 **NSTextFieldSquareBezel=0**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the bezel style of the text field cell. **Notes:**

Corners are square.
Available in Mac OS X v10.2 and later.
33.58.1 control NSTextFieldControlMBS

Function: The Xojo control for a NSTextField.
Notes:
This control embeds a special NSTextField subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

33.58.2 Properties

33.58.3 View as NSTextFieldMBS

Function: The view used in the control.
Notes:
Use this object to set more options on the control.
(Read only property)

33.58.4 Events

33.58.5 Action

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The control’s action was triggered.
Notes: The text changed.

33.58.6 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event called when the bounds, but not the frame, changed.
33.58.7 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event where you can enable menu items.

33.58.8 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

33.58.9 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus. **Notes:** This only fires if the control itself got focus and not a sub control.

33.58.10 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus. **Notes:** This only fires if the control itself lost focus and not a sub control.

33.58.11 MenuAction(HitItem as MenuItem) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen. **Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

33.58.12 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was pressed inside the controls region at the location passed in to x, y. **Notes:** The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

33.58.13 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event fires continuously after the mouse button was pressed inside the Control. Notes: Mouse location is local to the control passed in to x, y. As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

33.58.14 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The mouse button was released. Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

33.58.15 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The backing store scale factor has changed. Notes: Please invalidate any cached bitmaps or other relevant state.

33.58.16 TextDidBeginEditing(fieldEditor as NSTextFieldMBS, notification as NSNotificationCenterMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Sent when a control with editable text begins an editing session. Notes:
CHAPTER 33. COCOA CONTROLS

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

### 33.58.17 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

**Function:** Sent when the text in the receiving control changes.

**Notes:**
Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

### 33.58.18 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

**Function:** Sent when a control with editable text ends an editing session.

**Notes:**
Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

### 33.58.19 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

**Function:** The event called to decide whether text editing should be allowed.
33.58. CONTROL NSTEXTFIELDCONTROLMBS

Notes:
Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

33.58.20 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

Function: The event called to decide whether ending text editing should be allowed.
Notes:
Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.
CHAPTER 33. COCOA CONTROLS

33.59  class NSTextFieldMBS

33.59.1  class NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSTextField object is a kind of NSControl that displays text that the user can select or edit and that sends its action message to its target when the user presses the Return key while editing. **Notes:** Subclass of the NSControlMBS class.

33.59.2  Methods

33.59.3  Constructor

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text field with size 100/100 and position 0/0 **Example:**

```
dim t as new NSTextFieldMBS
```

**Notes:** On success the handle property is not zero. See also:

- 33.59.4 Constructor(Handle as Integer) 6716
- 33.59.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6717

33.59.4  Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSTextField handle. **Example:**

```
dim t as new NSTextFieldMBS(0, 0, 100, 100)
dim v as new NSTextFieldMBS(t.handle)
MsgBox str(v.Bounds.Width)+” x ”+str(v.Bounds.Height)
```

**Notes:** The handle is casted to a NSTextField and the plugin retains this handle. See also:

- 33.59.3 Constructor 6716
- 33.59.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6717
33.59. CLASS NSTEXTFIELDMBS

33.59.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text field with the given size and position. **Example:**

```ruby
dim x as new NSTextFieldMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero. See also:

- 33.59.3 Constructor
- 33.59.4 Constructor(Handle as Integer)

33.59.6 selectText

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Ends editing and selects the entire contents of the receiver if it’s selectable. **Notes:** If the receiver isn’t in some window’s view hierarchy, this method has no effect.

33.59.7 Properties

33.59.8 AllowsCharacterPickerTouchBarItem as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to allow character picker in touch bar. **Notes:** Available in macOS 10.12.2. (Read and Write property)

33.59.9 allowsEditingTextAttributes as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver allows the user to change font attributes of the receiver’s text. **Notes:** If true, the user is permitted to change font attributes of the receiver’s text; if flag is false, the user isn’t so permitted. You can change text attributes programmatically regardless of this setting.
33.59.10  AutomaticTextCompletionEnabled as Boolean

33.59.11  backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The color of the background that the receiver’s cell draws behind the text. Notes: (Read and Write property)

33.59.12  Bezeled as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A Boolean value indicating whether the receiver draws a bezeled frame. Notes: (Read and Write property)

33.59.13  bezelStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The receiver’s bezel style. Notes: You must have already sent the receiver Bezeled with true to make this property take affect. (Read and Write property)

33.59.14  Bordered as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A Boolean value indicating whether the receiver draws a black border around its contents. Notes:
33.59. CLASS NSTEXTFIELDMBS

True if the receiver draws a solid black border around its contents; otherwise false.  
(Read and Write property)

### 33.59.15 drawsBackground as boolean

**Function:** Controls whether the receiver’s cell draws its background color behind its text.  
**Notes:**  
In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields.  
To really make the background go away, also set bordered=false.  
(Read and Write property)

### 33.59.16 Editable as boolean

**Function:** Whether the user can edit the receiver’s text.  
**Notes:**  
If true, then the user is allowed to both select and edit text. If flag is false, then the user isn’t permitted to edit text, and the receiver’s selectability is restored to its previous value.  
For example, if an NSTextField object is selectable but not editable, then made editable for a time, then made not editable, it remains selectable. To guarantee that text is neither editable nor selectable, simply use setSelectable to turn off selectability.  
(Read and Write property)

### 33.59.17 importsGraphics as boolean

**Function:** Controls whether the receiver allows the user to drag image files into it.  
**Notes:**  
If true, the receiver accepts dragged images; if false, it doesn’t. You can add images programmatically regardless of this setting.  
(Read and Write property)
33.59.18 placeholderAttributedString as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The attributed placeholder string. **Notes:** (Read and Write property)

33.59.19 placeholderString as String

MBS MacCocoa Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plain text placeholder string. **Notes:** (Read and Write property)

33.59.20 Selectable as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver is selectable (but not editable). **Notes:**

If true, the receiver is made selectable but not editable (use Editable to make text both selectable and editable). If false, the text is neither editable nor selectable. (Read and Write property)

33.59.21 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color used to draw the receiver’s text. **Notes:** (Read and Write property)

33.59.22 Constants

33.59.23 NSTextFieldRoundedBezel = 1

MBS MacCocoa Plugin, Plugin Version: 10.4. **Function:** One of the constants for the bezelStyle property. **Notes:** Corners are rounded.
33.59.24 NSTextFieldSquareBezel = 0

MBS MacCocoa Plugin, Plugin Version: 10.4. **Function:** One of the constants for the bezelStyle property. **Notes:** Corners are square.
33.60  control NSTextViewControlMBS

33.60.1  control NSTextViewControlMBS

Function: The Xojo control for a NSTextView.
Notes: This control embeds a special NSTextView subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

33.60.2  Properties

33.60.3  AcceptTabs as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch
to next control.
(Read and Write property)

33.60.4  ScrollView as Variant

Function: The scrollview for this textview.
Notes: (Read only property)

33.60.5  View as NSTextViewMBS

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)
33.60. **CONTROL NSTEXTVIEWCONTROLMBS**

33.60.6 **Events**

33.60.7 **BoundsChanged**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the bounds, but not the frame, changed.

33.60.8 **EnableMenuItems**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event where you can enable menu items.

33.60.9 **FrameChanged**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

33.60.10 **GotFocus**

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus. **Notes:** This only fires if the control itself got focus and not a sub control.

33.60.11 **LostFocus**

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus. **Notes:** This only fires if the control itself lost focus and not a sub control.

33.60.12 **MenuAction(HitItem as MenuItem) As Boolean**

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen. **Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.
33.60.13 **MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean**

**Function:** The mouse button was pressed inside the controls region at the location passed in to x, y.  
**Notes:**  
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.  
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.  
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

33.60.14 **MouseDrag(x as Integer, y as Integer)**

**Function:** This event fires continuously after the mouse button was pressed inside the Control.  
**Notes:**  
Mouse location is local to the control passed in to x, y.  
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

33.60.15 **MouseUp(x as Integer, y as Integer)**

**Function:** The mouse button was released.  
**Notes:** Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

33.60.16 **ScaleFactorChanged(NewFactor as Double)**

**Function:** The backing store scale factor has changed.  
**Notes:** Please invalidate any cached bitmaps or other relevant state.
**33.60.17 shouldChangeTextInRange**

**Function:** Sent when a text view needs to determine if text in a specified range should be changed.

**Notes:**
- `affectedCharRange`: The range of characters to be replaced.
- `replacementString`: The characters that will replace the characters in `affectedCharRange`; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.

**33.60.18 textDidBeginEditing**

**Function:** Informs you that the text object has begun editing (that the user has begun changing it).

**33.60.19 textDidChange**

**Function:** Informs you that the text object has changed its characters or formatting attributes.

**33.60.20 textDidEndEditing**

**Function:** Informs you that the text object has finished editing (that it has resigned first responder status).

**33.60.21 textShouldBeginEditing as boolean**

**Function:** Invoked when a text object begins to change its text, this method requests permission to begin editing.

**Notes:** If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.
33.60.22  **textShouldEndEditing as boolean**

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked from a text object’s implementation of resignFirstResponder, this method requests permission to end editing.  
**Notes:** If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

33.60.23  **textViewDidChangeSelection**

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the selection changes in the text view.
33.61. CLASS NSTEXTVIEWMBS

33.61  class NSTextViewMBS

33.61.1  class NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The cocoa text view class. Notes:

Like the editfield in Realbasic.
Should be placed in a scrollview.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSTextMBS class.

33.61.2  Methods

33.61.3  alignJustified

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Applies full justification to selected paragraphs (or all text, if the receiver is a plain text object).

33.61.4  breakUndoCoalescing

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Informs the receiver that it should begin coalescing successive typing operations in a new undo grouping. Notes: This method should be invoked when saving the receiver’s contents to preserve proper tracking of unsaved changes and the document’s dirty state.

33.61.5  changeAttributes

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Changes the attributes of the current selection. Notes:

This method changes the attributes by invoking convertAttributes: on sender and applying the returned attributes to the appropriate text. See the NSFontManager class reference for more information on attribute conversion.

Available in Mac OS X v10.3 and later.
33.61.6 changeColor

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color of the selected text.

33.61.7 changeDocumentBackgroundColor

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An action method used to set the background color.
**Notes:**
This method gets the new color by sending a color message to sender.
This will only set the background color if allowsDocumentBackgroundColorChangereturns true.

33.61.8 checkTextInDocument

**Notes:** Available in Mac OS X v10.6 and later.

33.61.9 checkTextInSelection

**Notes:** Available in Mac OS X v10.6 and later.

33.61.10 complete

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invokes completion in a text view.
**Notes:** By default invoked using the Escape key, this method provides users with a choice of completions for the word currently being typed. May be invoked programmatically if autocompletion is desired by a client of the text system. You can change the key invoking this method using the text system’s key bindings mechanism; see ”Text System Defaults and Key Bindings” for an explanation of the procedure (on Apple website).
33.61. CLASS NSTEXTVIEWMBS

33.61.11 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text view with size 100/100 and position 0/0

**Example:**

dim t as new NSTextViewMBS

**Notes:** On success the handle property is not zero.

See also:

- 33.61.12 Constructor(Handle as Integer)
- 33.61.13 Constructor(left as Double, top as Double, width as Double, height as Double)

33.61.12 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSTextView handle.

**Example:**

dim t as new NSTextViewMBS(0, 0, 100, 100)
dim v as new NSTextViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)

**Notes:** The handle is casted to a NSTextView and the plugin retains this handle.

See also:

- 33.61.11 Constructor
- 33.61.13 Constructor(left as Double, top as Double, width as Double, height as Double)

33.61.13 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text view with the given size and position.

**Example:**

dim x as new NSTextViewMBS(0, 0, 100, 100)
Notes: On success the handle property is not zero.
See also:

- 33.61.11 Constructor
- 33.61.12 Constructor(Handle as Integer)

### 33.61.14 `didChangeText`

**Function:** Sends out necessary notifications when a text change completes.
**Notes:**
Invoked automatically at the end of a series of changes, this method posts an `NSTextDidChangeNotification` to the default notification center, which also results in the delegate receiving an `NSText` delegate `textDidChange` message.

Subclasses implementing methods that change their text should invoke this method at the end of those methods. See Subclassing `NSTextView` for more information.

### 33.61.15 `insertText(attributedString as NSAttributedStringMBS)`

**Function:** Inserts text into the receiver’s text at the insertion point if there is one, otherwise replacing the selection.
**Example:**

```dim textView as NSTextViewMBS // your view
dim a as new NSMutableAttributedStringMBS
if a.initWithString( "Hello World. This is just a little test." ) then
    Dim NSFont as NSFontMBS = NSFontMBS.fontWithName("Arial", 24.0)
    Dim NSColor as NSColorMBS = NSColorMBS.blueColor
    Dim NSRange as NSRangeMBS = NSMakeRangeMBS( 0, 20)
    Dim NSAttributes as New Dictionary
    NSAttributes.value(NSAtrributedStringMBS.NSFontAttributeName) = NSFont
    NSAttributes.value(NSAtrributedStringMBS.NSForegroundColorAttributeName) = NSColor
    a.addAttributeNSAttributes( NSRange)

textView.insertText a
// replace text with new one:
```
33.61. CLASS NSTEXTVIEWMBS

```
'textView.textStorage.setAttributedString a
end if
```

Notes:

text: The string to insert. Can be either an string or an NSAttributedStringMBS object.

The inserted text is assigned the current typing attributes.

This method is the means by which text typed by the user enters an NSTextView. See the NSInputManager class and NSTextInput protocol specifications for more information.

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.

See also:

- 33.61.16 insertText(text as string)

33.61.16 insertText(text as string)

Function: Inserts text into the receiver’s text at the insertion point if there is one, otherwise replacing the selection.

Notes:

text: The string to insert. Can be either an string or an NSAttributedStringMBS object.

The inserted text is assigned the current typing attributes.

This method is the means by which text typed by the user enters an NSTextView. See the NSInputManager class and NSTextInput protocol specifications for more information.

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.

See also:

- 33.61.15 insertText(attributedString as NSAttributedStringMBS)
33.61.17 invalidateTextContainerOrigin

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates the calculated origin of the text container. 
**Notes:** This method is invoked automatically; you should never need to invoke it directly. Usually called because the text view has been resized or the contents of the text container have changed.

33.61.18 loosenKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Increases the space between glyphs in the receiver’s selection, or in all text if the receiver is a plain text view. 
**Notes:** Kerning values are determined by the point size of the fonts in the selection.

33.61.19 lowerBaseline

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Lowers the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view. 
**Notes:** As such, this method defines a more primitive operation than subscripting.

33.61.20 orderFrontLinkPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Brings forward a panel allowing the user to manipulate links in the text view. 
**Notes:** Available in Mac OS X v10.4 and later.

33.61.21 orderFrontListPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Brings forward a panel allowing the user to manipulate text lists in the text view. 
**Notes:** Available in Mac OS X v10.4 and later.

33.61.22 orderFrontSpacingPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Brings forward a panel allowing the user to manipulate text line heights, interline spacing, and paragraph spacing, in the text view.
33.61. CLASS NSTEXTVIEWMBS

Notes: Available in Mac OS X v10.4 and later.

33.61.23 orderFrontSubstitutionsPanel

33.61.24 orderFrontTablePanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Brings forward a panel allowing the user to manipulate text tables in the text view.

33.61.25 outline

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Adds the outline attribute to the selected text attributes if absent; removes the attribute if present. Notes:

If there is a selection and the first character of the selected range has a non-zero stroke width, or if there is no selection and the typing attributes have a non-zero stroke width, then the stroke width is removed; otherwise the value of NSStrokeWidthAttributeName is set to the default value for outline (3.0).

Operates on the selected range if the receiver contains rich text. For plain text the range is the entire contents of the receiver.

33.61.26 pasteAsPlainText

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Inserts the contents of the pasteboard into the receiver’s text as plain text. Notes: This method behaves analogously to insertText.

33.61.27 pasteAsRichText

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This action method inserts the contents of the pasteboard into the receiver’s text as rich text, maintaining its attributes.
33.61.28 performFindPanelAction(FindAction as Integer)
Example:
const NSFindPanelActionShowFindPanel = 1

dim n as NSTextViewMBS = TextArea1.NSTextViewMBS
n.usesFindPanel = true
n.performFindPanelAction(NSFindPanelActionShowFindPanel)

Notes:
This is the generic action method for the find menu and find panel, and can be overridden to implement a custom find panel.

Possible values:
NSFindPanelActionShowFindPanel = 1
NSFindPanelActionNext = 2
NSFindPanelActionPrevious = 3
NSFindPanelActionReplaceAll = 4
NSFindPanelActionReplace = 5
NSFindPanelActionReplaceAndFind = 6
NSFindPanelActionSetFindString = 7
NSFindPanelActionReplaceAllInSelection = 8
NSFindPanelActionSelectAll = 9
NSFindPanelActionSelectAllInSelection = 10
See also:

• 33.61.29 performFindPanelAction(sender as object)

33.61.29 performFindPanelAction(sender as object)
Notes:
This is the generic action method for the find menu and find panel, and can be overridden to implement a custom find panel.
Sender could be a NSMenuItem or maybe also a NSView.
See also:
33.61. **CLASS NSTEXTVIEWMBS**
- 33.61.28 performFindPanelAction(FindAction as Integer)

### 33.61.30 raiseBaseline

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Raises the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view. **Notes:** As such, this method defines a more primitive operation than superscripting.

### 33.61.31 replaceTextContainer(textContainer as NSTextContainerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the text container for the group of text system objects containing the receiver, keeping the association between the receiver and its layout manager intact. **Notes:** textContainer: The new text container. This method raises NSInvalidArgumentException if TextContainer is nil.

### 33.61.32 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string = "") as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initiates a series of delegate messages (and general notifications) to determine whether modifications can be made to the characters and attributes of the receivers text. **Notes:**
- affectedCharRange: The range of characters affected by the proposed change.
- replacementString: The characters that will replace those in affectedCharRange. If only text attributes are being changed, replacementString is "".

Returns true to allow the change, false to prohibit it.

This method checks with the delegate as needed using textShouldBeginEditing and shouldChangeTextInRange.
This method must be invoked at the start of any sequence of user-initiated editing changes. If your subclass of NSTextView implements methods that modify the text, make sure to invoke this method to determine whether the change should be made. If the change is allowed, complete the change by invoking the didChangeText method.

If the receiver is not editable, this method automatically returns false. This result prevents instances in which a text view could be changed by user actions even though it had been set to be non-editable.
In macOS 10.4 and later, if there are multiple selections, this method acts on the first selected subrange. See also:
33.61.96 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

33.61.33 showFindIndicatorForRange(charRange as NSRangeMBS)

**Function:** Causes a temporary highlighting effect to appear around the visible portion (or portions) of the specified range.
**Notes:**
- charRange: The character range around which indicators appear.

This method supports lozenge-style indication of find results. The indicators automatically disappear after a certain period of time, or when the method is called again, or when any of a number of changes occur to the view (such as changes to text, view size, or view position).

This method does not itself scroll the specified range to be visible; any desired scrolling should be done before this method is called, first, because the method acts only on the visible portion of the specified range, and, second, because scrolling causes the indicators to disappear. Calling this method with a zero-length range always removes any existing indicators.

Available in OS X v10.5 and later.

33.61.34 startSpeaking

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Speaks the selected text, or all text if no selection.

33.61.35 stopSpeaking

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the speaking of text.

33.61.36 tightenKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decreases the space between glyphs in the receiver’s selection, or for all glyphs if the receiver is a plain text view.
33.61.37  **toggleAutomaticDashSubstitution**

**Notes:** Available on Mac OS X 10.6 or newer.

33.61.38  **toggleAutomaticDataDetection**

**Notes:** Available on Mac OS X 10.6 or newer.

33.61.39  **toggleAutomaticLinkDetection**

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the state of automatic link detection from enabled to disabled and vice versa.  
**Notes:**
Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Available in Mac OS X v10.5 and later.

33.61.40  **toggleAutomaticQuoteSubstitution**

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the state of automatic quotation mark substitution from enabled to disabled and vice versa.  
**Notes:**
Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Available in Mac OS X v10.5 and later.
33.61.41  **toggleAutomaticSpellingCorrection**

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles automatic spelling correction. **Notes:** Available on Mac OS X 10.6 or newer.

33.61.42  **toggleAutomaticTextReplacement**

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles automatic text replacements. **Notes:** Available on Mac OS X 10.6 or newer.

33.61.43  **toggleBold**

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles the use of a bold/non-bold font. **Example:**
```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch between bold and non bold
textview.toggleBold
```

**Notes:**
You can set this to continue typing with/without bold or change current selection. Can only provide bold if the font supports it.

33.61.44  **toggleContinuousSpellChecking**

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles whether continuous spell checking is enabled for the receiver.

33.61.45  **toggleGrammarChecking**

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the state of grammar checking from enabled to disabled and vice versa.
33.61.46 toggleItalic

**Function:** Toggles the use of an italic/non-italic font. 
**Example:**

```swift
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch between italic and non italic
textview.toggleItalic
```

**Notes:**

You can set this to continue typing with/without bold or change current selection. 
Can only provide italic if the font supports it.

33.61.47 toggleSmartInsertDelete

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** Changes the state of smart insert and delete from enabled to disabled and vice versa. 
**Notes:**

Controls whether the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation. 

Available in Mac OS X v10.5 and later.

33.61.48 toggleTraditionalCharacterShape

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** Toggles the NSCharacterShapeAttributeName attribute at the current selection.

33.61.49 turnOffKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** Sets the receiver to use nominal glyph spacing for the glyphs in its selection, or for all glyphs if the
receiver is a plain text view.

### 33.61.50 turnOffLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver to use only required ligatures when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it’s a plain text view.

### 33.61.51 updateDragTypeRegistration

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the acceptable drag types of all text views associated with the receiver’s layout manager. **Notes:**

If the receiver is editable and is a rich text view, causes all text views associated with the receiver’s layout manager to register their acceptable drag types. If the text view isn’t editable or isn’t rich text, causes those text views to unregister their dragged types.

Subclasses can override this method to change the conditions for registering and unregistering drag types, whether as a group or individually based on the current state of the text view. They should invoke this method when that state changes to perform the necessary update.

### 33.61.52 updateFontPanel

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the Font panel to contain the font attributes of the selection. **Notes:** Does nothing if the receiver doesn’t use the Font panel. You should never need to invoke this method directly, but you can override it if needed to handle additional font attributes.

### 33.61.53 updateRuler

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the ruler view in the receiver’s enclosing scroll view to reflect the selection’s paragraph and marker attributes. **Notes:** Does nothing if the ruler isn’t visible or if the receiver doesn’t use the ruler. You should never need to invoke this method directly, but you can override this method if needed to handle additional ruler attributes.
### 33.61.54 useAllLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver to use all ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it’s a plain text view.

### 33.61.55 useStandardKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set the receiver to use pair kerning data for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.

### 33.61.56 useStandardLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver to use the standard ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it’s a plain text view.

### 33.61.57 Properties

#### 33.61.58 acceptsGlyphInfo as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver accepts the glyph info attribute. **Notes:** True if the receiver should accept the NSGlyphInfoAttributeName attribute from text input sources such as input methods and the pasteboard, false otherwise. (Read and Write property)

#### 33.61.59 allowsDocumentBackgroundColorChange as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the receiver allows its background color to change. **Notes:** This corresponds to the background color of the entirety of the text view, not just to a selected range of text. (Read and Write property)
33.61.60  allowsImageEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether image attachments should permit editing of their images.
**Notes:**
True if image editing is allowed; otherwise, false.

For image editing to be allowed, the text view must be editable and the text attachment cell must support image editing.

Available in Mac OS X v10.5 and later.
(Read and Write property)

33.61.61  allowsUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether undo support is enabled.
**Notes:** (Read and Write property)

33.61.62  AutomaticDashSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether automatic dash substitution is enabled.
**Notes:**
Turning on automatic dash substitution enables automatic conversion of sequences of ASCII hyphen (-) characters to typographic dashes.
Available in Mac OS X v10.6 and later.
(Read and Write property)

33.61.63  AutomaticDataDetectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether automatic data detection is enabled.
**Notes:**
Automatic data detection enables detection of dates, addresses, and phone numbers.
Available in Mac OS X v10.6 and later.
(Read and Write property)
33.61.64  AutomaticLinkDetectionEnabled as boolean

Notes:
If true, automatic link detection is enabled; if false, it is disabled.
Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.
Available in Mac OS X v10.5 and later.
(Read and Write property)

33.61.65  AutomaticQuoteSubstitutionEnabled as boolean

Notes:
True if automatic quotation mark substitution is enabled; otherwise, false.
Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.
Available in Mac OS X v10.5 and later.
(Read and Write property)

33.61.66  AutomaticSpellingCorrectionEnabled as boolean

Notes:
Available in Mac OS X v10.6 and later.
(Read and Write property)
33.61.67 AutomaticTextReplacementEnabled as boolean

**Function:** Whether automatic text replacement is enabled. 
**Notes:**  
Turning on automatic text replacement enables automatic substitution of a variety of static text items based on user preferences. 
Available in Mac OS X v10.6 and later.  
(Read and Write property)

33.61.68 backgroundColor as NSColorMBS

**Function:** The background color.  
**Notes:** (Read and Write property)

33.61.69 Bold as Boolean

**Function:** Whether the current typing uses a bold font.  
**Example:**
```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch to bold font
textview.Bold = true
```

**Notes:**  
You can set this to continue typing with/without bold or change current selection.  
Can only provide bold if the font supports it.  
(Read and Write property)

33.61.70 ContinuousSpellCheckingEnabled as boolean

**Function:** Whether the receiver has continuous spell checking enabled.  
**Notes:**
True if the receiver has continuous spell checking enabled, otherwise, false.

(Read and Write property)

### 33.61.71 defaultParagraphStyle as Variant

**Function:** Gets or sets the receiver’s default paragraph style.
**Notes:**
Use with NSParagraphStyleMBS class.
(Read and Write property)

### 33.61.72 displaysLinkToolTips as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the text view automatically supplies the destination of a link as a tooltip for text that has a link attribute.
**Notes:**
True if link tooltips are automatically displayed; otherwise, false.

The default value for this feature is true; clients who do not wish tooltips to be displayed automatically must explicitly disable it.

Available in Mac OS X v10.5 and later.
(Read and Write property)

### 33.61.73 enabledTextCheckingTypes as Int64

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default text checking types.
**Notes:**
Available in Mac OS X v10.6 and later.

Can be NSTextCheckingAllSystemTypes (& hffffffff) or NSTextCheckingAllCustomTypes (& hffffffff00000000) or NSTextCheckingAllTypes (& hfffffffffffff).
(Read and Write property)
33.61.74 GrammarCheckingEnabled as boolean

**Function:** Whether or not grammar checking is enabled.
**Notes:**
Available on Mac OS X 10.5 or newer.
If grammar checking is enabled, then it is performed alongside spell checking, whenever the text view checks spelling, whether continuously or manually.
(Read and Write property)

33.61.75 insertionPointColor as NSColorMBS

**Function:** The color used to draw the insertion point.
**Notes:** (Read and Write property)

33.61.76 isCoalescingUndo as boolean

**Function:** Returns whether undo coalescing is in progress.
**Notes:**
True if undo coalescing is in progress, otherwise false.
Available in OS X v10.6 and later.
(Read only property)

33.61.77 Italic as Boolean

**Function:** Whether the current typing uses a italic font.
**Example:**
```/Objective-C
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch to italic font
textview.Italic = true
```
**Notes:**
You can set this to continue typing with/without italic or change current selection.
Can only provide italic if the font supports it.
(Read and Write property)

33.61.78  layoutManager as NSLayoutManagerMBS

Function: Returns the layout manager that lays out text for the receiver’s text container.
Notes:
The layout manager that lays out text for the receiver’s text container, or nil if there’s no such object, such
as when a text view isn’t linked into a group of text objects.
(Read only property)

33.61.79  linkTextAttributes as dictionary

Function: Gets and sets the attributes used to draw the onscreen presentation of link text.
Notes:
A dictionary of attributes corresponding to the onscreen presentation of link text.
Link text attributes are applied as temporary attributes to any text with a link attribute. Candidates include
those attributes that do not affect layout.
In applications created prior to OS X v10.3, the default value is an empty dictionary. In applications created
with OS X v10.3 or greater, the default attributes specify blue text with a single underline and the pointing
hand cursor.
(Read and Write property)

33.61.80  markedTextAttributes as dictionary

Function: Gets or sets the attributes used to draw marked text.
Notes:
A dictionary of attributes used to draw marked text. Text color, background color, and underline are the
only supported attributes for marked text.
(Read and Write property)
33.61.81 RTFData as Memoryblock

Function: Get or set the textview content as RTF data.
Notes:
Works only for Cocoa and uses RTF parser/generator from Apple.
(Read and Write property)

33.61.82 RulerVisible as boolean

Function: Whether the scroll view enclosing the text views sharing the receiver’s layout manager shows its ruler.
Notes:
True if the scroll view enclosing the text views sharing the receiver’s layout manager shows its ruler, false otherwise. The default is false.
(Read and Write property)

33.61.83 selectedTextAttributes as dictionary

Function: Gets or sets the attributes used to indicate the selection.
Example:

```plaintext
// underline selected text in TextArea1

dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim s as NSTextStorageMBS = t.textStorage

dim d as Dictionary = t.selectedTextAttributes
d.Value(NSAttributedStringMBS.NSStrikethroughStyleAttributeName) = s.NSUnderlineStyleSingle

t.selectedTextAttributes = d
```

Notes:
A dictionary of attributes used to indicate the selection. Text color, background color, and underline are the only supported attributes for selected text.
(Read and Write property)
33.61. **CLASS NSTEXTVIEWMBS**

### 33.61.84 smartInsertDeleteEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the view inserts or deletes space around selected words so as to preserve proper spacing and punctuation. **Notes:** (Read and Write property)

### 33.61.85 spellCheckerDocumentTag as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a tag identifying the text view’s text as a document for the spell checker server. **Notes:** The document tag is obtained by sending a uniqueSpellDocumentTag message to the spell server the first time this method is invoked for a particular group of text views. See the NSSpellChecker and NSSpellServer class specifications for more information on how this tag is used. (Read only property)

### 33.61.86 textContainer as NSTextContainerMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text container. **Notes:** The receiver uses the layout manager and text storage of aTextContainer. **Special Considerations** This method is invoked automatically when you create a text view; you should never invoke it directly, but might want to override it. To change the text view for an established group of text system objects, use TextView setter on the text container. To replace the text container for a text view and maintain the view’s association with the existing layout manager and text storage, use replaceTextContainer. (Read and Write property)

### 33.61.87 textContainerInset as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The empty space the receiver leaves around its text container. **Example:**

```
dim n as NSTextViewMBS = TextArea1.NSTextViewMBS
n.textContainerInset = NSMakeSizeMBS(-3,0)
```
Notes:
It is possible to set the text container and view sizes and resizing behavior so that the inset cannot be maintained exactly, although the text system tries to maintain the inset wherever possible. In any case, the textContainerOrigin and size of the text container are authoritative as to the location of the text container within the view.

The text itself can have an additional inset, inside the text container, specified by the setLineFragmentPadding method of NSTextContainer.
(Read and Write property)

33.61.88 textContainerOrigin as NSPointMBS

Function: Returns the origin of the receiver’s text container.
Notes:
The origin of the receiver’s text container, which is calculated from the receiver’s bounds rectangle, container inset, and the container’s used rect.
(Read only property)

33.61.89 textStorage as NSTextStorageMBS

Function: Returns the receiver’s text storage object.
Example:
// load rtfd file into textarea
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
  t.textStorage.setAttributedString(n)

Notes: (Read only property)
33.61.90 typingAttributes as dictionary

**Function:** Get or set typing attributes.  
**Notes:**  
Typing attributes are reset automatically whenever the selection changes. However, if you add any user actions that change text attributes, the action should use this method to apply those attributes afterwards. User actions that change attributes should always set the typing attributes because there might not be a subsequent change in selection before the next typing.  
(Read and Write property)

33.61.91 usesFindPanel as boolean

**Function:** Whether the receiver allows for a find panel.  
**Notes:** (Read and Write property)

33.61.92 usesFontPanel as boolean

**Function:** Controls whether the text views sharing the receiver’s layout manager use the Font panel and Font menu.  
**Notes:** (Read and Write property)

33.61.93 usesInspectorBar as Boolean

**Function:** Whether this text view uses the inspector bar.  
**Example:**

```vbnet
dim t as NSTextViewMBS = textarea1.NSTextViewMBS  
t.usesInspectorBar = true
```

**Notes:**  
Available in OS X v10.7 and later.  
(Read and Write property)
33.61.94 usesRuler as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the text views sharing the receiver’s layout manager use a ruler.

**Notes:**

True to cause text views sharing the receiver’s layout manager to respond to NSRulerView client messages and to paragraph-related menu actions, and update the ruler (when visible) as the selection changes with its paragraph and tab attributes, otherwise false.

Text views must use a ruler to respond to Format menu commands. If a set of text views don’t use the ruler, the ruler is hidden, and the text views disallow paragraph attribute changes. By default, text view objects use the ruler.

(Read and Write property)

33.61.95 Events

33.61.96 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a text view needs to determine if text in a specified range should be changed.

**Notes:**

affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.

See also:

• 33.61.32 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string = "") as Boolean

33.61.97 textViewDidChangeSelection

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the selection changes in the text view.
33.61. CLASS NSTEXTVIEWMBS

33.61.98 Constants

33.61.99 NSFindPanelSubstringMatchTypeContains=0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the type of substring matching used by the Find panel.

**Notes:**
Finds a word containing the search string.
Available in Mac OS X v10.5 and later.

33.61.100 NSFindPanelSubstringMatchTypeEndsWith=3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the type of substring matching used by the Find panel.

**Notes:**
Finds a word ending with the search string.
Available in Mac OS X v10.5 and later.

33.61.101 NSFindPanelSubstringMatchTypeFullWord=2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the type of substring matching used by the Find panel.

**Notes:**
Finds a word exactly matching the search string.
Available in Mac OS X v10.5 and later.

33.61.102 NSFindPanelSubstringMatchTypeStartsWith=1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the type of substring matching used by the Find panel.

**Notes:**
Finds a word starting with the search string.
Available in Mac OS X v10.5 and later.
33.61.103  **NSSelectByCharacter=0**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify how much the text view extends the selection when the user drags the mouse.  
**Notes:** Extends the selection character by character.

33.61.104  **NSSelectByParagraph=2**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify how much the text view extends the selection when the user drags the mouse.  
**Notes:** Extends the selection paragraph by paragraph.

33.61.105  **NSSelectByWord=1**

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify how much the text view extends the selection when the user drags the mouse.  
**Notes:** Extends the selection word by word.
33.61. NSSelectionAffinityDownstream=1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the preferred direction of selection.
**Notes:** The selection is moving toward the bottom of the document.

33.61.107 NSSelectionAffinityUpstream=0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the preferred direction of selection.
**Notes:** The selection is moving toward the top of the document.
33.62 control NSTokenFieldControlMBS

33.62.1 control NSTokenFieldControlMBS

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control to host a NSTokenField.

33.62.2 Properties

33.62.3 View as NSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used for the control.
Notes: (Read only property)

33.62.4 Events

33.62.5 BoundsChanged

Function: The event called when the bounds, but not the frame, changed.

33.62.6 completionsForSubstring(substring as string, tokenIndex as Integer, byref selectedIndex as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
Notes:
substring: The partial string that is to be completed.
tokenIndex: The index of the token being edited.
selectedIndex: Optionally, you can return by-reference an index into the returned array that specifies which of the completions should be initially selected. If none are to be selected, return by reference -1.

Returns an array of strings that are possible completions.

If the delegate does not implement this method, no completions are provided.
Available in OS X v10.4 and later.
33.62.7  **displayStringForRepresentedObject(representedObject as Variant) as string**

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Allows the delegate to provide a string to be displayed as a proxy for the given represented object.  
**Notes:**

representedObject: A represented object of the token field.

Returns the string to be used as a proxy for representedObject. If you return nil or do not implement this method, then representedObject is displayed as the string.

33.62.8  **editingStringForRepresentedObject(representedObject as Variant) as string**

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Allows the delegate to provide a string to be edited as a proxy for a represented object.  
**Notes:**

representedObject: A represented object of the token field.

Returns a string that’s an editable proxy of the represented object, or nil if the token should not be editable.

33.62.9  **EnableMenuItems**

**Function:** The event where you can enable menu items.

33.62.10  **FrameChanged**

**Function:** The event called when the frame changed.

33.62.11  **GotFocus**

**Function:** The control itself got focus.
CHAPTER 33. COCOA CONTROLS

Notes: This only fires if the control itself got focus and not a sub control.

33.62.12 hasMenuForRepresentedObject(representedObject as Variant) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to specify whether the given represented object provides a menu.
Notes:

representedObject: A represented object of the token field.

Returns true if the represented object has a menu, false otherwise.
By default tokens in a token field have no menus.

33.62.13 LostFocus

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

33.62.14 MenuAction(HitItem as MenuItem) As Boolean

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

33.62.15 menuForRepresentedObject(representedObject as Variant) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide a menu for the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the menu associated with the represented object.
By default tokens in a token field do not return menus.
33.62.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes:
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

• The Action event, if any, will not execute and the state of the object will not change.
• You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

33.62.17 MouseDrag(x as Integer, y as Integer)

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

33.62.18 MouseUp(x as Integer, y as Integer)

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

33.62.19 readFromPasteboard(pboard as NSPasteboardMBS) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
Notes:
pboard: The pasteboard from which to read the represented objects.
Returns an array of represented objects created from the pasteboard data.

**33.62.20**  
representedObjectForEditingString(editingString as string) as Variant

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Allows the delegate to provide a represented object for the given editing string.  
**Notes:**  
editingString: The edited string representation of a represented object.  
Returns a represented object that is displayed rather than the editing string.  

Note: In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

**33.62.21**  
ScaleFactorChanged(NewFactor as Double)

**Function:** The backing store scale factor has changed.  
**Notes:** Please invalidate any cached bitmaps or other relevant state.

**33.62.22**  
shouldAddObjects(tokens() as Variant, index as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Allows to validate the tokens to be added to the receiver at a particular location.  
**Notes:**  
tokens: An array of tokens to be inserted in the receiver at index.  
index: The index of the receiver in which the array of tokens to be validated (tokens) will be inserted.  
Returns an array of validated tokens.  

The event can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning nil causes an error.
### 33.62.23 `styleForRepresentedObject(representedObject as Variant) as Integer`

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Allows the delegate to return the token style for editing the specified represented object.

**Notes:**
- `representedObject`: A represented object of the token field.

Returns the style that should be used to display the `representedObject`. Possible values are shown in `NSTokenStyle` Values.

If the event implements this method and returns an `NSTokenStyle` that differs from the style set by `setTokenStyle:`, the value the event returns is preferred.

If you don’t implement this method, the token field’s `tokenStyle` is used.

### 33.62.24 `TextDidBeginEditing(fieldEditor as NSTextMBS, notification asNSNotificationMBS)`

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Sent when a control with editable text begins an editing session.

**Notes:**
- `Notification`: The notification object. The name of the notification is always `NSControlTextDidBeginEditingNotification`.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a `NSControlTextDidBeginEditingNotification` notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See `TextDidEndEditing` for an explanation of why you may not always get one invocation of `TextDidBeginEditing` for each invocation of `TextDidEndEditing`.

### 33.62.25 `TextDidChange(fieldEditor as NSTextMBS, notification as NotificationMBS)`

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Sent when the text in the receiving control changes.

**Notes:**
- `Notification`: The notification object. The name of the notification is always `NSControlTextDidChangeNotification`.

This event is invoked when the user edits text in a control such as a text field or a form field. The control posts a `NSControlTextDidChangeNotification` notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.
This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

33.62.26 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when a control with editable text ends an editing session.
Notes:
Notification: The notification object. The name of the notification is always NSControlTextDidEndEditing-Notification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control’s subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing: notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

33.62.27 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes:
Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

33.62.28 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes:
Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

### 33.62.29 tokenFieldAction

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** The control’s action was triggered.

**Notes:** For a button if it was pressed.
