MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a Facebook album that is visible in Aperture.

115.1.9  MLApertureFacebookGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a Facebook user account in Aperture. A Facebook user account contains one or more Facebook albums.

115.1.10  MLApertureFacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a Faces album in Aperture. Individual Faces albums are nested in the main Faces album.

115.1.11  MLApertureFlaggedTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** The media group that represents the album of flagged media in Aperture.

115.1.12  MLApertureFlickrAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a Flickr album that is visible in Aperture.

115.1.13  MLApertureFlickrGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a Flickr user account in Aperture. A Flickr user account contains
one or more Flickr albums.

115.1.14 MLApertureFolderAlbumTypeIdentifier as String

115.1.15 MLApertureLastImportAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the Aperture media source. Notes: The media group that represents the last import album in Aperture.

115.1.16 MLApertureLastNMonthsAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the Aperture media source. Notes: The media group that represents the recent content album in Aperture, known as the Last N Months album. The value for N is usually 12 (settable in Aperture >Preferences >General).

115.1.17 MLApertureLastViewedEventAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the Aperture media source. Notes: The media group that represents the last viewed event in Aperture.

115.1.18 MLApertureLightTableTypeIdentifier as String

115.1.19  MLAperturePhotoStreamAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a photo stream in Aperture.

115.1.20  MLAperturePlacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** The media group that represents the Places album in Aperture.

115.1.21  MLAperturePlacesCityAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a Places album for a city in Aperture. A city album is nested in a province or state album.

115.1.22  MLAperturePlacesCountryAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a Places album for a country in Aperture. A country album is nested in the main Places album.

115.1.23  MLAperturePlacesPointOfInterestAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a Places album for a point-of-interest in Aperture. A point of interest album is nested in a city album.

115.1.24  MLAperturePlacesProvinceAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Places album for a province or state in Aperture. A province or state album is nested in a country album.

### 115.1.25 MLAperatureProjectAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a project in Aperture.

### 115.1.26 MLAperatureProjectFolderAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a folder within a project in Aperture.

### 115.1.27 MLAperatureRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** The root media group for Aperture.

### 115.1.28 MLAperatureSlideShowTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** The media group that represents a slideshow in Aperture.

### 115.1.29 MLAperatureSmugMugAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a SmugMug album that is visible in Aperture.
115.1.30  MLApertureSmugMugGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a SmugMug user account in Aperture. A SmugMug user account contains one or more SmugMug albums.

115.1.31  MLApertureUserAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a user-created album in Aperture.

115.1.32  MLApertureUserSmartAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Aperture media source. **Notes:** A media group that represents a user-created smart album in Aperture.

115.1.33  MLFinalCutEventCalendarGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Final Cut Pro media source. **Notes:** A media group that represents a collection of events from a specific time period in Final Cut Pro.

115.1.34  MLFinalCutEventGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Final Cut Pro media source. **Notes:** A media group that represents an event in Final Cut Pro.

115.1.35  MLFinalCutEventLibraryGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Final Cut Pro media source. **Notes:** The media group that represents the event library in Final Cut Pro. The event library contains all event calendar groups.
115.1.36 **MLFinalCutFolderGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Final Cut Pro media source. **Notes:** A media group that represents a folder in Final Cut Pro.

115.1.37 **MLFinalCutProjectGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Final Cut Pro media source. **Notes:** A media group that represents a project in Final Cut Pro.

115.1.38 **MLFinalCutRootGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Final Cut Pro media source. **Notes:** The root media group for Final Cut Pro.

115.1.39 **MLFolderGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in folder-based media sources. **Notes:** A media group that represents a folder in folder-based media.

115.1.40 **MLFolderRootGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in folder-based media sources. **Notes:** The root media group for folder-based media.

115.1.41 **MLGarageBandFolderGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the GarageBand media source. **Notes:** A media group that represents a folder in GarageBand.
115.1.42  MLGarageBandRootGroupTypeIdentifier as String

115.1.43  MLIMovieEventCalendarGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iMovie media source. Notes: A media group that represents a collection of events from a specific time period in iMovie.

115.1.44  MLI.MovieEventGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iMovie media source. Notes: A media group that represents an event in iMovie.

115.1.45  MLI.MovieEventLibraryGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iMovie media source. Notes: The media group that represents the event library in iMovie. The event library contains all event calendar groups.

115.1.46  MLI.MovieFolderGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iMovie media source. Notes: A media group that represents a folder in iMovie.

115.1.47  MLI.MovieProjectGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iMovie media source. Notes: A media group that represents a project in iMovie.
115.1.48  MLI.MovieRootGroupTypeIdentifier as String

115.1.49  MLI.PhotoAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iPhoto media source. Notes: A media group that represents an album in iPhoto.

115.1.50  MLI.PhotoEventAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iPhoto media source. Notes: A media group that represents an event in iPhoto.

115.1.51  MLI.PhotoEventsFolderTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iPhoto media source. Notes: The media group that represents the Events album in iPhoto.

115.1.52  MLI.PhotoFacebookAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iPhoto media source. Notes: A media group that represents a Facebook album that is visible in iPhoto.

115.1.53  MLI.PhotoFacebookGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iPhoto media source. Notes: A media group that represents a Facebook user account in iPhoto. A Facebook user account contains one or more Facebook albums.
115.1.54 **MLiPhotoFacesAlbumTypeIdentifier** as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a Faces album in iPhoto. Individual Faces albums are nested in the main Faces album.

115.1.55 **MLiPhotoFlaggedAlbumTypeIdentifier** as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** The media group that represents the album of flagged media in iPhoto.

115.1.56 **MLiPhotoFlickrAlbumTypeIdentifier** as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a Flickr album that is visible in iPhoto.

115.1.57 **MLiPhotoFlickrGroupTypeIdentifier** as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a Flickr user account in iPhoto. A Flickr user account contains one or more Flickr albums.

115.1.58 **MLiPhotoFolderAlbumTypeIdentifier** as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a folder in iPhoto.

115.1.59 **MLiPhotoLastImportAlbumTypeIdentifier** as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** The media group that represents the Last Import album in iPhoto.
115.1.60  MLiPhotoLastNMonthsAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** The media group that represents the recent content album in iPhoto, known as the Last N Months album. The value for N is usually 12 (settable in iPhoto > Preferences > General).

115.1.61  MLiPhotoLastViewedEventAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** The media group that represents the last viewed event in iPhoto.

115.1.62  MLiPhotoLibraryAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** The media group that represents the Photos album in iPhoto.

115.1.63  MLiPhotoPhotoStreamAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a photo stream in iPhoto.

115.1.64  MLiPhotoPlacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** The media group that represents the Places album in iPhoto.

115.1.65  MLiPhotoPlacesCityAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a Places album for a city in iPhoto. A city album is nested in a province or state album.
115.1. CLASS MLMEDIAGROUPMBS

115.1.66  MLIPhotoPlacesCountryAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a Places album for a country in iPhoto. A country album is nested in the main Places album.

115.1.67  MLIPhotoPlacesPointOfInterestAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a Places album for a point-of-interest in iPhoto. A point of interest album is nested in a city album.

115.1.68  MLIPhotoPlacesProvinceAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a Places album for a province or state in iPhoto. A province or state album is nested in a country album.

115.1.69  MLIPhotoRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** The root media group for iPhoto.

115.1.70  MLIPhotoSlideShowAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source. **Notes:** A media group that represents a slideshow album in iPhoto.

115.1.71  MLIPhotoSmartAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a smart album in iPhoto.

115.1.72  MLiPhotoSubscribedAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iPhoto media source. Notes: A media group that represents a subscribed album in iPhoto.

115.1.73  MLiTunesAudioBooksPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source. Notes: The media group that represents the Audio Books playlist in iTunes.

115.1.74  MLiTunesFolderPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source. Notes: A media group that represents a folder in iTunes.

115.1.75  MLiTunesGeniusPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source. Notes: A media group that represents a genius playlist in iTunes.

115.1.76  MLiTunesiTunesUPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source. Notes: The media group that represents the iTunes U playlist in iTunes.

115.1.77  MLiTunesMoviesPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source.
115.1. CLASS MLMEDIAGROUPMBS

Notes: The media group that represents the Movies playlist in iTunes.

115.1.78 MLiTunesMusicPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source. Notes: The media group that represents the Music playlist in iTunes.

115.1.79 MLiTunesMusicVideosPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the Logic media source. Notes: Music videos playlist

115.1.80 MLiTunesPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source. Notes: A media group that represents a user-created playlist in iTunes.

115.1.81 MLiTunesPodcastPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source. Notes: The media group that represents the Podcast playlist in iTunes.

115.1.82 MLiTunesPurchasedPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source. Notes: The media group that represents the Purchased playlist in iTunes.

115.1.83 MLiTunesRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the iTunes media source.
115.84  **MLiTunesSavedGeniusPlaylistTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iTunes media source. **Notes:** A media group that represents a saved genius playlist in iTunes.

115.85  **MLiTunesSmartPlaylistTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iTunes media source. **Notes:** A media group that represents a smart playlist in iTunes.

115.86  **MLiTunesTVShowsPlaylistTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the iTunes media source. **Notes:** The media group that represents the TV Shows playlist in iTunes.

115.87  **MLiTunesVideoPlaylistTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Logic media source. **Notes:** Video Playlist

115.88  **MLLogicBouncesGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Logic media source. **Notes:** The media group that represents all bounces in Logic.

115.89  **MLLogicProjectsGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Logic media source.
115.1. CLASS MLMEDIAGROUPMBS

Notes: The media group that represents all projects in Logic.

115.1.90  MLLogicProjectTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the Logic media source. Notes: A media group that represents a project in Logic. Projects may be nested.

115.1.91  MLLogicRootGroupTypeIdentifier as String

115.1.92  MLPhotosAlbumsGroupTypeIdentifier as String

115.1.93  MLPhotosAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for media group types in the Photos media source. Notes: A media group that represents an album in Photos.

115.1.94  MLPhotosAllCollectionsGroupTypeIdentifier as String

115.1.95  MLPhotosAllMomentsGroupTypeIdentifier as String

115.1.96  **MLPhotosAllPhotosAlbumTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.97  **MLPhotosAllYearsGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.98  **MLPhotosAnimatedGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.99  **MLPhotosBurstGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.100  **MLPhotosCollectionGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.101  **MLPhotosDepthEffectGroupTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.102  **MLPhotosFacesAlbumTypeIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.
115.1.103 MLPhotosFavoritesGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.104 MLPhotosFolderTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.105 MLPhotosFrontCameraGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.106 MLPhotosLastImportGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.107 MLPhotosLivePhotosGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.108 MLPhotosLongExposureGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.109 MLPhotosMomentGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.
115.1.110 MLPhotosMyPhotoStreamTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.111 MLPhotosPanoramasGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.112 MLPhotosPublishedAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.113 MLPhotosRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.
**Notes:** The root media group for Photos.

115.1.114 MLPhotosScreenshotGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.115 MLPhotosSharedGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.116 MLPhotosSharedPhotoStreamTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.
115.1.117  MLPhotosSloMoGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

Notes: A media group that represents a slo-mo type in Photos.

115.1.118  MLPhotosSmartAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

Notes: A media group that represents a smart album in Photos.

115.1.119  MLPhotosTimelapseGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.120  MLPhotosVideosGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.121  MLPhotosYearGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for media group types in the Photos media source.

115.1.122  Properties

115.1.123  Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Internet object reference.

Notes: (Read and Write property)
115.1.124  IconImage as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The media groups icon. Notes: (Read only property)

115.1.125  Identifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: An identifier for the media group. Notes: Each groups identifier is unique within a media source. (Read only property)

115.1.126  MediaLibrary as MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A pointer to the media library instance that loaded the media groups source. Notes: (Read only property)

115.1.127  MediaSourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: An identifier for the source that loaded the media group. Notes: (Read only property)

115.1.128  ModificationDate as Date

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The date and time when the media group was last altered. Notes: (Read only property)

115.1.129  Name as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The name of the media group. Notes:
This string is human-readable. It is either user created (such as the name of an iTunes playlist) or already localized.
(Read only property)

115.1.130 Parent as MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The media groups parent group.
**Notes:** (Read only property)

115.1.131 Properties as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A dictionary of attributes describing the media group.
**Notes:**
These attributes are usually defined by the source app, such as iTunes. For example, an iTunes playlist is represented as a group. iTunes attaches attributes such as "Playlist Persistent ID" to the group in its attributes. The attribute names vary based on the media source. Attributes common to all sources are called out as separate properties.
(Read only property)

115.1.132 TypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An identifier for the media groups type.
**Notes:**
Multiple groups within a media source can have the same type identifier. For descriptions of group type identifiers, see MediaLibrary Constants.
(Read only property)

115.1.133 URL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The location of the media group.
**Notes:**
Some groups do not have a URL, in which case this returns nil. For example, a group that represents a filesystem folder on disk has a URL, but a group that represents a named face in iPhoto does not.
(Read only property)
115.2. **CLASS MLMEDIALIBRARYMBS**

### 115.2 class MLMediaLibraryMBS

**Function:** The MLMediaLibrary class provides an interface for accessing a collection of media objects from various sources.

**Notes:**

It serves as the initial access point of the Media Library framework.

The media library structure is defined by MLMediaSource, MLMediaGroup, and MLMediaObject classes. At the highest level, all content within a media library instance is categorized by media source. Conceptually, a media source represents a single app, such as iTunes or Aperture. Each source contains a hierarchy of media groups that originates from a root group. These groups consist of media objects—individual files containing a piece of media such as a photo, song, or movie. Only one copy of each object exists within a media library instance, but an object can be referenced by multiple groups from a single source. The structure of the group hierarchy is specific to each media source.

A media library is initialized using the Constructor. The options argument to this method serves as a filter. By specifying which folders or sources to include or exclude during load, you can view a particular subset of groups and objects from your collection. All objects provided are thread-safe. For descriptions of possible load options, see Load Options Keys.

The typical and most efficient use case is to create and use one instance of MLMediaLibrary for the lifetime of an app. When the underlying media files and metadata on the user’s system change, the corresponding data model objects (media groups and media objects) are automatically updated and KVO notifications are sent to notify the calling code of any changes. Multiple instances of MLMediaLibrary can be created and used, but their sources, groups, and objects will be independent of those provided by other instances of MLMediaLibrary.

### 115.2.2 Methods

### 115.2.3 Available as Boolean

**Function:** Whether this class available.

**Notes:** Returns true on Mac OS 10.7 or newer in 64-bit app.

### 115.2.4 Constructor(options as Dictionary)

**Function:** Initializes the media library based on the specified load options.
Notes:

options: A dictionary of load options.

Returns a new media library.

For descriptions of possible load options, see Load Options Keys.

115.2.5  MLMediaLoadAppFoldersKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the option keys. Notes: Specifies one or more relative paths inside the callers app bundle in which to search for media files. The value for this key is an array of strings (relative paths inside the callers app bundle).

115.2.6  MLMediaLoadAppleLoops as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the identifiers for well-known media folders used to specify the value for MLMediaLoadFoldersKey. Notes: Identifies the folder containing audio loops from Apple.

115.2.7  MLMediaLoadExcludeSourcesKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the option keys. Notes: Defines which media sources to exclude when loading. This option is processed after MLMediaLoadIncludeSourcesKey. The value for this key is an array of strings (media source identifiers). For a list of valid media source identifiers, see Media Source Identifiers.

115.2.8  MLMediaLoadFoldersKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the option keys. Notes: Specifies the well-known folders that should be searched for media files. If this key is not present, none of the well-known folders will be provided. The value for this key is an array of strings (identifiers that correspond to well-known folder locations). For a list of well-known folder identifiers, see MLMediaLoadMoviesFolder and MLMediaLoadAppleLoops.
115.2. CLASS MLMEDIALIBRARYMBS

115.2.9  MLMediaLoadIncludeSourcesKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys. **Notes:** Defines which media sources to include when loading. If not present, load all available media sources. This option is processed after MLMediaLoadSourceTypesKey. If MLMediaLoadIncludeSourcesKey is present but MLMediaLoadSourceTypesKey is not, then only those sources specified here will be loaded. This is useful for loading a single media source. When both keys are present, this is useful for adding one or more media sources that normally would not appear for the requested library type. The value for this key is an array of strings (media source identifiers). For a list of valid media source identifiers, see Media Source Identifiers.

115.2.10  MLMediaLoadMoviesFolder as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the identifiers for well-known media folders used to specify the value for MLMediaLoadFoldersKey. **Notes:** Identifies the users Movies folder.

115.2.11  MLMediaLoadSourceTypesKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys. **Notes:** Defines which sources to load based on library type. If not present, this will load all sources. The value for this key is a media source type.

115.2.12  Properties

115.2.13  Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Internet object reference. **Notes:** (Read and Write property)

115.2.14  mediaSources as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary of media sources by identifier. **Notes:**
Returns nil the first time, beginning an asynchronous load of the media sources. A KVO notification is sent when all media sources have been loaded. If there are no objects in a media source, the source does not appear in this dictionary.
(Read only property)
115.3.  CLASS MLMEDIAOBJECTMBS

115.3  class MLMediaObjectMBS

115.3.1  class MLMediaObjectMBS

Function: The MLMediaObject class describes a single media file, such as a photo, song, or movie.
Notes:
Each media object contains basic metadata including a name, media type, URL, and so on. Additional
information about each object is stored in its list of attributes. For a list of possible object attribute keys,
see Media Object Attribute Keys.

A media object belongs to a single media source but can be referenced by several groups within that source.
In other words, an object can appear in multiple places in the group hierarchy under a single media source.
In iTunes, a movie that was purchased through the iTunes Store is referenced by both the Purchased playlist
and the Movies playlist. If a user adds the movie to his own playlist, the group representing that playlist
will also reference the movie. All three groups reference the same media object.

All MLMediaObject properties are read-only, so this information can be accessed but not altered.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

115.3.2  Methods

115.3.3  Constructor

115.3.4  MLMediaObjectAlbumKey as String

Notes: Specifies the media objects album. The value for this key is a string.

115.3.5  MLMediaObjectArtistKey as String

Notes: Specifies the media objects artist. The value for this key is a string.
115.3.6 MLMediaObjectBitRateKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a media object. **Notes:** Specifies the media objects bit rate, in kilobits per second. The value for this key is a number.

115.3.7 MLMediaObjectChannelCountKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a media object. **Notes:** Specifies the media objects channel count. The value for this key is a number.

115.3.8 MLMediaObjectCommentsKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a media object. **Notes:** Specifies the contents of the comments field associated with the media object. The value for this key is a string.

115.3.9 MLMediaObjectDurationKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a media object. **Notes:** Specifies the media objects duration, in seconds. The value for this key is a number.

115.3.10 MLMediaObjectGenreKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a media object. **Notes:** Specifies the media objects genre. The value for this key is a string.

115.3.11 MLMediaObjectKeywordsKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a media object. **Notes:** Specifies the keywords associated with the media object. The value for this key is an array of strings.
115.3.12 MLMediaObjectKindKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the property keys for a media object. Notes: Used by iTunes only. Specifies the media objects file format (shown in the Kind column in iTunes). The value for this key is a string.

115.3.13 MLMediaObjectProtectedKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the property keys for a media object. Notes: Specifies whether the media object is protected by DRM (Digital Rights Management). The value for this key is a boolean value.

115.3.14 MLMediaObjectResolutionStringKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the property keys for a media object. Notes: Specifies the media objects resolution. The value for this key is a string with size.

115.3.15 MLMediaObjectSampleRateKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the property keys for a media object. Notes: Specifies the media objects sample rate, in samples per second (Hz). The value for this key is a number.

115.3.16 MLMediaObjectTrackNumberKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the property keys for a media object. Notes: Specifies the media objects track number. The value for this key is a number.
115.3.17 Properties

115.3.18 ArtworkImage as NSImageMBS

**Function:** Album artwork associated with the media object.
**Notes:**
Applies to iTunes media only. Returns nil if not applicable or not available.
(Read only property)

115.3.19 ContentType as String

**Function:** The UTI associated with the media object.
**Notes:** (Read only property)

115.3.20 File as FolderItem

**Function:** The location of the media object.
**Notes:**
For your convenience, the plugin provides here a folderitem for the URL.
(Read only property)

115.3.21 FileSize as UInt64

**Function:** The size, in bytes, of the media object.
**Notes:** (Read only property)

115.3.22 Handle as Integer

**Function:** Internet object reference.
**Notes:** (Read and Write property)
115.3. **CLASS MLMEDIAOBJECTMBS**

115.3.23 **Identifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An identifier for the media object. **Notes:** Each object's identifier is unique within a media source. (Read only property)

115.3.24 **MediaLibrary as MLMediaLibraryMBS**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A pointer to the media library instance that loaded the media object's source. **Notes:** (Read only property)

115.3.25 **MediaSourceIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An identifier for the source that loaded the media object. **Notes:** For a list of possible media source identifiers, see MLMediaLibraryMBS. (Read only property)

115.3.26 **MediaType as Integer**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The media object's type of media (image, audio, or movie). **Notes:** For a list of possible media types, see kType* constants. (Read only property)

115.3.27 **ModificationDate as Date**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The date and time when the media object was last altered. **Notes:** (Read only property)
115.3.28 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the media object.  
**Notes:** (Read only property)

115.3.29 OriginalFile as FolderItem

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The location of the original media object, if URL is not the original (master).  
**Notes:**  
For your convenience, the plugin provides here a folderitem for the URL.  
(Read only property)

115.3.30 OriginalURL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The location of the original media object, if URL is not the original (master).  
**Notes:**  
This property is provided as a security-scoped URL. In order to gain access to the file that this URL refers to, the caller must call startAccessingSecurityScopedResource before and stopAccessingSecurityScopedResource after using the URL to access the file. For more information about security-scoped URLs, see NSURL.  
(Read only property)

115.3.31 Properties as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A dictionary of attributes describing the media object.  
**Notes:**  
For a list of possible object attribute keys, see Media Object Attribute Keys.  
(Read only property)

115.3.32 ThumbnailFile as FolderItem

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The location of the media objects thumbnail image.  
**Notes:**
For your convenience, the plugin provides here a folderitem for the URL. (Read only property)

115.3.33 **ThumbnailURL as String**

*Function:* The location of the media objects thumbnail image.  
*Notes:* This property is provided as a security-scoped URL. In order to gain access to the file that this URL refers to, the caller must call startAccessingSecurityScopedResource before and stopAccessingSecurityScopedResource after using the URL to access the file. For more information about security-scoped URLs, see NSURL. (Read only property)

115.3.34 **URL as String**

*Function:* The location of the media object.  
*Notes:* This property is provided as a security-scoped URL. In order to gain access to the file that this URL refers to, the caller must call startAccessingSecurityScopedResource before and stopAccessingSecurityScopedResource after using the URL to access the file. For more information about security-scoped URLs, see NSURL. (Read only property)

115.3.35 **Constants**

115.3.36 **kTypeAudio = 1**

MBS Mac64bit Plugin, Plugin Version: 18.2.  
*Function:* One of the types.  
*Notes:* Audio

115.3.37 **kTypeImage = 2**

MBS Mac64bit Plugin, Plugin Version: 18.2.  
*Function:* One of the types.  
*Notes:* Image
115.3.38  kTypeMovie = 4

MBS Mac64bit Plugin, Plugin Version: 18.2. **Function:** One of the types.  
**Notes:** Movie
115.4  class MLMediaSourceMBS

115.4.1  class MLMediaSourceMBS

Notes:
Conceptually, a media source represents a single app, such as iTunes or Aperture. Each media source contains multiple groups of media objects—individual files containing a piece of media such as a photo, song, or movie.

The structure of the group hierarchy is specific to each media source, but all sources have certain commonalities. For example, every source has a single root media group, which contains all groups and objects within that source. It is the highest-level parent group in the hierarchy and each of its descendant groups contains its own subgroups and their objects. All groups have a reference to their parent within the hierarchy. A group with no descendants contains only its own objects. If a media group does not contain any objects, it is not visible in the hierarchy.

Every media source has a unique media source identifier within a single media library instance. For a list of possible media source identifiers, see Media Source Identifiers.

All MLMediaSourceMBS properties are read-only, so this information can be accessed but not altered. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

115.4.2  Methods

115.4.3  Constructor

115.4.4  mediaGroupForIdentifier(mediaGroupIdentifier as string) as MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the media group with the specified identifier.

Notes:
mediaGroupIdentifier: The media group identifier to search for in the source.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.
115.4.5 mediaGroupsForIdentifiers(mediaGroupIdentifiers() as string) as Dictionary

Function: Returns the media groups with the specified identifiers.
Notes:
mediaGroupIdentifiers: An array of media group identifiers to search for in the source.

Returns a dictionary of media groups matching the specified identifiers.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

115.4.6 mediaObjectForIdentifier(mediaObjectIdentifier as string) as MLMediaObjectMBS

Function: Returns the media object with the specified identifier.
Notes:
mediaObjectIdentifier: The media object identifier to search for in the media source.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

115.4.7 mediaObjectsForIdentifiers(mediaObjectIdentifiers() as string) as Dictionary

Function: Returns the media objects with the specified identifiers.
Notes:
mediaObjectIdentifiers: An array of media object identifiers to search for in the source.

Returns a dictionary of media objects matching the specified identifiers.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.
115.4.8  **MLMediaSourceApertureIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from Aperture.

115.4.9  **MLMediaSourceAppDefinedFoldersIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from app defined folder.

115.4.10 **MLMediaSourceCustomFoldersIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from a custom folder.

115.4.11 **MLMediaSourceFinalCutIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from Final Cut Pro.

115.4.12 **MLMediaSourceGarageBandIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from GarageBand.

115.4.13 **MLMediaSourceiMovieIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from iMovie.

115.4.14 **MLMediaSourceiPhotoIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from iPhoto.
115.4.15 MLMediaSourceiTunesIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from iTunes.

115.4.16 MLMediaSourceLogicIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from Logic.

115.4.17 MLMediaSourceMoviesFolderIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from movies folder.

115.4.18 MLMediaSourcePhotoBoothIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from Photo Booth.

115.4.19 MLMediaSourcePhotosIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the media source providing content from photos folder.

115.4.20 Properties

115.4.21 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Internet object reference. **Notes:** (Read and Write property)
115.4.22 MediaLibrary as MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A pointer to the media library instance that loaded this media source.  
**Notes:** (Read only property)

115.4.23 mediaSourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A unique identifier for the media source.  
**Notes:**  
For a list of possible media source identifiers, see shared methods.  
(Read only property)

115.4.24 Properties as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A list of attributes describing the media source.  
**Notes:** (Read only property)

115.4.25 rootMediaGroup as MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The base media group in the media source that contains all other groups within the source as descendant elements.  
**Notes:**  
This accessor property is nonblocking. If there is no data yet, it returns nil and automatically triggers an internal asynchronous request. When data arrives, a KVO notification is sent via the main thread.  
(Read only property)

115.4.26 Constants

115.4.27 kSourceTypeAudio = 1

MBS Mac64bit Plugin, Plugin Version: 18.2. **Function:** One of the source types.  
**Notes:** Audio
115.4.28  kSourceTypeImage = 2

MBS Mac64bit Plugin, Plugin Version: 18.2. **Function:** One of the source types.  
**Notes:** Images

115.4.29  kSourceTypeMovie = 4

MBS Mac64bit Plugin, Plugin Version: 18.2. **Function:** One of the source types.  
**Notes:** Movies
115.5. class NSMediaLibraryBrowserControllerMBS

115.5.1 class NSMediaLibraryBrowserControllerMBS

Function: An instance of an NSMediaLibraryBrowserController configures and displays a Media Library Browser Panel.
Notes: A User can drag and drop media files from the Media Library Browser into views in their application. Requires Mac OS X 10.9.

115.5.2 Methods

115.5.3 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 and false on other platforms.

115.5.4 Constructor

Function: Creates a new object for the shared library browser.

115.5.5 orderFront

Function: Orders window to front.

115.5.6 orderOut

Function: Orders window out.
Notes: Hides window.
115.5.7 sharedMediaLibraryBrowserController as NSMediaLibraryBrowserControllerMBS

**Function**: Returns a new object for the shared library browser.

115.5.8 togglePanel

**Function**: Toggles the panel to hide/show.

115.5.9 Properties

115.5.10 Frame as NSRectMBS

**Function**: The bounds of the panel.  
**Notes**: (Read and Write property)

115.5.11 Handle as Integer

**Function**: The internal object reference.  
**Notes**: (Read and Write property)

115.5.12 mediaLibraries as Integer

**Function**: Which media library to show: audio, video or image.  
**Notes**: (Read and Write property)

115.5.13 Visible as Boolean

**Function**: The visible state of the browser panel.  
**Notes**: (Read and Write property)
115.5.14 Constants

115.5.15 NSMediaLibraryAudio = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the media library type constants. **Notes:** Audio

115.5.16 NSMediaLibraryImage = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the media library type constants. **Notes:** Image

115.5.17 NSMediaLibraryMovie = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the media library type constants. **Notes:** Movie
Chapter 116
MemoryBlock

116.1 Globals

116.1.1 NewMemoryBlockWithBytesMBS(Data as Ptr, size as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new memoryblock with a copy of the given data.

116.1.2 NewMemoryBlockFromPtrMBS(ptr as Integer) as memoryblock

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a memoryblock for a given address in memory.

116.1.3 Memoryblock2ptrMBS(mem as memoryblock) as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the memory address of the memoryblock

116.1.4 ptr2MemoryblockMBS(Value as Integer) as memoryblock

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a memoryblock with the bytes at position mem in memory.
116.2 class Memoryblock

116.2.1 class Memoryblock

Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extends Realbasic’s Memoryblock class.

116.2.2 Methods

116.2.3 AddressMBS(offset as Int64 = 0) as UInt64

MBS Util Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the address of the byte at offset inside the memoryblock.

116.2.4 AddressPtrMBS(offset as Int64 = 0) as Ptr

MBS Util Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the address of the byte at offset inside the memoryblock.

116.2.5 AndBitsMBS(Second as memoryblock, Dest as memoryblock=nil) as memoryblock

MBS Util Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Performs a And on the bits in the memoryblock.

**Example:**

```plaintext
dim m1 as MemoryBlock = NewMemoryBlock(20)
dim m2 as MemoryBlock = NewMemoryBlock(20)
dim m3 as MemoryBlock = NewMemoryBlock(20)

m1.Int32Value(0)& b10000001
m2.Int32Value(0)& b10000000
MsgBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))
call m1.AndBitsMBS(m2,m3)
MsgBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))
```

**Notes:**
116.2. CLASS MEMORYBLOCK

Dest is first and second memoryblock combine with a bitwiseand. And first and second memoryblock are filled with the difference between them.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.

See also:

• 116.2.6 AndBitsMBS(Second as memoryblock, Mask as Integer, Dest as memoryblock=nil) as memoryblock

116.2.6 AndBitsMBS(Second as memoryblock, Mask as Integer, Dest as memoryblock=nil) as memoryblock

MBS Util Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Performs a And on the bits in the memoryblock.

**Example:**

```vba
dim m1 as MemoryBlock = NewMemoryBlock(20)
dim m2 as MemoryBlock = NewMemoryBlock(20)
dim m3 as MemoryBlock = NewMemoryBlock(20)

m1.Int32Value(0)=& b11110001
m2.Int32Value(0)=& b11110000

const mask = & b11001111

MsgBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))
call m1.AndBitsMBS(m2,mask,m3)

MsgBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))
```

**Notes:**

The mask is always 8 bit. Use the & b notation to specify it. Dest is first and second memoryblock combine with a bitwiseand. Only bits set int he given mask are used.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.
Returns nil on any error. For example if source is a memoryblock without a known size.
See also:

- 116.2.5 AndBitsMBS(Second as memoryblock, Dest as memoryblock=nil) as memoryblock

116.2.7 AppendMBS(other as memoryblock) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns a new memoryblock with the bytes of the two given memoryblocks.
**Notes:**
This function will not work if the memoryblock has an unknown size.
If one memoryblock is nil than you get a copy of the other memoryblock.

116.2.8 BytesEqualMBS(srcOfs as Integer, numBytes as Integer, destBlk as memoryBlock, destOfs as Integer) as Boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if equal byte data.
**Example:**
```vba
dim m1 as MemoryBlock = NewMemoryBlock(100)
dim m2 as MemoryBlock = NewMemoryBlock(100)

// try with 2 different strings
m1.CString(0)="Hello"
m2.CString(0)="Hallo"
if m1.BytesEqualMBS(0, 100, m2, 0) then
    MsgBox "equal"
else
    MsgBox "not equal"
end if

// try with 2 equal strings
m1.CString(0)="Hello"
m2.CString(0)="Hello"
if m1.BytesEqualMBS(0, 100, m2, 0) then
    MsgBox "equal"
else
    MsgBox "not equal"
end if
```
116.2. CLASS MEMORYBLOCK

Notes:

Fixed in 10.1 to return true on equal bytes and false on non equal bytes. Older plugin versions returned the wrong value.

Does not check the bounds of the memoryblock, so it can crash with wrong parameters. Returns false if one of the memoryblocks is nil.

116.2.9 BytesZeroMBS(srcOfs as Integer, numBytes as Integer) as Boolean

MBS Util Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns true if all bytes in the memoryblock in the given range are zero.
Example:

```vbnet
dim m as MemoryBlock = NewMemoryBlock(100)

if m.BytesZeroMBS(0,100) then
    MsgBox "all zero"
else
    MsgBox "error"
end if

m.Byte(50)=1

if m.BytesZeroMBS(0,100) then
    MsgBox "error"
else
    MsgBox "okay"
end if
```

Notes:

Returns false on any error.
Bounds are not checked with the memoryblock, so be careful.

116.2.10 ConvertRGB12BitTo8BitMBS(Width as Integer)

Converts a memoryblock with 12 bit RGB data into 8 bit RGB data.
Notes:

Width is number of pixels.
Please make sure the memoryblock is 9 bytes bigger than input to avoid errors.
Plugin converts each 9 bytes (72 bits) with 2 RGB triple. So first 12 bits are red, next 12 bits green and last 12 bits blue.
Plugin removes last 4 bits.

116.2.11 CopyBytesFromMacHandleMBS(srcHandle as Integer, numBytes as Integer, destOfs as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies bytes from Mac Handle into your memoryblock.
**Notes:** Same as CopyBytesFromMacPtr, only that the memory address is a so-called Handle (see documentation about the MacOS memory Manager), which is double-referenced.

116.2.12 CopyBytesFromMacPtrMBS(srcPtr as Ptr, numBytes as Integer, destOfs as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies the given amount of bytes from the given address in the Mac’s memory address space into the memoryBlock.
**Notes:** Make sure that the destination block is large enough to hold the copied bytes (if not, your application or even the whole system can crash).

116.2.13 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destBlk as memoryBlock, destOfs as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies the specified amount of bytes into a second memoryBlock.
**Example:**
```dim m as MemoryBlock
dim n as MemoryBlock
m=NewMemoryBlock(100)
n=NewMemoryBlock(100)
m.Long(0)=12345
m.CopyBytesMBS(0,4,n,0)
MsgBox str(n.long(0))```
Notes: You must make sure that the destination block is large enough to hold the copied bytes (if not, your application or even the whole system can crash).
See also:

- 116.2.14 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destOfs as Integer)

116.2.14 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destOfs as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Copies the specified amount of bytes inside the memoryBlock.
Notes: You must make sure that the copied bytes fit inside the block (if they don’t, your application or even the whole system can crash).
See also:

- 116.2.13 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destBlk as memoryBlock, destOfs as Integer)

116.2.15 CopyBytesToMacHandleMBS(srcOfs as Integer, numBytes as Integer, destHandle as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Copies byte data from the memoryblock into the memory the handle is pointing to.
Notes: Same as CopyBytesToMacPtr, only that the memory address is a so-called Handle (see documentation about the MacOS memory Manager), which is double-referenced.

116.2.16 CopyBytesToMacPtrMBS(srcOfs as Integer, numBytes as Integer, destPtr as Ptr)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Copies the given amount of bytes from the memoryBlock to the given address in the Mac’s memory address space.
Notes: Be careful where you copy the data to - you can easily crash your computer if you write to the wrong address space.

116.2.17 CopyByteToUShortMBS(dest as memoryblock, SourceOffset as Integer, DestinationOffset as Integer, ByteCount as Integer, divisor as Integer)

MBS Util Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Copies bytes in a memoryblock to another memoryblock converting the 8bit values to 16bit values.
Notes:
Common values for divisor are 256 and 257.
No bound checking. Crashes with invalid values. Optimized for special divisor values.

116.2.18 CopyNthBitsMBS(source as memoryblock, SourceOffsetBits as Integer, DestinationOffsetBits as Integer, BitCount as Integer, StepCount as Integer, NumberOfSteps as Integer) as boolean

MBS Util Plugin, Plugin Version: 6.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies every nth bits in the source memoryblock to the current memoryblock.
**Notes:**
BitCount = the number of bits to copy from each step.
StepCount = the number of bits to not copy.
NumberOfSteps = the number of rounds to do.
There is no bound checking. The function will crash with invalid parameters!

116.2.19 CopyNthBytesMBS(source as memoryblock, SourceOffsetBytes as Integer, DestinationOffsetBytes as Integer, ByteCount as Integer, StepCount as Integer, NumberOfSteps as Integer) as boolean

MBS Util Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies every nth bytes in the source memoryblock to the current memoryblock.
**Example:**

```vbnet
dim s,d as memoryBlock
s=NewmemoryBlock(100)
d=NewmemoryBlock(100)
s.CString(0)="Hello World!"
call d.CopyNthBytesMBS(s,0,0,2,4,3)
MsgBox d.CString(0) // "Heo rl"
```

**Notes:**
ByteCount = the number of bytes to copy from each step.
StepCount = the number of bytes to not copy.
NumberOfSteps = the number of steps to do.
There is no bound checking. The function will crash with invalid parameters!
116.2. CLASS MEMORYBLOCK

116.2.20 CopyUShortToByteMBS(dest as memoryblock, SourceOffset as Integer, DestinationOffset as Integer, ByteCount as Integer, divisor as Integer)

MBS Util Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Copies shorts in a memoryblock to another memoryblock converting the 16bit values to 8bit values.
Notes:
Common values for divisor are 256 and 257.
No bound checking. Crashes with invalid values. Optimized for special divisor values.

116.2.21 CRC_32ContMBS(offset as Integer, numBytes as Integer, prevCRC as UInt32) as UInt32

MBS Util Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Calculates a 32bit Checksum about the provided block of data.

116.2.22 CRC_32MBS(offset as Integer, numBytes as Integer) as UInt32

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Calculates a 32bit Checksum about the provided block of data.

116.2.23 CRC_CCITTContMBS(offset as Integer, numBytes as Integer, prevCRC as UInt32) as UInt32

MBS Util Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Calculates a 16bit Checksum about the provided string.

116.2.24 CRC_CCITTMBS(offset as Integer, numBytes as Integer) as UInt32

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Calculates a 16bit Checksum about the provided block of data.
Notes:
See the text "About-CRC" for details about this Checksum things.
This function is also available for strings.

See the CRC_32 for more details on Checksums.
116.2.25 CRC_DillonMBS(bitWidth as Integer, offset as Integer, numBytes as Integer) as String

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Calculates a 16 to 64bit Checksum about the provided block of data.  
**Notes:**
This function is also available for strings.

See the CRC_32 for more details on Checksums.

116.2.26 EndianS16_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.  
**Example:**
```plaintext
dim mem as memoryblock // your memoryblock
mem.EndianS16_BtoLMBS(0,mem.size/2)
```

**Notes:**

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

**Details:**
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.27 EndianS16_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.  
**Example:**
```plaintext
dim mem as memoryblock // your memoryblock
mem.EndianS16_BtoNMBS(0,mem.size/2)
```
116.2. CLASS MEMORYBLOCK

Notes:
e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.28 EndianS16_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**
```
dim mem as memoryblock  // your memoryblock
mem.EndianS16_LtoBMBS(0,mem.size/2)
```

Notes:
e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.29 EndianS16_LtoNMBBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```vbs
dim mem as memoryblock // your memoryblock
mem.EndianS16_LtoNMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

### 116.2.30 EndianS16_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```vbs
dim mem as memoryblock // your memoryblock
mem.EndianS16_NtoBMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.
116.2.31 EndianS16_NtoLMBS(offset as Integer, count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```plaintext
dim mem as memoryblock // your memoryblock
mem.EndianS16_NtoLMBS(0, mem.size/2)
```

**Notes:**

```
e.g.:
EndianS32_BtoNMBS(offset as Integer, count as Integer)
EndianU16_LtoBMBS(offset as Integer, count as Integer)
```

**Details:**
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.32 EndianS32_BtoLMBS(offset as Integer, count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```plaintext
dim mem as memoryblock // your memoryblock
mem.EndianS32_BtoLMBS(0, mem.size/4)
```

**Notes:**

```
e.g.:
EndianS32_BtoNMBS(offset as Integer, count as Integer)
EndianU16_LtoBMBS(offset as Integer, count as Integer)
```

**Details:**
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.
CHAPTER 116. MEMORYBLOCK

Note that count is not the size of the block, but the count of the integers to change.

116.2.33 EndianS32_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_BtoNMBS(0,mem.size/4)
```

**Notes:**

```
e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)
```

**Details:**

S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.34 EndianS32_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_LtoBMBS(0,mem.size/4)
```

**Notes:**

```
e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)
```

**Details:**
116.2. CLASS MEMORYBLOCK

S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.35 EndianS32_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_LtoNMBS(0,mem.size/4)
```

**Notes:**

e.g.:

```
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)
```

**Details:**

S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.36 EndianS32_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_NtoBMBS(0,mem.size/4)
```

**Notes:**

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.37 **EndianS32_NtoLMBS(offset as Integer,count as Integer)**

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.
**Example:**
```
dim mem as memoryblock // your memoryblock
mem.EndianS32_NtoLMBS(0,mem.size/4)
```

**Notes:**

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.38 **EndianSwap16MBS(offset as Integer,count as Integer)**

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Swaps several 16 bit integers inside a memoryblock.
**Example:**
```
dim mem as memoryblock // your memoryblock
mem.EndianSwap16MBS(0,mem.size/2)
```
116.2.39 **EndianSwap32MBS(offset as Integer, count as Integer)**

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Swaps several 32 bit integers inside a memory block.

**Example:**

```plaintext
dim mem as memoryblock // your memoryblock
mem.EndianSwap32MBS(0, mem.size/4)
```

116.2.40 **EndianU16_BtoLMBS(offset as Integer, count as Integer)**

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```plaintext
dim mem as memoryblock // your memoryblock
mem.EndianU16_BtoLMBS(0, mem.size/2)
```

**Notes:**

e.g.:

- EndianS32_BtoNMBS(offset as Integer, count as Integer)
- EndianU16_LtoBMBS(offset as Integer, count as Integer)

**Details:**

- S for signed or U for unsigned.
- 16 for short and 32 for integer.
- B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.41 **EndianU16_BtoNMBS(offset as Integer, count as Integer)**

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```plaintext
dim mem as memoryblock // your memoryblock
mem.EndianU16_BtoNMBS(0, mem.size/2)
```
Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.42   EndianU16_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.
**Example:**

dim mem as memoryblock // your memoryblock
mem.EndianU16_LtoBMBS(0,mem.size/2)

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.
116.2. CLASS MEMORYBLOCK

116.2.43 EndianU16_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```vbnet
dim mem as memoryblock // your memoryblock
mem.EndianU16_LtoNMBS(0,mem.size/2)
```

**Notes:**

e.g.:

```
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)
```

**Details:**

S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.44 EndianU16_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

```vbnet
dim mem as memoryblock // your memoryblock
mem.EndianU16_NtoBMBS(0,mem.size/2)
```

**Notes:**

e.g.:

```
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)
```

**Details:**

S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.
Note that count is not the size of the block, but the count of the integers to change.

### 116.2.45 EndianU16_NtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**
```
dim mem as memoryblock // your memoryblock
mem.EndianU16_NtoLMBS(0,mem.size/2)
```

**Notes:**
- e.g.:
  - EndianS32_BtoNMBS(offset as Integer,count as Integer)
  - EndianU16_LtoBMBS(offset as Integer,count as Integer)

**Details:**
- S for signed or U for unsigned.
- 16 for short and 32 for integer.
- B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

### 116.2.46 EndianU32_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**
```
dim mem as memoryblock // your memoryblock
mem.EndianU32_BtoLMBS(0,mem.size/4)
```

**Notes:**
- e.g.:
  - EndianS32_BtoNMBS(offset as Integer,count as Integer)
  - EndianU16_LtoBMBS(offset as Integer,count as Integer)

**Details:**
116.2. CLASS MEMORYBLOCK

S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.47 EndianU32_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding. **Example:**

```vba
dim mem as memoryblock // your memoryblock
mem.EndianU32_BtoNMBS(0,mem.size/4)
```

**Notes:**

e.g.:
`EndianS32_BtoNMBS(offset as Integer,count as Integer)`
`EndianU16_LtoBMBS(offset as Integer,count as Integer)`

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.48 EndianU32_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding. **Example:**

```vba
dim mem as memoryblock // your memoryblock
mem.EndianU32_LtoBMBS(0,mem.size/4)
```

**Notes:**

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.49 EndianU32_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**
```plaintext
dim mem as memoryblock // your memoryblock
mem.EndianU32_LtoNMBS(0,mem.size/4)
```

**Notes:**

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.50 EndianU32_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**
```plaintext
dim mem as memoryblock // your memoryblock
mem.EndianU32_NtoBMBS(0,mem.size/4)
```
116.2. CLASS MEMORYBLOCK

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer, count as Integer)
EndianU16_LtoBMBS(offset as Integer, count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

116.2.51 EndianU32_NtoLMBS(offset as Integer, count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts between BigEndian, LowEndian and Native byte encoding.

**Example:**

dim mem as memoryblock // your memoryblock
mem.EndianU32_NtoLMBS(0, mem.size/4)

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer, count as Integer)
EndianU16_LtoBMBS(offset as Integer, count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.
116.2.52 ExpandBitsMBS(dest as memoryblock, SourceByteCount as Integer, LowValue as Integer = 0, HighValue as Integer = 255) as boolean

MBS Util Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Expands bits into bytes.
**Example:**
```vbs
    dim m1 as new MemoryBlock(200)
    dim m2 as new MemoryBlock(1600)
    for i as Integer = 0 to 127
        m1.Int8Value(i) = i
    next
    dim n as Integer = 128
    dim b as Boolean = m1.ExpandBitsMBS(m2, n)
    break // see result in debugger
```

**Notes:**
- Takes a bit from the source memoryblock and writes a byte for it to destination. Uses LowValue (default 0) if the bit is not set and HighValue (Default 255) if the bit is set.
- Works only on x86 CPUs (no PPC).
- Reads source memoryblock in 32 bit blocks and writes the destination in 32 byte blocks.

116.2.53 ExtractBitsMBS(Mask as Integer, Dest as memoryblock=nil) as memoryblock

MBS Util Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies bits from a memoryblock to another.
**Example:**
```vbs
    dim mask as Integer = &b01010101
    dim m as MemoryBlock = "Hello World"
    dim r as MemoryBlock = m.ExtractBitsMBS(mask)
    MsgBox r.StringValue(0,r.size) // shows "@EDDE UEPDD"
```

**Notes:**
The mask is always 8 bit. Use the & b notation to specify it.
If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memory-
116.2. CLASS MEMORYBLOCK

block in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.

116.2.54 FillBytesMBS(offset as Integer, count as Integer, value as Integer)

MBS Util Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Fills memory with a specific byte value. **Notes:** Caution: No bounds checking.

116.2.55 FindByteMBS(srcOfs as Integer, numBytes as Integer, byteValue as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Finds the position of the first byte which has the given value. **Example:**

```vba
dim m as MemoryBlock = NewMemoryBlock(100)
dim n as Integer

n = m.FindByteMBS(0, 100, 0)
MsgBox str(n) // shows 0 as the byte at offset 0 is zero
m.Byte(0)=1
n = m.FindByteMBS(0, 100, 0)
MsgBox str(n) // shows 1 as the byte at offset 1 is zero
m.FillBytesMBS(0,100,5)

n = m.FindByteMBS(0, 100, 6)
MsgBox str(n) // shows -1 as there is no byte with value 6
```

**Notes:** Returns -1 if the byte is not found.
116.2.56  **FindBytesMBS(srcOfs as Integer, maxBytes as Integer, target as memoryBlock, targOfs as Integer, targLen as Integer) as Integer**

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Finds some bytes from the target memoryblock inside the current memoryblock.

116.2.57  **FindNotByteMBS(srcOfs as Integer, numBytes as Integer, byteValue as Integer) as Integer**

MBS Util Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Finds the position of the first byte which has no the given value.  
**Example:**
```
    dim m as MemoryBlock = NewMemoryBlock(100)
    dim n as Integer

    n = m.FindNotByteMBS(0, 100, 0)
    MsgBox str(n)  // -1 as no value is not zero

    m.Byte(30)=1
    n = m.FindNotByteMBS(0, 100, 0)
    MsgBox str(n)  // shows 30 as the byte at offset 30 is not zero

    m.Byte(0)=255
    n = m.FindNotByteMBS(0, 100, 255)
    MsgBox str(n)  // shows 1 as the byte at offset 1 is not 255
```

**Notes:** Returns -1 if the no byte was found which has not the given value.

116.2.58  **FindStringMBS(srcOfs as Integer, maxBytes as Integer, target as String) as Integer**

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Finds a string inside a memoryblock.
116.2. CLASS MEMORYBLOCK

116.2.59 GetStringMBS(offset as Integer, numBytes as Integer) as String

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a string from the memoryblock.
**Notes:** With newer RB versions you may better use StringValue.

116.2.60 InvertBytesMBS(offset as Integer, count as Integer)

MBS Util Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inverts the given number of bytes in a memoryblock.
**Example:**
```plaintext
dim m as memoryblock
m=newmemoryblock(100)
' do something
m.InvertBytesMBS(0,100) // invert all bytes
```
**Notes:** Does work faster if count is a multiply of 4.

116.2.61 LeftMBS(length as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a memoryblock with the first given number of bytes.
**Notes:**
If length is greater than the size of the memoryblock then then length is set to size.
Returns nil if length<=0 or on low memory.
This function will not work if the memoryblock has an unknown size.

116.2.62 MaxMBS(firstMem as Ptr, secondMem as Ptr, BitSize as Integer = 8, Signed as Boolean = false, offsetByte as Integer = 0, lengthBytes as Integer = 0) as boolean

MBS Util Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Calculates max values of values in memory.
**Example:**
```plaintext
dim m1 as new MemoryBlock(12)
dim m2 as new MemoryBlock(12)
dim mr1 as new MemoryBlock(12)
dim mr2 as new MemoryBlock(12)
```
for i as Integer = 0 to 11
m1.UInt8Value(i) = i
m2.UInt8Value(11-i) = i
next

if mr1.minMBS(m1, m2) then
if mr2.maxMBS(m1, m2) then
MsgBox EncodeHex(m1)+” first”+EndOfLine+_
EncodeHex(m2)+” second”+EndOfLine+_
EncodeHex(mr1)+” min”+EndOfLine+_
EncodeHex(mr2)+” max”
end if
end if

Notes:

firstMem and secondMem can be ptr or memoryblock with some values. Can be same as destination (the memoryblock the method is called at)
BitSize defines integer bit depth 8, 16, 32 or 64. Signed defines if to expect signed or unsigned integers.
offsetByte defines offset in destination memoryblock. lengthBytes is length of memory. If zero, we use size of destination memoryblock.
Passing bad parameters can easily lead to crash. Return true on success and false on failure and raises exceptions for invalid parameters.

116.2.63 MidMBS(offset as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns a memoryblock with the bytes of the given memoryblock from the given offset on.
Notes:
Offset is 0 based.
Returns nil if offset<0 or on low memory.
This function will not work if the memoryblock has an unknown size.
See also:
• 116.2.64 MidMBS(offset as Integer, length as Integer) as memoryblock

116.2.64 MidMBS(offset as Integer, length as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns a memoryblock with the given bytes from the middle of the memoryblock.
116.2. CLASS MEMORYBLOCK

Notes:

Offset is 0 based.
Returns nil if offset<0 or on low memory.
If length is too long then length is set to a lower value.
This function will not work if the memoryblock has an unknown size.
See also:

• 116.2.63 MidMBS(offset as Integer) as memoryblock

116.2.65 MinMBS(firstMem as Ptr, secondMem as Ptr, BitSize as Integer = 8, Signed as Boolean = false, offsetByte as Integer = 0, lengthBytes as Integer = 0) as boolean

Example:

dim m1 as new MemoryBlock(24)
dim m2 as new MemoryBlock(24)
dim mr1 as new MemoryBlock(24)
dim mr2 as new MemoryBlock(24)

for i as Integer = 0 to 11
m1.UInt16Value(2*i) = i
m2.UInt16Value(2*(11-i)) = i
next

if mr1.minMBS(m1, m2, 16, false, 0, 24) then
if mr2.maxMBS(m1, m2, 16, false, 0, 24) then
MsgBox EncodeHex(m1)+“ first”+EndOfLine+
EncodeHex(m2)+“ second”+EndOfLine+
EncodeHex(mr1)+“ min”+EndOfLine+
EncodeHex(mr2)+“ max”
end if
end if

Notes:

firstMem and secondMem can be ptr or memoryblock with some values. Can be same as destination (the memoryblock the method is called at)
BitSize defines integer bit depth 8, 16, 32 or 64. Signed defines if to expect signed or unsigned integers.
offsetByte defines offset in destination memoryblock. lengthBytes is length of memory. If zero, we use size of destination memoryblock.
Passing bad parameters can easily lead to crash. Return true on success and false on failure and raises exceptions for invalid parameters.

116.2.66 MirrorBitsInBytesMBS(offsetByte as Integer, lengthByte as Integer)

MBS Util Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Mirrors bits in each byte.

**Example:**

```vbs
dim m as new MemoryBlock(12)
m.CString(0)="HelloHello"
m.MirrorBitsInBytesMBS(0,5)
MsgBox EncodingToHexMBS(m.StringValue(5,5))+" »"+EncodingToHexMBS(m.StringValue(0,5))
```

**Notes:**

- offsetByte: where to start in the memoryblock
- lengthByte: number of bytes to swap

Mirror means in this case, that if you a byte with bits 11001100, after the mirror, you have 00110011. So bit 0 and 7 exchange values. Same for 1 and 6, 2 and 5, 3 and 4.

116.2.67 MirrorBitsMBS(offsetBit as Integer, lengthBit as Integer)

MBS Util Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Mirrors the bits in a memoryblock.

**Notes:**

- e.g. "111100001" in the memoryblock would give "100001111"
- This function is certainly not the fastest one, but faster than anything you can get written in Realbasic.
- And make sure the bounds are matched, because on memory access outside the valid ranges, the function will crash.
- 0 offsetBit < mem.size*8 and 0 lengthBit mem.size*8 - offsetBit
116.2. CLASS MEMORYBLOCK

116.2.68 MirrorBytesMBS(offsetByte as Integer = 0, lengthByte as Integer = -1)

MBS Util Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Mirrors the bytes in the given range.

**Notes:**

e.g. "abcdefg" in the memoryblock would give "hgfedcba"
This function is certainly not the fastest one, but faster than anything you can get written in Realbasic.
And make sure the bounds are matched, because on memory access outside the valid ranges, the function will crash.
offsetByte < mem.size and lengthByte < mem.size - offsetByte

If lengthByte is -1, we query memoryblock for size. If size is unknown or negative, the function does nothing.

116.2.69 MultiplyUInt16MBS(Factor as Double, offsetByte as Integer = 0, lengthBytes as Integer = 0)

MBS Util Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Multiplied UInt16 values in the memoryblock.

**Example:**

```javascript
dim myMemOut3 as new MemoryBlock(500)
myMemOut3.MultiplyUInt16MBS(0.9)
```

**Notes:**

Values bigger than 65535 are set to 65535.
lengthBytes is in bytes, so 2 times the number of values.
Factor must be >= 0.0.
Offset is the offset in bytes from the beginning of the memoryblock to start. Wrong offsets (e.g. negative) can lead to crashes. lengthBytes is optional, if not specified or zero uses the length of memoryblock.

116.2.70 MultiplyUInt8MBS(Factor as Double, offsetByte as Integer = 0, lengthBytes as Integer = 0)

MBS Util Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Multiplies UInt8 values in the memoryblock.

**Example:**

```javascript
dim myMemOut3 as new MemoryBlock(500)
myMemOut3.MultiplyUInt8MBS(0.9)
```

**Notes:**

Values bigger than 65535 are set to 65535.
lengthBytes is in bytes, so 2 times the number of values.
Factor must be >= 0.0.
Notes:
Values bigger than 255 are set to 255.
lengthBytes is in bytes, so 2 times the number of values.
Factor must be $\geq 0.0$.
Offset is the offset in bytes from the beginning of the memoryblock to start. Wrong offsets (e.g. negative) can lead to crashes. lengthBytes is optional, if not specified or zero uses the length of memoryblock.

### 116.2.71 RightMBS(length as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a memoryblock with the given number of bytes from the right side of the memoryblock.

**Example:**
```
dim mem, m as MemoryBlock
mem = m.RightMBS(5)
```

**Notes:**
If length is more than the memoryblock’s size, than length is set to size.
Returns nil if length $\leq 0$ or on low memory.
This function will not work if the memoryblock has an unknown size.

### 116.2.72 SetStringMBS(str as String, offset as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets a string inside the memoryblock.

**Notes:** With newer RB versions you may better use StringValue.

### 116.2.73 SwapBytes16MBS(offset as Integer, numBytes as Integer)

MBS Util Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Swaps words inside the given bounds inside the memoryblock.

**Example:**
```
dim numbytes as Integer // number of bytes in MemoryBlock
dim m as MemoryBlock // your memoryblock
dim i as Integer
```
for i=0 to numbytes step 2  
m.USHort(i)=EndianSwap16MBS(m.USHort(i))  
next

### 116.2.74 SwapBytes32MBS(offset as Integer, numBytes as Integer)

MBS Util Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Swaps longs inside the given bounds inside the memory block.  

**Example:**

```vbnet
// Test SwapBytes32MBS and SwapBytes16MBS:

const h11223344=& h11223344
const h22114433=& h22114411 // 16bit swap
const h44332211=& h44332211 // 32bit swap

dim m as memoryBlock

dim ok as Integer

m=NewmemoryBlock(20)
m.Long(00)=h11223344
m.Long(04)=h11223344
m.Long(08)=h11223344
m.Long(12)=h11223344
m.Long(16)=h11223344

m.SwapBytes16MBS(4,4)
m.SwapBytes32MBS(12,4)

if m.Long(00)=h11223344 then
ok=ok+1
else
MsgBox "00: " +hex(m.Long(00))
end if

if m.Long(04)=h22114411 then
ok=ok+1
else
MsgBox "04: " +hex(m.Long(04))
end if

if m.Long(08)=h11223344 then
ok=ok+1
else
MsgBox "08: " +hex(m.Long(08))
end if
```
if m.Long(12)=h44332211 then
  ok=ok+1
else
  MsgBox "$12: $"+hex(m.Long(12))
end if

if m.Long(16)=h11223344 then
  ok=ok+1
else
  MsgBox "$16: $"+hex(m.Long(16))
end if

if ok=5 then
  MsgBox "OK"
else
  MsgBox "Fail"
end if

Notes:
It should do something like this:

dim m as memoryBlock

for i=0 to numbytes step 2
  m.long(i)=EndianSwap32MBS(m.long(i))
next

116.2.75  SwapBytesMBS(offset as Integer, numBytes as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Swaps bytes inside the given bounds inside the memoryblock. Notes: Reverses the order of the bytes at the given offset and length in the memoryBlock. This is helpful to change representation of values from Little Endian (used in Windows) to Big Endian (used in Mac OS) and vice versa. Thanks to Franco Vaccari for the code of this routine.
116.2. CLASS MEMORYBLOCK

116.2.76 Properties

116.2.77 BytesMBS as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The size of the memoryblock.  
**Notes:**  
Some newer RB version introduced a size property which is read and writeable, but older RB versions didn’t have even a readable size property, so this bytes property will help there.  
Also it should as a property be viewable in the debugging windows.  
(Read only property)

116.2.78 OSTypeMBS(offset as Integer) as String

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Read/Write an OSType.  
**Notes:**  
Interprets 4 bytes starting at the given offset as a OSType value.  
(Read and Write computed property)
116.3 class MemoryBlockMBS

116.3.1 class MemoryBlockMBS

MBS Util Plugin, Plugin Version: 5.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A class to hold a memoryblock.

**Example:**

```basic
dim m as new MemoryBlockMBS

if m.Create(2000) then

    // copy string into memory
    m.Memory.StringValue(0,5)="Hello"

    // and read again
    MsgBox m.Memory.StringValue(0,5)

end if
```

**Notes:**

Realbasics memoryblocks have two bad things:
- they are limited to 1 GB on Mac OS X and Mac OS Classic
- they take a lot of time to create them
- they take a lot of real memory

Realbasic allocates the memory and fills it with zeros.

The plugin in contrast uses zero filled pages to create the memoryblock which nearly take no time to create them and it does only need virtual memory until the memory is really used which saved swapping space.

116.3.2 Methods

116.3.3 Close

MBS Util Plugin, Plugin Version: 5.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

**Notes:**

There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)
116.3. CLASS MEMORYBLOCKMBS

116.3.4 Constructor

MBS Util Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor. **Notes:** This constructor does nothing, so you can call Create yourself. See also:

- 116.3.5 Constructor(Mem as MemoryBlock)
- 116.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0)
- 116.3.7 Constructor(Size as Int64)
- 116.3.8 Constructor(Str as String)
- 116.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0)

116.3.5 Constructor(Mem as MemoryBlock)

MBS Util Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new MemoryBlockMBS with content of memoryblock. **Example:**

```vbnet
dim s as string = "Hello World"
dim m as MemoryBlock = s
dim x as new MemoryBlockMBS(m)
MsgBox str(x.Size)
```

**Notes:** Raises exception is size is invalid or no memory is available. See also:

- 116.3.4 Constructor
- 116.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0)
- 116.3.7 Constructor(Size as Int64)
- 116.3.8 Constructor(Str as String)
- 116.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0)
116.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0)

Example:

dim s as string = "Hello World"
dim m as MemoryBlock = s

dim x as new MemoryBlockMBS(m, 9)

MsgBox str(x.Size)

Notes: Raises exception is size is invalid or no memory is available.
See also:

- 116.3.4 Constructor
- 116.3.5 Constructor(Mem as MemoryBlock)
- 116.3.7 Constructor(Size as Int64)
- 116.3.8 Constructor(Str as String)
- 116.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0)

116.3.7 Constructor(Size as Int64)

Notes: Raises exception is size is invalid or no memory is available.
See also:

- 116.3.4 Constructor
- 116.3.5 Constructor(Mem as MemoryBlock)
- 116.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0)
- 116.3.8 Constructor(Str as String)
- 116.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0)

116.3.8 Constructor(Str as String)

Example:
116.3. CLASS MEMORYBLOCKMBS

```vbnet
dim s as string = "Hello World"
dim x as new MemoryBlockMBS(s)
```

MsgBox str(x.Size)

### Notes:

Text encoding is ignored and bytes copied as they are.

Raises exception is size is invalid or no memory is available.

See also:

- 116.3.4 Constructor
- 116.3.5 Constructor(Mem as MemoryBlock)
- 116.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0)
- 116.3.7 Constructor(Size as Int64)
- 116.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0)

---

116.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0)

MBS Util Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Creates a new MemoryBlockMBS with given size and copies content of string.

**Example:**

```vbnet
dim s as string = "Hello World"
dim x as new MemoryBlockMBS(s, 9)
```

MsgBox str(x.Size)

### Notes:

Text encoding is ignored and bytes copied as they are.

Raises exception is size is invalid or no memory is available.

See also:

- 116.3.4 Constructor
- 116.3.5 Constructor(Mem as MemoryBlock)
- 116.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0)
- 116.3.7 Constructor(Size as Int64)
- 116.3.8 Constructor(Str as String)
116.3.10 Create(size as Int64) as boolean

MBS Util Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new memoryblock.
**Example:**
```vbscript
dim m as MemoryBlockMBS
dim n as MemoryBlock
dim t as Integer

const size=2200000000

// RB: up to 1 GigaByte
// Plugin: up to 2 GigaByte - 1 Byte
m=New MemoryBlockMBS

if m.Create(size) then
    n=m.Memory
end if
```
```
MsgBox str(ticks-t)
```
```
t=ticks
if m.Create(size) then
    n=m.Memory
MsgBox str(ticks-t)
end if
```

**Notes:**
Returns true on success and false on failure.
Size can be any positive value up to &h7FFFFFFF (=2^31-1).

Size became 64bit to avoid integer overflows.

116.3.11 Resize(Size as Int64) as boolean

MBS Util Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Tries to resize the memoryblock to the new size.
**Example:**
116.3. CLASS MEMORYBLOCKMBS

dim m as new MemoryBlockMBS

if m.Create(1000) then
MsgBox str(m.Size)
if m.Resize(2000) then
MsgBox str(m.Size)
end if
end if

Notes:

Returns true on success.
If false is returned, the memoryblockMBS is not touched.

If the new size is smaller, data is lost as the memoryblock is cut.
If the new size is bigger, the memoryblock is resized. Or if that does not work, a new memoryblock is created
and data is copied. New bytes will be zero.

116.3.12 Properties

116.3.13 Address as Int64

MBS Util Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The address of the memory.
**Notes:**
This value became 64bit to avoid integer overflows.
(Read only property)

116.3.14 Memory as Memoryblock

MBS Util Plugin, Plugin Version: 5.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The memoryblock to access this memory.
**Notes:**
Keep a reference to the MemoryBlockMBS object as long as you use this memoryblock object.
(Read only property)
116.3.15  Size as Int64

MBS Util Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The size of this memoryblock.

**Notes:**
This value became 64bit to avoid integer overflows. (Read only property)
116.4.  CLASS MEMORYSTORAGEMBS

116.4  class MemoryStorageMBS

116.4.1  class MemoryStorageMBS

MBS Util Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class to store stuff in memory outside of the app memory.  
**Notes:**
The memory is stored using mapped memory in the system address space outside of the 32bit app memory of your app.

Normally a 32-bit app can only use 2 to 4 GB of memory. Using blocks of memory outside this address space, you can easily keep 10 GB of data in memory.

Be aware that a some point creating more storages may fail due to out of memory. The system may decide to swap memory to disk if you run out of physical memory.

Please have your app check free space on boot disk regularly and avoid running out of disk space for swap!

116.4.2  Methods

116.4.3  Constructor(Size as Int64 = 0)

MBS Util Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.
**Notes:** If size >0, we allocate the memory for this size right away.

116.4.4  Destructor

MBS Util Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

116.4.5  MemoryValue(Offset as Int64, Assigns s as MemoryBlock)

MBS Util Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets part of memory storage as string.
**Notes:**
Offset and Size are checked for range and an OutOfBoundsException can be raised. Please use constructor before to create memory storage with given size.
116.6  MemoryValue(Offset as Int64, Size as Int64) as MemoryBlock

MBS Util Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries part of memory storage as memory block. **Notes:** Offset and Size are checked for range and an OutOfBoundsException can be raised. See also:

- 116.4.10 MemoryValue as MemoryBlock
- 116.4.5 MemoryValue(Offset as Int64, Assigns s as MemoryBlock)

116.7  StringValue(Offset as Int64, Assigns s as String)

MBS Util Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries part of memory storage as string. **Notes:** Offset and Size are checked for range and an OutOfBoundsException can be raised. Please use constructor before to create memory storage with given size. See also:

- 116.4.13 StringValue as String
- 116.4.8 StringValue(Offset as Int64, Size as Int64) as String

116.8  StringValue(Offset as Int64, Size as Int64) as String

MBS Util Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries part of memory storage as string. **Notes:** Offset and Size are checked for range and an OutOfBoundsException can be raised. See also:

- 116.4.13 StringValue as String
- 116.4.7 StringValue(Offset as Int64, Assigns s as String)
116.4. CLASS MEMORYSTORAGEMBS

116.4.9 Properties

116.4.10 MemoryValue as MemoryBlock

MBS Util Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The content of this memory storage as a memoryblock. **Notes:** (Read and Write property) See also:

- 116.4.5 MemoryValue(Offset as Int64, Assigns s as MemoryBlock) 16623
- 116.4.6 MemoryValue(Offset as Int64, Size as Int64) as MemoryBlock 16624

116.4.11 Size as Integer

MBS Util Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The size of the data in bytes. **Notes:** (Read and Write property)

116.4.12 SizeAllocated as Integer

MBS Util Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The size of memory allocated. **Notes:** (Read and Write property)

116.4.13 StringValue as String

MBS Util Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The content of this memory storage as a string. **Notes:** (Read and Write property) See also:

- 116.4.7 StringValue(Offset as Int64, Assigns s as String) 16624
- 116.4.8 StringValue(Offset as Int64, Size as Int64) as String 16624
Chapter 117

Menu

117.1 Globals

117.1.1 MenuBarHeightMBS as Integer

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Returns the height of the menubar in pixels.  

**Example:**

```vba
msgbox "The menubar is " + str(MenuBarHeightMBS) + " pixels height."
```

**Notes:**

Requires the appearance manager.

Without plugin, you can use this:

```vba
declare function GetThemeMenuBarHeight lib "Carbon" (p as ptr) as Integer

dim l as Integer

dim p as memoryBlock

p = newmemoryBlock(10)

error = GetThemeMenuBarHeight(p)  // 0 if okay.

menuheight = p.short(0)  // in pixels. 22 on Mac OS X.
```

Added Cocoa support in plugin version 10.0.
117.2  class MenubarMBS

117.2.1  class MenubarMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Gives access to the Mac menubar.
**Example:**

```ruby
dim mb as MenubarMBS
mb=new MenubarMBS
mb.PreferencesMenuVisible=false // hide Preferences MenuMBS
```

**Notes:** Don’t use this class with RB5 or newer.

117.2.2  Methods

117.2.3  close

MBS Util Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.
**Notes:**

There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

117.2.4  CreateStandardWindowMenu

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates the standard Carbon Window menu.
**Example:**

```ruby
dim mb as MenubarMBS
mb=new MenubarMBS
mb.CreateStandardWindowMenu
```

**Notes:**

Only works in Carbon.
This window has some bugs like that the menu is not working correctly before you click on a window. But I think this is because of RB not using Carbon Events.
Do not use this method with RB5 or newer.

### 117.2.5 Item(index as Integer) as MenuMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu from the MenubarMBS at position index.

**Example:**
```pascal
dim mb as MenubarMBS
dim m as MenuMBS

mb=new MenubarMBS

m=mb.Item(4) // get MenuMBS number 4
```

### 117.2.6 Properties

#### 117.2.7 HideMenuCommandKey as string

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The command key of the Hide menu entry on Mac OS X.

**Notes:** (Read and Write computed property)

#### 117.2.8 HideMenuEnabled as boolean

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the Mac OS X Hide menu item is enabled.

**Notes:** (Read and Write computed property)

#### 117.2.9 HideMenuText as string

MBS Util Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The text of the hide menu entry on Mac OS X.

**Example:**
```pascal
dim m as MenuBarMBS

m=new MenuBarMBS
```
m.HideMenuText="Hello "+m.HideMenuText
m.HideOthersMenuText="Hello "+m.HideOthersMenuText
m.ShowAllMenuText="Hello "+m.ShowAllMenuText
m.PreferencesMenuText="Hello "+m.PreferencesMenuText
m.QuitMenuText="Hello "+m.QuitMenuText

Notes: (Read and Write computed property)

117.2.10 HideMenuVisible as boolean

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Whether the Mac OS X Hide menu item is visible.
Notes: (Read and Write computed property)

117.2.11 HideOthersMenuCommandKey as string

Notes: (Read and Write computed property)

117.2.12 HideOthersMenuEnabled as boolean

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Whether the Mac OS X Hide Others menu item is enabled.
Notes: (Read and Write computed property)

117.2.13 HideOthersMenuText as string

MBS Util Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The text of the hide others menu entry on Mac OS X.
Example:

dim m as MenuBarMBS
m=new MenuBarMBS
m.HideMenuText="Hello "+m.HideMenuText
117.2. CLASS MENUBARMBS

m.HideOthersMenuText="Hello " + m.HideOthersMenuText
m.ShowAllMenuText="Hello " + m.ShowAllMenuText
m.PreferencesMenuText="Hello " + m.PreferencesMenuText
m.QuitMenuText="Hello " + m.QuitMenuText

Notes: (Read and Write computed property)

117.2.14 HideOthersMenuVisible as boolean

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Whether the Mac OS X Hide Others menu item is visible. Notes: (Read and Write computed property)

117.2.15 MenuBarVisible as Boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns the menu from the menubar at position index.

Example:

dim mb as MenubarMBS
dim m as MenuMBS

mb=new MenubarMBS

m=mb.Item(4) // get MenuMBS number 4

Notes:
Requires Mac OS 8.5 or newer to work.
Returns always true on Windows.
(Read and Write computed property)

117.2.16 PreferencesMenuCommandKey as string

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The command key of the preferences menu entry on Mac OS X.

Example:

dim mb as MenubarMBS
mb=new MenubarMBS
mb.PreferencesMenuCommandKey="K"

Notes:
Don’t use this in RB 4.5 or newer. Use the PrefMenuItem class.
(Read and Write computed property)

117.2.17 PreferencesMenuEnabled as Boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the Mac OS X Preferences menu is enabled.

**Example:**
```lisp
dim mb as MenubarMBS
mb=new MenubarMBS
mb.PreferencesMenuEnabled=true // enable the pref MenuMBS
```

Notes:
Don’t use this in RB 4.5 or newer. Use the PrefMenuItem class.

For Mac OS 9 or Windows you need to make another Pref MenuMBS Entry which you hide if you are running on Mac OS X like this:

```
# if debugbuild then
# else
  // if not debugging
  # if targetcarbon then
    // if carbon
    if system.runningOnCarbonX then
      // if on Mac OS X
      EditPreferences.visible=False
      EditPreferencesLine.visible=False
      // Remove our lines from the Edit MenuMBS
    end if
  # endif
# endif
```

In the HandleAppleEvent Eventhandler in the application subclass you get an event of ID ”pref” if your
117.2.  CLASS MENUBARMBS

application is run on Mac OS X outside the Realbasic IDE.
(Read and Write computed property)

117.2.18  PreferencesMenuIconResID as Integer

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The ID of a CICN Resource in use as an icon for the preferences menu entry on Mac OS X.

**Example:**
```vbnet
Dim mb as MenubarMBS
mb=new MenubarMBS
mb.PreferencesMenuIconResID=257
```

**Notes:**
Don’t use this in RB 4.5 or newer. Use the PrefMenuItem class.
ID needs to be in Range between 256 and 511.
(Read and Write computed property)

117.2.19  PreferencesMenuSeparatorVisible as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether the line below the preferences menu entry on Mac OS X is visible.

**Example:**
```vbnet
Dim mb as MenubarMBS
mb=new MenubarMBS
mb.PreferencesMenuVisible=false // hide it
mb.PreferencesMenuSeparatorVisible=false // hide line below
```

**Notes:**
Don’t use this in RB 4.5 or newer. Use the PrefMenuItem class.
Returns always true on Windows.
(Read and Write computed property)
117.2.20 PreferencesMenuText as string

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The text of the preferences menu entry on Mac OS X.

**Example:**

```vba
dim mb as MenubarMBS
mb=new MenubarMBS
mb.PreferencesMenuText="My applications preferences..."
```

**Notes:**

Don’t use this in RB 4.5 or newer. Use the PrefMenuItem class.
(Read and Write computed property)

117.2.21 PreferencesMenuVisible as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether the preferences menu entry on Mac OS X is visible.

**Example:**

```vba
dim mb as MenubarMBS
mb=new MenubarMBS
mb.PreferencesMenuVisible=false // hide it
mb.PreferencesMenuSeparatorVisible=false // hide line below
```

**Notes:**

Don’t use this in RB 4.5 or newer. Use the PrefMenuItem class.
Returns always true on Windows.
(Read and Write computed property)

117.2.22 QuitMenuCommandKey as string

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The command key of the Quit menu entry on Mac OS X.

**Example:**
117.2. **CLASS MENUBARMBS**

```vbnet
dim mb as MenubarMBS

mb=new MenubarMBS

mb.QuitMenuCommandKey="K"
```

**Notes:**
Don’t use this in RB 4.5 or newer. Use the QuitMenuItem class.
(Read and Write computed property)

---

117.2.23 **QuitMenuEnabled as boolean**

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the Mac OS X Quit menu item is enabled.
**Notes:** (Read and Write computed property)

117.2.24 **QuitMenuIconResID as Integer**

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The ID of a CICN Resource in use as an icon for the Quit menu entry on Mac OS X.
**Example:**
```vbnet
dim mb as MenubarMBS

mb=new MenubarMBS

mb.QuitMenuIconResID=257
```

**Notes:**
Don’t use this in RB 4.5 or newer. Use the PrefMenuItem class.
ID needs to be in Range between 256 and 511.
(Read and Write computed property)

---

117.2.25 **QuitMenuSeparatorVisible as boolean**

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether the line below the Quit menu entry on Mac OS X is visible.
**Example:**
dim mb as MenubarMBS

mb=new MenubarMBS

mb.QuitMenuVisible=false // hide it
mb.QuitMenuSeparatorVisible=false // hide line below

Notes:
Don’t use this in RB 4.5 or newer. Use the QuitMenuItem class.
Returns always true on Windows.
(Read and Write computed property)

117.2.26 QuitMenuText as string

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The text of the Quit menu entry on Mac OS X.
**Example:**

```ruby
dim mb as MenubarMBS

mb=new MenubarMBS

mb.QuitMenuText='"My applications Quit..."'
```

Notes:
Don’t use this in RB 4.5 or newer. Use the QuitMenuItem class.
(Read and Write computed property)

117.2.27 QuitMenuVisible as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether the Quit menu entry on Mac OS X is visible.
**Example:**

```ruby
dim mb as MenubarMBS

mb=new MenubarMBS

mb.QuitMenuVisible=false // hide it
mb.QuitMenuSeparatorVisible=false // hide line below
```
Notes:
Don’t use this in RB 4.5 or newer. Use the QuitMenuItem class.
Returns true on Windows.
(Read and Write computed property)

117.2.28 ServicesMenuCommandKey as string

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The command key of the Services menu entry on Mac OS X.
**Notes:** (Read and Write computed property)

117.2.29 ServicesMenuEnabled as boolean

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the Mac OS X services menuitem is enabled.
**Notes:** (Read and Write computed property)

117.2.30 ServicesMenuText as string

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The text of the services menu entry on Mac OS X.
**Notes:** (Read and Write computed property)

117.2.31 ServicesMenuVisible as boolean

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the Mac OS X Services menuitem is visible.
**Notes:** (Read and Write computed property)

117.2.32 ShowAllMenuCommandKey as string

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The command key of the Show All menu entry on Mac OS X.
**Notes:** (Read and Write computed property)
117.2.33 ShowAllMenuEnabled as boolean

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the Mac OS X Show All menu item is enabled. **Notes:** (Read and Write computed property)

117.2.34 ShowAllMenuText as string

MBS Util Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The text of the show all menu entry on Mac OS X. **Example:**

```vba
dim m as MenuBarMBS
m= new MenuBarMBS
m.HideMenuText= "Hello "+m.HideMenuText
m.HideOthersMenuText= "Hello "+m.HideOthersMenuText
m.ShowAllMenuText= "Hello "+m.ShowAllMenuText
m.PreferencesMenuText= "Hello "+m.PreferencesMenuText
m.QuitMenuText= "Hello "+m.QuitMenuText
```

**Notes:** (Read and Write computed property)

117.2.35 ShowAllMenuVisible as boolean

MBS Util Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the Mac OS X Show All menu item is visible. **Notes:** (Read and Write computed property)
117.3.  

class MenuMBS

117.3.1  

class MenuMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Gives access to a MenuMBS in the MenubarMBS.  
**Example:**

```vba
    dim mb as MenubarMBS
    dim m as MenuMBS
    mb=new MenubarMBS
    m=mb.item(2)  // second MenuMBS
    m.bold(1)=true  // make it bold
```

**Deprecated:** This item is deprecated and should no longer be used. You can use NSMenuMBS and NSMenuItemMBS for Cocoa projects instead.

117.3.2  

Methods

117.3.3  

**AppendItem(description as string)**

**Function:** Appends a new menu item to a menu, using a string for the item’s text.

117.3.4  

**AppendItems(description as string)**

**Function:** Appends a new menu item to a menu, using a string for the item’s text.

117.3.5  

**close**

**Function:** The destructor.  
**Notes:**

There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.  
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)
117.3.6 Count as Integer

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The number of items

**Example:**

```vba
dim mb as MenubarMBS
dim m as MenuMBS
mb=new MenubarMBS
m=mb.item(2)
msgbox str(m.count)+" items in the second MenuMBS."
```

117.3.7 DeleteItem(index as Integer)

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Deletes a menuitem in the menu.

117.3.8 DisableAllMenuItems

MBS Util Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Disables all menu items.

117.3.9 DisposeMenu

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Disposes the menu.

117.3.10 EnableAllMenuItems

MBS Util Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Enables all menu items.

117.3.11 InsertItem(description as string,afteritem as Integer)

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Inserts a menuitem in the menu.
117.3.12 InsertItems(description as string, afteritem as Integer)

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Inserts menuitems in the menu.

117.3.13 MenuHasEnabledItems as boolean

MBS Util Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if there is at least one enabled menu item.

117.3.14 NewMenu(id as Integer, name as string) as boolean

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new menu.

117.3.15 SetIconCFStringHandle(index as Integer, CFStringRef as Integer)

MBS Util Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The CFString Handle for the icon name of a menuitem.

**Notes:**
Use the handle property of a CFStringMBS object.
A CFString naming a resource in the main bundle of the process.
(Mac OS X 10.1 and later only)
This one works with the dock tile menus.

117.3.16 SetIconCGImageHandle(index as Integer, CGImageRef as Integer)

MBS Util Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The CGImage Handle for the icon name of a menuitem.

**Notes:** Use the handle property of a CGImageMBS object.

117.3.17 SetIconRefHandle(index as Integer, IconRef as Integer)

MBS Util Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The Icon Reference Handle for the icon name of a menuitem.

**Example:**
dim i as IconMBS
dim m as MenuMBS
dim b as MenuBarMBS

i=new IconMBS(SpecialFolder.Desktop)

b=new MenuBarMBS
m=b.Item(2+16) // Edit menu in RB 4.5
m.SetIconRefHandle 1, i.Handle // edit -> undo
m.SetIconRefHandle 3, i.Handle // edit -> cut

Notes: Use the handle property of a IconMBS object.

117.3.18 SetIconSelector(index as Integer, Selector as string)

Example:
dim m as MenuMBS
dim b as MenuBarMBS

b=new MenuBarMBS
m=b.Item(3) // Edit menu in RB 4.5
m.SetIconSelector 1, "FNDR" // Finder Icon

Notes: This one works with the dock tile menus.

117.3.19 Properties

117.3.20 Handle as Integer

Notes:
A MenuRef.
Value is 0 if there is no Mac OS menu.
(Read and Write property)
117.3.21 Popup as PopupMenu

MBS Util Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The popupmenu this menu was made from.  
**Notes:**  
Only filled by the PopupMenu.MenuMBS function.  
(Read and Write property)

117.3.22 Bold(index as Integer) as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The font style to use for the MenuMBS item.  
**Example:**
```
dim mb as MenubarMBS  
dim m as MenuMBS  
mb=new MenubarMBS  
m=mb.item(2)  
m.Bold(1)=true
```

**Notes:** (Read and Write computed property)

117.3.23 CommandID(index as Integer) as Integer

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The command id for a menu entry.  
**Notes:**  
Used for Carbon Events.  
Index is from 1 to count.  
You should use codes which are created from 4 letter strings with the OSTypeFromStringMBS function. All low letter codes like "new" are reserved by Apple, but you can of course use them.  

Common codes defined by Apple:

(Read and Write computed property)
117.3.24  CommandKey(index as Integer) as string

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The command key code to use with the MenuMBS entry.

**Example:**
```vbnet
dim mb as MenubarMBS
dim m as MenuMBS
mb=new MenubarMBS
m=mb.item(2)
m.CommandKey(1)="K"
```

**Notes:** (Read and Write computed property)

117.3.25  Condense(index as Integer) as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The font style to use for the MenuMBS item.

**Example:**
```vbnet
dim mb as MenubarMBS
dim m as MenuMBS
mb=new MenubarMBS
m=mb.item(2)
m.Condense(1)=true
```

**Notes:** (Read and Write computed property)

117.3.26  Enabled(index as Integer) as boolean

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether the menu item is enabled.

**Notes:** (Read and Write computed property)

117.3.27  Extend(index as Integer) as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The font style to use for the MenuMBS item.

**Example:**
117.3. CLASS MENUMBS

```vbs
    dim mb as MenubarMBS
    dim m as MenuMBS
    mb=new MenubarMBS
    m=mb.item(2)
    m.Extend(1)=true
```

Notes: (Read and Write computed property)

117.3.28 FontName(index as Integer) as string

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The Font to use for the MenuMBS item.

**Example:**

```vbs
    dim mb as MenubarMBS
    dim m as MenuMBS
    mb=new MenubarMBS
    m=mb.item(2)
    m.FontName(1)="Comic sans ms"
```

Notes: (Read and Write computed property)

117.3.29 IconEnabled(index as Integer) as boolean

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether the menu item is enabled.

Notes: (Read and Write computed property)

117.3.30 IconResID(index as Integer) as Integer

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The ID of a CICN Resource in use as an icon for the MenuMBS entry.

**Example:**

```vbs
    dim mb as MenubarMBS
    dim m as MenuMBS
    mb=new MenubarMBS
    m=mb.item(2)
    m.IconResID(1)=257
```
Notes:

ID needs to be in Range between 256 and 511.
(Read and Write computed property)

117.3.31 Italic(index as Integer) as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The font style to use for the MenuMBS item.

**Example:**

```pascal
dim mb as MenubarMBS
dim m as MenuMBS
mb=new MenubarMBS
m=mb.item(2)
m.Italic(1)=true
```

Notes: (Read and Write computed property)

117.3.32 Mark(index as Integer) as Integer

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether to show a mark.

**Example:**

```pascal
dim mb as MenubarMBS
dim m as MenuMBS
mb=new MenubarMBS
m=mb.item(2)
m.mark(1)=& h12
```

Notes:

(Read and Write computed property)

117.3.33 MenuFont as string

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The font for the menu item.
117.3. **CLASS MENUMB S**

**Notes:** (Read and Write computed property)

### 117.3.34 MenuFontSize as Integer

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The font size of this menu item.  
**Notes:** (Read and Write computed property)

### 117.3.35 MenuIconHandle as Integer

MBS Util Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The icon of the given menu.  
**Example:**

```vbnet
dim b as MenuBarMBS
dim m as MenuMBS
dim i as Integer
dim ic as IconMBS

ic=new IconMBS(SpecialFolder.Desktop)
b=new MenuBarMBS
m=b.Item(3)
m.MenuTitle="Hello Edit Menu"
m=b.Item(2)
m.MenuIconHandle=ic.Handle
```

**Notes:**
You pass a handle of a IconMBS object (IconRef).  
(Read and Write computed property)

### 117.3.36 MenuTitle as string

MBS Util Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The title of the menu itself.  
**Example:**
dim b as MenuBarMBS
dim m as MenuMBS
dim i as Integer
dim ic as IconMBS

ic=new IconMBS(SpecialFolder.Desktop)

b=new MenuBarMBS

m=b.Item(3)
m.MenuTitle="Hello Edit Menu"

m=b.Item(2)
m.MenuIconHandle=ic.Handle

Notes:
As internally the string is converted to a CFString you may prefer to use MenuTitleCFString instead of MenuTitle if your string is already a CFString. (e.g. coming from the localization functions)
(Read and Write computed property)

117.3.37 MenuTitleCFString as object

Notes:
As internally the string is converted to a CFString you may prefer to use MenuTitleCFString instead of MenuTitle if your string is already a CFString. (e.g. coming from the localization functions)
(Read and Write computed property)

117.3.38 Outline(index as Integer) as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The font style to use for the MenuMBS item.
Example:

dim mb as MenubarMBS
dim m as MenuMBS
mb=new MenubarMBS
m=mb.item(2)
117.3. CLASS MENUMBS

m.Outline(1)=true

Notes:
Seems not to work for popupmenu on Mac OS X 10.1.5.
(Read and Write computed property)

117.3.39 Shadow(index as Integer) as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The font style to use for the MenuMBS item.
**Example:**
```vba
dim mb as MenubarMBS
dim m as MenuMBS
mb=new MenubarMBS
m=mb.item(2)
m.Shadow(1)=true
```

Notes:
Seems not to work for popupmenu on Mac OS X 10.1.5.
(Read and Write computed property)

117.3.40 SubMenu(index as Integer) as MenuMBS

MBS Util Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The submenu attached to the menu entry with the given index.
**Notes:**
Set to nil to remove a menu.
Returns nil if no menu is on the given position.
Works only in Carbon Mac OS applications.
(Read and Write computed property)

117.3.41 SubmenuParentChoosable(index as Integer) as boolean

MBS Util Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the submenu parent menuitem can be choosed by the user.
**Notes:** (Read and Write computed property)
117.3.42  **Text(index as Integer) as string**

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The caption to use with the MenuMBS entry.

**Example:**

```vbs
dim mb as MenubarMBS
dim m as MenuMBS
mb=new MenubarMBS
m=mb.item(2)
m.Text(1)="A nice text"
```

**Notes:**
Set TextEncoding(index) to & h08000100 if you use UTF8 text!
(Read and Write computed property)

117.3.43  **TextEncoding(index as Integer) as UInt32**

MBS Util Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The Textencoding of the menu item.

**Notes:**
The text encoding script ID for the menu.
(Read and Write computed property)

117.3.44  **Underline(index as Integer) as boolean**

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The font style to use for the MenuMBS item.

**Example:**

```vbs
dim mb as MenubarMBS
dim m as MenuMBS
mb=new MenubarMBS
m=mb.item(2)
m.Underline(1)=true
```

**Notes:** (Read and Write computed property)
CHAPTER 117. MENU

kHICommandOK OSTYPEFromStringMBS("ok") The OK button in a dialog or alert.
kHICommandCancel OSTYPEFromStringMBS("not") The Cancel button in a dialog or alert.
kHICommandQuit OSTYPEFromStringMBS("quit") The application should quit.
kHICommandUndo OSTYPEFromStringMBS("undo") The last editing operation should be undone.
kHICommandRedo OSTYPEFromStringMBS("redo") The last editing operation should be redone.
kHICommandCut OSTYPEFromStringMBS("cut") The selected items should be cut.
kHICommandCopy OSTYPEFromStringMBS("copy") The selected items should be copied.
kHICommandPaste OSTYPEFromStringMBS("past") The contents of the clipboard should be pasted.
kHICommandClear OSTYPEFromStringMBS("clea") The selected items should be deleted.
kHICommandSelectAll OSTYPEFromStringMBS("all") All items in the active window should be selected.
kHICommandHide OSTYPEFromStringMBS("hidc") The application should be hidden. The Menu Manager will respond to this command automatically; your application does not need to handle it.
kHICommandHideOthers OSTYPEFromStringMBS("hidc") Other applications should be hidden. The Menu Manager will respond to this command automatically; your application does not need to handle it.
kHICommandShowAll OSTYPEFromStringMBS("shal") All applications should become visible. The Menu Manager will respond to this command automatically; your application does not need to handle it.
kHICommandPreferences OSTYPEFromStringMBS("ahlp") The Preferences menu item has been selected.
kHICommandZoomWindow OSTYPEFromStringMBS("zoom") The active window should be zoomed in or out. The Window Manager will respond to this event automatically; your application does not need to handle it, but you may want to install a Carbon event handler for kEventWindowGetIdealSize to return the ideal size for your document windows.
kHICommandMinimizeWindow OSTYPEFromStringMBS("mini") The active window should be minimized. The Window Manager will respond to this event automatically; your application does not need to handle it. All windows of the same class as the active window that have collapse boxes should be minimized. The Window Manager will respond to this event automatically; your application does not need to handle it.
kHICommandMaximizeWindow OSTYPEFromStringMBS("maxi") The active window should be maximized. Only sent on Mac OS 9. The Window Manager will respond to this event automatically; your application does not need to handle it.
kHICommandMaximizeAll OSTYPEFromStringMBS("maxa") All windows of the same class as the active window that have collapse boxes should be maximized. The Window Manager will respond to this event automatically; your application does not need to handle it.
kHICommandArrangeInFront OSTYPEFromStringMBS("frnt") All document-class windows should be arranged in a stack. The Window Manager will respond to this event automatically; your application does not need to handle it.
kHICommandBringAllToFront OSTYPEFromStringMBS("bfrt") All windows of this application should be brought in front of windows from other applications. Only sent on Mac OS X. The Window Manager will respond to this event automatically; your application does not need to handle it.
kHICommandWindowListSeparator OSTYPEFromStringMBS("wldv") This command ID is used as a placeholder to mark the separator item dividing the Zoom/Minimize/Maximize/Arrange menu items in the standard Window menu from the menu items listing the visible windows. If you need to add your own menu items to the standard Window menu before the window list section, you can look for the menu item with this command ID using GetIndMenuItemWithCommandID, and insert your menu items before the item with this ID.
kHICommandWindowListTerminator OSTYPEFromStringMBS("wlst") This command ID is used as a placeholder to mark the end of the window list section of the standard Window menu. If you need to add your own menu items to the standard Window menu after the window list section, you can look for the menu item with this command ID using GetIndMenuItemWithCommandID, and insert your menu items after the item with this ID.
kHICommandSelectWindow OSTYPEFromStringMBS("swin") A window in the standard Window menu has been selected and should be activated. The Window Manager will respond to this event automatically; your application does not need to handle it.
kHICommandAbout OSTYPEFromStringMBS("about") The About menu item has been selected.
kHICommandNew OSTYPEFromStringMBS("new") A new document or item should be created.
kHICommandOpen OSTYPEFromStringMBS("open") The user wants to open an existing document.
kHICommandClose OSTYPEFromStringMBS("cloa") The active window should be closed.
kHICommandSave OSTYPEFromStringMBS("save") The active document should be saved.
kHICommandSaveAs OSTYPEFromStringMBS("svas") The user wants to save the active document under a new name.
kHICommandRevert OSTYPEFromStringMBS("rvrt") The contents of the active document should be reverted to the last saved version.
kHICommandPrint OSTYPEFromStringMBS("prnt") The active window should be printed.
kHICommandPageSetup OSTYPEFromStringMBS("page") The user wants to configure the current page margins, formatting, and print options.
kHICommandAppHelp OSTYPEFromStringMBS("ahlp") The application’s help book should be displayed. Used by the Help Manager when it adds the ”<AppName>Help” menu item to the Help menu. The Help Manager will respond to this event automatically; your application does not need to handle it.
& h00  no mark
& h12  check mark
& h13  diamond mark
117.4 class Popupmenu

117.4.1 class Popupmenu

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Gives access to the MenuMBS of the PopupMenu.

**Example:**
```vbscript
dim m as MenuMBS
m=popupmenu1.MenuMBS
m.italic(1)=true
m.bold(2)=true
m.underline(3)=true
m.Condense(4)=true
m.extend(5)=true
m.Outline(6)=true
m.shadow(7)=true
m.Enabled(8)=true
m.enabled(9)=false
```

117.4.2 Methods

117.4.3 MenuMBS as MenuMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a MenuMBS object to access the Menuitems.

**Example:**
```vbscript
dim m as MenuMBS
m=popupmenu1.MenuMBS
m.italic(1)=true
m.bold(2)=true
m.underline(3)=true
m.Condense(4)=true
m.extend(5)=true
m.Outline(6)=true
m.shadow(7)=true
m.Enabled(8)=true
m.enabled(9)=false
```

Notes:
It looks like there is a bug in RB5 which forces this function to always return nil. Seems not to work in RB 2007 well. See the "FontPopupMenu.rb" example for a different usage.

117.4.4 NSButtonMBS as NSButtonMBS

**Function:** Creates a NSButtonMBS object for the given control.
**Example:**

```
MsgBox PopupMenu1.NSButtonMBS.className
```

**Notes:** This way you can manipulate Cocoa controls directly.

117.4.5 NSPopUpButtonMBS as NSPopUpButtonMBS

**Function:** Creates a NSPopUpButtonMBS object for the given control.
**Example:**

```
// get cocoa view for the popupmenu
dim p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

// find a menu entry
dim it as NS(MenuItemMBS = p.itemAtIndex(0)

// get a picture
dim pic as Picture = LogoMBS(500)
dim img as new NSImageMBS(pic)
img.setSize 16,16

// and assign icon
it.image = img
```

**Notes:** This way you can manipulate Cocoa controls directly.
Chapter 118

Midi

118.1 class AVMIDIPhlayerMBS

118.1.1 class AVMIDIPhlayerMBS

Function: The AVMIDIPhlayer class is a player for music file formats such as MIDI and iMelody.
Notes: Requires Mac OS X 10.10.

118.1.2 Methods

118.1.3 Constructor(Data as MemoryBlock, SoundBankFile as Folderitem = nil, byref error as NSErrorMBS)

Function: Initializes a newly allocated MIDI player with the contents of the String, using the specified sound bank.
Notes: Data: The data to play.
SoundBankFile: The folderitem of the sound bank. The sound bank must be a SoundFont2 or DLS bank.
Error: Returns, by-reference, a description of the error, if an error occurs.

For OS X the bank folderitem can be set to nil to use the default sound bank. However, iOS must always refer to a valid bank file.
See also:

• 118.1.4 Constructor(Data as String, SoundBankFile as Folderitem = nil, byref error as NSErrorMBS)

16657
118.1.4 Constructor(Data as String, SoundBankFile as Folderitem = nil, byref error as NSErrorMBS)

Function: Initializes a newly allocated MIDI player with the contents of the String, using the specified sound bank.
Notes:
Data: The data to play.
SoundBankFile: The folderitem of the sound bank. The sound bank must be a SoundFont2 or DLS bank.
Error: Returns, by-reference, a description of the error, if an error occurs.

For OS X the bank folderitem can be set to nil to use the default sound bank. However, iOS must always refer to a valid bank file.
See also:

- 118.1.3 Constructor(Data as MemoryBlock, SoundBankFile as Folderitem = nil, byref error as NSErrorMBS)
- 118.1.5 Constructor(File as Folderitem, SoundBankFile as Folderitem = nil, byref error as NSErrorMBS)

118.1.5 Constructor(File as Folderitem, SoundBankFile as Folderitem = nil, byref error as NSErrorMBS)

Function: Initializes a newly allocated MIDI player with the contents of the file, using the specified sound bank.
Notes:
File: The file to play.
SoundBankFile: The folderitem of the sound bank. The sound bank must be a SoundFont2 or DLS bank.
Error: Returns, by-reference, a description of the error, if an error occurs.

For OS X the bank folderitem can be set to nil to use the default sound bank. However, iOS must always refer to a valid bank file.
See also:

- 118.1.3 Constructor(Data as MemoryBlock, SoundBankFile as Folderitem = nil, byref error as NSErrorMBS)
118.1. Constructor

- 118.1.4 Constructor(Data as String, SoundBankFile as Folderitem = nil, byref error as NSErrorMBS)

118.1.6 Destructor

Function: The destructor.

118.1.7 play

Function: Plays the sequence.
Notes: If prepareToPlay has not been invocked, play may be delayed while the events are prerolled.

118.1.8 prepareToPlay

Function: Prepares to play the sequence by prerolling all events.
Notes: This happens automatically on play if it has not already been called, but may produce a delay in startup.

118.1.9 stop

Function: Stops playing the sequence.

118.1.10 Properties

118.1.11 CurrentPosition as Double

Function: The current playback position, in seconds.
Notes:
You can set the currentPosition of the player while the player is playing, in which case playback will resume at the new time.
Note: No range checking on the currentPosition value is done when you set it to a new value. It is your responsibility to ensure the position is valid relative to the duration.
(Read and Write property)

118.1.12 Duration as Double

**Function:** The length of the currently loaded file, in seconds.
**Notes:** (Read only property)

118.1.13 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

118.1.14 Playing as Boolean

**Function:** Whether the sequence is playing.
**Notes:**
The player may have reached the end of all the events in any of its tracks, but it will return true until it is stopped.
(Read only property)

118.1.15 Rate as Double

**Function:** The playback rate of the player.
**Notes:**
The default value is 1.0, normal playback rate.
(Read and Write property)
118.1. CLASS AVMIDIPLAYERMBS

118.1.16 Events

118.1.17 Completed

MBS AVFoundation Plugin, Plugin Version: 16.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: Called when a MIDI playback request is completed.
118.2  class MidiClientMBS

118.2.1  class MidiClientMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the global MIDI stuff on Mac OS X.

**Notes:**
Only make one instance of this class in your application.

From Apple’s documentation:

**History:**

Apple’s MIDI Manager (ca. 1990) had a simple model of the world. There were application and driver clients, which had MIDI in/out ports, which could be interconnected in arbitrary ways. This model failed to provide a way for applications to make reasonable assumptions about how to make bi-directional connections to a MIDI device. MIDI Manager also had limitations on the number of ports per client, and became very unwieldy with the advent of large studios and multi-port MIDI interfaces such as the MIDI Time Piece and Studio 5.

Opcode’s OMS (1991) addressed some of the shortcomings of MIDI Manager. There was the concept of a studio setup document, where drivers detected their devices, and the user could define the characteristics of additional devices connected to the MIDI ports. Applications could view the studio both as a collection of MIDI source and destination ”nodes”, but also as a collection of devices. OMS collected information about, and made available to its clients, useful characteristics of the devices in the studio, such as their system-exclusive IDs, MIDI channels on which they were listening, which were controllers (as opposed to simple tone generators), etc.

**API Overview:**
This design expands slightly on OMS’s device/node hierarchy, inspired by the USB MIDI spec.

Drivers own and control devices, e.g. USB interfaces, PCI cards, etc. A device is defined as a physical object that would be represented by a single icon if there were a graphical view of the studio.

Devices may have multiple logically distinct sub-components, e.g. a MIDI synthesizer and a pair of MIDI ports, both addressable via a USB port. These are called Entities.

Entities have any number of Endpoints, sources and destinations of 16-channel MIDI streams. By grouping a device’s endpoints into entities, the system has enough information for an application to make reasonable assumptions about how to communicate in a bi-directional manner with each entity, as is necessary in MIDI librarian applications.
Third-party services like FreeMIDI or OMS can collect and report interesting properties of a device by attaching those properties to the devices' entities – CoreMIDI provides a central database, but no user interfaces. It's worth noting that some device characteristics are dynamic (e.g. MIDI receive channel and system-exclusive ID's), or a matter of user preference (choice of icon, whether the device should appear in lists of possible controllers), while other properties are static and could be looked up in a database, using the device's manufacturer and model names as a key.

Persistent configurations / Device Information:
There are a number of reasons why CoreMIDI has a persistent state.

Consider a USB MIDI interface driver, in the case where there are two instances of one model of interface present. The driver needs a way to permanently distinguish, to the system and its clients, between the two interfaces. Which is # 1 and which is # 2? If # 1 gets unplugged, # 2 should not automatically become # 1; the user's documents may be referring to devices which were attached to # 2.

The system needs a persistent concept of which driver's device is attached to a serial port.

These needs for persistent configuration information provide a rationale for having something akin to OMS's studio setup document, a saved configuration for the system. Mobile users who work in multiple environments could select between multiple saved configurations in a Location Manager-compatible manner.

Given services with which to store driver configuration information, we then have built the groundwork for a client studio setup editor application.

Such an application can define external MIDI devices (not to be confused with the driver-owned cards/interfaces/etc whose presence in the configuration is determined by the driver).

Implementation overview:
The client API is implemented as the CoreMIDI framework, which uses IPC to communicate with a server process, MIDIServer.

The server process loads, and manages all communication with, MIDI drivers. Most of its implementation is in the CoreMIDIServer framework, which drivers may import in order to access the API.

"Drivers" are not I/O Kit drivers. They are dynamic libraries, using CFPlugin.

Many MIDI drivers can simply be user-side I/O Kit clients (probably for serial, USB, Firewire).
But unlike OMS, the system is able to begin functioning immediately, using only the MIDI devices/endpoints detected by the drivers, without forcing the user to go through a somewhat lengthy and confusing initial configuration process. Definition of external MIDI devices can be a completely optional step, only made possible when a client application requests that they be added to the configuration.

PCI card drivers will need their MIDI drivers to communicate with a separate kernel extension.

If you have an old file named EmagicUSBMIDIDriver.plugin in your /Library/Audio/MIDI Drivers folder, please remove it. It makes trouble with our Midi classes.
Subclass of the MidiObjectMBS class.

118.2.2 Methods

118.2.3 Available as boolean

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
True if the MIDI stuff was successful loaded.

118.2.4 close

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The destructor.
**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

118.2.5 CreateDestination(name as CFStringMBS, TargetEndpointObject as MidiEndpointMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Create a virtual destination in a client.
**Notes:**
Clients may use this to create virtual destinations.
Lasterror is set.
You must pass a valid new MidiEndpointMBS for TargetEndpointObject. Best is if you make a subclass from MidiEndpointMBS and fill the event. You can add there additional methods and properties. CreateDestination will than fill the handle property on success.
118.2. CLASS MIDICLIENTMBS

118.2.6 CreateInputPort(name as CFStringMBS, targetportobject as MidiPortMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create an input port through which the client may receive incoming MIDI messages from any MIDI source. **Example:**

```vba
dim mc as MidiClientMBS
dim mp as MidiPortMBS

mc=new MidiClientMBS
mc.Init NewCFStringRefMBS("Testapp")

mp=new MidiPortMBS
mc.CreateInputPort NewCFStringRefMBS("Testport"), mp

if mp.Handle=0 then
    MsgBox "There was an error: " +str(mc.Lasterror)
else
    MsgBox "ok"
end if
```

**Notes:**

After creating a port, use MIDIPortConnectSource to establish an input connection from any number of sources to your port.

Lasterror is set.

As you can subclass the MidiPortMBS class you must pass to this function a valid MidiPortMBS object so it can be filled.

118.2.7 CreateOutputPort(name as CFStringMBS, targetportobject as MidiPortMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create an output port through which the client may send outgoing MIDI messages to any MIDI destination. **Example:**

```vba
dim mc as MidiClientMBS
dim mp as MidiPortMBS

mc=new MidiClientMBS
mc.Init NewCFStringRefMBS("Testapp")
```
Let mp = new MidiPortMBS
mc.CreateOutputPort NewCFStringMBS(”Testport”), mp

if mp.Handle=0 then
MsgBox ”There was an error: ” +str(mc.Lasterror)
else
MsgBox ”ok”
end if

**Notes:**

Output ports provide a mechanism for MIDI merging. The system assumes that each output port will be responsible for sending only a single MIDI stream to each destination, although a single port may address all of the destinations in the system.

Lasterror is set.

As you can subclass the MidiPortMBS class you must pass to this function a valid MidiPortMBS object so it can be filled.

### 118.2.8 CreateSource(name as CFStringMBS) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new virtual Midi source. **Example:**

```vbnet
dim m as MidiClientMBS
dim e as MidiEndpointMBS

m=new MidiClientMBS
// Initialize
m.Init NewCFStringMBS(”Hallo”)

// Create device:
e=m.CreateSource(NewCFStringMBS(”Hallo”))
// if error is 0 and handle is not 0, it’s okay
MsgBox ”error: ”+str(m.Lasterror)+”, handle: ”+str(e.Handle)
```

**Notes:**

Lasterror is set.
118.2. CLASSTMIDICLIENTMBS

Returns nil on any error.

Clients may use this to create virtual sources.

After creating a virtual source, use Received to transmit MIDI messages from your virtual source to any clients connected to the virtual source.

118.2.9 FindObjectByUniqueID(id as Integer) as MidiObjectMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Locate a device, typedefal device, entity, or endpoint by its uniqueID.

**Notes:**

New for CoreMIDI 1.3.
You may cast the returned object to MidiEndpointMBS, MidiEntityMBS or MidiDeviceMBS. RB's "isa" command may help you.
Returns nil on any error. Lasterror is set.

118.2.10 GetDestination(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return one of the destinations in the system.

**Notes:**

The index goes from 0 to NumberOfDestinations-1.
Lasterror is set.
Returns nil on any error.

118.2.11 GetDevice(index as Integer) as MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return one of the devices in the system.

**Notes:**

To enumerate the entities in the system, you can walk through the devices, then walk through the devices' entities.

Note: If a client iterates through the devices and entities in the system, it will not ever visit any virtual sources and destinations created by other clients. Also, a device iteration will return devices which are "offline" (were present in the past but are not currently present), while iterations through the system's sources and destinations will not include the endpoints of offline devices.
Thus clients should usually prefer NumberOfSources, GetSource, NumberOfDestinations and GetDestination to iterating through devices and entities to locate endpoints.

LastError is set.
Returns nil on any error.

118.2.12 GetExternalDevice(index as Integer) as MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Return one of the external devices in the system.
Notes:
The index goes from 0 to NumberOfDevices-1.
LastError is set.
Returns nil on any error.

118.2.13 GetSource(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Return one of the sources in the system.
Notes:
The index goes from 0 to NumberOfSources-1.
LastError is set.
Returns nil on any error.

118.2.14 Init(name as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Creates a new Client object with the given client name.
Notes: Lasterror is set.

118.2.15 NumberOfDestinations as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the number of destinations in the system.
Example:
118.2. CLASS MIDICLIENTMBS

dim m as new MidiClientMBS
dim n as Integer = m.NumberOfDestinations

MsgBox "NumberOfDestinations: " + str(n)

Notes:

Returns 0 on any error.
Lasterror is set.

118.2.16 NumberOfDevices as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the number of devices in the system.
Example:

dim m as new MidiClientMBS
dim n as Integer = m.NumberOfDevices

MsgBox "NumberOfDevices: " + str(n)

Notes:

Returns 0 on any error.
Lasterror is set.

118.2.17 NumberOfExternalDevices as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the number of typedefal MIDI devices in the system.
Example:

dim m as new MidiClientMBS
dim n as Integer = m.NumberOfExternalDevices

MsgBox "NumberOfExternalDevices: " + str(n)

Notes:

External MIDI devices are MIDI devices connected to endpoints via a standard MIDI cable. Their presence is completely optional, only when a UI somewhere adds them.
New for CoreMIDI 1.1.

Returns 0 on any error.
Lasterror is set.

118.2.18  **NumberOfSources as Integer**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of sources in the system.
**Example:**
```vbnet
dim m as new MidiClientMBS
dim n as Integer = m.NumberOfSources

MsgBox "NumberOfSources: " +str(n)
```

**Notes:**
Returns 0 on any error.
Lasterror is set.

118.2.19  **Restart as Integer**

MBS MacCF Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Stops and restarts MIDI I/O.
**Notes:**
This is useful for forcing CoreMIDI to ask its drivers to rescan for hardware.
Returns the Mac OS X error code.

118.2.20  **Send(port as MidiPortMBS, endpoint as MidiEndpointMBS, packets as MidiPacketListMBS)**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sends midi data using the port to the given endpoint.
**Example:**
```vbnet
// Not 100% if this example works:
dim client as MIDIClientMBS
```
118.2. CLASS MIDIClientMBS

```
dim outport as MIDIPortMBS
dim dest as MIDIEndpointMBS
dim pack as MIDIEndpointMBS
dim list as MIDIPacketListMBS
dim packs(-1) as MIDIPacketMBS

client = new MidiClientMBS

if client <> nil then
    client.Init newcfstringmbs("CoreMIDI")
    outport = new MIDIPortMBS
    client.CreateOutputPort(NewCFStringMBS("outport"), outport)
    dest = client.getDestination(0)
    outport.connectSource dest

    pack = new MIDIPacketMBS
    list = new MIDIPacketListMBS
    pack.timeStamp = nil
    pack.datastring = charb(& h90) + charb(& h5A) + charb(& h7C)
    packs.append pack
    if not list.FillList(packs) then
        msgBox "bad"
    end

    client.Send(outport, dest, list)
end
```

Notes:
Events with future timestamps are scheduled for future delivery. The system performs any needed MIDI merging.

Lasterror is set.

118.2.21 Events

118.2.22 ObjectAdded(parent as MidiObjectMBS, child as MidiObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called when an object is added to a MidiObject.
Notes: Seems not to be called currently.
### 118.2.23 ObjectRemoved(parent as MidiObjectMBS, child as MidiObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when an object is removed from a MidiObject. **Notes:** Seems not to be called currently.

### 118.2.24 PropertyChanged(target as MidiObjectMBS, theProperty as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a property was changed. **Notes:** Seems to be never called currently.

### 118.2.25 SerialPortOwnerChanged

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A persistent MIDI Thru connection was created or destroyed. **Notes:** New for CoreMIDI 1.3.

### 118.2.26 SetupChanged

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Some aspect of the current MIDISetup has changed. **Notes:** You should ignore this message if you handle the other messages.

### 118.2.27 ThruConnectionsChanged

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A persistent MIDI Thru connection was created or destroyed. **Notes:** New for CoreMIDI 1.3.

### 118.2.28 Constants

#### 118.2.29 kMIDIIDNotUnique = -10843

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error. **Notes:** Attempt to set a non-unique kMIDIPropertyUniqueID on an object.
118.2. CLASS MIDICLIENTMBS

118.2.30  kMIDIInvalidClient = -10830

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** An invalid MIDIClientRef was passed.

118.2.31  kMIDIInvalidPort = -10831

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** An invalid MIDIPortRef was passed.

118.2.32  kMIDIInvalidUniqueID = 0

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** A constant for an invalid unique ID.

118.2.33  kMIDIMessageSendErr = -10838

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** Communication with MIDIServer failed.

118.2.34  kMIDIMsgIOError = 7

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI Notification.  
**Notes:** A driver I/O error occurred.

118.2.35  kMIDIMsgObjectAdded = 2

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI Notification.  
**Notes:** A device, entity or endpoint was added.

118.2.36  kMIDIMsgObjectRemoved = 3

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI Notification.  
**Notes:** A device, entity or endpoint was removed.
118.2.37  kMIDIMsgPropertyChanged = 4

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI Notification. **Notes:** An object’s property was changed.

118.2.38  kMIDIMsgSerialPortOwnerChanged = 6

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI Notification. **Notes:** A persistent MIDI Thru connection was created or destroyed. No data. New for CoreMIDI 1.3.

118.2.39  kMIDIMsgSetupChanged = 1

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI Notification. **Notes:** Some aspect of the current MIDISetup has changed. No data. Should ignore this message if messages 2-6 are handled.

118.2.40  kMIDIMsgThruConnectionsChanged = 5

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI Notification. **Notes:** A persistent MIDI Thru connection was created or destroyed. No data. New for CoreMIDI 1.3.

118.2.41  kMIDINoConnection = -10833

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error. **Notes:** Attempt to close a non-existant connection.

118.2.42  kMIDINoCurrentSetup = -10837

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error. **Notes:** Internal error; there is no current MIDI setup object.

118.2.43  kMIDIObjectNotFound = -10842

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error. **Notes:** The requested object does not exist.
118.2.44  kMIDIServerStartErr = -10839

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** Unable to start MIDIServer.

118.2.45  kMIDISetupFormatErr = -10840

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** Unable to read the saved state.

118.2.46  kMIDIUnknownEndpoint = -10834

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** An invalid MIDIEndpointRef was passed.

118.2.47  kMIDIUnknownProperty = -10835

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** Attempt to query a property not set on the object.

118.2.48  kMIDIWrongEndpointType = -10832

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** A source endpoint was passed to a function expecting a destination, or vice versa.

118.2.49  kMIDIWrongPropertyType = -10836

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** Attempt to set a property with a value not of the correct type.

118.2.50  kMIDIWrongThread = -10841

MBS MacCF Plugin, Plugin Version: 9.6. **Function:** One of the type constants for a MIDI error.  
**Notes:** A driver is calling a non-I/O function in the server from a thread other than the server’s main thread.
118.3  class MidiDeviceMBS

118.3.1  class MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a MIDI device.
**Notes:**
A MIDI device, which either attaches directly to the computer and is controlled by a MIDI driver, or which is "external," meaning that it is connected to a driver-controlled device via a standard MIDI cable.
Subclass of the MidiObjectMBS class.

118.3.2  Methods

118.3.3  GetEntity(index as Integer) as MidiEntityMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return one of a given device’s entities.
**Notes:**
The index goes from 0 to NumberOfEntities-1.
Lasterror is set.
Returns nil on any error.

118.3.4  NumberOfEntities as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of entities for this device.
**Notes:**
Returns nil on any error.
Lasterror is set.
118.4. CLASS MIDIENDPOINTMBS

118.4 class MidiEndpointMBS

118.4.1 class MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the CoreMidi classes.
**Notes:**
Entities have any number of MIDIEndpointRef's, sources and destinations of 16-channel MIDI streams.
Subclass of the MidiObjectMBS class.

118.4.2 Methods

118.4.3 close

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The destructor.
**Notes:**
Frees the endpoint handle.
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

118.4.4 Entity as MidiEntityMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
Returns an endpoint's entity.
**Notes:**
Returns nil on any error.
Lasterror is set.
New for CoreMIDI 1.3.

118.4.5 FlushOutput

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Unschedule previously-sent packets.
**Notes:**
Clients may use MIDIFlushOutput to cancel the sending of packets that were previously scheduled for future delivery.
New for CoreMIDI 1.1.
Lasterror is set.

118.4.6 Received(packets as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Distribute MIDI from a source to the client input ports which are connected to that source.

**Notes:**
Drivers should call this function when receiving MIDI from a source.
Clients which have created virtual sources, using MIDICreateSource, should call this function when the source is generating MIDI.
Lasterror is set.

118.4.7 Events

118.4.8 Read(endpoint as MidiEndpointMBS, list as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when data arrives at an endpoint.

**Notes:**
If more than 256 bytes of data is received, it may be splitted and send in several events.

For some devices a Note Off is just a Note On with a zero velocity.
118.5. **CLASS MIDIENTITYMBS**

118.5 class MidiEntityMBS

118.5.1 class MidiEntityMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the CoreMidi classes.  

**Notes:**  
Devices may have multiple logically distinct sub-components, e.g. a MIDI synthesizer and a pair of MIDI ports, both addressable via a USB port.

By grouping a device’s endpoints into entities, the system has enough information for an application to make reasonable assumptions about how to communicate in a bi-directional manner with each entity, as is desirable in MIDI librarian applications.

These sub-components are MIDIEntityRef’s.  
Subclass of the MidiObjectMBS class.

118.5.2 Methods

118.5.3 Device as MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Returns an entity’s device.  

**Notes:**  
Returns nil on any error.  
LastError is set.  
New for CoreMIDI 1.3.

118.5.4 GetDestination(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return one of a given entity’s destinations.  

**Notes:**  
LastError is set.  
Returns nil on any error.
118.5.5  GetSource(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Return one of a given entity’s sources.

**Notes:**

Lasterror is set.

Returns nil on any error.

118.5.6  NumberOfDestinations as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Return the number of destinations in a given entity.

**Notes:**

Lasterror is set.

Returns 0 on any error.

118.5.7  NumberOfSources as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Return the number of sources in a given entity.

**Notes:**

Lasterror is set.

Returns 0 on any error.
118.6. **CLASS MIDIOBJECTMBS**

118.6  **class MidiObjectMBS**

118.6.1  **class MidiObjectMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** A class for a Mac OS X CoreMidi object.

118.6.2  **Methods**

118.6.3  **kMIDIPROPERTYAdvanceScheduleTimeMuSec as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

device/entity/endpoint property, integer
Set by the owning driver; should not be touched by other clients.
If it is >0, then it is a recommendation of how many microseconds in advance clients should schedule output.
Clients should treat this value as a minimum. For devices with a >0 advance schedule time, drivers will receive outgoing messages to the device at the time they are sent by the client, via MIDISend, and the driver is responsible for scheduling events to be played at the right times according to their timestamps.
As of CoreMIDI 1.3, this property may also be set on virtual destinations (but only the creator of the destination should do so).
When a client sends to a virtual destination with an advance schedule time of 0, the virtual destination receives its messages at their scheduled delivery time. If a virtual destination has a non-zero advance schedule time, it receives timestamped messages as soon as they are sent, and must do its own scheduling of the events.

118.6.4  **kMIDIPROPERTYCanRoute as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is a boolean property, 0/1
118.6.5  kMIDIPropertyConnectionUniqueID as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.

**Notes:**

Only available after you called the Init Method.

device/entity/endpoint property, integer or CFDataRef

UniqueID of an external device/entity/endpoint attached to this one (strongly recommended that it be an endpoint). This is for the use of a setup editor UI; not currently used internally. A driver-owned entity or endpoint has this property to refer to an external MIDI device that is connected to it.

The property is non-existent or 0 if there is no connection.

New for CoreMIDI 1.1.

Beginning with CoreMIDI 1.3, this property may be a CFDataRef containing an array of big-endian SInt32's, to allow specifying that a driver object connects to multiple external objects (via MIDI thru-ing or splitting).

This property may also exist for external devices/entities/endpoints, in which case it signifies a MIDI Thru connection to another external device/entity/endpoint (again, strongly recommended that it be an endpoint).

118.6.6  kMIDIPropertyDeviceID as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.

**Notes:**

Only available after you called the Init Method.

device/entity property, integer

The entity’s system-exclusive ID, in user-visible form

Drivers may set this property on their devices or entities.

Setup editors may allow the user to set this property on external devices.

118.6.7  kMIDIPropertyDisplayName as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.

**Notes:**
118.6. CLASS MIDIOBJECTMBS

device/entity/endpoint property, string.

Provides the Apple-recommended user-visible name for an endpoint, by combining the device and endpoint
names.

For objects other than endpoints, the display name is the same as the name.

New for CoreMIDI 1.5.

118.6.8 kMIDIPropertyDriverDeviceEditorApp as CFStringMBS

MBS MacCF Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the properties for MIDI on Mac OS X.
Notes:
device property, string, contains the full path to an application which knows how to configure this driver-
owned devices. Drivers may set this property on their owned devices. Applications must not write to it.

New for CoreMIDI 1.4.

118.6.9 kMIDIPropertyDriverOwner as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the properties for MIDI on Mac OS X.
Notes:
Only available after you called the Init Method.

device/entity/endpoint property, string

Name of the driver that owns a device.
Set by the owning driver, on the device; should not be touched by other clients. Property is inherited from
the device by its entities and endpoints.

New for CoreMIDI 1.1.
118.6.10 kMIDIProp\(\text{driverVersion}\) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.

**Notes:**

Only available after you called the Init Method.

device/entity/endpoint property, integer, returns the driver version API of the owning driver (only for driver-owned devices). Drivers need not set this property; applications should not write to it.

New for CoreMIDI 1.3.

118.6.11 kMIDIProp\(\text{factoryPatchNameFile}\) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.

**Notes:**

Only available after you called the Init Method.

device/entity/endpoint property, CFData containing AliasHandle

An alias to the device’s current factory patch name file.

Added in CoreMIDI 1.1. DEPRECATED as of CoreMIDI 1.3. Use kMIDIProp\(\text{PropertyNameConfiguration}\) instead.

118.6.12 kMIDIProp\(\text{image}\) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.

**Notes:**

Only available after you called the Init Method.

device property, CFStringRef which is a full POSIX path to a device or external device’s icon, stored in any standard graphic file format such as JPEG, GIF, PNG and TIFF are all acceptable. (See CFURL for functions to convert between POSIX paths and other ways of specifying files.) The image’s maximum size should be 128x128.
Drivers should set the icon on the devices they add.
A studio setup editor should allow the user to choose icons for external devices.

New for CoreMIDI 1.3.

118.6.13  kMIDIPropertyIsBroadcast as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.
entity/endpoint property, integer
1 if the endpoint broadcasts messages to all of the other endpoints in the device, 0 if not. Set by the owning
driver; should not be touched by other clients.
New for CoreMIDI 1.3.

118.6.14  kMIDIPropertyIsDrumMachine as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer properties, 0/1

118.6.15  kMIDIPropertyIsEffectUnit as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer properties, 0/1
118.6.16  kMIDIPROPERTYIsEmbeddedEntity as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

entity/endpoint property, integer
0 if there are external MIDI connectors, 1 if not.
New for CoreMIDI 1.1.

118.6.17  kMIDIPROPERTYIsMixer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer properties, 0/1

118.6.18  kMIDIPROPERTYIsSampler as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer properties, 0/1

118.6.19  kMIDIPROPERTYManufacturer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Example:**
```vbnet
dim m as MidiClientMBS
dim i, n as Integer
dim e as MIDIEndpointMBS
```
dim d as MIDIDeviceMBS
dim s as CFStringMBS

m = new MidiClientMBS
m.Init NewCFStringMBS("Test")
d = m.GetDevice(0)

s = d.StringProperty(d.kMIDIPropertyManufacturer)

MsgBox s.str

Notes:
Only available after you called the Init Method.

device/endpoint property, string
Drivers should set this property on their devices.
Setup editors may allow the user to set this property on external devices.
Creators of virtual endpoints may set this property on their endpoints.

118.6.20 kMIDIPropertyMaxReceiveChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the properties for MIDI on Mac OS X.
Notes:
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer properties, 0-16

118.6.21 kMIDIPropertyMaxSysExSpeed as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the properties for MIDI on Mac OS X.
Notes:
Only available after you called the Init Method.
device/entity/endpoint property, integer
Set by the owning driver; should not be touched by other clients.
maximum bytes/second of sysex messages sent to it
(default is 3125, as with MIDI 1.0)
118.6.22 kMIDIPropertyMaxTransmitChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.
**Notes:** Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0-16.

118.6.23 kMIDIPropertyModel as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.
**Notes:** Only available after you called the Init Method.

device/endpoint property, string
Drivers should set this property on their devices.
Setup editors may allow the user to set this property on external devices.
Creators of virtual endpoints may set this property on their endpoints.

118.6.24 kMIDIPropertyName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.
**Example:**
```
// init midi
dim m as new MidiClientMBS
m.Init NewCFStringMBS("TestApp")

// create a source
dim name as CFStringMBS = NewCFStringMBS("TestSource")
dim source as MidiEndpointMBS = m.CreateSource(name)

// query name property
dim s as CFStringMBS = source.StringProperty(source.kMIDIPropertyName)
MsgBox "Name: " + s.str
```

**Notes:**
Only available after you called the Init Method.

device/entity/endpoint property, string
Devices, entities, and endpoints may all have names. The recommended way to display an endpoint’s name is to ask for the endpoint name, and display only that name if it is unique. If it is non-unique, prepend the device name.
A setup editor may allow the user to set the names of both driver-owned and external devices.

118.6.25  kMIDIPropertyNameConfiguration as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.

**Notes:**
Only available after you called the Init Method.

device/entity/endpoint property, CFDictionary

This specifies the device’s current patch, note and control name values using the MIDINameDocument XML format. This specification requires the use of higher-level, OS-specific constructs outside of the specification, to fully define the current names for a device.

The MIDINameConfiguration property is implementated as a CFDictionary:

key "master" maps to a CFDataRef containing an AliasHandle referring to the device’s master name document.

key "banks" maps to a CFDictionaryRef. This dictionary’s keys are CFStringRef names of patchBank elements in the master document, and its values are each a CFDictionaryRef: key "file" maps to a CFDataRef containing an AliasHandle to a document containing patches that override those in the master document, and key "patchNameList" maps to a CFStringRef which is the name of the patchNameList element in the overriding document.

key "currentModes" maps to a 16-element CFArrayRef, each element of which is a CFStringRef of the name of the current mode for each of the 16 MIDI channels.

Clients setting this property must take particular care to preserve dictionary values other than the ones they are interested in changing, and to properly structure the dictionary.

New for CoreMIDI 1.3.
118.6.26  kMIDIPROPERTYOffline as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.

**Notes:**
Only available after you called the Init Method.

device/entity/endpoint property, integer

1 = device is offline (is temporarily absent), 0 = present
Set by the owning driver, on the device; should not be touched by other clients. Property is inherited from
the device by its entities and endpoints.

New for CoreMIDI 1.1.

118.6.27  kMIDIPROPERTYPanDisruptsStereo as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.

**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

118.6.28  kMIDIPROPERTYPrivate as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.

**Notes:**
Only available after you called the Init Method.

device/entity/endpoint property, integer

1 = endpoint is private, hidden from other clients.
May be set on a device or entity, but they will still appear in the API; only
affects whether the owned endpoints are hidden.

New for CoreMIDI 1.3.
118.6.29 kMIDIPropertyReceiveChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the properties for MIDI on Mac OS X.
Notes:
Only available after you called the Init Method.
endpoint property, integer
The value is a bitmap of channels on which the object receives, \((1<0)=ch\ 1...(1<15)=ch\ 16\).
Drivers may set this property on their entities or endpoints.
Setup editors may allow the user to set this property on external endpoints.
Virtual destination may set this property on their endpoints.

118.6.30 kMIDIPropertyReceivesBankSelectLSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the properties for MIDI on Mac OS X.
Notes:
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

118.6.31 kMIDIPropertyReceivesBankSelectMSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the properties for MIDI on Mac OS X.
Notes:
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

118.6.32 kMIDIPropertyReceivesClock as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the properties for MIDI on Mac OS X.
Notes:
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

**118.6.33 kMIDIPROPERTYRECEIVESMTC as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

**118.6.34 kMIDIPROPERTYRECEIVESNOTES as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

**118.6.35 kMIDIPROPERTYRECEIVESPROGRAMCHANGES as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

**118.6.36 kMIDIPROPERTYSINGLEREALTIMEENTITY as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
118.6. **CLASS MIDIOBJECTMBS**

Only available after you called the Init Method.

device property, integer

Some MIDI interfaces cannot route MIDI realtime messages to individual outputs; they are broadcast. On such devices the inverse is usually also true – incoming realtime messages cannot be identified as originating from any particular source.

When this property is set on a driver device, it signifies the 0-based index of the entity on which incoming realtime messages from the device will appear to have originated from.

New for CoreMIDI 1.3.

118.6.37 **kMIDIPROPERTYSupportsGeneralMIDI as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.

**Notes:**

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer properties, 0/1

118.6.38 **kMIDIPROPERTYSupportsMMC as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.

**Notes:**

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer properties, 0/1

118.6.39 **kMIDIPROPERTYSupportsShowControl as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the properties for MIDI on Mac OS X.

**Notes:**
CHAPTER 118. MIDI

device/entity property, integer (0/1). Indicates whether the device implements the MIDI. New for CoreMIDI 1.5.

118.6.40 kMIDIPropertyTransmitChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.

**Notes:**
Only available after you called the Init Method.

endpoint property, integer
The value is a bitmap of channels on which the object transmits, \((1<<0)=ch\ 1...(1<<15)=ch\ 16\)
New for CoreMIDI 1.3.

118.6.41 kMIDIPropertyTransmitsBankSelectLSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.

**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

118.6.42 kMIDIPropertyTransmitsBankSelectMSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.

**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

118.6.43 kMIDIPropertyTransmitsClock as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.

**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

118.6.44 kMIDIPROPERTYTransmitsMTC as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

118.6.45 kMIDIPROPERTYTransmitsNotes as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

118.6.46 kMIDIPROPERTYTransmitsProgramChanges as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Notes:**
Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is an integer property, 0/1

118.6.47 kMIDIPROPERTYUniqueId as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the properties for MIDI on Mac OS X.
**Example:**
CHAPTER 118. MIDI

```plaintext
// init midi
dim m as new MidiClientMBS
m.Init NewCFStringMBS("TestApp")

// create a source
dim name as CFStringMBS = NewCFStringMBS("TestSource")
dim source as MidiEndpointMBS = m.CreateSource(name)

// query name property
dim s as Integer = source.IntegerProperty(source.kMIDIPropertyUniqueID)
MsgBox "UniqueID: " +str(s)
```

**Notes:**

Only available after you called the Init Method.

devices, entities, endpoints all have unique ID’s, integer

The system assigns unique ID’s to all objects. Creators of virtual endpoints may set this property on their endpoints, though doing so may fail if the chosen ID is not unique.

118.6.48  kMIDIPROPERTYUserPatchNameFile as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

One of the properties for MIDI on Mac OS X.

**Notes:**

Only available after you called the Init Method.

device/entity/endpoint property, CFData containing AliasHandle

An alias to the device’s current user patch name file.

Added in CoreMIDI 1.1. DEPRECATED as of CoreMIDI 1.3.

Use kMIDIPROPERTYNameConfiguration instead.

118.6.49  Properties(deep as boolean) as CFOBJECTMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Get all of an object’s properties.

**Notes:**

Deep parameter: true if the object’s child objects are to be included (e.g. a device’s entities, or an entity’s endpoints).
118.6. **CLASS MIDIOBJECTMBS**

Properties which an object inherits from its owning object (if any) are not included.

New for CoreMIDI 1.1.

Returns nil on any error.
Lasterror is set.

### 118.6.50 RemoveProperty(name as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Remove an object’s property.
**Notes:** Lasterror is set.

### 118.6.51 Properties

### 118.6.52 DisplayName as String

MBS MacCF Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the Apple-recommended user-visible name for an endpoint, by combining the device and endpoint names.
**Notes:**
For objects other than endpoints, the display name is the same as the name.
(Read only property)

### 118.6.53 Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle of this object.
**Notes:** (Read and Write property)

### 118.6.54 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code reported.
**Notes:**
0 if the function was successful.
-1 if the function is not available or the RB parameters were bad. (e.g. nil)
else a Mac OS error code.

Some MIDI specific error codes:

- kMIDIInvalidClient -10830
- kMIDIInvalidPort -10831
- kMIDIWrongEndpointType -10832 want source, got destination, or vice versa
- kMIDINoConnection -10833 attempt to close a non-existent connection
- kMIDIUnknownEndpoint -10834
- kMIDIUnknownProperty -10835
- kMIDIWrongPropertyType -10836
- kMIDINoCurrentSetup -10837 there is no current setup, or it contains no devices
- kMIDIMessageSendErr -10838 communication with server failed
- kMIDIServerStartErr -10839 couldn’t start the server
- kMIDISetupFormatErr -10840 unparseable saved state
- kMIDIWrongThread -10841 driver is calling non I/O function in server from a thread other than server’s main one:
- kMIDOObjectNotFound -10842
- kMIDIDNotUnique -10843

(Read and Write property)

### 118.6.55 Manufacturer as String

MBS MacCF Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Drivers should set this property on their devices.  
**Notes:** Setup editors may allow the user to set this property on external devices.  
(Read only property)

### 118.6.56 Model as String

MBS MacCF Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The model name.  
**Notes:** (Read only property)

### 118.6.57 Name as String

MBS MacCF Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The item’s name.  
**Notes:**
Devices, entities, and endpoints may all have names. The recommended way to display an endpoint’s name is to ask for the endpoint name, and display only that name if it is unique. If it is non-unique, prepend the device name.

A setup editor may allow the user to set the names of both driver-owned and external devices.
(Read only property)

BinaryProperty(name as CFStringMBS) as CFBinaryDataMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Set or Get an object’s data-type property.
Notes:
Lasterror is set.
Returns nil on any error.
(Read and Write computed property)

IntegerProperty(name as CFStringMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Set or Get an object’s integer-type property.
Example:

// init midi
dim m as new MidiClientMBS
m.Init NewCFStringMBS("TestApp")

// create a source
dim name as CFStringMBS = NewCFStringMBS("TestSource")
dim source as MidiEndpointMBS = m.CreateSource(name)

// query name property
dim s as Integer = source.IntegerProperty(source.kMIDIPropertyUniqueID)
MsgBox "UniqueID: " + str(s)

// set it
source.IntegerProperty(source.kMIDIPropertyUniqueID) = 1234

// query again
dim t as Integer = source.IntegerProperty(source.kMIDIPropertyUniqueID)
MsgBox "UniqueID: " + str(t)
Notes:
Returns 0 on any error.
LastError is set.
(Read and Write computed property)

118.6.60 ObjectProperty(name as CFStringMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get or Set an object’s dictionary-type property.

Notes:
LastError is set.
New for CoreMIDI 1.3.
Renamed from Property to ObjectProperty in v4.3 for REALbasic 6 compatibility.
(Read and Write computed property)

118.6.61 StringProperty(name as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get or Set an object’s string-type property.

Example:
```
dim m as MidiClientMBS
dim i, n as Integer
dim e as MIDIMessageMBS
dim d as MIDIDeviceMBS
dim s as CFStringMBS

m = new MidiClientMBS
m.Init NewCFStringMBS("Test")
d = m.GetDevice(0)

s = d.StringProperty(d.kMIDIPropertyManufacturer)
```

Notes:
LastError is set.
(Read and Write computed property)
118.7  class MidiPacketListMBS

118.7.1  class MidiPacketListMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class to hold a list of MidiPackets.

118.7.2  Methods

118.7.3  FillList(packets() as MidiPacketMBS) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Fills the list with the given Realbasic array of MidiPackets.

118.7.4  Item(index as Integer) as MidiPacketMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the item with the given index.

118.7.5  Properties

118.7.6  Count as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The number of items in the list.
**Notes:** (Read and Write property)
118.8 class MidiPacketMBS

118.8.1 class MidiPacketMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a midi packet.

118.8.2 Methods

118.8.3 AbsoluteToNanoseconds(value as UInt64) as UInt64

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts an absolute time value to a nanoseconds time value. **Example:**

```vba
dim x as UInt64 = MidiPacketMBS.CurrentTime
dim y as UInt64 = x + MidiPacketMBS.NanosecondsToAbsolute(5)
MsgBox str(x) + " + 5 ns = " + str(y)
```

118.8.4 CurrentTime as UInt64

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current time of the computer as an absolute time value. **Example:**

```vba
dim u as uint64 = MidiPacketMBS.CurrentTime
dim n as uint64 = MidiPacketMBS.AbsoluteToNanoseconds(u)
dim x as Double = n / 1000000000.0
MsgBox str(u) + " " + str(n) + " " + str(x)
```

```vba
dim d as new date
d.Minute = 0
d.Hour = 0
d.Second = 0
d.TotalSeconds = d.TotalSeconds + x
MsgBox d.ShortTime // how long the mac is running.
```
Notes: While some Macs do have host clock time being in nanoseconds, this is not guaranteed. So use the function AbsoluteToNanoseconds to convert to nanoseconds.

118.8.5 NanosecondsToAbsolute(value as UInt64) as UInt64

Example:

```vbs
dim x as UInt64 = MidiPacketMBS.CurrentTime

dim y asUInt64 = MidiPacketMBS.NanosecondsToAbsolute(x)

dim seconds as uint64 = y / 1000000000

dim hours as uint64 = seconds / 3600

seconds = seconds - hours*3600

dim minutes as uint64 = seconds / 60

seconds = seconds - minutes*60

// shows how long the Mac is running:
MsgBox str(hours) + " hours, " + str(minutes) + " minutes, " + str(seconds) + " seconds"
```

118.8.6 Properties

118.8.7 DataMemory as MemoryBlock

Notes:
Setting this value will automatically fill the DataString property, so both are in sync.
(Read and Write property)

118.8.8 DataString as String

Notes:
Setting this value will automatically fill the DataMemory property, so both are in sync.
This will not work:
DataString="90 5A 7C"

But this is better:
DataString=chrb(& h90)+chrb(& h5A)+chrb(& h7C)

or with the DataMemory property:
m=newmemoryblock(3)
m.byte(0)=& h90
m.byte(1)=& h5A
m.byte(2)=& h7C
DataMemory=m
(Read and Write property)

118.8.9 TimeStamp as MemoryBlock

dim pack as MIDIPacketMBS
dim m as memoryblock

m=newmemoryblock(8)
m.Long(0) = 2345678 // some time value
m.Long(4) = 3456789
pack = new MIDIPacketMBS
pack.TimeStamp = m

Notes:
A host clock time (64 bit value) representing the time of an event, as returned by MidiPacketMBS.CurrentTime.

As a convenience, you can use zero to use the current time.
And using nil for the memoryblock represents a value of zero (=now).
(Read and Write property)
118.8.10 TimeStampValue as UInt64

MBS MacCF Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The timestamp of the packet.

**Notes:**

A host clock time (64 bit value) representing the time of an event, as returned by MidiPacketMBS.Current-Time.

As a convenience, you can use zero to use the current time.
(Read and Write property)
118.9 class MidiPlaybackMBS

118.9.1 class MidiPlaybackMBS

MBS MacOSX Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to do Midi playback on Mac OS X.

**Notes:**
With sandbox, you need the com.apple.security.temporary-exception.audio-unit-host entitlement as of September 2013.

118.9.2 Methods

118.9.3 Callback as Integer

MBS MacOSX Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Needed for the MidiPortMBS class to know which function to call

**Example:**
```pascal
dim p as MidiPlaybackMBS
dim m as MidiPortMBS
// do something useful
m.SetCallback p.Callback, p
```

**Notes:**
Return the address of the callback method used to process Midi data.
The method is to be used together with the SetCallback method in the MidiPortMBS class.

118.9.4 Constructor(UsesInternalReverb as boolean=false, AutoStart as boolean=true)

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the midi playback.

**Notes:**
After calling the constructor the Inited flag is true on success.
If AutoStart is false the midi playback is not started.
118.9. CLASS MIDIPLAYBACKMBS

118.9.5 CPULoad as single

MBS MacOSX Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CPU load of the graph.
**Notes:**
Returns a short-term running average of the current CPU load of the graph.

118.9.6 InstrumentCount as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of instruments.

118.9.7 InstrumentID(index as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the instrument with the given index.

118.9.8 InstrumentName(index as Integer) as string

MBS MacOSX Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the instrument with the given index.
**Example:**
```vba
// show list of all names
dim m as new MidiPlaybackMBS

dim u as Integer = m.InstrumentCount-1
for i as Integer = 0 to u
Listbox1.AddItem m.InstrumentName(i)
next
```

**Notes:** Index from 0 to InstrumentCount-1.

118.9.9 IsRunning as boolean

MBS MacOSX Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the midi playback is running.
118.9.10 LoadSoundBankFile(file as folderitem)

MBS MacOSX Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Loads a sound bank file.

**Example:**

```vba
Sub LoadSoundFont (SoundFontName as string)
    
    dim j as Integer
    dim f as folderitem
    dim e as string
    
    //GET SOUNDFONT
    f = Volume(0).Child("Library").Child("Audio").Child("Sounds").Child("Banks").Child(SoundFontName)
    
    if f <> Nil then
        //INSTALL SOUNDFONT
        me.LoadSoundBankFile(f)
        Window1.PopupMenu1.DeleteAllRows
        for j = 0 to 127
            if me.InstrumentName(j) <> "" then
                Window1.PopupMenu1.addrow me.InstrumentName(j)
            end if
        next
        Window1.PopupMenu1.ListIndex = 0
    else
        e = "Could not locate the SoundFont: " + SoundFontName
        e = e + " Please make sure the file is a valid soundfont file"
        e = e + " and is located in the folder YourHardDrive/Library/Audio/Sounds/Banks"
        e = e + " and has the extension .sf2"
        MsgBox e
        end if
    
End Sub
```

**Notes:**

This function can load files with .sf2 extension placed in the location: Library/Audio/Sounds/Banks.

Lasterror is set.

To avoid crashes on Mac OS X 10.5, the midi playback is stopped before loading is done and restarted if
necessary after loading completed.

As a side effect stopping the midi playback may reset volume, reverb and tuning.

118.9.11 MaxCPULoad as single

Notes: Returns the max CPU load of the graph since this call was last made or the graph was last started.

118.9.12 SendMidiEvent(Status as Integer, Data1 as Integer, Data2 as Integer, OffsetSampleFrame as Integer)

118.9.13 Start

Notes: Lasterror is set.

118.9.14 Stop

Notes:
Lasterror is set.

As a side effect stopping the midi playback may reset volume, reverb and tuning.
118.9.15 Properties

118.9.16 FilterNodeHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal reference for the filter graph node. Notes: (Read only property)

118.9.17 GraphHandle as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The handle for the AUGraph. Notes: (Read only property)

118.9.18 Initied as boolean

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the constructor was successful. Notes: This property is false if the constructor failed to initialize. (Read only property)

118.9.19 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The last error code. Notes: (Read only property)

118.9.20 OutputNodeHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal reference for the output graph node. Notes: (Read only property)
118.9. CLASS MIDIPLAYBACKMBS

118.9.21 SynthNodeHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal reference for the synth graph node. Notes: (Read only property)

118.9.22 SynthUnitHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal reference for the synth audio unit. Notes: (Read only property)

118.9.23 InstrumentIDOnChannel(Channel as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Which instrument is playing on which channel. Notes: (Read and Write computed property)

118.9.24 ReverbVolume as single

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The reverb volume. Notes: The value range is -120 to 40 dB. (Read and Write computed property)

118.9.25 StreamFromDisk as boolean

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether we are streaming from disk. Notes: Currently setting this value can crash the application. (Read and Write computed property)
118.9.26 Tuning as single

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tuning setting.
**Notes:**
Value is in cents from -1200 to 1200.
(Read and Write computed property)

118.9.27 UsesInternalReverb as boolean

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the audio unit properties.
**Example:**
```
dim m as new MidiPlaybackMBS

MsgBox "UsesInternalReverb: "+str(m.UsesInternalReverb)
m.UsesInternalReverb=true
MsgBox "UsesInternalReverb: "+str(m.UsesInternalReverb)
```
**Notes:**
Lasterror is set.
(Read and Write computed property)

118.9.28 Volume as single

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The volume.
**Notes:**
The value is in dB from -120 to 40.
(Read and Write computed property)
118.10. **CLASS MIDIPORTMBS**

**118.10 class MidiPortMBS**

**118.10.1 class MidiPortMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a MIDI port.

**Notes:**

A MIDIPortMBS, which may be an input port or output port, is an object through which a client may communicate with any number of MIDI sources or destinations.

Subclass of the MidiObjectMBS class.

**118.10.2 Methods**

**118.10.3 close**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

**Notes:**

There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.

(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

**118.10.4 ConnectSource(source as MidiEndpointMBS)**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Establish a connection from a source to a client’s input port.

**Notes:** Lasterror is set.

**118.10.5 DisconnectSource(source as MidiEndpointMBS)**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Close a previously-established source-to-input port connection.

**Notes:** Lasterror is set.

**118.10.6 SetCallback(callback as Integer, reference as object)**

MBS MacCF Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**

Connects the MidiPort to send data to given MidiPlayback reference.
Example:

```plaintext
dim p as MidiPlaybackMBS
dim m as MidiPortMBS
// do something useful
m.SetCallback p.Callback, p
```

Notes:
The method is to be used together with the Callback function in the MidiPlaybackMBS class. Read event is still being called if needed.

118.10.7  Events

118.10.8  Read(endpoint as MidiEndpointMBS, list as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Called when data arrives at this port.
Notes:
If more than 256 bytes of data is received, it may be splitted and send in several events.

For some devices a Note Off is just a Note On with a zero velocity.
118.11  class MIDISysexSendRequestMBS

118.11.1  class MIDISysexSendRequestMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
An asynchronous request to send a single system-exclusive MIDI event to a MIDI destination.

118.11.2  Methods

118.11.3  close

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The destructor.
**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

118.11.4  Send

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Send a single system-exclusive event, asynchronously.
**Notes:** Keep a reference to this object until the call Completes.

118.11.5  Properties

118.11.6  BytesToSend as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Initially set when sending starts to the number of bytes to be sent.
**Notes:**
MIDISendSysex will decrement this counter as bytes are sent.
(Read and Write property)
118.11.7  Data as Memoryblock

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The memoryblock with the data you want to send.  
**Notes:** (Read and Write property)

118.11.8  Destination as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The endpoint to which the event is to be sent.  
**Notes:** (Read and Write property)

118.11.9  IsComplete as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The client may set this to true at any time to abort transmission.  
**Notes:**  
The implementation sets this to true when all bytes have been sent.  
Renamed from Complete to IsComplete in v4.3 for REALbasic 6 compatibility.  
(Read and Write property)

118.11.10  Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code.  
**Notes:**  
0 for success.  
(Read and Write property)

118.11.11  Length as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The length of the memoryblock.  
**Notes:**  
If 0, the memoryblock.size property is taken, but not all memoryblocks know their size.  
(Read and Write property)
118.11.12  Events

118.11.13  Complete

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event to notify the client of the completion of a call to MIDISendSysex.
118.12 class MidiThruConnectionControlTransformMBS

118.12.1 class MidiThruConnectionControlTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A class for a control transformation midi connection.

**Notes:**
Note: must order control transforms appropriately – first, filter out and remap. Further transforms can follow, and will apply to the remapped control number (if any).
N.B. All transformations are done using 14-bit control values, so, when doing an add/min/max transform on a 7-bit value, the parameter must be a 14-bit value, e.g. to add n, param must be n <<7.

118.12.2 Properties

118.12.3 ControlNumber as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control number.

**Notes:** (Read and Write property)

118.12.4 ControlType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control type.

**Notes:**
implementation note: some code tests bits of these values

constants:

```
kMIDIControlType_7Bit  0  control numbers may be 0-127
kMIDIControlType_14Bit 1  control numbers may be 0-31
kMIDIControlType_7BitRPN 2  control numbers may be 0-16383
kMIDIControlType_14BitRPN 3
kMIDIControlType_7BitNRPN 4
kMIDIControlType_14BitNRPN 5
```

(Read and Write property)
118.12.5 Parameter as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The parameter for the transformation.
**Notes:** (Read and Write property)

118.12.6 RemappedControlType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The Remapped Control Type.
**Notes:**
Only used when transform is kMIDITransform_MapControl
(Read and Write property)

118.12.7 Transform as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The transformation code to apply.
**Notes:**
Some constants:

```
  kMIDITransform_None         0  no param
  kMIDITransform_FilterOut    1  filter out event type, no param
  kMIDITransform_MapControl   2  param is remapped control number
  kMIDITransform_Add          8  param is value to add
  kMIDITransform_Scale        9  param is amount to scale by: fixed point bbbb.bbbb bbbb bbbb
  kMIDITransform_MinValue     10
  kMIDITransform_MaxValue     11
  kMIDITransform_MapValue     12  param is index of map in connection’s map array
```

(Read and Write property)
118.13 class MidiThruConnectionEndpointMBS

118.13.1 class MidiThruConnectionEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A class for an endpoint specifications.
**Notes:**
When filling one of these out, clients can leave uniqueID 0 if the endpoint exists. When when one is provided back to the client, the endpoint may be null if it doesn’t exist, but the uniqueID will always be non-zero.

118.13.2 Methods

118.13.3 close

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The destructor.
**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you. (e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

118.13.4 Properties

118.13.5 Endpoint as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The endpoint to use for a connection.
**Notes:** (Read and Write property)

118.13.6 UniqueID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
An unique ID for an endpoint.
**Notes:** (Read and Write property)
118.14 class MidiThruConnectionMBS

118.14.1 class MidiThruConnectionMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a midi connection.

**Notes:**
This class defines functions to create MIDI play-through connections between the MIDI sources and destinations. These connections may be persistent or transitory, owned by a client.

By using connections instead of doing MIDI Thru operations themselves, the overhead of moving MIDI messages between the server and the client for thru-ing is reduced.

The aim of these functions is to permit as flexible a set of transformations as possible while keeping the API and data structures relatively simple.

118.14.2 Methods

118.14.3 close

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The destructor.

**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

118.14.4 Create(PersistentOwnerID as CFStringMBS, params as MidiThruConnectionParamsMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new connection.

**Notes:**
If inPersistentOwnerID is nil, then the connection is marked as owned by the client and will be automatically disposed with the client.
If it is non-nil, then it should be a unique identifier, e.g. ”com.mycompany.MyCoolProgram".
118.14.5 Properties

118.14.6 Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The handle for the Connection.
**Notes:** (Read and Write property)

118.14.7 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The last error code reported.
**Notes:** (Read and Write property)

118.14.8 Parameter as MidiThruConnectionParamsMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The parameters for the connection.
**Notes:**
Lasterror is set.
(Read and Write computed property)
118.15 class MidiThruConnectionParamsMBS

118.15.1 class MidiThruConnectionParamsMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The class for the parameters of a midi connection.

118.15.2 Methods

118.15.3 close

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The destructor.
**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

118.15.4 Properties

118.15.5 ChannelPressure as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
One of the transformations.
**Notes:** (Read and Write property)

118.15.6 ControlTransformsCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The number of control transformations used.
**Notes:**
If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the ControlTransform array.
(Read and Write property)
118.15.7 DestinationsCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The number of destinations.  
**Notes:** If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the destination array.  
(Read and Write property)

118.15.8 FilterOutAllControls as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Unknown.  
**Notes:** (Read and Write property)

118.15.9 FilterOutBeatClock as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Unknown.  
**Notes:** (Read and Write property)

118.15.10 FilterOutMTC as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Unknown.  
**Notes:** (Read and Write property)

118.15.11 FilterOutSysEx as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Unknown.  
**Notes:** (Read and Write property)

118.15.12 FilterOutTuneRequest as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Unknown.
118.15. **CLASS MIDITHRUCONNECTIONPARAMSMBS**

**Notes:** (Read and Write property)

118.15.13 **HighNote as Integer**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The high note value.

**Notes:**
Ignored if mapping.
If highNote < lowNote, then 0..highNote and lowNote..127 are passed.
(Read and Write property)

118.15.14 **KeyPressure as MidiThruConnectionTransformMBS**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
One of the transformations.

**Notes:** (Read and Write property)

118.15.15 **LowNote as Integer**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The low note value.

**Notes:**
Ignored if mapping.
If highNote < lowNote, then 0..highNote and lowNote..127 are passed.
(Read and Write property)

118.15.16 **MapsCount as Integer**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The number of mappings used.

**Notes:**
If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the Map array.
(Read and Write property)
118.15.17  NoteNumber as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the transformations.  
**Notes:** (Read and Write property)

118.15.18  PitchBend as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the transformations.  
**Notes:** (Read and Write property)

118.15.19  ProgramChange as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the transformations.  
**Notes:** (Read and Write property)

118.15.20  SourcesCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The number of sources used.  
**Notes:** If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the Source array.  
(Read and Write property)

118.15.21  Velocity as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the transformations.  
**Notes:** (Read and Write property)

118.15.22  ChannelMap(index as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The array with the value mappings.
Notes:
Map each of the source 16 MIDI channels to channel 0-15 (1-16) or 0xFF to filter out.
(Read and Write computed property)

118.15.23  ControlTransform(index as Integer) as MidiThruConnectionControlTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
The array of control transformations.
Notes: (Read and Write computed property)

118.15.24  Destination(index as Integer) as MidiThruConnectionEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
The array of destination endpoints.
Notes: (Read and Write computed property)

118.15.25  Map(index as Integer) as MidiThruConnectionValueMapMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
The list of mappings for this midi connection.
Notes:
Index is from 0 to 15.
(if you need more, send me an email and I upper the limit.)
(Read and Write computed property)

118.15.26  Source(index as Integer) as MidiThruConnectionEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
The array of source endpoints.
Notes: (Read and Write computed property)
118.16 class MidiThruConnectionTransformMBS

118.16.1 class MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The class for a Midi connection transformation.

118.16.2 Properties

118.16.3 Parameter as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The parameter of the transformation. **Notes:** (Read and Write property)

118.16.4 Transform as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The transformation code. **Notes:**

Some constants:

- kMIDITransform_None 0 no param
- kMIDITransform_FilterOut 1 filter out event type, no param
- kMIDITransform_MapControl 2 param is remapped control number
- kMIDITransform_Add 8 param is value to add
- kMIDITransform_Scale 9 param is amount to scale by: fixed point bbbb.bbbb bbbb bbbb bbbb
- kMIDITransform_MinValue 10
- kMIDITransform_MaxValue 11
- kMIDITransform_MapValue 12 param is index of map in connection’s map array

(Read and Write property)
118.17.  **MidiThruConnectionValueMapMBS**

118.17.1  **MidiThruConnectionValueMapMBS**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A value map for a Midi connection.  
**Notes:** This is an array to map Midi values from 0 to 127 to new values from 0 to 127.

118.17.2  **Properties**

118.17.3  **Value(index as Integer) as Integer**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The value Map.  
**Notes:**  
Index is from 0 to 127.  
Use only values from 0 to 127.  
(Read and Write computed property)
118.18 class PortMidiDeviceInfoMBS

118.18.1 class PortMidiDeviceInfoMBS

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class for device information.

**118.18.2 Properties**

118.18.3 *HasInput* as Boolean

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** True if input is available.  
**Notes:** (Read only property)

118.18.4 *HasOutput* as Boolean

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** True if output is available.  
**Notes:** (Read only property)

118.18.5 *InterfaceName* as String

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Underlying MIDI API.  
**Notes:**  
e.g. MMSystem, DirectX or CoreMidi.  
(Read only property)

118.18.6 *Name* as String

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The device name.  
**Notes:**  
e.g. USB MidiSport 1x1  
(Read only property)
118.19. CLASS PORTMIDIEVENTMBS

118.19  class PortMidiEventMBS

118.19.1 class PortMidiEventMBS

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a piece of midi data.

118.19.2 Methods

118.19.3 Set(status as Integer, data1 as Integer, data2 as Integer)

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the value to the given data.

118.19.4 SetRaw(data0 as Integer, data1 as Integer, data2 as Integer, data3 as Integer)

MBS Audio Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the raw data by setting all 4 bytes together.

118.19.5 Properties

118.19.6 CurrentEvent as PortMidiEventMBS

MBS Audio Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The current event played.
**Notes:**
You can use this to show current note playing.
(Read only property)

118.19.7 Data1 as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The first data value in the midi event.
**Notes:** (Read and Write property)
118.19.8  Data2 as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The second data value in the midi event.
**Notes:** (Read and Write property)

118.19.9  RawData0 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The first byte of the raw data in this event.
**Notes:**
Same as Status property.
(Read and Write property)

118.19.10  RawData1 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The second byte of the raw data in this event.
**Notes:**
Same as Data1 property.
(Read and Write property)

118.19.11  RawData2 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The third byte of the raw data in this event.
**Notes:**
Same as Data2 property.
(Read and Write property)

118.19.12  RawData3 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The forth byte of the raw data in this event.
**Notes:** (Read and Write property)
118.19.13 RawMessage as Integer

MBS Audio Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The raw content of the event as an integer.
**Notes:**
Take care about platform differences like the byte order.
(Read and Write property)

118.19.14 Status as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The status value.
**Notes:** (Read and Write property)

118.19.15 When as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The time value of this MIDI data.
**Notes:**
Should be milliseconds.
(Read and Write property)
118.20 class PortMidiMBS

118.20.1 class PortMidiMBS

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The PortMidi library wrapped for use in Realbasic.

**Notes:**

Error codes:

- const pmNoError = 0
- const pmHostError = -10000
- const pmInvalidDeviceId = -9999
- const pmInsufficientMemory = -9998
- const pmBufferTooSmall = -9997
- const pmBufferOverflow = -9996
- const pmBadPtr = -9995
- const pmBadData = -9994
- const pmInternalError = -9993
- const pmBufferMaxSize = -9992

Requires libasound.so.2 on Linux to be installed.

118.20.2 Methods

118.20.3 CountDevices as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Counts the devices.

**Example:**

```basic
dim pa as new PortMidiMBS

Dim u as Integer = pa.CountDevices-1
for i as Integer = 0 to u
    dim d as PortMidiDeviceInfoMBS = pa.DeviceInfo(i)
    MsgBox d.Name+", " +D.InterfaceName
next
```

**Notes:** Returns 0 on any error.
118.20.4 DefaultInputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the default device ID or pmNoDevice (-1) if there are no devices.

**Notes:**
On the PC, the user can specify a default device by setting an environment variable. For example, to use device # 1.

set PM\_RECOMMENDED\_OUTPUT\_DEVICE=1

The user should first determine the available device ID by using the supplied application "testin" or "testout".

In general, the registry is a better place for this kind of info, and with USB devices that can come and go, using integers is not very reliable for device identification. Under Windows, if PM\_RECOMMENDED\_OUTPUT\_DEVICE (or PM\_RECOMMENDED\_INPUT\_DEVICE) is *NOT* found in the environment, then the default device is obtained by looking for a string in the registry under: HKEY\_LOCAL\_MACHINE/SOFTWARE/PortMidi/Recommended\_Input\_Device and HKEY\_LOCAL\_MACHINE/SOFTWARE/PortMidi/Recommended\_Output\_Device for a string. The number of the first device with a substring that matches the string exactly is returned. For example, if the string in the registry is "USB", and device 1 is named "In USB MidiSport 1x1", then that will be the default input because it contains the string "USB".

In addition to the name, PmDeviceInfo has the member "interf", which is the interface name. (The "interface" is the underlying software system an API used by PortMidi to access devices. Examples are MMSystem, DirectX (not implemented), ALSA, OSS (not implemented), etc.) As a result, the only Windows interface is "MMSystem", the only Linux interface is "ALSA", and the only Mac OS X interface is "CoreMIDI".

To specify both the interface and the device name in the registry, separate the two with a comma and a space, e.g.: MMSystem, In USB MidiSport 1x1
In this case, the string before the comma must be a substring of the "interf" string, and the string after the space must be a substring of the "name" name string in order to match the device.

Note: in the current release, the default is simply the first device (the input or output device with the lowest PmDeviceID).

118.20.5 DefaultOutputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the default device ID or pmNoDevice (-1) if there are no devices.

**Notes:**
On the PC, the user can specify a default device by setting an environment variable. For example, to use device # 1.
set PM_RECOMMENDED_OUTPUT_DEVICE=1

The user should first determine the available device ID by using the supplied application "testin" or "testout".

In general, the registry is a better place for this kind of info, and with USB devices that can come and go, using integers is not very reliable for device identification. Under Windows, if PM_RECOMMENDED_OUTPUT_DEVICE (or PM_RECOMMENDED_INPUT_DEVICE) is *NOT* found in the environment, then the default device is obtained by looking for a string in the registry under: HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Input_Device and HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Output_Device for a string. The number of the first device with a substring that matches the string exactly is returned. For example, if the string in the registry is "USB", and device 1 is named "In USB MidiSport 1x1", then that will be the default input because it contains the string "USB".

In addition to the name, PmDeviceInfo has the member "interf", which is the interface name. (The "interface" is the underlying software system or API used by PortMidi to access devices. Examples are MMSystem, DirectX, and ALSA. In general, the only Mac OS X interface is "CoreMIDI".)

To specify both the interface and the device name in the registry, separate the two with a comma and a space, e.g.: MMSystem, In USB MidiSport 1x1
In this case, the string before the comma must be a substring of the "interf" string, and the string after the space must be a substring of the "name" name string in order to match the device.

Note: in the current release, the default is simply the first device (the input or output device with the lowest PmDeviceID).

118.20.6 DeviceInfo(DeviceID as Integer) as PortMidiDeviceInfoMBS

Example:

dim pa as new PortMidiMBS

Dim u as Integer = pa.CountDevices-1
for i as Integer = 0 to u
dim d as PortMidiDeviceInfoMBS = paDeviceInfo(i)
MsgBox d.Name+", "+D.InterfaceName
next

Notes: Returns nil on any error.
118.20.7  ErrorText(ErrorNumber as Integer) as string

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The error text for the given error code.
**Notes:** Returns "" on any error.

118.20.8  Initialize as Integer

MBS Audio Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Initializes the PortMidi functions.
**Notes:**
You call this manually to trigger initialization now.
Or you just let the plugin do it automatically when you call one of the portmidi functions.
Returns the error code. (0 = okay)

118.20.9  ReInitialize as Integer

MBS Audio Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Shuts down PortMidi and initializes it again.
**Notes:**
As PortMidi does not recognize the attachment of new MIDI devices, you can only reinitialize.

Returns a PortMidi error code.

118.20.10  Constants

118.20.11  pmBadData = -9994

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.
**Notes:** illegal midi data, e.g. missing EOX

118.20.12  pmBadPtr = -9995

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.
118.20.13  pmBufferMaxSize = -9992
MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.  
**Notes:** buffer is already as large as it can be.

118.20.14  pmBufferOverflow = -9996
MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.

118.20.15  pmBufferTooSmall = -9997
MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.

118.20.16  pmHostError = -10000
MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.

118.20.17  pmInsufficientMemory = -9998
MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.

118.20.18  pmInternalError = -9993
MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.

118.20.19  pmInvalidDeviceId = -9999
MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.  
**Notes:** out of range or output device when input is requested or input device when output is requested or device is already opened.
118.20. CLASS PORTMIDIMBS

118.20.20  pmNoDevice = -1

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.

118.20.21  pmNoError = 0

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi errors.
118.21 class PortMidiStreamMBS

118.21.1 class PortMidiStreamMBS

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Realbasic class to represent a PortMidi stream.
**Notes:** A single PortMidiStream is a descriptor for an open MIDI device.

118.21.2 Methods

118.21.3 Abort as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Terminates outgoing messages immediately.
**Notes:**
The caller should immediately close the output port; this call may result in transmission of a partial midi message. There is no abort for Midi input because the user can simply ignore messages in the buffer and close an input device at any time.
Returns an error code.

118.21.4 Close

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.
**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

118.21.5 currentTimeStamp as Integer

MBS Audio Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries current time stamp.

118.21.6 ErrorText(ErrorNumber as Integer) as string

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The error message for this error number.
118.21.7  **HostError as string**

MBS Audio Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries host error string.  
**Example:**

```vba
dim s as new PortMidiStreamMBS
// do something that causes an error
MsgBox "HostError: " + s.HostError
```

**Notes:** Clears error.

118.21.8  **OpenInput(DeviceID as Integer, Buffersize as Integer) as Integer**

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens a device for reading.  
**Notes:**

DeviceID is the id of the device used for input.

For input, the buffersize specifies the number of input events to be buffered waiting to be read using Pm_Read().

(In some cases – see below – PortMidi does not buffer output at all and merely passes data to a lower-level API, in which case buffersize is ignored.)

**return value:**

Upon success OpenInput returns PmNoError.  
If a call to OpenInput fails a nonzero error code is returned (see PMError above) and the value of port is invalid.

118.21.9  **OpenOutput(DeviceID as Integer, Buffersize as Integer, Latency as Integer) as Integer**

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens a device for writing.  
**Notes:**

DeviceID is the id of the device used for input.
For output, buffersize specifies the number of output events to be buffered waiting for output. (In some cases – see below – PortMidi does not buffer output at all and merely passes data to a lower-level API, in which case buffersize is ignored.)

Latency is the delay in milliseconds applied to timestamps to determine when the output should actually occur. (If latency is <0, 0 is assumed.) If latency is zero, timestamps are ignored and all output is delivered immediately. If latency is greater than zero, output is delayed until the message timestamp plus the latency. (NOTE: time is measured relative to the time source indicated by time_proc. Timestamps are absolute, not relative delays or offsets.) In some cases, PortMidi can obtain better timing than your application by passing timestamps along to the device driver or hardware. Latency may also help you to synchronize midi data to audio data by matching midi latency to the audio buffer latency. Due to the may timers work on Windows, the latency is limited there.

return value:
Upon success OpenInput returns PmNoError. If a call to OpenInput fails a nonzero error code is returned (see PMError above) and the value of port is invalid.

118.21.10  Poll as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Tests whether input is available,
**Notes:** Returns 1 on success and 0 on failure.

118.21.11  Read(byref data as PortMidiEventMBS) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads midi data.
**Notes:**
Returns the number of read items.
(0 for error and 1 for success)

Read retrieves midi data into a buffer, and returns the number of events read. Result is a non-negative number unless an error occurs, in which case a PmError value will be returned.

Buffer Overflow

The problem: if an input overflow occurs, data will be lost, ultimately because there is no flow control all the way back to the data source. When data is lost, the receiver should be notified and some sort of
graceful recovery should take place, e.g. you shouldn’t resume receiving in the middle of a long sysex message.

With a lock-free fifo, which is pretty much what we’re stuck with to enable portability to the Mac, it’s tricky for the producer and consumer to synchronously reset the buffer and resume normal operation.

Solution: the buffer managed by PortMidi will be flushed when an overflow occurs. The consumer (Read()) gets an error message (pmBufferOverflow) and ordinary processing resumes as soon as a new message arrives. The remainder of a partial sysex message is not considered to be a ”new message” and will be flushed as well.

118.21.12 SetChannelMask(mask as Integer) as Integer

Example:

```
dim s as PortMidiStreamMBS // your midi stream

call s.SetChannelMask(1+4) // Channel 1 and 3.
```

Notes:
The mask is a 16-bit bitfield corresponding to appropriate channels
All channels are allowed by default.
Returns an error code.

118.21.13 SetFilter(filters as Integer) as Integer

Notes:
By default, only active sensing messages are filtered.
To prohibit, say, active sensing and sysex messages, call SetFilter(FilterActive + FilterSysEx);
Filtering is useful when midi routing or midi thru functionality is being provided by the user application.
For example, you may want to exclude timing messages (clock, MTC, start/stop/continue), while allowing note-related messages to pass.
Or you may be using a sequencer or drum-machine for MIDI clock information but want to exclude any notes it may play.

Returns an error code.
118.21.14  Write(data as PortMidiEventMBS) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes midi data from a buffer.  
**Notes:**
This may contain:
- short messages or
- sysex messages that are converted into a sequence of PortMidiStreamMBS objects, e.g. sending data from a file or forwarding them from midi input.

Use WriteSysEx() to write a sysex message stored as a contiguous array of bytes.

Sysex data may contain embedded real-time messages.
Returns an error code.

118.21.15  WriteShort(When as Integer, message as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a timestamped non-system-exclusive midi message.  
**Notes:** Messages are delivered in order as received, and timestamps must be non-decreasing. (But timestamps are ignored if the stream was opened with latency = 0.)

118.21.16  WriteSysEx(When as Integer, message as memoryblock, offset as Integer) as Integer

MBS Audio Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a timestamped system-exclusive midi message.  
**Notes:**
The data is taken from the memoryblock at the given offset.  
The message must be 0 terminated.

This message must be valid and contain the special start value and a EOX value on the end.
See also:

- 118.21.17  WriteSysEx(When as Integer, message as string) as Integer
118.21  CLASS PORTMIDISTREAMMBS

118.21.17  WriteSysEx(When as Integer, message as string) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a timestamped system-exclusive midi message. **Notes:** This message must be valid and contain the special start value and a EOX value on the end. See also:

- 118.21.16 WriteSysEx(When as Integer, message as memoryblock, offset as Integer) as Integer 16744

118.21.18  Properties

118.21.19  ChannelMask as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The channel mask used. **Notes:** Use SetChannelMask to change it. (Read only property)

118.21.20  DeviceID as Integer

MBS Audio Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The device ID. **Notes:** The ID of the device the stream is connected to. (Read only property)

118.21.21  DeviceName as String

MBS Audio Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The device name. **Notes:** The name of the device the stream is connected to. (Read only property)

118.21.22  Filters as Integer

MBS Audio Plugin, Plugin Version: 5.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The filters setting.
Notes:
Use SetFilters to change it.
(Read only property)

118.21.23  Constants

118.21.24  FilterActive = & h4000

Notes: filter active sensing messages (& hFE)

118.21.25  FilterAftertouch = & h6000000

Notes: filter both channel and poly aftertouch

118.21.26  FilterChannelAftertouch = & h2000000

Notes: filter channel aftertouch (most midi controllers use this) (& hD0-& hDF)

118.21.27  FilterClock = & h1D00

Notes: filter clock messages (CLOCK & hF8, START & hFA, STOP & hFC, and CONTINUE & hFB)

118.21.28  FilterControl = & h8000000

Notes: Control Changes (CC's) (& hB0-& hBF)

118.21.29  FilterFD = & h2000

Notes: filter undefined FD messages
118.21.30  FilterMTC = 2

MBS Audio Plugin, Plugin Version: 9.4. **Function**: One of the PortMidi filter constants.  
**Notes**: MIDI Time Code (& hF1)

118.21.31  FilterNote = & h3000000

MBS Audio Plugin, Plugin Version: 9.4. **Function**: One of the PortMidi filter constants.  
**Notes**: filter note-on and note-off (& h90-& h9F and & h80-& h8F)

118.21.32  FilterPitchBend = & h40000000

MBS Audio Plugin, Plugin Version: 9.4. **Function**: One of the PortMidi filter constants.  
**Notes**: Pitch Bender (& hE0-& hEF)

118.21.33  FilterPlay = & h400

MBS Audio Plugin, Plugin Version: 9.4. **Function**: One of the PortMidi filter constants.  
**Notes**: filter play messages (start & hFA, stop & hFC, continue & hFB)

118.21.34  FilterPolyAftertouch = & h4000000

MBS Audio Plugin, Plugin Version: 9.4. **Function**: One of the PortMidi filter constants.  
**Notes**: per-note aftertouch (& hA0-& hAF)

118.21.35  FilterProgram = & h10000000

MBS Audio Plugin, Plugin Version: 9.4. **Function**: One of the PortMidi filter constants.  
**Notes**: Program changes (& hC0-& hCF)
118.21.36 FilterRealTime = & hFF01

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi filter constants.  
**Notes:** filter all real-time messages.

118.21.37 FilterReset = & h8000

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi filter constants.  
**Notes:** filter reset messages (& hFF)

118.21.38 FilterSongPosition = 4

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi filter constants.  
**Notes:** Song Position (& hF2)

118.21.39 FilterSongSelect = 8

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi filter constants.  
**Notes:** Song Select (& hF3)

118.21.40 FilterSysEx = 1

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi filter constants.  
**Notes:** filter system exclusive messages (& hF0)

118.21.41 FilterSystemCommon = & h4E

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi filter constants.  
**Notes:** All System Common messages (mtc, song position, song select, tune request)

118.21.42 FilterTick = & h200

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi filter constants.  
**Notes:** filter tick messages (& hF9)
118.21.43 FilterTune = & h40

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi filter constants.  
**Notes:** Tuning request (& hF6)

118.21.44 FilterUndefined = & h2000

MBS Audio Plugin, Plugin Version: 9.4. **Function:** One of the PortMidi filter constants.  
**Notes:** filter undefined real-time messages
118.22 class WindowsMidiInputInfoMBS

118.22.1 class WindowsMidiInputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for information about a certain Midi Device.

118.22.2 Properties

118.22.3 DriverVersion as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Version number of the device driver for the MIDI input device. **Notes:** The high-order byte is the major version number, and the low-order byte is the minor version number. (Read only property)

118.22.4 Flags as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Some flags. **Notes:** Currently unused in Windows XP. (Read only property)

118.22.5 ManufacturerID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Manufacturer identifier of the device driver for the MIDI input device. **Notes:** (Read only property)

118.22.6 Name as String

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Product name. **Notes:**
Currently an ANSI string.
(Read only property)

118.22.7  **ProductID as Integer**

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Product identifier of the MIDI input device.
**Notes:** (Read only property)
118.23 class WindowsMidiInputMBS

118.23.1 class WindowsMidiInputMBS

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to represent an open Midi Input device in Realbasic. **Notes:** Subclass of the WindowsMidiMBS class.

118.23.2 Methods

118.23.3 Close

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Closes the device. **Notes:** First stops recording, second resets midi output device and third Closes the device with waiting till device is done. Handle is set to 0 and lasterror is set.

118.23.4 Idle

MBS Audio Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Processes events. **Notes:** Midi events are buffered in data structures. This method dispatches them to the Realbasic event handlers. Call this method as often as you need events to fire. For example every 100ms in a timer.

same as WindowsMidiMBS.Idle

118.23.5 InputErrorText(errorcode as Integer) as string

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Translates an error number into a human readable text. **Notes:** Returns "" on unknown errors. String returned has Windows ANSI text encoding.
118.23.6  Open(DeviceID as Integer, BufferSize as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Opens a Midi device.

**Notes:**
- DeviceID is from 0 to NumberOfMidiInputDevices-1.
- Buffersize is the maximum size to allocate for each SysEx receive buffer.
- Minimum is 256 bytes. Windows does not handle SysEx messages bigger than 64K.
- Lasterror is set.
- On success the handle property is non zero.

118.23.7  Reset

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resets the device.

**Notes:** Lasterror is set.

118.23.8  Start

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Starts listening for events.

**Notes:**
- Lasterror is set.
- Please do not call from Open event as that’s too early.

118.23.9  Stop

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Stops recording.

**Notes:**
- Lasterror is set.
- You should not need this and just call close or let the object die.
118.23.10  Events

118.23.11  DeviceClose

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
An event called whenever the output device is closed.
**Notes:** Called when you call close.

118.23.12  DeviceData(timestamp as Integer, status as Integer, data1 as Integer, data2 as Integer, RawData as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
A simple Midi message has been received.
**Notes:**
Process this event fast to avoid losing events.
Status, Data1 and Data2 are all 8 bit values.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

118.23.13  DeviceError(timestamp as Integer, status as Integer, data1 as Integer, data2 as Integer, RawData as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
A bad Midi message has been received.
**Notes:**
Process this event fast to avoid losing events.
Status, Data1 and Data2 are all 8 bit values.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

118.23.14  DeviceLongData(timestamp as Integer, data as string, dataMemory as memoryblock)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
SysEx data was received.
**Notes:**
If data is "" no free buffer was available to store the data.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.
118.23.15  DeviceLongError(timestamp as Integer, data as string, dataMemory as memoryblock)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Bad SysEx data was received.

**Notes:**
If data is "" no free buffer was available to store the data.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

118.23.16  DeviceOpen

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
An event called whenever the output device is opened.

**Notes:**
Called when you call open.
Please do not call Start from Open event as that’s too early.
118.24 class WindowsMidiMBS

118.24.1 class WindowsMidiMBS

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Windows Midi base class.

**Example:**

```vba
dim midi as WindowsMidiMBS // your midi object

Sub Open()
    dim i as WindowsMidiInputInfoMBS
    dim o as WindowsMidiOutputInfoMBS
    dim c,n as Integer

    midi=new WindowsMidiMBS
    c=midi.NumberOfMidiInputDevices-1

    for n=0 to c
        i=midi.InputDevice(n)
        listbox1.AddRow str(n+1)
        listbox1.Cell(listbox1.LastIndex,1)=i.Name
        listbox1.Cell(listbox1.LastIndex,2)=hex(i.DriverVersion)
    next
    c=midi.NumberOfMidiOutputDevices-1
    for n=0 to c
        o=midi.OutputDevice(n)
        listbox2.AddRow str(n+1)
        listbox2.Cell(listbox2.LastIndex,1)=o.Name
        listbox2.Cell(listbox2.LastIndex,2)=hex(o.DriverVersion)
    next
End Sub
```
118.24.2 Methods

118.24.3 Connect(output as WindowsMidiOutputMBS)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Connect function connects a MIDI input device to a MIDI thru or output device, or connects a MIDI thru device to a MIDI output device.

**Notes:**
- `self` must be a MIDI input device or a MIDI thru device.
- `output` must be the MIDI output or thru device.

After calling this function, the MIDI input device receives event data in an DeviceData event whenever a message with the same event data is sent to the output device driver.

A thru driver is a special form of MIDI output driver. The system will allow only one MIDI output device to be connected to a MIDI input device, but multiple MIDI output devices can be connected to a MIDI thru device. Whenever the given MIDI input device receives event data in an DeviceData event, a message with the same event data is sent to the given output device driver (or through the thru driver to the output drivers).

Lasterror is set.

118.24.4 DataLost as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Number of data blocks lost.

**Notes:**
- The buffers in the plugins have a certain size.
- In case midi events are coming fast in and the Idle method is not called often enough events are lost.
- In that case increase the frequency of calling Idle or request the buffer size to be increased in the next plugin version.

118.24.5 Disconnect(output as WindowsMidiOutputMBS)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Disconnect function disconnects a MIDI input device from a MIDI thru or output device, or disconnects a MIDI thru device from a MIDI output device.

**Notes:**
- `self` must be a MIDI input device or a MIDI thru device.
- `output` must be the MIDI output device to be disconnected.
MIDI input, output, and thru devices can be connected by using the Connect function. Thereafter, whenever the MIDI input device receives event data in an DeviceData event, a message with the same event data is sent to the output device driver (or through the thru driver to the output drivers).

Lasterror is set.

### 118.24.6 EventsLost as Integer

**MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:** Number of events lost.  
**Notes:**  
The buffers in the plugins have a certain size.  
In case midi events are coming fast in and the Idle method is not called often enough events are lost.  
In that case increase the frequency of calling Idle or request the buffer size to be increased in the next plugin version.

### 118.24.7 Idle

**Notes:**  
Midi events are buffered in data structures. This method dispatches them to the Realbasic event handlers. 
Call this method as often as you need events to fire. For example every 100ms in a timer.

### 118.24.8 InputDevice(index as Integer) as WindowsMidiInputInfoMBS

**MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:** The InputDevice function queries a specified MIDI input device to determine its capabilities.  
**Example:**
```
dim midi as WindowsMidiMBS // your midi object  
dim n,c as Integer  
dim i as WindowsMidiInputInfoMBS  

c=midi.NumberOfMidiInputDevices-1  

for n=0 to c  
  i=midi.InputDevice(n)  
  listbox1.AddRow str(n+1)  
```
```vbnet
listbox1.Cell(listbox1.LastIndex,1)=i.Name
listbox1.Cell(listbox1.LastIndex,2)=hex(i.DriverVersion)
next

**Notes:** Index is from 0 to NumberOfMidiInputDevices-1.

### 118.24.9 NumberOfMidiInputDevices as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the number of MIDI input devices present in the system.  
**Example:**
```
    dim midi as new WindowsMidiMBS
    MsgBox str(midi.NumberOfMidiInputDevices)
```

**Notes:** A return value of zero means that there are no devices.

### 118.24.10 NumberOfMidiOutputDevices as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the number of MIDI output devices present in the system.  
**Example:**
```
    dim midi as new WindowsMidiMBS
    MsgBox str(midi.NumberOfMidiOutputDevices)
```

**Notes:** A return value of zero means that there are no devices.

### 118.24.11 OutputDevice(index as Integer) as WindowsMidiOutputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The OutputDevice function queries a specified MIDI output device to determine its capabilities.  
**Example:**
```
    dim midi as WindowsMidiMBS ' // your midi object
    dim c,n as Integer
    dim o as WindowsMidiOutputInfoMBS
```
c=midi.NumberOfMidiOutputDevices-1

for n=0 to c
  o=midi.OutputDevice(n)
  listbox2.AddRow str(n+1)
  listbox2.Cell(listbox2.LastIndex,1)=o.Name
  listbox2.Cell(listbox2.LastIndex,2)=hex(o.DriverVersion)
next

Notes: Index is from 0 to NumberOfMidiOutputDevices-1.

118.24.12 Properties

118.24.13 Handle as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The handle for this Midi input or output port.
**Notes:**
Depending on which Realbasic class this is, value is a HMIDI, HMIDIIN or HMIDIOUT handle.
(Read only property)

118.24.14 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code reported.
**Notes:**
0 is no error and -1 is parameter error from the plugin.
(Read only property)
118.25. CLASS WINDOWSMIDIOUTPUTINFOMBS

118.25 class WindowsMidiOutputInfoMBS

118.25.1 class WindowsMidiOutputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A class for information about a certain Midi Device.

118.25.2 Properties

118.25.3 ChannelMask as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Channels that an internal synthesizer device responds to, where the least significant bit refers to channel 0
and the most significant bit to channel 15.
**Notes:**
Port devices that transmit on all channels set this member to & hFFFF.
(Read only property)

118.25.4 DriverVersion as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Version number of the device driver for the MIDI input device.
**Notes:**
The high-order byte is the major version number, and the low-order byte is the minor version number.
(Read only property)

118.25.5 Flags as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Optional functionality supported by the device.
**Notes:**
It can be one or more of the following:

- MIDICAPS_CACHE = 4 Supports patch caching.
- MIDICAPS_LRVOLUME = 2 Supports separate left and right volume control.
- MIDICAPS_STREAM = 8 Provides direct support for the midiStreamOut function.
- MIDICAPS_VOLUME = 1 Supports volume control.
If a device supports volume changes, the MIDICAPS\_VOLUME flag will be set for the dwSupport member. If a device supports separate volume changes on the left and right channels, both the MIDICAPS\_VOLUME and the MIDICAPS\_LRVOLUME flags will be set for this member. (Read only property)

118.25.6 ManufacturerID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Manufacturer identifier of the device driver for the MIDI input device. **Notes:** (Read only property)

118.25.7 Name as String

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Product name. **Notes:** Currently an ANSI string. (Read only property)

118.25.8 Notes as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Maximum number of simultaneous notes that can be played by an internal synthesizer device. **Notes:** If the device is a port, this member is not meaningful and is set to 0. (Read only property)

118.25.9 ProductID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Product identifier of the MIDI input device. **Notes:** (Read only property)

118.25.10 Technology as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Type of the MIDI output device.
118.25. CLASS WINDOWSMIDIOUTPUTINFOMBS

Notes:

This value can be one of the following:

- MOD_MIDIPORT = 1 // output port
- MOD_SYNTH = 2 // generic internal synth
- MOD_SQSYNTH = 3 // square wave internal synth
- MOD_FMSYNTH = 4 // FM internal synth
- MOD_MAPPER = 5 // MIDI mapper
- MOD_WAVETABLE = 6 // hardware wavetable synth
- MOD_SWSYNTH = 7 // software synth

(Read only property)

118.25.11 Voices as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Number of voices supported by an internal synthesizer device.
Notes:
If the device is a port, this member is not meaningful and is set to 0.
(Read only property)

118.25.12 Volume as Boolean

Notes:
True if yes and False if no.
(Read only property)

118.25.13 VolumeStereo as Boolean

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Whether the device can control volume on two independent channels.
Notes:
True if stereo, False if mono.
(Read only property)
118.26  class WindowsMidiOutputMBS

118.26.1  class WindowsMidiOutputMBS

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to represent a Midi Output device.  
**Notes:** Subclass of the WindowsMidiMBS class.

118.26.2  Methods

118.26.3  Close

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Closes the output device.  
**Notes:** Closes the device with waiting till device is done.  
Handle is set to 0 and lasterror is set.

118.26.4  Open(DeviceID as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Opens the midi device with the given index.  
**Notes:** DeviceID is from 0 to NumberOfMidiOutputDevices-1.  
Lasterror is set.

118.26.5  OpenDefault

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Opens the Midi mapper which opens the device the user selected as the default midi device.  
**Notes:** If only one midi output device is available this one is opened.  
On success the handle property is not zero.  
Lasterror is set.
118.26.6 OutputErrorText(errorcode as Integer) as string

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Translates an error number into a human readable text. **Notes:**

Returns "" on unknown errors.
String returned has Windows ANSI text encoding.

118.26.7 Reset

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resets the output device. **Notes:** Lasterror is set.

118.26.8 SendData(data as memoryblock)

MBS Audio Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sends sysex data. **Notes:** Lasterror is set.

See also
See also:
- 118.26.9 SendData(data as memoryblock, size as Integer) 16765
- 118.26.10 SendData(data as string) 16766

118.26.9 SendData(data as memoryblock, size as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends sysex data. **Example:**

```vbnet
dim m as MemoryBlock
dim o as WindowsMidiOutputMBS // your midi output
m=NewMemoryBlock(8)
m.Byte(0)=& hF0
```
m.Byte(1)=& h7F
m.Byte(2)=& h7F
m.Byte(3)=& h04
m.Byte(4)=& h01
m.Byte(5)=& h7F
m.Byte(6)=& h7F
m.Byte(7)=& hF7

o.SendData m

Notes:

Lasterror is set.
size is the size of the memoryblock to use. A wrong value will crash the application.

See also
See also:

• 118.26.8 SendData(data as memoryblock) 16765
• 118.26.10 SendData(data as string) 16766

118.26.10  SendData(data as string)

See also
The plugin prepares MIDIHDR structure and uses your data there. See also:

• 118.26.8 SendData(data as memoryblock) 16765
• 118.26.9 SendData(data as memoryblock, size as Integer) 16765

118.26.11  SendMessage(message as Integer)

Example:
dim o as WindowsMidiOutputMBS // your windows midi output
// & h90 = Note down
// & h43 = the note number
// & h40 = the velocity
o.SendMessage & h404390

Notes:
The message is stored in one 32bit integer.
lowest 8 bit is status, second 8 bit is data1, third 8 bit is data2 and highest 8 bit is left 0.

Between sending note on and off messages, you need to leave time for actual playback.
LastError is set.

See also

See also:
• 118.26.12 SendMessage(status as Integer, data1 as Integer, data2 as Integer)

118.26.12  SendMessage(status as Integer, data1 as Integer, data2 as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Sends a short midi message immediately.
Example:

dim o as WindowsMidiOutputMBS // your windows midi output
// & h90 = Note down
// & h3C = the note number
// & h40 = the velocity
o.SendMessage & h90, & h3C, & h40

Notes:
LastError is set.
Between sending note on and off messages, you need to leave time for actual playback.

See also

See also:
• 118.26.11 SendMessage(message as Integer)
118.26.13 Properties

118.26.14 Volume as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The volume to be used for this device. **Example:**

```vbnet
dim m as WindowsMidiOutputMBS // your midi output
m.Volume=0          // all silent
m.Volume=& hFFFFF000 // right only
m.Volume=& h0000FFFF // left only or max volume for mono device
m.Volume=& h7FFF7FFF // half volume for both channels
```

**Notes:**

Not all devices can set the volume. Lasterror is set.

The low-order word contains the left-channel volume setting, and the high-order word contains the right-channel setting. A value of & hFFFF represents full volume, and a value of & h0000 is silence.

If a device does not support both left and right volume control, the low-order word of dwVolume specifies the mono volume level, and the high-order word is ignored. (Read and Write computed property)

118.26.15 Events

118.26.16 DeviceClose

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** An event called when the device is closed. **Notes:** Should be called when you call close or the object dies.

118.26.17 DeviceDataSent

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** An event called whenever SysEx data was sent.
118.26. DeviceOpen

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** An event called whenever the device was opened successfully.

118.26.19 DevicePositionCallback

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called when a MEVT_F_CALLBACK Midi event is about to be executed. **Notes:** A way to track progress in playback.
118.27 class WindowsMidiStreamMBS

118.27.1 class WindowsMidiStreamMBS

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A class for a Windows Midi Stream.

118.27.2 Methods

118.27.3 Close

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Closes the Midi stream.

118.27.4 Open(DeviceID as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Opens a MIDI stream for output.
**Notes:**
By default, the device is opened in paused mode.
LastError is set.
DeviceID: The device is opened on behalf of the stream and closed again when the stream is closed.

118.27.5 Pause

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Pauses playback of a specified MIDI stream.
**Notes:** Lasterror is set.

118.27.6 PositionBytes as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Position of the stream in bytes.
**Notes:** Lasterror is set.
118.27.7  PositionMS as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Position of the stream in milliseconds.

**Notes:** Lasterror is set.

118.27.8  PositionSamples as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Position of the stream in samples.
**Notes:** Lasterror is set.

118.27.9  PositionTicks as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Position of the stream in ticks.
**Notes:** Lasterror is set.

118.27.10  Restart

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Restart function restarts a paused MIDI stream.
**Notes:** Lasterror is set.

118.27.11  SendMessage(message as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Sends a short midi message immediately.
**Example:**

```vbnet
dim o as WindowsMidiStreamMBS ' your midi stream

' & h90 = Note down
' & h43 = the note number
' & h40 = the velocity
o.SendMessage & h404390
```
Notes:
The message is stored in one 32bit integer.
lowest 8 bit is status, second 8 bit is data1, third 8 bit is data2 and highest 8 bit is left 0.

Between sending note on and off messages, you need to leave time for actual playback.
Lasterror is set.
See also:

- 118.27.12 SendMessage(status as Integer, data1 as Integer, data2 as Integer)

118.27.12  SendMessage(status as Integer, data1 as Integer, data2 as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Sends a short midi message immediately.
Example:

dim o as WindowsMidiStreamMBS // your midi stream

// & h90 = Note down
// & h3C = the note number
// & h40 = the velocity
o.SendMessage & h90, & h3C, & h40

Notes:
Lasterror is set.
Between sending note on and off messages, you need to leave time for actual playback.
See also:

- 118.27.11 SendMessage(message as Integer)

118.27.13  Stop

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The Stop function turns off all notes on all MIDI channels for the specified MIDI output device.
Notes: Lasterror is set.
118.27. Properties

118.27.15 Handle as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle for the midi stream. **Notes:** Type is HMIDISTRM. (Read only property)

118.27.16 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code reported by one of the class functions. **Notes:** (Read only property)

118.27.17 Tempo as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Tempo of the stream, in microseconds per quarter note. **Notes:** The tempo is honored only if the time division for the stream is specified in quarter note format. Lasterror is set. (Read and Write computed property)

118.27.18 TimeDiv as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Time division for this stream, in the format specified in the Standard MIDI Files 1.0 specification. **Notes:** The low 16 bits of this integer value contain the time division. Lasterror is set. (Read and Write computed property)

118.27.19 Volume as Integer

MBS Audio Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The volume to be used for this stream.
Example:

```cpp
dim m as WindowsMidiStreamMBS // your midi stream

m.Volume=0 // all silent
m.Volume=& hFFFFFF0000 // right only
m.Volume=& h0000FFFF // left only or max volume for mono device
m.Volume=& h7FFF7FFF // half volume for both channels
```

Notes:

Not all devices can set the volume. Lasterror is set.

The low-order word contains the left-channel volume setting, and the high-order word contains the right-channel setting. A value of & hFFFF represents full volume, and a value of & h0000 is silence.

If a device does not support both left and right volume control, the low-order word of dwVolume specifies the mono volume level, and the high-order word is ignored. Lasterror is set.

(Read and Write computed property)
Chapter 119

Navigation

119.1 class NavigationDialogMBS

119.1.1 class NavigationDialogMBS

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A class for a Carbon Navigation dialog.

**Example:**

// A very bad example:

dim n as NavigationDialogMBS

n=new NavigationDialogMBS
n.CreateChooseObjectDialog
n.ShowDialog

MsgBox n.Result.Selection(0).AbsolutePath

**Deprecated:** This item is deprecated and should no longer be used. You can use NSOpenPanelMBS or NSSavePanelMBS for Cocoa projects instead. **Notes:** If you are using this dialog for sheets, keep a reference on the dialog object so it is not destroyed by RB before the dialog closes.
119.1.2 Methods

119.1.3 CloseDialog

MBS MacOSX Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Closes the dialog. **Notes:** Called automatically by the destructor if needed.

119.1.4 CreateAskDiscardChangesDialog

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a dialog box. **Example:**

```vbnet
dim n as new NavigationDialogMBS
dim o as new NavigationDialogOptionsMBS

o.SaveFileName="Hello.txt"

n.Options=o
n.CreateAskDiscardChangesDialog
n.ShowDialog
```

**Notes:** Lasterror is set.

119.1.5 CreateAskReviewDocumentsDialog(DocumentCount as Integer)

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a dialog. **Notes:**

- Lasterror is set.
- DocumentCount is the number of documents. The text in the dialog will be adjusted for the given number of documents.

119.1.6 CreateAskSaveChangesDialog(QuittingApplication as boolean)

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a dialog box. **Notes:**
Lasterror is set.
Set QuittingApplication to true if the dialog text should be adjusted.

119.1.7  CreateChooseFileDialog(typelist as NavigationTypeListMBS)
MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a choose file dialog.
**Notes:**
Lasterror is set.
Typelist can be used to filter the shown files in the dialog.

119.1.8  CreateChooseFolderDialog
MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a choose folder dialog.
**Notes:** Lasterror is set.

119.1.9  CreateChooseObjectDialog
MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a choose object dialog.
**Example:**
```vbscript
dim n as NavigationDialogMBS
n=new NavigationDialogMBS
n.CreateChooseObjectDialog
n.ShowDialog
MsgBox n.Result.File.AbsolutePath
```
**Notes:** Lasterror is set.

119.1.10 CreateChooseVolumeDialog
MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a choose volume dialog.
**Example:**
dim n as NavigationDialogMBS
n=new NavigationDialogMBS
n.CreateChooseVolumeDialog
n.ShowDialog
MsgBox n.Result.File.AbsolutePath

Notes: Lasterror is set.

119.1.11 CreateNewFolderDialog

Notes: Lasterror is set.

119.1.12 CreateOpenFileDialog(typelist as NavigationTypeListMBS)

Notes:
Lasterror is set.
Typelist can be used to filter the shown files in the dialog.

119.1.13 CreateSaveFileDialog(FileType as string, FileCreator as string)

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Creates an save file dialog box.
Notes:
Lasterror is set.
Typelist can be used to filter the shown files in the dialog.

119.1.14 Result as NavigationDialogResultMBS

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The result of the dialog.
Example:
dim n as NavigationDialogMBS
n=new NavigationDialogMBS
n.CreateChooseObjectDialog
n.ShowDialog
MsgBox n.Result.File.AbsolutePath

Notes:
Only available after the user has choosen something.
Lasterror is set.
If you read this property, a new result object is created, so cache it in a local variable if you use it more than once.

119.1.15 ShowAskDiscardChangesDialog as Integer

Notes:
Lasterror is set.

constants for the result on Mac OS 9:

kNavAskDiscardChanges = 1
kNavAskDiscardChangesCancel = 2

On Carbon, use the UserAction property to find the result.

119.1.16 ShowAskSaveChangesDialog(QuittingApplication as boolean) as Integer

Notes:
Lasterror is set.
Set QuittingApplication to true if the dialog text should be adjusted.
constants for the result on Mac OS 9:

```
kNavAskSaveChangesSave   = 1
kNavAskSaveChangesCancel = 2
kNavAskSaveChangesDontSave = 3
```

On Carbon, use the UserAction property to find the result.

### 119.1.17 ShowChooseFileDialog(typelist as NavigationTypeListMBS)

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates and shows a choose file dialog. **Notes:** Lasterror is set. Typelist can be used to filter the shown files in the dialog.

### 119.1.18 ShowChooseFolderDialog

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates and shows a choose folder dialog. **Notes:** Lasterror is set.

### 119.1.19 ShowChooseObjectDialog

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates and shows a choose object dialog. **Example:**

```vba
dim n as NavigationDialogMBS
n=new NavigationDialogMBS
n.CreateChooseObjectDialog
n.ShowDialog
MsgBox n.Result.File.AbsolutePath
```

**Notes:** Lasterror is set.
119.1.20  **ShowChooseVolumeDialog**

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates and shows a choose volume dialog.  
**Example:**

```vba
Dim n As NavigationDialogMBS
n = New NavigationDialogMBS
n.ShowChooseVolumeDialog
MsgBox n.Result.File.AbsolutePath
```

**Notes:** Lasterror is set.

119.1.21  **ShowDialog**

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Shows the dialog.  
**Example:**

```vba
Dim n As NavigationDialogMBS
n = New NavigationDialogMBS
n.CreateChooseObjectDialog
n.ShowDialog
MsgBox n.Result.File.AbsolutePath
```

**Notes:** Lasterror is set.

119.1.22  **ShowNewFolderDialog**

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates and shows a choose new folder dialog.  
**Notes:** Lasterror is set.
119.1.23  ShowOpenFileDialog(typelist as NavigationTypeListMBS)

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates and shows an open file dialog box.
**Notes:**
Lasterror is set.
Typelist can be used to filter the shown files in the dialog.

119.1.24  ShowSaveFileDialog(FileType as string, FileCreator as string)

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates and shows an save file dialog box.
**Notes:**
Lasterror is set.
Typelist can be used to filter the shown files in the dialog.

119.1.25  Properties

119.1.26  DialogHandle as Integer

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The internal used handle to the dialog.
**Notes:** (Read and Write property)

119.1.27  FileExtensionHidden as Boolean

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the file extension is to be hidden.
**Notes:**
Can only be set after the dialog was created.
Lasterror is set.
(Read and Write property)

119.1.28  FileName as String

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The filename used in a save dialog.
**Notes:**
119.1. **CLASS NAVIGATIONDIALOGMBS**

Can only be set after the dialog was created.
LastError is set.
(Read and Write property)

### 119.1.29 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The last error code reported.
**Notes:**

0 for success, -1 for parameter error or low memory.
Else a Mac OS error code.
(Read and Write property)

### 119.1.30 Options as NavigationDialogOptionsMBS

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The Options to use in the Create methods.
**Notes:**

Can only be set before the dialog was created.
(Read and Write property)

### 119.1.31 PopupMenuSelection as NavigationTypeMBS

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The selection from the extension popup menu.
**Notes:**

Value is nil for default type or points to the selected type.
(Changed from Integer to NavigationTypeMBS in v5.3)
(Read and Write property)

### 119.1.32 StartLocation as FolderItem

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The start location for a dialog.
**Notes:**

Used in the SaveFileDialog, NewFolderDialog, ChooseObjectDialog, ChooseVolumeDialog, ChooseFolderDialog and ChooseFileDialog.
119.1.33 UserAction as Integer

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Return the current user action taken by the user.

**Notes:**
A user action occurs when the user dismisses the dialog or otherwise does something generating a reply record
that the client needs to act upon. If the user has not taken such an action, NavDialogGetUserAction returns
kNavUserActionNone. If the dialog is terminated using the NavCustomControl selector kNavCtlTerminate,
the final user action is kNavUserActionNone.
For file dialogs, if the final user action is not kNavUserActionCancel, then there is a valid reply record which
can be obtained with NavDialogGetReply. Although the user action is sent to the client event proc as a
kNavCBUserAction event, this function is provided as a convenience for clients of modal dialogs who may
find it easier to get the user action immediately after NavDialogRun returns.

(Read only property)

119.1.34 WindowHandle as Integer

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The internal used handle to the dialog's window.

**Notes:**
Returns 0 on any error.

(Read only property)

119.1.35 Events

119.1.36 Accepted

MBS MacOSX Plugin, Plugin Version: 5.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The user clicked on the "OK" button.

119.1.37 Cancelled

MBS MacOSX Plugin, Plugin Version: 5.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The user clicked on the "Cancel" button.
119.1.38 Closed

MBS MacOSX Plugin, Plugin Version: 5.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The dialog was closed.

119.1.39 FilterItem(file as folderitem, filterMode as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever a file is about to be displayed and you need to decide whether it should be enabled.
**Notes:**
Constants for which elements are being filtered for objects:

- kNavFilteringBrowserList 0
- kNavFilteringFavorites 1
- kNavFilteringRecents 2
- kNavFilteringShortCutVolumes 3
- kNavFilteringLocationPopup 4

119.1.40 FormatChanged(Selected as NavigationTypeMBS)

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The selection in the extension popup menu changed.
**Notes:** (Added selected parameter in v5.3)

119.1.41 Opened

MBS MacOSX Plugin, Plugin Version: 5.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The dialog was opened.
119.2  class NavigationDialogOptionsMBS

119.2.1  class NavigationDialogOptionsMBS

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A class for the dialog options of a Navigation Dialog. **Notes:** All dialogs should work without options.

119.2.2  Properties

119.2.3  ActionButtonLabel as String

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The custom label for the default (Open/Save/Choose) button. **Notes:**

Use "" for the default label. (Read and Write property)

119.2.4  CancelButtonLabel as String

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The custom label for the Cancel button. **Notes:**

Use "" for the default label. (Read and Write property)

119.2.5  clientName as String

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The user-readable name of the client, usually the name of the current application. **Notes:**

This value is used to construct the default window title in the file dialogs, and the message text in the Ask dialogs. On Mac OS 9 and earlier, this value is used as a key to store persistent per-client dialog settings, so it’s always a good idea to set this field to a non "" value. (Read and Write property)
119.2.6  Flags as Integer

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Options for the dialog.
**Notes:**
Some possible values:

- `kNavDefaultNavDlogOptions` & h000000E4 use defaults for all the options
- `kNavNoTypePopup` & h00000001 don’t show file type/extension popup on Open/Save
- `kNavDontAutoTranslate` & h00000002 don’t automatically translate on Open
- `kNavDontAddTranslateItems` & h00000004 don’t add translation choices on Open/Save
- `kNavAllFilesInPopup` & h00000010 "All Files" menu item in the type popup on Open
- `kNavAllowStationery` & h00000020 allow saving of stationery files
- `kNavAllowPreviews` & h00000040 allow preview to show
- `kNavAllowMultipleFiles` & h00000080 allow multiple items to be selected
- `kNavAllowVisibleFiles` & h00000100 allow invisible items to be shown
- `kNavDontResolveAliases` & h00000200 don’t resolve aliases
- `kNavSelectDefaultLocation` & h00000400 make the default location the browser selection
- `kNavSelectAllReadableItem` & h00000800 make the dialog select "All Readable Documents" on open
- `kNavSupportPackages` & h00001000 recognize file system packages, v2.0 or greater
- `kNavAllowOpenPackages` & h00002000 allow opening of packages, v2.0 or greater
- `kNavDontAddRecents` & h00004000 don’t add chosen objects to the recent list, v2.0 or greater
- `kNavDontUseCustomFrame` & h00008000 don’t draw the custom area bevel frame, v2.0 or greater
- `kNavDontConfirmReplacement` & h00010000 don’t show the "Replace File?" alert on save conflict, v3.0 or greater
- `kNavPreserveSaveFileExtension` & h00020000 extension in default file name is preserved and initially hidden, v3.1 or greater

(Read and Write property)

119.2.7  Left as Integer

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The screen position at which to place the upper left corner of the dialog, in global coordinates.
**Notes:**
Specify (left=-1, top=-1) to use the default (persistent) location. Ignored for sheet dialogs.
(Read and Write property)

119.2.8  Message as String

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** For the file dialogs, a banner message appearing across the top of the dialog.
**Notes:**
Specify "" to provide no banner message.
For the Ask alerts, a custom message to replace the default message.
119.2.9  Modality as Integer

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The modality in which to present the dialog.
**Notes:**
The default modality for all dialogs is kWindowModalityAppModal. If kWindowModalityWindowModal is specified, then a valid parentWindow is required.

Constants for Window Modality:
- kWindowModalityNone
- kWindowModalityNonModal
- kWindowModalityModal
- kWindowModalityAppModal
- kWindowModalityWindowModal

119.2.10  Parent as Window

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The parent window.
**Notes:**
Used for sheets.
(Read and Write property)

119.2.11  PopupMenuExtension as NavigationTypeListMBS

MBS MacOSX Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The entries for the PopupMenu in the dialog.
**Notes:**
On this list, the NavigationTypeListMBS.Signature value is ignored.
(Read and Write property)

119.2.12  PreferenceKey as Integer

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A key to uniquely identify the dialog’s usage context within the application.
Notes:

If an application uses the same class of dialog (e.g. GetFile or ChooseFile) for more than one purpose, set this field to a unique value for each usage in order to give each dialog its own persistent settings (e.g. screen rectangle, starting target folder).
(Read and Write property)

119.2.13 **SaveFileName as String**

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The initial value appearing in the edit text field for the file name to be saved (PutFile only).
**Notes:** (Read and Write property)

119.2.14 **Top as Integer**

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The screen position at which to place the upper left corner of the dialog, in global coordinates.
**Notes:**
Specify (left=-1, top=-1) to use the default (persistent) location. Ignored for sheet dialogs.
(Read and Write property)

119.2.15 **WindowTitle as String**

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The custom title for the dialog window.
**Notes:**
Specify "" to use the default title.
(Read and Write property)
119.3  class NavigationDialogResultMBS

119.3.1  class NavigationDialogResultMBS

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: A class for the result of a Navigation Dialog.

119.3.2  Methods

119.3.3  close

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The destructor. Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you. (e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

119.3.4  Selection(index as Integer) as folderitem

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The selection (files and folders). Notes: Index goes from 0 to count-1.

119.3.5  SelectionCount as Integer

119.3.6  Properties

119.3.7  File as FolderItem

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The selected file (if only one was selectable). Notes: (Read and Write property)
119.3. **CLASS NAVIGATIONDIALOGRESULTMBS**

### 119.3.8 isStationery as Boolean

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** True if this reply is from a PutFile dialog and the user wants to save the file as stationery. **Notes:** (Read and Write property)

### 119.3.9 Replacing as Boolean

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** True if this reply is from a PutFile dialog and the file to be saved already exists and needs to be replaced. **Notes:** The user has already been warned unless the kNavDontConfirmReplacement option flag is used. (Read and Write property)

### 119.3.10 SaveFileExtensionHidden as Boolean

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The extension on the name of the saved file should be hidden. **Notes:** Once the file has been saved, the client should call NavCompleteSave. NavCompleteSave will take care of hiding the extension on the file. However, the client needs to know that the extension is hidden so that it can display the document name correctly in the UI, such as in window titles and menus. This field is only used if the client has requested extension preservation using the kNavPreserveSaveFileExtension dialog option flag. (Read and Write property)

### 119.3.11 SaveFileName as String

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Carbon PutFile dialog only: the name of the file to be saved. **Notes:** This field contains the true file name to saved, even if the extension will be hidden from the user. (Read and Write property)

### 119.3.12 Valid as Boolean

MBS MacOSX Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** True if the reply contains a non-null selection.
Notes: (Read and Write property)
119.4. CLASS NAVIGATIONTYPELISTMBS

119.4 class NavigationTypeListMBS

119.4.1 class NavigationTypeListMBS

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The list of type/creator codes for the navigation dialog.

119.4.2 Methods

119.4.3 Add(NavType as NavigationTypeMBS)

MBS MacOSX Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Adds a type to the list.
**Notes:** (Changed from String to NavigationTypeMBS in plugin version 5.3)

119.4.4 clear

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Clears the type list.

119.4.5 close

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The destructor.
**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

119.4.6 Count as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Counts the number of items in the list.
119.4.7 Get(index as Integer) as NavigationTypeMBS

MBS MacOSX Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Returns an item from the list.

**Notes:**
Index is from 0 to count-1.
(Changed from String to NavigationTypeMBS in plugin version 5.3)

119.4.8 Properties

119.4.9 Signature as String

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The Creator code of your Application.

**Notes:**
Specify "****" as a wildcard.
(Read and Write property)
119.5  class NavigationTypeMBS

119.5.1  class NavigationTypeMBS

MBS MacOSX Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** A class for a File Type definition.

119.5.2  Methods

119.5.3  Close

MBS MacOSX Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The destructor.

**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

119.5.4  Properties

119.5.5  Creator as String

MBS MacOSX Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The Mac Creator code to use.

**Notes:**
String must be 4 characters long.
Used only on Mac OS Classic.
(Read and Write property)

119.5.6  Name as String

MBS MacOSX Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The name of this navigation type.

**Notes:**
Used on Mac OS Classic and Mac OS X.
(Read and Write property)
119.5.7 Type as String

MBS MacOSX Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The MacType code to use.

**Example:**

```vbnet
dim t as NavigationTypeMBS
  t=new NavigationTypeMBS
  t.Type="TIFF"
  t.Creator="GKON"
  t.Name="Graphicconverter TIFF file"
```

**Notes:**

String must be 4 characters long.
Used only on Mac OS Classic.
(Read and Write property)
119.6. CLASS NSOPENPANELMBS

119.6 class NSOpenPanelMBS

119.6.1 class NSOpenPanelMBS

119.6.2 Methods

119.6.3 beginForDirectory(path as folderitem, name as string, filetypes() as string)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Presents a modeless Open panel. Notes:

path: Directory whose files the panel displays. When nil, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

name: Specifies a particular file in absoluteDirectoryPath that is selected when the Open panel is presented to the user. When nil, no file is initially selected.

fileTypes: Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. An empty array makes all files in path selectable by the user.

This method will later called the savePanelDidEnd event.

119.6.4 beginSheetForDirectory(path as folderitem, name as string, filetypes() as string, targetWindow as window)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Presents a sheet Open panel on a given window. Notes:

path: Directory whose files the panel displays. When nil, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.
name:
Specifies a particular file in path that is selected when the Open panel is presented to the user. When "", no file is initially selected.

directory:
Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. An empty array makes all files in absoluteDirectoryPath selectable by the user.

targetWindow:
Window to open the sheet on.

This method will later called the savePanelDidEnd event.

Seems like on Mac OS X 10.4 the usage of sheets will raise NSExceptions for missing methods in the NSCarbonWindowFrame class.

### 119.6.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The constructor which initializes the panel with default values.

### 119.6.6 Files as Folderitem()

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries all folderitems.
See also:
- 119.6.7 Files(index as UInt32) as folderitem

### 119.6.7 Files(index as UInt32) as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The array of files.
**Notes:** Index is zero based.
See also:
- 119.6.6 Files as Folderitem()
119.6.8  runModalForDirectory(path as folderitem, name as string, filetypes as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A convenience version of the runModalForDirectory function which passes one filetype instead of an array of file types.

See also:

- 119.6.9 runModalForDirectory(path as folderitem, name as string, filetypes() as string) as Integer

119.6.9  runModalForDirectory(path as folderitem, name as string, filetypes() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Runs the panel as a modal dialog with the given filetypes.

**Notes:**

path is the directory to use as a start point. Pass nil to use the last directory which has been used.

filetypes:
The filetypes you want to allow.

See also:

- 119.6.8 runModalForDirectory(path as folderitem, name as string, filetypes as string) as Integer

119.6.10  runModalForTypes(filetypes as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A convenience version of the runModalForTypes function which passes one filetype instead of an array of file types.

**Example:**

```
Dim dlg As New NSOpenPanelMBS
Dim iResult as Integer = dlg.runModalForTypes(“jpg”)
```

See also:

- 119.6.11 runModalForTypes(filetypes() as string) as Integer

119.6.11  runModalForTypes(filetypes() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Runs the panel as a modal dialog with the given filetypes.
Example:

```vbnet
Dim dlg As New NSOpenPanelMBS
Dim types() as string = array("jpg", "tif")
Dim iResult as Integer = dlg.runModalForTypes(types)
```

See also:

- 119.6.10 runModalForTypes(filetypes as string) as Integer

119.6.12 **URL(index as UInteger32) as string**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The array of file URLs.

**Notes:** Index is zero based.

119.6.13 **URLs as String()**

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries all URLs.

119.6.14 **Properties**

119.6.15 **allowsMultipleSelection as boolean**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the panel’s browser allows the user to open multiple files (and directories) at a time.

**Notes:** (Read and Write property)

119.6.16 **canChooseDirectories as boolean**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the user can select directories in the pane’s browser.

**Notes:**

When a directory is selected, the OK button is enabled only if flag is true.

(Read and Write property)
119.6. **CLASS NSOPENPANELMBS**

119.6.17 **canChooseFiles as boolean**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Whether the panel allows the user to choose files to open.
**Notes**: (Read and Write property)

119.6.18 **canDownloadUbiquitousContents as Boolean**

**Function**: Controls how the receiver responds to ubiquitous documents that aren’t yet fully downloaded locally.
**Notes**: If true, then the receiver will disallow opening non-local ubiquitous files. Also, if the user attempts to select a non-local file, the receiver will trigger or reprioritize downloading for that file so that it can be opened as soon as possible. If false, then the receiver will allow the user to select and open non-local files, giving your application responsibility for downloading and reporting progress. The default value is true, except for applications linked against the 10.9 SDK or earlier that have adopted iCloud by specifying a ubiquitous container identifier entitlement.

To provide the ideal user experience, you should set this property to NO and download the file’s contents (with NSFileCoordinator) and show downloading progress (with NSProgress or NSMetadataQuery) in the context of your application, instead of relying on the open panel to do it.

Available in Mac OS X 10.10 and newer.
(Read and Write property)

119.6.19 **canResolveUbiquitousConflicts as Boolean**

**Function**: Controls how the receiver responds to ubiquitous documents with conflicting versions.
**Notes**: If true, then when the user attempts to open one or more documents with conflicts, the receiver will first display conflict resolution UI, requiring the user to resolve those conflicts before the documents can be opened. If false, then the receiver does nothing in response to conflicts, allowing your application to handle them. The default value is true, except for applications linked against the 10.9 SDK or earlier that have adopted iCloud by specifying a ubiquitous container identifier entitlement.

To provide the ideal user experience, you should set this property to NO and do conflict detection and resolution (using NSURLUbiquitousItemHasUnresolvedConflictsKey and NSFileVersion) in the context of your application, instead of relying on the open panel to do it.
119.6.20  FilesCount as UInt32

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The number of selected files. Notes: (Read only property)

119.6.21  resolvesAliases as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the receiver resolves aliases. Notes: If true, the effect is that dropping an alias on the panel or asking for filenames returns the resolved aliases. The default is true. (Read and Write property)
119.7. class NSSavePanelMBS

119.7.1 class NSSavePanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The class for a Cocoa Save Panel.  
**Notes:** Subclass of the NSPanelMBS class.

119.7.2 Methods

119.7.3 allowedFileTypes as string()

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the allowed file types.  
**Notes:**  
If the user specifies a file whose type is in the array of allowed types, the user is not presented with another dialog (see allowsOtherFileTypes for details about this dialog) when trying to save. Examples of common file types are "rtf", "tiff", and "ps". File type strings encoding HFS file types are not valid values for this attribute. A nil return value, which is the default, indicates that the user can save to any ASCII file.  

Available in Mac OS X v10.3 and later.

119.7.4 beginSheetForDirectory(path as folderitem, name as string, targetWindow as window)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Presents a Save panel as a sheet with the directory specified by path and optionally, the file specified by name selected.  
**Notes:**  
If targetWindow is nil, the panel will be a modal dialog.  

This method will later called the savePanelDidEnd event.

Seems like on Mac OS X 10.4 the usage of sheets will raise NSExceptions for missing methods in the NSCarbonWindowFrame class.
119.7.5 Cancel

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** You can cancel the dialog using this method.

119.7.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The constructor which initializes the panel with default values.

119.7.7 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The file currently shown in the panel.
**Notes:** May be nil.

119.7.8 FileTypeForHFSType(hfstype as string) as string

MBS MacCocoa Plugin, Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string encoding a file type code.
**Example:**
```
    dim n as new NSSavePanelMBS

    MsgBox n.FileTypeForHFSType("TEXT") // shows 'TEXT'
```

**Notes:** When using Mac Type codes, you need to use this function to convert them in a string the file manager understands.

119.7.9 HideNSNavNodePopUpButton

MBS MacCocoa Plugin, Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Hides the navigation popup menu.
**Notes:** This is a function using undocumented features from the Apple NSSavePanel class, so there is not guarantee that it will work in future versions.
119.7.10 Ok

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: You can click ok in the dialog using this method.

119.7.11 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: Displays the panel and begins its event loop with the current working (or last selected) directory as the default starting point. **Notes**: Returns NSOKButton or NSCancelButton or -1 on any error.

119.7.12 runModalForDirectory(path as folderitem, name as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: Initializes the panel to the directory specified by path and, optionally, the file specified by filename, then displays it and begins its modal event loop; path and filename can be empty strings. **Notes**: If path is nil, the previous directory the Save panel was in is used.

119.7.13 setAllowedFileTypes(filetype as string)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: A convenience method for setAllowedFileTypes with only one file type. See also:

- 119.7.14 setAllowedFileTypes(filetypes() as string)

119.7.14 setAllowedFileTypes(filetypes() as string)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: Specifies the allowed file types. **Notes**: A file type is an extension to be appended to any selected files that don’t already have that extension; ”nib” and ”rtf” are examples. The items in types should not include the period that begins the extension. File type strings encoding HFS file types are not valid values. Pass an empty array, to allow any file type, which is the default. See also:

- 119.7.13 setAllowedFileTypes(filetype as string)
119.7.15 validateVisibleColumns

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Validates and possibly reloads the browser columns visible in the receiver by invoking the delegate method shouldShowFilename.  
**Notes:** You might use this method if you want the browser to only allow selection of files with certain extensions based on the selection made in an accessory-view pop-up list. When the user changes the selection, you would invoke this method to revalidate the visible columns.

119.7.16 Properties

119.7.17 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The custom accessory view for the current application.  
**Notes:**  
You can place any Cocoa control on that panel.  
(Read and Write property)

119.7.18 allowsOtherFileTypes as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver allows the user to save files with an extension that’s not in the list of allowed types.  
**Notes:**  
If the user tries to save a filename with a recognized extension that’s not in the list of allowed types they are presented with a dialog. If this property is true, then the dialog presents the option of using the extension the user specified.  

The default setting is false.  
(Read and Write property)

119.7.19 canCreateDirectories as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver allows the user to create directories.  
**Notes:** (Read and Write property)
119.7.20  canSelectHiddenExtension as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver allows the user to hide or show extensions. **Notes:** (Read and Write property)

119.7.21  Directory as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of the directory currently shown in the panel. **Notes:** May be nil on any error. (Read and Write property)

119.7.22  directoryURL as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The directory shown in the panel as a URL. **Notes:** Available in Mac OS X v10.6 and later. (Read and Write property)

119.7.23  isExpanded as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the panel is expanded. **Notes:** (Read only property)

119.7.24  isExtensionHidden as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the extension-hiding checkbox is visible and checked. **Notes:** True to show the checkbox and false to hide. (Read and Write property)
119.7.25  **Message as string**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The message displayed in the panel.

**Notes:**

The default message text is an empty string.

(Read and Write property)

119.7.26  **NameFieldLabel as string**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string displayed in front of the filename text field.

**Notes:**

By default the label is "Save As:"

(Read and Write property)

119.7.27  **nameFieldStringValue as string**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user-editable filename currently shown in the name field.

**Notes:**

Available in Mac OS X v10.6 and later.

(Read and Write property)

119.7.28  **Prompt as string**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The prompt of the default button.

**Notes:**

This prompt appears on all SavePanel objects (or all OpenPanel objects if the panel of this message is an NSOpenPanel instance) in your application. By default the text in the default button is "Open" for an Open panel and "Save" for a Save panel.

It is intended that short words or phrases, such as "Open", "Save", "Set", or "Choose", be used on the button. The button is not resized to accommodate long prompts.

Since this method previously affected a title field, any colon at the end of prompt is removed.

(Read and Write property)
119.7.29  **requiredFileType as string**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The required file type (if any).
**Notes:**
A file specified in the Save panel is saved with the designated filename and this file type as an extension. Examples of common file types are "rtf", "tiff", and "ps". File type strings encoding HFS file types are not valid values for this attribute. An "" return value indicates that the user can save to any ASCII file.

This method is equivalent to calling allowedFileTypes and returning the first element of the list of allowed types, or "" if there are none.
(Read and Write property)

119.7.30  **showsHiddenFiles as boolean**

MBS MacCocoa Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to show or hide the invisible files.
**Notes:**
This is a function using undocumented features from the Apple NSSavePanel class, so there is not guarantee that it will work in future versions.
(Read and Write property)

119.7.31  **Title as string**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The title of the panel.
**Notes:** (Read and Write property)

119.7.32  **treatsFilePackagesAsDirectories as boolean**

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the panel displays file packages to the user as directories.
**Notes:** (Read and Write property)
119.7.33 Events

119.7.34 `compareFilename(name1 as string, name2 as string, caseSensitive as boolean) as Integer`

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Controls the ordering of files presented by the NSSavePanel.

**Notes:**
If this event has no code, the default behavior is used.

The caseSensitive argument, if true, indicates that the ordering is to be case-sensitive.

Don’t reorder filenames in the Save panel without good reason, because it may confuse the user to have files in one Save panel or Open panel ordered differently than those in other such panels or in the Finder. The default behavior of Save and Open panels is to order files as they appear in the Finder. Note also that by implementing this method you will reduce the operating performance of the panel.

**Constants:**
- `const NSOrderedAscending=-1` // The left operand is smaller than the right operand.
- `const NSOrderedSame=0` // The two operands are equal.
- `const NSOrderedDescending=1` // The left operand is greater than the right operand.

119.7.35 `directoryDidChange(path as string, folder as folderitem)`

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the user has changed the selected directory in the panel.

**Notes:** If this event has no code, the default behavior is used.

119.7.36 `isValidFilename(path as string, item as folderitem) as boolean`

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Gives the delegate the opportunity to validate selected items.

**Notes:**
If this event has no code, the default behavior is used.

The NSSavePanel object sender sends this event just before the end of a modal session for each filename displayed or selected (including filenames in multiple selections). The event determines whether it wants the file identified by filename; it returns true if the filename is valid, or false if the save panel should stay in its modal loop and wait for the user to type in or select a different filename or names. If the event refuses a
filename in a multiple selection, none of the filenames in the selection is accepted.

119.7.37 panelSelectionDidChange

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called whenever the selection changed in the dialog. **Notes:** If this event has no code, the default behavior is used.

119.7.38 savePanelDidEnd(ReturnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The save panel finished in sheet mode. **Notes:** Returncode is NSOKButton or NSCancelButton.

119.7.39 shouldShowFilename(path as string, item as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Gives the delegate the opportunity to filter items that it doesn’t want the user to choose. **Notes:** If this event has no code, the default behavior is used.

The NSSavePanel sends this event for each file or directory (filename) it is about to load in the browser. The delegate returns true if filename should be selectable, and false if the save panel should disable the file or directory.

119.7.40 userEnteredFilename(filename as string, confirmed as boolean) as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the user confirms a filename choice by hitting OK or Return in the NSSavePanel. **Notes:** You can either leave the filename alone, return a new filename, or return "" to cancel the save (and leave the Save panel as is). This method is sent before any required extension is appended to the filename and before the Save panel asks the user whether to replace an existing file.

Note that in the future, this method may be called multiple times in the sessions as the user types. In those cases, okFlag will be false until the user confirms the choice, in which case okFlag will become true. If the
delegate does extensive validation or puts up alerts, it should do so only when okFlag is true.

If this event has no code, the default behavior is used.

119.7.41 willExpand(expanding as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the NSSavePanel is about to expand or collapse because the user clicked the disclosure triangle that displays or hides the file browser. **Notes:** If this event has no code, the default behavior is used.

119.7.42 Constants

119.7.43 NSCancelButton = 0

MBS MacCocoa Plugin, Plugin Version: 7.8. **Function:** One of the result codes you may need with this class.

119.7.44 NSOKButton = 1

MBS MacCocoa Plugin, Plugin Version: 7.8. **Function:** One of the result codes you may need with this class.
119.8  class OpenDialogFileTypeMBS

119.8.1  class OpenDialogFileTypeMBS

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class for a file type for the OpenDialog class.

**Notes:** For Cocoa, only the type field is used and can be an UTI or file extension.

119.8.2  Methods

119.8.3  Close

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

119.8.4  Properties

119.8.5  Extension as String

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The extension for this filetype.

**Notes:**
Currently this value is only used on Windows.
Value e.g. "*.TXT" or "*.TXT;*.BMP".

Use a value like "*.TXT" or to match multiple types, list multiple extensions separated by semicolons like this: "*.TXT;*.BMP".

With version 8.2, we use extensions also for MacOS.
(Read and Write property)
119.8.6 Name as String

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The name of this file type.
**Notes:**
Currently this value is only used on Windows.
(Read and Write property)

119.8.7 Type as String

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The Mac OS type code for this file type.
**Notes:**
Currently this value is only used on Mac OS.
And check the documentation on the Navigation Manager if you use it as you will need a KIND Resource for
this.

For Cocoa, only the type field is used and can be an UTI or file extension.
(Read and Write property)
119.9. CLASS OPENDIALOGMBS

119.9  class OpenDialogMBS

119.9.1  class OpenDialogMBS

**Example:**

```vbnet
dim o as OpenDialogMBS
dim i,c as Integer
dim f as FolderItem

o=new OpenDialogMBS
o.ShowHiddenFiles=true
o.PromptText="Select one or more files:"
o.MultipleSelection=true
o.ActionButtonLabel="Open files"
o.CancelButtonLabel="no, thanks."
o.WindowTitle="This is a window title."
o.ClientName="Client Name?"
o.ShowDialog

```

```vbnet
for i=0 to c-1
f=o.Files(i)
Listbox1.AddRow f.AbsolutePath
next
```

```vbnet
```

**Notes:** OpenDialogMBS does not yet use NSOpenPanel yet. So for Cocoa applications you can use NSOpenPanelMBS class directly. For the Mac App Store, you must use NSOpenPanelMBS and avoid OpenDialogMBS.
119.9.2 Methods

119.9.3 AddType(t as OpenDialogFileTypeMBS)

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a file type to the list.

119.9.4 ClearTypes

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears the file type list.

119.9.5 CountTypes as Integer

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of file types in the file type list.

119.9.6 Files(index as Integer) as folderitem

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The array with the selected files.
**Notes:** Index goes from 0 to filecount-1.

119.9.7 GetCustomImageHeight as Integer

MBS Util Plugin, Plugin Version: 11.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns the height of the custom picture in pixels.

**Example:**
```
dim o as new OpenDialogMBS
msgbox "GetCustomImageHeight: " + str(o.GetCustomImageHeight) // could show 72 as value.
```

**Notes:**
The height depends on the size of the Windows system font, so it's variable and this function calculates the size for you.
119.9. **CLASS OPENDIALOGMBS**

Returns 0 on any error.

### 119.9.8 **GetGetType(index as Integer) as OpenDialogFileTypeMBS**

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the file type with the given index. **Notes:** Returns nil on any error.

### 119.9.9 **RefreshCustomImage**

MBS Util Plugin, Plugin Version: 11.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Call this method after you set the custompicture property to update the window. **Notes:** The control is asked to redraw and will use the CustomPicture property for the picture content. Space around is colored with window background color.

### 119.9.10 **ShowDialog**

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Shows the dialog. **Example:**

```vbnet
dim o as new OpenDialogMBS
o.ShowDialog
```

**Notes:** Check the FileCount property to see whether something was selected.

### 119.9.11 **Properties**

### 119.9.12 **accessoryView as Variant**

MBS Util Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Customizes the panel for the application by adding a custom view to the panel. **Notes:** Only for Cocoa target. Must be a NSViewMBS or subclass.

The custom object that is added appears just above the OK and Cancel buttons at the bottom of the panel. The open panel automatically resizes itself to accommodate the view. You can invoke this method repeatedly.
to change the accessory view as needed. If view is nil, the panel removes the current accessory view.
(Read and Write property)

### 119.9.13 ActionButtonLabel as String

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The label of the action button.

**Example:**
```vbscript
dim o as new OpenDialogMBS

o.ActionButtonLabel = "Hello"
o.ShowDialog
```

**Notes:**
Used only on Mac OS.
For RB 4.5 and earlier you need to make sure the encoding is set correctly.
Can be set to "" to use the default value.
(Read and Write property)

### 119.9.14 AllowFolderSelection as Boolean

MBS Util Plugin, Plugin Version: 7.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Whether folders can be selected.

**Example:**
```vbscript
dim o as OpenDialogMBS
dim i,c as Integer
dim f as FolderItem

o=new OpenDialogMBS
o.ShowHiddenFiles=true
o.PromptText="Select one or more files/folders:"
o.MultipleSelection=true
o.ActionButtonLabel="Open files/folders"
o.CancelButtonLabel="no, thanks."
o.WindowTitle="This is a window title."
o.ClientName="Client Name?"
o.AllowFolderSelection=true
o.ShowDialog

c=o.FileCount
```
119.9. CLASS OPENDIALOGMBS

if c>0 then
    for i=0 to c-1
        f=o.Files(i)
        ListBox1.AddRow f.AbsolutePath
    next
end if

Notes:
Default is false.
Setting this to true on Windows or Linux has no effect there.
(Read and Write property)

119.9.15 CancelButtonLabel as String

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The text for the cancel button.
**Example:**

```vbs
dim o as new OpenDialogMBS

o.CancelButtonLabel = "Hello"

o.ShowDialog
```

Notes:
Used only on Mac OS.
For RB 4.5 and earlier you need to make sure the encoding is set correctly.
Can be set to "" to use the default value.
(Read and Write property)

119.9.16 ClientName as String

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The name of the client.
**Example:**

```vbs
dim o as new OpenDialogMBS

o.ClientName = "Hello"

o.ShowDialog
```
Notes:
Used only on Mac OS.
For RB 4.5 and earlier you need to make sure the encoding is set correctly.
Can be set to "" to use the default value.
(Read and Write property)

119.9.17 Creator as String

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The creator code of your application.
**Notes:**
This property is only used Mac OS if you specify one or more file types.
(Read and Write property)

119.9.18 CustomPicture as Picture

MBS Util Plugin, Plugin Version: 11.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The custom picture content.
**Notes:**
You need to call RefreshCustomImage to refresh the picture visible to the user.
(Read and Write property)

119.9.19 File as Folderitem

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The first file selected.
**Example:**
```vba
dim o as new OpenDialogMBS
o.MultipleSelection = true
o.ShowDialog

MsgBox o.File.displaypathmbs
```
**Notes:**
file = files(0)
Just for the cases where you only need the first file.
119.9. **CLASS OPENDIALOGMBS**

(Read only property)

119.9.20 **FileSyncount as Integer**

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of files selected.

**Example:**

```vbs
    dim o as new OpenDialogMBS
    o.MultipleSelection = true
    o.ShowDialog
    MsgBox str(o.FileCount)
```

**Notes:** (Read only property)

119.9.21 **InitialDirectory as FolderItem**

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The initial directory.

**Example:**

```vbs
    dim o as new OpenDialogMBS
    o.InitialDirectory = SpecialFolder.Desktop
    o.ShowDialog
```

**Notes:**

Set to nil to get the last directory used.
(Read and Write property)

119.9.22 **Lasterror as Integer**

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last error code reported.

**Notes:** (Read and Write property)
119.9.23  **Left as Integer**

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The horizontal position of the dialog.

**Notes:**
-1 is for the default position.
Used only on the Mac side.
(Read and Write property)

119.9.24  **MultipleSelection as Boolean**

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether you want to allow multiple file selection.

**Example:**
```vbnet
dim o as new OpenDialogMBS
o.MultipleSelection = true
o.ShowDialog
```

**Notes:** (Read and Write property)

119.9.25  **ParentWindow as Window**

**Example:**
```vbnet
dim o as new OpenDialogMBS
o.ParentWindow = window1
o.ShowDialog
```

**Notes:**
Only implemented for Windows and Linux.
(Read and Write property)
119.9. CLASS OPENDIALOGMBS

119.9.26 PromptText as String

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The prompt text.
**Example:**
```vbnet
dim o as new OpenDialogMBS
o.PromptText = "Hello"
o.ShowDialog
```

**Notes:**
For RB 4.5 and earlier you need to make sure the encoding is set correctly.
Can be set to "" to use the default value.
(Read and Write property)

119.9.27 ResolveAliases as Boolean

MBS Util Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether aliases should be resolved.
**Example:**
```vbnet
dim o as new OpenDialogMBS
o.ResolveAliases = false
o.ShowDialog
```

**Notes:**
This property is only used on Mac OS X.
Default is true.
Flag seems to be broken on Mac OS X 10.7.
(Read and Write property)

119.9.28 ShowHiddenFiles as Boolean

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether hidden files should be shown.
**Example:**
dim o as new OpenDialogMBS
o.ShowHiddenFiles = true
o.ShowDialog

Notes:
Default is false.
(Read and Write property)

### 119.9.29 Top as Integer

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The vertical position of the dialog.
**Notes:**
-1 is for the default position.
Used only on the Mac side.
(Read and Write property)

### 119.9.30 TreatFilePackagesAsDirectories as Boolean

MBS Util Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the panel’s behavior for displaying file packages (for example, MyApp.app) to the user.
**Notes:**
If true, the panel will display file packages as directories; if false, it will not.
(Read and Write property)

### 119.9.31 UseCustomPicture as Integer

MBS Util Plugin, Plugin Version: 11.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Whether to add a custom picture control.
**Notes:**
Specify the size of the area you want. As the size is relative to the font size of the system font on windows, the results can be interesting. For example a value of 50 gives here a 72 pixel height area. Value can be from 1 to 100. Or zero to disable.

This method was added for a client who needed to show a small preview of a project file in the open dialog on Windows.
For Mac OS X you can use the NSSavePanelMBS/NSOpenPanelMBS with an accessory view.
119.9.32 **WindowTitle as String**

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The window title to use.

**Example:**

```vbscript
dim o as new OpenDialogMBS

o.WindowTitle = "Hello World"
o.ShowDialog
```

**Notes:**
For RB 4.5 and earlier you need to make sure the encoding is set correctly.
Can be set to "" to use the default value.
(Read and Write property)

119.9.33 **Events**

119.9.34 **FilterItem(file as folderitem, filterMode as Integer) as boolean**

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** An event where you can filter the file list.

**Notes:**
Return true to disable the file.
The result of the event is ignored by Windows. But on Mac OS it works.
So use the event on Mac and the filetype objects on Windows.

119.9.35 **SelectionChanged(file as folderitem)**

MBS Util Plugin, Plugin Version: 11.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called when the selection changes in the window.
**Notes:** This is currently only implemented for Windows and gives you only one file name.
Chapter 120

Network

120.1 class AvahiBrowserMBS

120.1.1 class AvahiBrowserMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The class to browse for services.

120.1.2 Methods

120.1.3 Browse(InterfaceIndex as Integer, Protocol as Integer, servicetype as string, domain as string = "", flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Browse for services of a type on the network.

**Notes:**

In most cases you probably want to pass kInterfaceAny and kProtocolAny in InterfaceIndex, resp. protocol to browse on all local networks. The specified events will be called whenever a new service appears or is removed from the network. Please note that events may be collapsed to minimize traffic (i.e. a REMOVED followed by a NEW for the same service data is dropped because redundant). If you want to subscribe to service data changes, you should use AvahiResolverMBS class and keep it open, in which case you will be notified via Found event everytime the service data changes.

Only one browse call per AvahiBrowserMBS object please.

Returns true on success and false on failure.
120.1.4 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The constructor.

120.1.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

120.1.6 Properties

120.1.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The reference to the parent client object.
**Notes:** (Read only property)

120.1.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference.
**Notes:** (Read only property)

120.1.9 Events

120.1.10 AllForNow(type as string)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

120.1.11 CacheExhausted(type as string)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** One-time event, to notify the user that all entries from the caches have been sent.
120.1. CLASS AVAHIBROWSERMBS

120.1.12 Failure(error as string, errorcode as Integer)
MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Some error occurred.

120.1.13 ServiceFound(InterfaceIndex as Integer, protocol as Integer, name as string, type as string, domain as string, flags as Integer)
MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Found a new object on the network.

120.1.14 ServiceRemoved(InterfaceIndex as Integer, protocol as Integer, name as string, type as string, domain as string, flags as Integer)
MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The service has been removed from the network.

120.1.15 Constants

120.1.16 kInterfaceAny = -1
MBS Linux Plugin, Plugin Version: 12.4. **Function:** Special constant to use any interface available. **Notes:** Otherwise you would pass the index of the network interface you want to use.

120.1.17 kProtocolAny = -1
MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the IP protocol constants. **Notes:** Any protocol.

120.1.18 kProtocolIPv4 = 0
MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the IP protocol constants. **Notes:** Only IPv4.
120.1.19  kProtocolIPv6 = 1

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the IP protocol constants.  
**Notes:** Only IPv6.
120.2. **CLASS AVAHICLIENTMBS**

### 120.2.1 class AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The base class for avahi.

**Notes:**
Typically you create an object of your subclass of AvahiClientMBS at application launch and keep it running. If events are too slow in GUI events, please use a timer with 50ms and call the AvahiClientMBS.Poll method there.

### 120.2.2 Methods

#### 120.2.3 Available as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Whether the avahi library has been found and loaded.

#### 120.2.4 Constructor(flags as Integer = 0)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Initializes the client.

#### 120.2.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The destructor.

#### 120.2.6 DomainName as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Get domain name.
**120.2.7 HostName as string**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Get host name.

---

**120.2.8 Poll**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Polls for events.

**Example:**
```
// in a timer with 50ms
AvahiClientMBS.Poll
```

**Notes:**
This is automatically called by the plugin for GUI applications. If you call it in a timer, you can speedup avahi.
Console applications with their own event loop need to call Poll method regularly.

---

**120.2.9 Version as string**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Get the version of the server.

---

**120.2.10 Properties**

**120.2.11 Handle as Integer**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference.

**Notes:** (Read only property)
120.2. CLASS AVAHICLIENMTMBS

120.2.12 Events

120.2.13 Collision

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** We’re still connecting. **Notes:** This state is only entered when kClientNoFail has been passed to Constructor() and the daemon is not yet available.

120.2.14 Connecting

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Client is connecting.

120.2.15 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Some kind of error happened on the client side.

120.2.16 Registering

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Client is registering.

120.2.17 Running

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Client is running.

120.2.18 Constants

120.2.19 kClientIgnoreUserConfig = 1

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the client initialization flags. **Notes:** Don’t read user configuration
120.2.20 \( k_{\text{ClientNoFail}} = 2 \)

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the client initialization flags.

**Notes:** Don’t fail if the daemon is not available when `avahi_client_new()` is called, instead enter `AVAHI_CLIENT_CONNECTING` state and wait for the daemon to appear.
120.3. class AvahiDomainBrowserMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The class to browse for domains.

120.3.2 Methods

120.3.3 BrowseDomains(InterfaceIndex as Integer, Protocol as Integer, domain as string = "", BrowserType as Integer = 0, flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Browse for domains on the local network.
**Notes:**
Only one BrowseDomains call per AvahiDomainBrowserMBS object please.
Returns true on success and false on failure.

120.3.4 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The constructor.

120.3.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The destructor.

120.3.6 Properties

120.3.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The reference to the parent client object.
**Notes:** (Read only property)
120.3.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference.
**Notes:** (Read only property)

120.3.9 Events

120.3.10 AllForNow

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

120.3.11 CacheExhausted

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** One-time event, to notify the user that all entries from the caches have been sent.

120.3.12 DomainFound(InterfaceIndex as Integer, protocol as Integer, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Found a new domain on the network.

120.3.13 DomainRemoved(InterfaceIndex as Integer, protocol as Integer, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The domain has been removed from the network.

120.3.14 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Some error occurred.
120.3.15 Constants

120.3.16 kBrowseTypeBrowse = 0

MBS Linux Plugin, Plugin Version: 12.4. Function: One of the browse modes for domain browsing. Notes: Browse for a list of available browsing domains.

120.3.17 kBrowseTypeBrowseDefault = 1

MBS Linux Plugin, Plugin Version: 12.4. Function: One of the browse modes for domain browsing. Notes: Browse for the default browsing domain.

120.3.18 kBrowseTypeBrowseLegacy = 4

MBS Linux Plugin, Plugin Version: 12.4. Function: One of the browse modes for domain browsing. Notes: Legacy browse domain - see DNS-SD spec for more information.

120.3.19 kBrowseTypeRegister = 2

MBS Linux Plugin, Plugin Version: 12.4. Function: One of the browse modes for domain browsing. Notes: Browse for a list of available registering domains.

120.3.20 kBrowseTypeRegisterDefault = 3

MBS Linux Plugin, Plugin Version: 12.4. Function: One of the browse modes for domain browsing. Notes: Browse for the default registering domain.

120.3.21 kInterfaceAny = -1

MBS Linux Plugin, Plugin Version: 12.4. Function: Special constant to use any interface available. Notes: Otherwise you would pass the index of the network interface you want to use.
120.3.22 kProtocolAny = -1

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the IP protocol constants.  
**Notes:** Any protocol.

120.3.23 kProtocolIPv4 = 0

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the IP protocol constants.  
**Notes:** Only IPv4.

120.3.24 kProtocolIPv6 = 1

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the IP protocol constants.  
**Notes:** Only IPv6.
120.4. class AvahiResolverMBS

120.4.1 class AvahiResolverMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The class to resolve service name to IP address.

120.4.2 Methods

120.4.3 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The constructor.

120.4.4 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The destructor.

120.4.5 Resolve(InterfaceIndex as Integer, Protocol as Integer, name as string, servicetype as string, domain as string, flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Create a new service resolver object.
**Notes:**
Please make sure to pass all the service data you received via Found event, especially interface and protocol.
The protocol argument specifies the protocol (IPv4 or IPv6) to use as transport for the queries which are sent out by this resolver. The protocol argument specifies the address family (IPv4 or IPv6) of the address of the service we are looking for. Generally, on "protocol" you should only pass what was supplied to you as parameter to your Browse function. In protocol you should pass what your application code can deal with when connecting to the service. Or, more technically speaking: protocol specifies if the mDNS queries should be sent as UDP/IPv4 resp. UDP/IPv6 packets. protocol specifies whether the query is for a A resp. AAAA resource record.

Only one resolve call per AvahiResolverMBS object please.
Returns true on success and false on failure.
120.4.6 Properties

120.4.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The reference to the parent client object.
**Notes:** (Read only property)

120.4.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read only property)

120.4.9 Events

120.4.10 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Some error occurred.

120.4.11 Found(interfaceIndex as Integer, Protocol as Integer, name as string, type as string, domain as string, hostname as string, port as Integer, address as string, txt as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
An address was found.

120.4.12 Constants

120.4.13 kResultCached = 1

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the flags for events.
**Notes:** This response originates from the cache.
120.4.14  kResultLocal = 8

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the flags for events.  
**Notes:** This record/service resides on and was announced by the local host. Only available in service and record browsers and only on Found event.

120.4.15  kResultMultiCast = 4

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the flags for events.  
**Notes:** This response originates from multicast DNS.

120.4.16  kResultOurOwn = 16

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the flags for events.  
**Notes:** This service belongs to the same local client as the browser object. Only available in avahi-client, and only for service browsers and only on Found event.

120.4.17  kResultStatic = 32

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the flags for events.  
**Notes:** The returned data has been defined statically by some configuration option.

120.4.18  kResultWideArea = 2

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the flags for events.  
**Notes:** This response originates from wide area DNS.
120.5  class AvahiTypeBrowserMBS

120.5.1  class AvahiTypeBrowserMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The class to browse for types.

120.5.2  Methods

120.5.3  BrowseTypes(InterfaceIndex as Integer, Protocol as Integer, domain as string = "", flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Browse for service types on the local network.
**Notes:**
Only one BrowseTypes call per AvahiTypeBrowserMBS object please.
Returns true on success and false on failure.

120.5.4  Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The constructor.

120.5.5  Destructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The destructor.

120.5.6  Properties

120.5.7  Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The reference to the parent client object.
**Notes:** (Read only property)
120.5. CLASS AVAHITYPEBROWSERMBS

120.5.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference.
**Notes:** (Read only property)

120.5.9 Events

120.5.10 AllForNow

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

120.5.11 CacheExhausted

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** One-time event, to notify the user that all entries from the caches have been sent.

120.5.12 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Some error occurred.

120.5.13 TypeFound(InterfaceIndex as Integer, protocol as Integer, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Found a new type on the network.

120.5.14 TypeRemoved(InterfaceIndex as Integer, protocol as Integer, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The type has been removed from the network.
120.5.15 Constants

120.5.16 kInterfaceAny = -1

MBS Linux Plugin, Plugin Version: 12.4. **Function:** Special constant to use any interface available. **Notes:** Otherwise you would pass the index of the network interface you want to use.

120.5.17 kProtocolAny = -1

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the IP protocol constants. **Notes:** Any protocol.

120.5.18 kProtocolIPv4 = 0

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the IP protocol constants. **Notes:** Only IPv4.

120.5.19 kProtocolIPv6 = 1

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the IP protocol constants. **Notes:** Only IPv6.
120.6. **CLASS CW8021XPROFILEMBS**

120.6 class CW8021XProfileMBS

### 120.6.1 class CW8021XProfileMBS

**Function:** CoreWLAN 802.1X profile.

**Notes:**
Encapsulates an 802.1X profile providing accessors to various profile properties.

Requires Mac OS X 10.6 or newer.

### 120.6.2 Methods

#### 120.6.3 allUser8021XProfiles as CW8021XProfileMBS()

**Function:** Getting all stored 802.1X user profiles.

**Notes:**
An array object containing CW8021XProfile objects representing all stored 802.1X user profiles for the login user.

Retrieves the all the stored 802.1X profiles for the login user.

If there are no 802.1X user profiles for the login user, then this method will return an empty array object.

#### 120.6.4 Constructor

**Function:** Creates an CW8021XProfile object with default parameters.

**Notes:** The default EAP profile supports (in preferred order) TLS, PEAP, TTLS, and EAP-FAST. The profile will conditionally support TLS only if their is a certificate available. TTLS uses MSCHAPv2 inner authentication and EAP-FAST uses automatic PAC provisioning. Support for more advanced EAP profile options may be added in a future implementation.

#### 120.6.5 copy as CW8021XProfileMBS

**Function:** Creates a copy of this object.
120.6.6 isEqualToProfile(profile as CW8021XProfileMBS) as boolean

Function: The CW8021XProfile object for which to test equality.
Notes:
Returns true if two profiles are equal.

Two CW8021XProfile objects are considered equal if all their corresponding properties are equal.

120.6.7 Operator_Compare(profile as CW8021XProfileMBS) as Integer

Function: Compares two profiles.

120.6.8 profile as CWWirelessProfileMBS

Function: An CW8021XProfile object with default parameters for the given network.
Notes:
Convenience method for getting an CW8021XProfile object with default parameters.

The default EAP profile supports (in preferred order) TLS, PEAP, TTLS, and EAP-FAST. The profile will conditionally support TLS only if there is a certificate available. TTLS uses MSCHAPv2 inner authentication and EAP-FAST uses automatic PAC provisioning. Support for more advanced EAP profile options may be added in a future implementation.

120.6.9 Properties

120.6.10 alwaysPromptForPassword as boolean

Function: IEEE 802.1X client always prompts the user for the IEEE 802.1X password.
Notes: (Read and Write property)
120.6. CLASS CW8021XPROFILEMBS

120.6.11 description as string

Function: The object description
Notes: (Read only property)

120.6.12 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

120.6.13 password as string

Function: IEEE 802.1X password.
Notes: (Read and Write property)

120.6.14 ssid as string

Function: Wireless network name.
Notes: (Read and Write property)

120.6.15 userDefinedName as string

Function: User-defined name.
Notes: (Read and Write property)

120.6.16 username as string

Function: IEEE 802.1X username.
Notes: (Read and Write property)
120.7 class CWChannelMBS

120.7.1 class CWChannelMBS

Function: The CoreWLAN class for a channel.
Notes: Encapsulates an IEEE 802.11 channel.

Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWChannel class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.7.2 Methods

120.7.3 Constructor

Function: The private constructor.

120.7.4 copy as CWChannelMBS

Function: Creates a copy of the object.

120.7.5 isEqualToChannel(channel as CWChannelMBS) as boolean

Function: Compares two channels.
Notes: Returns true if both are equal.

120.7.6 Operator_Compare(channel as CWChannelMBS) as Integer

Function: Compares two channels.
120.7. CLASS CWCHANNELMBS

120.7.7 Properties

120.7.8 channelBand as Integer

Function: The channel band.
Notes: (Read only property)

120.7.9 channelNumber as Integer

Function: The channel number.
Notes: (Read only property)

120.7.10 channelWidth as Integer

Function: The channel width.
Notes: (Read only property)

120.7.11 Handle as Integer

Function: The internal reference for this object.
Notes: (Read and Write property)
120.8  class CWConfigurationMBS

120.8.1  class CWConfigurationMBS

**Function:** CoreWLAN configuration.  
**Notes:**  
Encapsulates a static configuration for a given IEEE 802.11 wireless interface.  

Requires Mac OS X 10.6 or newer.

120.8.2  Methods

120.8.3  configuration as CWConfigurationMBS

**Function:** Convenience method for getting an CWConfiguration object.  
**Notes:**  
dim c as CWConfigurationMBS = CWConfigurationMBS.configuration  
MsgBox hex(c.Handle)  
See also:

* 120.8.4 configuration(config as CWConfigurationMBS) as CWConfigurationMBS

120.8.4  configuration(config as CWConfigurationMBS) as CWConfigurationMBS

**Function:** Convenience method for getting a CWConfiguration object initialized with the given CWConfiguration object.  
**Notes:** Available on Mac OS X 10.7 or later.  
See also:

* 120.8.3 configuration as CWConfigurationMBS

120.8.5  Constructor

**Function:** Creates an CWConfiguration.  
See:
120.8. CLASS CWCONFIGURATIONMBS

- 120.8.6 Constructor(configuration as CWConfigurationMBS)

120.8.6 Constructor(configuration as CWConfigurationMBS)

**Function:** Creates a CWConfigurationMBS object initialized with the given CWConfigurationMBS object.
**Notes:** Available on Mac OS X 10.7 or later.

See also:

- 120.8.5 Constructor

120.8.7 copy as CWConfigurationMBS

**Function:** Creates a copy of this object.

120.8.8 isEqualToConfiguration(configuration as CWConfigurationMBS) as boolean

**Function:** Test whether two configurations are equal.
**Notes:** Two CWConfiguration objects are considered equal if all their corresponding properties are equal.

120.8.9 mutableCopy as CWMutableConfigurationMBS

**Function:** Creates a mutable copy of this object.
**Notes:** Available on Mac OS X 10.7 or later.

120.8.10 networkProfiles as CWNetworkProfileMBS()

**Function:** An array of remembered CWNetworkProfileMBS objects.
**Notes:**
The order of this array corresponds to the order in which the the CWNetworkProfile objects participate in the auto-join process.

Available on Mac OS X 10.7 or later.
**120.8.11 Operator_Compare(configuration as CWConfigurationMBS) as Integer**

**Function:** Compares two profiles.

**120.8.12 preferredNetworks as CWWirelessProfileMBS()**

**Function:** Ordered array of CWWirelessProfile objects.  
**Notes:** The preferred networks list is a subset of the remembered networks set. It cannot contain duplicate entries and cannot contain any entries that are not present in the remembered networks set.

**120.8.13 rememberedNetworks as CWWirelessProfileMBS()**

**Function:** Array of stored CWWirelessProfile objects for the given CWConfiguration.

**120.8.14 setPreferredNetworks(profiles() as CWWirelessProfileMBS)**

**Function:** Sets the ordered array of CWWirelessProfile objects.  
**Notes:** The preferred networks list is a subset of the remembered networks set. It cannot contain duplicate entries and cannot contain any entries that are not present in the remembered networks set.

**120.8.15 setRememberedNetworks(profiles() as CWWirelessProfileMBS)**

**Function:** Sets the array of stored CWWirelessProfile objects for the given CWConfiguration.

**120.8.16 Properties**

**120.8.17 alwaysRememberNetworks as boolean**

**Function:** Preference to always remember networks joined.
120.8. **CLASS CWCONFIGURATIONMBS**

Notes: (Read and Write property)

### 120.8.18 disconnectOnLogout as boolean

**Function:** Preference to disconnect from the current network upon user logout.
**Notes:** (Read and Write property)

### 120.8.19 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

### 120.8.20 rememberJoinedNetworks as boolean

**Function:** AirPort client will remember all joined networks.
**Notes:**
Available on Mac OS X 10.7 or later.
(Read only property)

### 120.8.21 requireAdminForIBSSCreation as boolean

**Function:** Preference to require administrative privileges to create computer-to-computer networks.
**Notes:** (Read and Write property)

### 120.8.22 requireAdminForNetworkChange as boolean

**Function:** Preference to require administrative privileges to change networks.
**Notes:** (Read and Write property)
120.8.23  requireAdminForPowerChange as boolean

Function: Preference to require administrative privileges to change the CoreWLAN interface power state.
Notes: (Read and Write property)

120.8.24  requireAdministratorForAssociation as boolean

Function: Require an administrator password to change networks.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

120.8.25  requireAdministratorForIBSSMode as boolean

Function: Require an administrator password to create a computer-to-computer network.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

120.8.26  requireAdministratorForPower as boolean

Function: Require an administrator password to change the interface power state.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)
120.9.  MODULE CWGLOBALSMBS

120.9  module CWGlobalsMBS

120.9.1  module CWGlobalsMBS

**Function:** The module for the global constants.  
**Notes:** Please note that MBS Plugin implements all methods from 10.6 to 10.9 in CoreWLAN. But Apple changes things often, so some methods are only for older system, some only for newer. e.g. kCWErrorDomain is for 10.6 and CWEErrorDomain for 10.7 and newer.

120.9.2  Methods

120.9.3  CWBSSIDDidChangeNotification as string

**Function:** One of the notification names for CoreWLAN.  
**Notes:**  
Please use with NSNotificationObserverMBS class.  
Posted when the BSSID of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

120.9.4  CWCountryCodeDidChangeNotification as string

**Function:** One of the notification names for CoreWLAN.  
**Notes:**  
Please use with NSNotificationObserverMBS class.  
Posted when the country code of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

120.9.5  CWEErrorDomain as string

**Function:** CoreWLAN Error Domain.
120.9.6  **CWLinkDidChangeNotification as string**

**Function:** One of the notification names for CoreWLAN.

**Notes:**

Please use with NSNotificationObserverMBS class.

Posted when the link state of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

120.9.7  **CWLinkQualityDidChangeNotification as string**

**Function:** One of the notification names for CoreWLAN.

**Notes:**

Please use with NSNotificationObserverMBS class.

Posted when the link quality for any WLAN interface changes. The object for this notification is the corresponding BSD interface name. The userInfo dictionary for this notification contains the current RSSI and current transmit rate for the given CoreWLAN interface.

120.9.8  **CWLinkQualityNotificationRSSIKey as string**

**Function:** Dictionary key for link quality change details.

**Notes:** Number containing the current RSSI value for the WLAN interface. Found in the userInfo dictionary for the CWLinkQualityChangedNotification.

120.9.9  **CWLinkQualityNotificationTransmitRateKey as string**

**Function:** Dictionary key for link quality change details.

**Notes:** Number containing the current transmit rate value for the WLAN interface. Found in the userInfo dictionary for the CWLinkQualityChangedNotification.

120.9.10 **CWModeDidChangeNotification as string**

**Function:** One of the notification names for CoreWLAN.

**Notes:**
Module CWGLOBALSMBS

Please use with NSNotificationCenterMBS class.

Posted when the mode of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

**120.9.11 CWPowerDidChangeNotification as string**

**Function:** One of the notification names for CoreWLAN. 
**Notes:** Please use with NSNotificationCenterMBS class. 
Posted when the power state of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

**120.9.12 CWScanCacheDidUpdateNotification as string**

**Function:** One of the notification names for CoreWLAN.
**Notes:** Please use with NSNotificationCenterMBS class. 
Posted when new entries are added to the scan cache, or existing entries are updated with more current information. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

**120.9.13 CWServiceDidChangeNotification as string**

**Function:** One of the notification names for CoreWLAN. 
**Notes:** Please use with NSNotificationCenterMBS class. 
Posted when the network service availability for any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

**120.9.14 CWSSIDDidChangeNotification as string**

**Function:** One of the notification names for CoreWLAN.
Notes:
Please use with NSNotificationObserverMBS class.
Posted when the SSID of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

120.9.15 kCWAssocKey8021XProfile as string

Function: One of the Association Parameter Keys.
Notes: CW8021XProfile object containing the network IEEE 802.1X profile. Required for association to IEEE 802.1X dynamic WEP and WPA/WPA2 Enterprise networks.

120.9.16 kCWAssocKeyPassphrase as string

Function: One of the Association Parameter Keys.
Notes: String containing network passphrase or key. Required for association to WEP and WPA/WPA2 Personal networks.

120.9.17 kCWBSSIDDidChangeNotification as string

Function: One of the notification names for CoreWLAN.
Notes:
Posted when the BSSID of the wireless interface changes. This notification does not contain a userInfo dictionary.
As CoreWLAN has been deprecated, this events may not fire any more.

120.9.18 kCWCountryCodeDidChangeNotification as string

Function: One of the notification names for CoreWLAN.
Notes:
Posted when the country code of the CoreWLAN interface changes. This notification does not contain a userInfo dictionary.
As CoreWLAN has been deprecated, this events may not fire any more.
120.9. **MODULE CWGLOBALSMBS**

**120.9.19  kCWErrorDomain as string**

**Function:** Error domain for NSErrors returned by calls to CWInterface.

**Notes:** NSErrorMBS class has a domain property and there is this domain value used for errors from the CoreWLAN framework.

---

**120.9.20  kCWIBSSKeyChannel as string**

**Function:** One of the IBSS Parameter Keys.

**Notes:** Number containing the channel number on which the network will be created. Defaults to channel 11.

---

**120.9.21  kCWIBSSKeyPassphrase as string**

**Function:** One of the IBSS Parameter Keys.

**Notes:** String containing network cipher key. 40-bit and 104-bit WEP modes are currently supported. Cipher mode is inferred from the key length. A cipher key that has 5 characters or has 10 hexadecimal characters corresponds to a 40-bit WEP key. A cipher key that has 13 characters or has 26 hexadecimal characters corresponds to a 104-bit WEP key. If this key is not present, then no cipher key will be used on the network.

---

**120.9.22  kCWIBSSKeySSID as string**

**Function:** One of the IBSS Parameter Keys.

**Notes:** String containing the SSID of the network to be created.

---

**120.9.23  kCWLinkDidChangeNotification as string**

**Function:** One of the notification names for CoreWLAN.

**Notes:**

Posted when the link state of the CoreWLAN interface changes. This notification does not contain a userInfo dictionary. As CoreWLAN has been deprecated, this events may not fire any more.
120.9.24  **kCWModeDidChangeNotification as string**

**MBS MacFrameworks Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** One of the notification names for CoreWLAN.

**Notes:**

Posted when the op mode of the CoreWLAN interface changes. This notification does not contain a userInfo dictionary.

As CoreWLAN has been deprecated, this events may not fire any more.

120.9.25  **kCWPowerDidChangeNotification as string**

**MBS MacFrameworks Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** One of the notification names for CoreWLAN.

**Notes:**

Posted when the power state of the CoreWLAN interface changes. This notification does not contain a userInfo dictionary.

As CoreWLAN has been deprecated, this events may not fire any more.

120.9.26  **kCWScanKeyBSSID as string**

**MBS MacFrameworks Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** One of the Scan Parameter Keys.

**Notes:** String containing the target BSSID of a directed scan request.

120.9.27  **kCWScanKeyDwellTime as string**

**MBS MacFrameworks Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** One of the Scan Parameter Keys.

**Notes:** Number specifying the time in milliseconds that the interface will spend on each channel listening for beacon frames and probe responses. Defaults to driver default.

120.9.28  **kCWScanKeyMerge as string**

**MBS MacFrameworks Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** One of the Scan Parameter Keys.

**Notes:** Boolean value indicating whether or not duplicate SSID entries should be included in the scan results. A value evaluating to true will include the BSSID with the strongest signal strength and remove all
other duplicate SSID entries. Defaults to true.

120.9.29  kCWScanKeyRestTime as string

Function: One of the Scan Parameter Keys.  
Notes: Number specifying the time in milliseconds that the interface will spend on its home channels between intervals of off-channel activity during the scan request. Defaults to driver default.

120.9.30  kCWScanKeyScanType as string

Function: One of the Scan Parameter Keys.  
Notes: String indicating the type of scan to perform. Defaults to APScanTypeActive.

120.9.31  kCWScanKeySSID as string

Function: One of the Scan Parameter Keys.  
Notes: String containing the target SSID of a directed scan request.

120.9.32  kCWSSIDDidChangeNotification as string

Function: One of the notification names for CoreWLAN.  
Notes: Posted when the SSID of the CoreWLAN interface changes. This notification does not contain a userInfo dictionary.  
As CoreWLAN has been deprecated, this events may not fire any more.

120.9.33  KeychainDeleteEAPUsernameAndPassword(ssidData as memoryblock) as Integer

Function: Deletes the 802.1X username and password for the specified SSID.  
Notes:
ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an error code indicating whether or not a failure occurred. errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainDeleteWiFiEAPUsernameAndPassword instead.

120.9.34 KeychainDeletePassword(ssidData as memoryblock) as Integer

Function: Deletes the password for the specified SSID and keychain domain.
Notes:
ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an error code indicating whether or not a failure occurred. errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainDeleteWiFiPassword instead.

120.9.35 KeychainDeleteWiFiEAPUsernameAndPassword(KeychainDomain as Integer, ssidData as memoryblock) as Integer

Function: Deletes the 802.1X username and password for the specified SSID and keychain domain.
Notes:
domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an OSStatus error code indicating whether or not a failure occurred. errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.
120.9.36 **KeychainDeleteWiFiPassword(KeychainDomain as Integer, ssidData as memoryblock) as Integer**

**Function:** Deletes the password for the specified SSID and keychain domain.

**Notes:**
- domain: The keychain domain, which determines which keychain will be used.
- ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an OSStatus error code indicating whether or not a failure occurred.
- errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

---

120.9.37 **KeychainFindWiFiEAPUsernameAndPassword(KeychainDomain as Integer, ssidData as memoryblock, byref username as string, byref password as string) as Integer**

**Function:** Finds and returns the 802.1X username and password stored for the specified SSID and keychain domain.

**Notes:**
- domain: The keychain domain, which determines which keychain will be used.
- ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
- username: a string passed by reference, which upon return will contain the 802.1X username for the specified SSID.
- password: a string passed by reference, which upon return will contain the 802.1X password for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
- errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

---

120.9.38 **KeychainFindWiFiPassword(KeychainDomain as Integer, ssidData as memoryblock, byref password as string) as Integer**

**Function:** Finds and returns (by reference) the password for the specified SSID and keychain domain.

---
Notes:

domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: An string passed by reference, which upon return will contain the Wi-Fi keychain password for
the specified SSID. This parameter is optional.

Returns an error code indicating whether or not a failure occurred. errSecSuccess indicates no error occurred.
Available on Mac OS X 10.9 or newer.

120.9.39 KeychainGetEAPIdentity(ssidData as memoryblock, byref SecIdentityRef as Integer) as Integer

Function: Finds and returns the identity stored for the specified SSID and keychain domain.
Notes:

ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: An Integer passed by reference, which upon return will contain the SecIdentityRef associated with
the specified SSID.
The returned value must be released by the caller.

Returns an OStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainGetWiFiEAPIdentity instead.

120.9.40 KeychainGetEAPIdentityList(byref ListSecIdentityRef() as Integer) as Integer

Function: Finds and returns all available identities.
Notes:

ListSecIdentityRef: An array passed by reference, which upon return will be populated with a list of integers
(SecIdentityRef).

Returns an OStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.
120.9.41  KeychainGetEAPUsernameAndPassword(ssidData as memoryblock, byref username as string, byref password as string) as Integer

Function: Finds and returns the 802.1X username and password stored for the specified SSID.
Notes:
ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: A string passed by reference, which upon return will contain the 802.1X username for the specified SSID.
password: A string passed by reference, which upon return will contain the 802.1X password for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().

Available in Mac OS X 10.7, deprecated in 10.9. Please use FindWiFiEAPUsernameAndPassword instead.

120.9.42  KeychainGetPassword(ssidData as memoryblock, byref password as string) as Integer

Function: Finds and returns (by reference) the password for the specified SSID.
Notes:
ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: A string passed by reference, which upon return will contain the Wi-Fi keychain password for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().

Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainFindWiFiPassword instead.
120.9.43  KeychainGetWiFiEAPIdentity(KeychainDomain as Integer, ssidData as memoryblock, byref SecIdentityRef as Integer) as Integer

Function: Finds and returns the identity stored for the specified SSID and keychain domain.
Notes:
domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: An Integer passed by reference, which upon return will contain the SecIdentityRef associated with the specified SSID.
The returned value must be released by the caller.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

120.9.44  KeychainSetEAPIdentity(ssidData as memoryblock, SecIdentityRef as Integer) as Integer

Function: Associates an identity to the specified SSID.
Notes:
ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: The identity containing the certificate to use for 802.1X authentication.
Passing 0 clears any identity association for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainSetWiFiEAPIdentity instead.

120.9.45  KeychainSetEAPUsernameAndPassword(ssidData as memoryblock, username as string, password as string) as Integer

Function: Sets the 802.1X username and password for the specified SSID.
Notes:
ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: The 802.1X username.
password: The 802.1X password. This parameter is optional.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainSetWiFiEAPUsernameAndPassword instead.

**120.9.46 KeychainSetPassword(ssidData as memoryblock, password as string) as Integer**

**Function:** Sets the Wi-Fi network keychain password for the specified SSID.
**Notes:**
ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: The Wi-Fi network password.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainSetWiFiPassword instead.

**120.9.47 KeychainSetWiFiEAPIdentity(KeychainDomain as Integer, ssidData as memoryblock, SecIdentityRef as Integer) as Integer**

**Function:** Associates an identity to the specified SSID and keychain domain.
**Notes:**
domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: The identity containing the certificate to use for 802.1X authentication. a SecIdentityRef passed as Integer.

Passing 0 clears any identity association for the specified SSID.
Returns an OSStatus error code indicating whether or not a failure occurred. errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

120.9.48 KeychainSetWiFiEAPUsernameAndPassword(KeychainDomain as Integer, ssidData as memoryblock, Username as string, Password as string) as Integer

Function: Sets the 802.1X username and password for the specified SSID and keychain domain.
Notes:
domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: The 802.1X username.
password: The 802.1X password. This parameter is optional.

Returns an OSStatus error code indicating whether or not a failure occurred. errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

120.9.49 KeychainSetWiFiPassword(KeychainDomain as Integer, ssidData as memoryblock, password as string) as Integer

Function: Sets the Wi-Fi network keychain password for the specified SSID and keychain domain.
Notes:
domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: The Wi-Fi network password.

Returns an error code indicating whether or not a failure occurred. errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.
120.9.50  MergeNetworks(networks() as CWNetworkMBS) as CWNetworkMBS()

**Function:** Merges the specified set of CWNetwork objects.
**Notes:**

networks: The set of networks to merge.

Duplicate networks are defined as networks with the same SSID, security type, and BSS type (IBSS or Infrastructure).
When duplicate networks exist, the network with the best RSSI value will be chosen.

120.9.51  Constants

120.9.52  kCWAPFullErr = -3913

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.
**Notes:** Access point is unable to handle another associated station.

120.9.53  kCWAssociationDeniedErr = -3909

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.
**Notes:** Association was denied for an unspecified reason.

120.9.54  kCWAuthAlgUnsupportedErr = -3910

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.
**Notes:** Specified authentication algorithm is not supported.

120.9.55  kCWAuthenticationAlgorithmUnsupportedErr = -3910

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors.
**Notes:** Specified authentication algorithm is not supported.
120.9.56  kCWChallengeFailureErr = -3912

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Authentication was rejected because of a challenge failure.

120.9.57  kCWChannelBand2GHz = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN channel bands used for CWChannel.  
**Notes:** 2 GHz channel band.

120.9.58  kCWChannelBand5GHz = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN channel bands used for CWChannel.  
**Notes:** 5 GHz channel band.

120.9.59  kCWChannelBandUnknown = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN channel bands used for CWChannel.  
**Notes:** Unknown channel band.

120.9.60  kCWChannelWidth160MHz = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN channel widths used for CWChannel.  
**Notes:** 160MHz channel width.

120.9.61  kCWChannelWidth20MHz = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN channel widths used for CWChannel.  
**Notes:** 20MHz channel width.
120.9.62  kCWChannelWidth40MHz = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN channel widths used for CWChannel.
**Notes:** 40MHz channel width.

120.9.63  kCWChannelWidth80MHz = 3

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN channel widths used for CWChannel.
**Notes:** 80MHz channel width.

120.9.64  kCWChannelWidthUnknown = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN channel widths used for CWChannel.
**Notes:** Unknown channel width.

120.9.65  kCWCipherKeyFlagsMulticast = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN chipher key flags.
**Notes:** Cipher key will be used for multicast packets.

120.9.66  kCWCipherKeyFlagsNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN chipher key flags.
**Notes:** Open System authentication.

120.9.67  kCWCipherKeyFlagsRx = 16

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN chipher key flags.
**Notes:** Cipher key will be used for packets received by the interface.
120.9.68  kCWCipherKeyFlagsTx = 8

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN cipher key flags.  
**Notes:** Cipher key will be used for packets sent from the interface.

120.9.69  kCWCipherKeyFlagsUnicast = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN cipher key flags.  
**Notes:** Cipher key will be used for unicast packets.

120.9.70  kCWCipherSuiteRejectedErr = -3923

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Cipher suite rejected due to network security policy.

120.9.71  kCWDSSSOFDMUnsupportedErr = -3916

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Association denied because DSSS-OFDM is not supported by requesting station.

120.9.72  kCWEAPOLErr = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors.  
**Notes:** EAPOL-related error.

120.9.73  kCWErr = -3931

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors.  
**Notes:** Generic error, no specific error code exists to describe the error condition.

120.9.74  kCWErro = -3931

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Generic error.
120.9. **MODULE CWGLOBALSMBS**

120.9.75 **kCWFormatErr = -3904**

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN. **Notes:** Invalid protocol element field detected.

120.9.76 **kCWHTFeaturesNotSupported = -3926**

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN. **Notes:** Association was denied because the requesting station does not support HT features.

120.9.77 **kCWHTFeaturesNotSupportedErr = -3926**

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors. **Notes:** Association was denied because the requesting station does not support HT features.

120.9.78 **kCWIBSSModeSecurityNone = 0**

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the IBSS mode security types. **Notes:** Open System authentication.

120.9.79 **kCWIBSSModeSecurityWEP104 = 2**

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the IBSS mode security types. **Notes:** WPA Personal authentication.

120.9.80 **kCWIBSSModeSecurityWEP40 = 1**

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the IBSS mode security types. **Notes:** WEP security.

120.9.81 **kCWIInterfaceModeHostAP = 3**

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN interface operation modes. **Notes:** Interface is participating in an infrastructure network as an access point.
120.9.82  kCWInterfaceModeIBSS = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN interface operation modes.  
**Notes:** Interface is participating in an IBSS network.

120.9.83  kCWInterfaceModeNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN interface operation modes.  
**Notes:** Interface is not in any mode.

120.9.84  kCWInterfaceModeStation = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN interface operation modes.  
**Notes:** Interface is participating in an infrastructure network as a non-AP station.

120.9.85  kCWInterfaceStateAssociating = 3

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the interface state constants in CoreWLAN.  
**Notes:** CoreWLAN interface is associating.

120.9.86  kCWInterfaceStateAuthenticating = 2

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the interface state constants in CoreWLAN.  
**Notes:** CoreWLAN interface is authenticating.

120.9.87  kCWInterfaceStateInactive = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the interface state constants in CoreWLAN.  
**Notes:** CoreWLAN interface is in the initial, inactive state.
120.9.88  kCWInterfaceStateRunning = 4

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the interface state constants in CoreWLAN.
**Notes:** CoreWLAN interface is running.

120.9.89  kCWInterfaceStateScanning = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the interface state constants in CoreWLAN.
**Notes:** CoreWLAN interface is scanning.

120.9.90  kCWInvalidAKMPErr = -3920

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.
**Notes:** Invalid authentication selector requested.

120.9.91  kCWInvalidAuthenticationSequenceNumberErr = -3911

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors.
**Notes:** Authentication frame received with an authentication sequence number out of expected sequence.

120.9.92  kCWInvalidAuthSeqNumErr = -3911

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.
**Notes:** Authentication frame received with an authentication sequence number out of expected sequence.

120.9.93  kCWInvalidFormatErr = -3904

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors.
**Notes:** Invalid protocol element field detected.

120.9.94  kCWInvalidGroupCipherErr = -3918

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.
**Notes:** Invalid group cipher requested.
120.9.95  kCWInvalidInfoElementErr = -3917

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN. **Notes:** Invalid information element included in association request.

120.9.96  kCWInvalidInformationElementErr = -3917

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors. **Notes:** Invalid information element included in association request.

120.9.97  kCWInvalidPairwiseCipherErr = -3919

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN. **Notes:** Invalid pairwise cipher requested.

120.9.98  kCWInvalidParameterErr = -3900

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors. **Notes:** Parameter error.

120.9.99  kCWInvalidPMKErr = -3924

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN. **Notes:** PMK rejected by the access point.

120.9.100  kCWInvalidRSNCapabilitiesErr = -3922

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN. **Notes:** Invalid RSN capabilities specified in association request.
120.9.101  kCWIPCError = -3929
MBS MacFrameworks Plugin, Plugin Version: 11.0. Function: One of the error constants in CoreWLAN. Notes: Error communicating with a separate process.

120.9.102  kCWIPCFailureErr = -3929
MBS MacFrameworks Plugin, Plugin Version: 13.5. Function: One of the CoreWLAN Errors. Notes: Error communicating with a separate process.

120.9.103  kCWKeychainDomainNone = 0
MBS MacFrameworks Plugin, Plugin Version: 13.5. Function: One of the CoreWLAN keychain domains used in the CWKeychain API. Notes: No keychain domain specified.
120.9.104  kCWKeychainDomainSystem = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN keychain domains used in the CWKeychain API.  
**Notes:** The system keychain domain.

120.9.105  kCWKeychainDomainUser = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN keychain domains used in the CWKeychain API.  
**Notes:** The login (user) keychain domain.

120.9.106  kCWNoErr = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Success.

120.9.107  kCWNoMemErr = -3901

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Memory allocation failed.

120.9.108  kCWNoMemoryErr = -3901

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors.  
**Notes:** Memory allocation failed.

120.9.109  kCWNotSupportedErr = -3903

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Operation not supported.

120.9.110  kCWOOperationNotPermittedErr = -3930

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors.  
**Notes:** Calling process does not have permission to perform this operation.
120.9.111 kCWOpModeHostAP = 3

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the interface operation mode constants in CoreWLAN.
**Notes:** Interface is participating in an infrastructure network as an access point.

120.9.112 kCWOpModeIBSS = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the interface operation mode constants in CoreWLAN.
**Notes:** Interface is participating in an IBSS network.

120.9.113 kCWOpModeMonitorMode = 2

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the interface operation mode constants in CoreWLAN.
**Notes:** Interface is in 802.11 monitor mode.

120.9.114 kCWOpModeStation = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the interface operation mode constants in CoreWLAN.
**Notes:** Interface is participating in an infrastructure network as a non-AP station.

120.9.115 kCWOpNotPermitted = -3930

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.
**Notes:** Calling process does not have permission to perform this operation.

120.9.116 kCWParamErr = -3900

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.
**Notes:** Parameter error.
**120.9.117** kCWPCOTransitionTimeNotSupported = -3927

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN. **Notes:** Association was denied because the requesting station does not support the PCO transition time required by the AP.

**120.9.118** kCWPCOTransitionTimeNotSupportedErr = -3927

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors. **Notes:** Association was denied because the requesting station does not support the PCO transition time required by the AP.

**120.9.119** kCWPHYMode11a = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN physical layer modes. **Notes:** IEEE 802.11a PHY.

**120.9.120** kCWPHYMode11ac = 5

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN physical layer modes. **Notes:** IEEE 802.11ac PHY.

**120.9.121** kCWPHYMode11b = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN physical layer modes. **Notes:** IEEE 802.11b PHY.

**120.9.122** kCWPHYMode11g = 3

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN physical layer modes. **Notes:** IEEE 802.11g PHY.

**120.9.123** kCWPHYMode11n = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN physical layer modes. **Notes:** IEEE 802.11n PHY.
120.9.124  kCWPHYModeNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN physical layer modes. **Notes:** No PHY mode.

120.9.125  kCWReassociationDeniedErr = -3908

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN. **Notes:** Reassociation was denied because the access point was unable to determine that an association exists.

120.9.126  kCWReferenceNotBoundErr = -3928

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors. **Notes:** No interface is bound to the CWInterface.

120.9.127  kCWRefNotBoundErr = -3928

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN. **Notes:** No interface is bound to the CWInterface.

120.9.128  kCWScanTypeActive = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the scan type constants in CoreWLAN. **Notes:** In accordance with the supported channels for the active country code, the interface will transmit probe request frames and listen for probe responses.

120.9.129  kCWScanTypeFast = 2

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the scan type constants in CoreWLAN. **Notes:** The scan will return cached scan results.
120.9.130  kCWScanTypePassive = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the scan type constants in CoreWLAN. **Notes:** The interface will listen for beacon frames on each channel irrespective of country code.

120.9.131  kCWSecurityDynamicWEP = 6

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types. **Notes:** Dynamic WEP security.

120.9.132  kCWSecurityEnterprise = 10

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types. **Notes:** Enterprise authentication.

120.9.133  kCWSecurityModeDynamicWEP = 7

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the security mode constants in CoreWLAN. **Notes:** Dynamic WEP 802.1X authentication.

120.9.134  kCWSecurityModeOpen = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the security mode constants in CoreWLAN. **Notes:** Open System authentication.

120.9.135  kCWSecurityModeWEP = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the security mode constants in CoreWLAN. **Notes:** WEP authentication.
120.9.136  **kCWSecurityModeWPA2_Enterprise = 5**

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the security mode constants in CoreWLAN.  
**Notes:** WPA2 Enterprise authentication.

120.9.137  **kCWSecurityModeWPA2_PSK = 3**

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the security mode constants in CoreWLAN.  
**Notes:** WPA2 Personal authentication.

120.9.138  **kCWSecurityModeWPA_Enterprise = 4**

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the security mode constants in CoreWLAN.  
**Notes:** WPA Enterprise authentication.

120.9.139  **kCWSecurityModeWPA_PSK = 2**

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the security mode constants in CoreWLAN.  
**Notes:** WPA Personal authentication.

120.9.140  **kCWSecurityModeWPS = 6**

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the security mode constants in CoreWLAN.  
**Notes:** WiFi Protected Setup authentication.

120.9.141  **kCWSecurityNone = 0**

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types.  
**Notes:** Open System authentication.
120.9.142 kCWSecurityPersonal = 5

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types. **Notes:** Personal authentication.

120.9.143 kCWSecurityUnknown = & h7FFFFFFF

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types. **Notes:** Unknown security type.

120.9.144 kCWSecurityWEP = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types. **Notes:** WEP security.

120.9.145 kCWSecurityWPA2Enterprise = 9

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types. **Notes:** WPA2 Enterprise authentication.

120.9.146 kCWSecurityWPA2Personal = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types. **Notes:** WPA2 Personal authentication.

120.9.147 kCWSecurityWPAEnterprise = 7

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types. **Notes:** WPA Enterprise authentication.

120.9.148 kCWSecurityWPAEnterpriseMixed = 8

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types. **Notes:** WPA/WPA2 Enterprise authentication.
120.9.149  kCWSecurityWPAPersonal = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types.  
**Notes:** WPA Personal authentication.

120.9.150  kCWSecurityWPAPersonalMixed = 3

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN security types.  
**Notes:** WPA/WPA2 Personal authentication.

120.9.151  kCWShortSlotUnsupportedErr = -3915

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Association denied because short slot time option is not supported by requesting station.

120.9.152  kCWSupplicantTimeoutErr = -3925

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** WPA/WPA2 handshake timed out.

120.9.153  kCWTimeoutErr = -3905

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Authentication/Association timed out.

120.9.154  kCWUnknownErr = -3902

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Unexpected error condition encountered for which no error code exists.

120.9.155  kCWUnknownErr = -3902

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** One of the CoreWLAN Errors.  
**Notes:** Unexpected error condition encountered for which no error code exists.
120.9.156  kCWUnspecifiedFailureErr = -3906

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Access point did not specify a reason for authentication/association failure.

120.9.157  kCWUnsupportedCapabilitiesErr = -3907

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Access point cannot support all requested capabilities.

120.9.158  kCWUnsupportedRateSetErr = -3914

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Interface does not support all of the rates in the access point’s basic rate set.

120.9.159  kCWUnsupportedRSNVersionErr = -3921

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the error constants in CoreWLAN.  
**Notes:** Invalid WPA/WPA2 version specified.

120.9.160  kOldCWPHYMode11A = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the physical layer mode constants in CoreWLAN.  
**Notes:** IEEE 802.11a

120.9.161  kOldCWPHYMode11B = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the physical layer mode constants in CoreWLAN.  
**Notes:** IEEE 802.11b

120.9.162  kOldCWPHYMode11G = 2

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the physical layer mode constants in CoreWLAN.
120.9.163  kOldCWPHYMode11N = 3

MBS MacFrameworks Plugin, Plugin Version: 11.0. **Function:** One of the physical layer mode constants in CoreWLAN.
**Notes:** IEEE 802.11n
120.10  class CWInterfaceMBS

120.10.1  class CWInterfaceMBS

Function: CoreWLAN interface.
Notes:
Encapsulates an CoreWLAN interface providing controlled access to various interface operations such as
scanning, association, and IBSS creation, and providing a means to query and manipulate interface parame-
ters.

Requires Mac OS X 10.6 or newer.

Please note that MBS Plugin implements all methods from 10.6 to 10.9 in CoreWLAN. But Apple changes
things often, so some methods are only for older system, some only for newer. e.g. kCWErrorDomain is for
10.6 and CWErrorDomain for 10.7 and newer.

120.10.2  Methods

120.10.3  associateToEnterpriseNetwork(network as CWNetworkMBS, SecIdentityRef as Integer, username as string, password as string, byref error as NSErrorMBS) as boolean

Function: Connects to the given enterprise network.
Notes:

network: The network to which the interface will associate.
username: The username to use for IEEE 802.1X authentication.
password: The password to use for IEEE 802.1X authentication.
identity: The identity to use for IEEE 802.1X authentication. Holds the corresponding client certificate.
error: An NSError object passed by reference, which will be populated with the error code and the error
description if an error occurs during the execution of this method.

Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indi-
cates no error occurred.

This method will block for the duration of the association. This operation may require an administrator
password.
120.10.4  `associateToNetwork(network as CWNetworkMBS, parameters as dictionary, byref error as NSErrorMBS) as boolean`

**Function:** Attempts to associate to the given CWNetworkMBS, with the given association parameters.

**Notes:**
- `parameters`: A dictionary object containing association parameters.
- `error`: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the association parameters defined in CWGlobalsMBS for more information. Certain networks will require specific authentication credentials for association (i.e. a network using WPA2 Personal authentication will require a passphrase). This method will block for the duration of the association. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration. See also:

- 120.10.5 associateToNetwork(network as CWNetworkMBS, password as string, byref error as NSErrorMBS) as boolean

120.10.5  `associateToNetwork(network as CWNetworkMBS, password as string, byref error as NSErrorMBS) as boolean`

**Function:** Associates to a given network using the given network passphrase.

**Notes:**
- `network`: The network to which the interface will associate.
- `password`: The network passphrase or key. Required for association to WEP, WPA Personal, and WPA2 Personal networks.
- `error`: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

Returns a boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

This method will block for the duration of the association. This operation may require an administrator password.

Available on Mac OS X 10.7 or later.

See also:
CHAPTER 120. NETWORK

- 120.10.4 associateToNetwork(network as CWNetworkMBS, parameters as dictionary, byref error as NSErrorMBS) as boolean

120.10.6 cachedScanResults as CWNetworkMBS()

Function: The networks currently in the scan cache for the WLAN interface.
Notes:
Returns empty array in the case of an error.
Available on Mac OS X 10.7 or later.

120.10.7 commitConfiguration(config as CWConfigurationMBS, byref error as NSErrorMBS) as boolean

Function: Changing the interface configuration.
Notes:
config: An CWConfiguration object containing the desired changes to the current CW configuration preferences.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

This method uses the SFAuthorization property of the given CWInterface object to commit the given configuration. The SFAuthorization property must be authorized with administrative privileges.
See also:

- 120.10.8 commitConfiguration(config as CWConfigurationMBS, SFAuthorizationRef as Integer, byref error as NSErrorMBS) as boolean

120.10.8 commitConfiguration(config as CWConfigurationMBS, SFAuthorizationRef as Integer, byref error as NSErrorMBS) as boolean

Function: Commit a configuration for the given WLAN interface.
Notes:
configuration: The configuration to commit.
authorization: An SFAuthorization object to use for authorizing the commit. This parameter is optional and can be passed as 0.
error: An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.

Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

This method requires the caller have root privileges or obtain administrator privileges with the authorization parameter.
See also:

* 120.10.7 commitConfiguration(config as CWConfigurationMBS, byref error as NSErrorMBS) as boolean

### 120.10.9 Constructor

**Function:** Creates an CWInterface for the primary interface.

**Example:**

dim c as new CWInterfaceMBS

MsgBox c.description

See also:

* 120.10.10 Constructor(name as string)

### 120.10.10 Constructor(name as string)

**Function:** Creates an interface object linked to the interface of the given name.

**Example:**

dim c as new CWInterfaceMBS("en0")

MsgBox c.description

See also:

* 120.10.9 Constructor
120.10.11  disassociate

**Function:** Disassociates the CoreWLAN interface from the currently associated network.

**Notes:** This method is a no-op if the given CoreWLAN interface is not associated to a network. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

120.10.12  enableIBSSWithParameters as boolean

**Function:** Attempts to create a computer-to-computer network with the given parameters.

**Notes:**

- parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
- error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

- 120.10.14 enableIBSSWithParameters(parameters as dictionary) as boolean 16893
- 120.10.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean 16893

120.10.13  enableIBSSWithParameters(byref error as NSErrorMBS) as boolean

**Function:** Attempts to create a computer-to-computer network with the given parameters.

**Notes:**

- parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
- error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.
Return a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

- 120.10.14 enableIBSSWithParameters(parameters as dictionary) as boolean
- 120.10.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean

**120.10.14 enableIBSSWithParameters(parameters as dictionary) as boolean**

**Function:** Attempts to create a computer-to-computer network with the given parameters.

**Notes:**

parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

- 120.10.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean

**120.10.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean**

**Function:** Attempts to create a computer-to-computer network with the given parameters.
Notes:
parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

• 120.10.14 enableIBSSWithParameters(parameters as dictionary) as boolean 16893

120.10.16  interfaceNames as String()

Function: Returns the list of BSD names for WLAN interfaces available on the current system.
Example:

dim names() as string = CWInterfaceMBS.interfaceNames
MsgBox Join(names,EndOfLine)

Notes:
Returns an array of strings representing the supported WLAN BSD interface names available on the current system (i.e. "en1", "en2"). If there are no supported interfaces for the current system, then this method will return an empty NSArray object.
Returns empty array in the case of an error.

Available on Mac OS X 10.7 or later.

120.10.17  interfaceWithName(name as string) as CWInterfaceMBS

Function: Queries the interface with the given name.
Example:
120.10. CLASS CWINTERFACEMBS

\[
dim c \text{ as } CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
\]

MsgBox c.description

Notes: name: A string representing the name of an Airport interface.

120.10.18 isEqualToInterface(otherInterface as CWInterfaceMBS) as boolean

Function: Comparing interfaces.
Notes:
Two CWInterface objects are considered equal if their corresponding <i>name</i>and capabilities properties are equal.

Returns true if both interfaces are equal.

120.10.19 primaryInterface as CWInterfaceMBS

Function: Convenience method for getting an CWInterface object for the primary interface.
Example:
\[
dim c \text{ as } CWInterfaceMBS = CWInterfaceMBS.primaryInterface
\]

MsgBox c.name

120.10.20 scanForNetworksWithName(networkName as string, byref error as NSErrorMBS) as CWNetworkMBS()

Function: Scans for networks.
Notes:

networkName: The name (SSID) of the network for which to scan.
error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.
Returns an array of CWNetworkMBS objects.

If ssid parameter is present, a directed scan will be performed by the interface, otherwise a broadcast scan will be performed. This method will block for the duration of the scan.

Available on Mac OS X 10.7 or later.

120.10.21 scanForNetworksWithParameters as CWNetworkMBS()

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.

Notes:
parameters: A dictionary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.

- 120.10.22 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS() 16896
- 120.10.23 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS() 16897
- 120.10.24 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS() 16898

120.10.22 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS()

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.

Notes:
parameters: A dictionary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.
error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.

See also:

- 120.10.21 scanForNetworksWithParameters as CWNetworkMBS() 16896
- 120.10.23 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS() 16897
- 120.10.24 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS() 16898

120.10.23 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS()

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.

Notes:

parameters: A dictionary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.

See also:

- 120.10.21 scanForNetworksWithParameters as CWNetworkMBS() 16896
- 120.10.22 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS() 16896
- 120.10.24 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS() 16898
120.10.24  \texttt{scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS()}

\textbf{Function:} Performs a scan with the given CoreWLAN interface, returning any found networks.
\textbf{Notes:}

parameters: A dictionary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.
See also:

- 120.10.21 \texttt{scanForNetworksWithParameters as CWNetworkMBS()} 16896
- 120.10.22 \texttt{scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS()} 16896
- 120.10.23 \texttt{scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS()} 16897

120.10.25  \texttt{scanForNetworksWithSSID(ssid as memoryblock, byref error as NSErrorMBS) as CWNetworkMBS()}

\textbf{Function:} Scans for networks.
\textbf{Notes:}

ssid The SSID for which to scan.

error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

Returns an array of CWNetworkMBS objects.

If ssid parameter is present, a directed scan will be performed by the interface, otherwise a broadcast scan will be performed. This method will block for the duration of the scan.

Available on Mac OS X 10.7 or later.
120.10. CLASS CWI\textsc{NFACEMBS}

120.10.26 setChannel(channel as UInt32) as boolean

**Function:** Sets the channel for the given CoreWLAN interface.

**Notes:**

channel: An integer representing the channel to which the CoreWLAN interface should be tuned.
error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

The current channel cannot be changed if the CoreWLAN interface is associated to a network. channel must be supported by the given interface.

See also:

- 120.10.27 setChannel(channel as UInt32, byref error as NSErrorMBS) as boolean

120.10.27 setChannel(channel as UInt32, byref error as NSErrorMBS) as boolean

**Function:** Sets the channel for the given CoreWLAN interface.

**Notes:**

channel: An integer representing the channel to which the CoreWLAN interface should be tuned.
error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

The current channel cannot be changed if the CoreWLAN interface is associated to a network. channel must be supported by the given interface.

See also:

- 120.10.26 setChannel(channel as UInt32) as boolean

120.10.28 setPairwiseMasterKey(key as Memoryblock, byref error as NSErrorMBS) as boolean

**Function:** Sets the interface pairwise master key (PMK).

**Notes:**

key: A memoryblock containing the pairwise master key (PMK).
error: An NSError object passed by reference, which will be populated with the error code and the error
description if an error occurs during the execution of this method.
Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indi-
cates no error occurred.

Key must be 32 octets. If key is nil, this method clears the PMK for the interface.

### 120.10.29  `setPower(p as boolean) as boolean`

**Function:** Sets the power state for the given CoreWLAN interface.
**Notes:**

- power: A boolean value indicating the power state to which the CoreWLAN interface should be set. False
  indicates the "OFF" state.

- error: A error object passed by reference, which will be populated with error code and error description if
  an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

This method may prompt for an administrator password if the corresponding preference is enabled in the
current configuration.

See also:

- 120.10.30 `setPower(p as boolean, byref error as NSErrorMBS) as boolean`

### 120.10.30  `setPower(p as boolean, byref error as NSErrorMBS) as boolean`

**Function:** Sets the power state for the given CoreWLAN interface.
**Notes:**

- power: A boolean value indicating the power state to which the CoreWLAN interface should be set. False
  indicates the "OFF" state.

- error: A error object passed by reference, which will be populated with error code and error description if
  an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occured. True indicates no error occured.
This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

See also:

- 120.10.29 setPower(p as boolean) as boolean

120.10.31 setWEPKey(key as Memoryblock, flags as Integer, index as Integer, byref error as NSErrorMBS) as boolean

**Function:** Sets the interface WEP key.

**Notes:**

- **key:** A memoryblock containing the WEP key.
- **flags:** The cipher key flags to use for the specified key. Combination of kWCipherKeyFlagsNone, kWCipherKeyFlagsUnicast, kWCipherKeyFlagsMulticast, kWCipherKeyFlagsTx or kWCipherKeyFlagsRx.
- **index:** Integer which default key index to use for the specified key.
- **error:** An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.

Returns a boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

Key must be 5 octets for WEP-40 or 13 octets for WEP-104. If key is nil, this method clears the WEP key for the interface. index must correspond to default key index 1-4.

120.10.32 setWLANChannel(channel as CWChannelMBS, byref error as NSErrorMBS) as boolean

**Function:** Sets the interface channel.

**Notes:**

- **channel:** A CWChannel object corresponding to the channel.
- **error:** An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

A Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

The channel cannot be changed if the interface is associated to a network.
Available on Mac OS X 10.7 or later.

120.10.33  startIBSSModeWithSSID(ssidData as MemoryBlock, security as Integer, channel as Integer, password as string, byref error as NSErrorMBS) as boolean

Function: Creates a computer-to-computer (ad-hoc) network with the given network name, security type, and password on the specified channel.
Notes:
security: The security type to be used. kCWIBSSModeSecurityNone, kCWIBSSModeSecurityWEP40 or kCWIBSSModeSecurityWEP104.
channel: The channel on which the network will be created.
password: The password to be used. This parameter is not applicable to open system authentication.

Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

This operation may require an administrator password.

120.10.34  supportedChannels as Integer()

Function: Array of channels supported by the CoreWLAN interface for the active country code.
Notes: Dynamically queries the interface for the supported channels.

120.10.35  supportedInterfaces as String()

Function: Getting all supported interfaces
Notes: Returns an array containing strings representing the supported CoreWLAN interface names available on the current system (i.e. "en1", "en2"). If there are no supported interfaces for the current system, then this method will return an empty array.

120.10.36  supportedPHYModes as Integer()

Function: Array of PHY modes supported by the CoreWLAN interface.
Notes: Dynamically queries the interface for the supported PHY modes.

**120.10.37 supportedWLANChannels as CWChannelMBS()**

**Function:** An array of channels supported by the interface for the active country code.

**Example:**
```vbnet
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
dim channels() as CWChannelMBS = c.supportedWLANChannels
dim lines() as string
for each ch as CWChannelMBS in channels
    lines.append str(ch.channelNumber) + ":" + str(ch.channelBand)
next
MsgBox join(lines, ",")
```

Notes:
Dynamically queries the interface for the supported channels. Returns an array of CWChannel objects, or nil in the case of an error.

Available on Mac OS X 10.7 or later.

**120.10.38 Properties**

**120.10.39 activePHYMode as Integer**

**Function:** The current active PHY modes for the interface.

**Example:**
```vbnet
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.activePHYMode)
```

Notes:
Dynamically queries the interface for the current active PHY mode. Returns kCWPHYModeNone in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)
120.10.40  bssid as string

Function: Current BSSID of the CoreWLAN interface.
Notes:
Dynamically queries the interface for the current BSSID.
(Read only property)

120.10.41  bssidData as Memoryblock

Function: Current BSSID of the CoreWLAN interface.
Notes:
Dynamically queries the interface for the current BSSID.
(Read only property)

120.10.42  channel as Integer

Function: Current channel of the CoreWLAN interface.
Notes:
Dynamically queries the interface for the current channel.
(Read only property)

120.10.43  configuration as CWConfigurationMBS

Function: Current stored configuration for the CoreWLAN interface.
Notes: (Read only property)

120.10.44  countryCode as string

Notes:
Dynamically queries the interface for the current country code.  
(Read only property)

120.10.45 description as string

Function: The object description.  
Notes: (Read only property)

120.10.46 deviceAttached as boolean

Function: The interface has its corresponding hardware attached.  
Example:  
```vbnet
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.deviceAttached)
```
Notes:  
Returns false in the case of an error.  
Available on Mac OS X 10.7 or later.  
(Read only property)

120.10.47 Handle as Integer

Function: The internal object reference.  
Notes: (Read and Write property)

120.10.48 hardwareAddress as string

Function: The hardware media access control (MAC) address for the interface, returned as a UTF-8 string.  
Example:  
```vbnet
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox c.hardwareAddress
```
Notes:
The standard format for printing a MAC-48 address <00:00:00:00:00:00> is used to represent the MAC address as a string. Returns "" in the case of an error.

Available on Mac OS X 10.7 or later.
(Read only property)

### 120.10.49 interfaceMode as Integer

**Function:** The current mode for the interface.  
**Example:**
```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")  
MsgBox str(c.interfaceMode)
```

Notes:
Dynamically queries the interface for the current mode. Returns kCWInterfaceModeNone in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.  
(Read only property)

### 120.10.50 interfaceName as string

**Function:** The BSD name of the interface.  
**Example:**
```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")  
MsgBox c.interfaceName  
MsgBox str(c.noiseMeasurement)
```

Notes:
Available on Mac OS X 10.7 or later.  
(Read only property)
120.10.51  interfaceState as Integer

Function: Current state of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current interface state.  
(Read only property)

120.10.52  name as string

Function: BSD name for the CoreWLAN interface.
Example:  
  dim c as CWInterfaceMBS = CWInterfaceMBS.primaryInterface
  MsgBox c.name

Notes: (Read only property)

120.10.53  noise as Double

Function: Current aggregate noise measurement (dBm) of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current aggregate noise measurement.  
(Read only property)

120.10.54  noiseMeasurement as Integer

Function: The current aggregate noise measurement (dBm) for the interface.
Example:  
  dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
  MsgBox str(c.noiseMeasurement)
Notes:
Dynamically queries the interface for the current aggregate noise measurement.
Returns 0 in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

120.10.55  opMode as Integer

Function: Current operation mode of the CoreWLAN interface.
Notes:
Dynamically queries the interface for the current operation mode.
(Read only property)

120.10.56  phyMode as Integer

Function: Current active PHY mode of the CoreWLAN interface.
Notes:
Dynamically queries the interface for the current active PHY mode.
(Read only property)

120.10.57  power as boolean

Function: Current power state for the CoreWLAN interface.
Notes:
Dynamically queries the interface for the current power state.
(Read only property)
120.10. **CLASS CWINTERFACEMBS**

### 120.10.58 powerOn as boolean

**Function:** The interface power state is set to "ON".

**Example:**

```vba
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.rssiValue)
```

**Notes:**

Available on Mac OS X 10.7 or later.
(Read only property)

### 120.10.59 powerSave as boolean

**Function:** Current power save state for the CoreWLAN interface.

**Notes:**

Dynamically queries the interface for the current power save state.
Introduced in 10.6, deprecated in 10.7 and gone in 10.9.
(Read only property)

### 120.10.60 rssi as Double

**Function:** Current aggregate RSSI measurement (dBm) of the CoreWLAN interface.

**Notes:**

Dynamically queries the interface for the current aggregate RSSI measurement.
(Read only property)

### 120.10.61 rssiValue as Integer

**Function:** The current aggregate received signal strength indication (RSSI) measurement (dBm) for the interface.

**Example:**

```vba
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.rssiValue)
```
Notes:
Dynamically queries the interface for the current aggregate RSSI measurement.
Returns 0 in the case of an error, or if the interface is not participating in a network.
Available on Mac OS X 10.7 or later.
(Read only property)

120.10.62 security as Integer

Function: The current security mode for the interface.
Notes:
Dynamically queries the interface for the security mode. Returns kCWSecurityUnknown in the case of an
error, or if the interface is not participating in a network.
Available on Mac OS X 10.7 or later.
(Read only property)

120.10.63 securityMode as Integer

Function: Current security mode of the CoreWLAN interface.
Notes:
Dynamically queries the interface for the current security mode.
(Read only property)

120.10.64 serviceActive as boolean

Function: The interface has its corresponding network service enabled.
Example:

```vbscript
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.serviceActive)
```
120.10. CLASS CWINTERFACEMBS

Notes:
Returns false in the case of an error.
Available on Mac OS X 10.7 or later.
(Read only property)

120.10.65 ssid as string

Function: Current SSID of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current SSID.
(Read only property)

120.10.66 ssidData as Memoryblock

Function: The current service set identifier (SSID) for the interface, returned as data.
Notes: Dynamically queries the interface for the current SSID. The SSID is 1-32 octets.
Returns nil in the case of an error, or if the interface is not participating in a network.
Available on Mac OS X 10.7 or later.
(Read only property)

120.10.67 supportsAES_CCM as boolean

Function: CoreWLAN interface supports AES-CCM (IEEE 802.11i Advanced Encryption Standard -
Counter Mode with Cipher-Block Chaining Message Authentication Code).
Notes: (Read only property)

120.10.68 supportsHostAP as boolean

Function: CoreWLAN interface supports host access point mode.
120.10.69 supportsIBSS as boolean

**Function:** CoreWLAN interface supports IBSS networks (IEEE 802.11 Independent Basic Service Set).  
**Notes:** (Read only property)

120.10.70 supportsMonitorMode as boolean

**Function:** CoreWLAN interface supports monitor mode.  
**Notes:** (Read only property)

120.10.71 supportsPMGT as boolean

**Function:** CoreWLAN interface supports power save modes.  
**Notes:** (Read only property)

120.10.72 supportsShortGI20MHz as boolean

**Function:** CoreWLAN interface supports short guard interval in 20MHz channels.  
**Notes:** (Read only property)

120.10.73 supportsShortGI40MHz as boolean

**Function:** CoreWLAN interface supports short guard interval in 40MHz channels.  
**Notes:** (Read only property)

120.10.74 supportsTKIP as boolean

**Function:** CoreWLAN interface supports TKIP (IEEE 802.11i Temporal Key Integrity Protocol).
120.10. CLASS CWINTERFACEMBS

Notes: (Read only property)

120.10.75  supportsTSN as boolean

Function: CoreWLAN interface supports TSN authentication (Transitional Security Network).
Notes: (Read only property)

120.10.76  supportsWEP as boolean

Function: CoreWLAN interface supports WEP authentication (IEEE 802.11 Wired Equivalent Privacy).
Notes: (Read only property)

120.10.77  supportsWME as boolean

Function: CoreWLAN interface supports WME (IEEE 802.11e Wireless Multimedia Extensions).
Notes: (Read only property)

120.10.78  supportsWoW as boolean

Function: CoreWLAN interface supports wake on wireless capability.
Notes: (Read only property)

120.10.79  supportsWPA as boolean

Function: CoreWLAN interface supports WPA (Wi-Fi Alliance Wi-Fi Protected Access).
Notes: (Read only property)

120.10.80  supportsWPA2 as boolean

Function: CoreWLAN interface supports WPA2 (Wi-Fi Alliance Wi-Fi Protected Access 2).
120.10.81 transmitPower as Integer

Function: The current transmit power (mW) for the interface.
Notes: Dynamically queries the interface for the current transmit power.
Returns 0 in the case of an error.
Available on Mac OS X 10.7 or later.
(Read only property)

120.10.82 transmitRate as Double

Function: The current transmit rate (Mbps) for the interface.
Notes: Dynamically queries the interface for the current transmit rate.
Returns 0 in the case of an error, or if the interface is not participating in a network.
Available on Mac OS X 10.7 or later.
(Read only property)

120.10.83 txPower as Double

Function: Current target transmit power (mW) of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current transmit power.
(Read only property)

120.10.84 txRate as Double

Function: Current transmit rate (Mbps) of the CoreWLAN interface.
Notes:
120.10. CLASS CWINTERFACE MBS

Dynamically queries the interface for the current transmit rate.
(Read only property)

120.10.85 wlanChannel as CWChannelMBS

Function: The current channel for the interface.
Notes: Dynamically queries the interface for the current channel. Returns nil in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)
120.11 class CWMutableConfigurationMBS

120.11.1 class CWMutableConfigurationMBS

Function: Encapsulates a mutable configuration for an AirPort WLAN interface.  
Notes: 
Available on Mac OS X 10.7 or later.  
Please also check the documentation from Apple for the CWMutableConfiguration class.  
Subclass of the CWConfigurationMBS class.

120.11.2 Methods

120.11.3 Constructor

Function: Creates a new mutable configuration.

120.11.4 setNetworkProfiles(values() as CWNetworkProfileMBS)

Function: An array of remembered CWNetworkProfileMBS objects.  
Notes: The order of this array corresponds to the order in which the CWNetworkProfileMBS objects participate in the auto-join process.

120.11.5 setRememberJoinedNetworks(value as boolean)

Function: AirPort client will remember all joined networks.

120.11.6 setRequireAdministratorForAssociation(value as boolean)

Function: Require an administrator password to change networks.
120.11.7 `setRequireAdministratorForIBSSMode(value as boolean)`

**Function:** Require an administrator password to create a computer-to-computer network.

120.11.8 `setRequireAdministratorForPower(value as boolean)`

**Function:** Require an administrator password to change the interface power state.
120.12 class CWMutableNetworkProfileMBS

120.12.1 class CWMutableNetworkProfileMBS

Function: Encapsulates a mutable network profile entry.
Notes:
Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWMutableNetworkProfile class.
Subclass of the CWNetworkProfileMBS class.

120.12.2 Methods

120.12.3 Constructor

Function: The constructor.

120.12.4 setSecurity(value as Integer)

Function: Sets the security mode for the network profile.
Notes: See kCWSecurity* constants.

120.12.5 setSsidData(data as Memoryblock)

Function: Sets the service set identifier (SSID) for the network profile, returned as data.
Notes: The SSID is 1-32 octets.
120.13. class CWNetworkMBS

120.13.1. class CWNetworkMBS

Function: CoreWLAN wireless (IEEE 802.11) network.
Notes:
Encapsulates a wireless network providing read-only accessors to various properties of the network.

Requires Mac OS X 10.6 or newer.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.13.2. Methods

120.13.3. Constructor

Function: The private constructor.

120.13.4. copy as CWNetworkMBS

Function: Creates a copy of this object.

120.13.5. isEqualToNetwork(network as CWNetworkMBS) as boolean

Notes:
Returns true if the network objects are equal.

Two CWNetworkMBS objects are considered equal if their corresponding ssid, securityMode, and isIBSS properties are equal.
120.13.6  **Operator Compare(profile as CWNetworkMBS) as Integer**

**Function:** Compares two networks.

120.13.7  **supportsPHYMode(phyMode as Integer) as boolean**

**Function:** Method for determining which PHY modes a network supports.  
**Notes:** True if the network supports the specified PHY mode.  
Available on Mac OS X 10.7 or later.

120.13.8  **supportsSecurity(security as Integer) as boolean**

**Function:** Getting supported security types  
**Notes:** True if the network supports the specified security type.  
Method for determining which security types a network supports.  
Available on Mac OS X 10.7 or later.

120.13.9  **Properties**

120.13.10  **beaconInterval as Integer**

**Function:** The beacon interval (ms) for the network.  
**Notes:** Available on Mac OS X 10.7 or later.  
(Read only property)
120.13. CLASS CWNETWORKMBS

120.13.11  bssid as string

Function: Basic service set identifier for the given CWNetworkMBS.
Notes: (Read only property)

120.13.12  bssidData as Memoryblock

Function: Basic service set identifier for the given CWNetworkMBS.
Notes: (Read only property)

120.13.13  channel as Integer

Function: Channel number for the given CWNetworkMBS.
Notes: (Read only property)

120.13.14  countryCode as string

Notes: Available on Mac OS X 10.7 or later.
(Read only property)

120.13.15  description as string

Function: The object description.
Notes: (Read only property)

120.13.16  Handle as Integer

Function: The internal object reference.
120.13.17  **ibss as boolean**

**Function:** The network is an IBSS network.  
**Notes:**  
Available on Mac OS X 10.7 or later.  
(Read only property)

120.13.18  **ieData as Memoryblock**

**Function:** Information element data included in beacon or probe response.  
**Notes:**  
(Read only property)

120.13.19  **informationElementData as Memoryblock**

**Function:** Information element data included in beacon or probe response frames.  
**Notes:**  
Available on Mac OS X 10.7 or later.  
(Read only property)

120.13.20  **isIBSS as boolean**

**Function:** Whether or not the given CWNetworkMBS is a computer-to-computer network.  
**Notes:**  
(Read only property)

120.13.21  **noise as Double**

**Function:** Aggregate noise value for the given CWNetworkMBS.  
**Notes:**  
(Read only property)
120.13.22 noiseMeasurement as Integer

**Function:** The aggregate noise measurement (dBm) for the network.
**Notes:**
Available on Mac OS X 10.7 or later.
(Read only property)

120.13.23 phyMode as Integer

**Function:** Physical layer mode for the given CWNetworkMBS.
**Notes:** (Read only property)

120.13.24 rssi as Double

**Function:** Aggregate RSSI value for the given CWNetworkMBS.
**Notes:** (Read only property)

120.13.25 rssiValue as Integer

**Function:** The aggregate received signal strength indication (RSSI) measurement (dBm) for the network.
**Notes:**
Available on Mac OS X 10.7 or later.
(Read only property)

120.13.26 securityMode as Integer

**Function:** Security mode for the given CWNetworkMBS.
**Notes:** (Read only property)
120.13.27  ssid as string

Function: Service set identifier for the given CWNetworkMBS.
Notes: (Read only property)

120.13.28  ssidData as Memoryblock

Function: The service set identifier (SSID) for the network, returned as data.
Notes: The SSID is defined as 1-32 octets.
(Read only property)

120.13.29  wirelessProfile as CWWirelessProfileMBS

Function: Stored CWWirelessProfile for the given CWNetworkMBS.
Notes: (Read only property)

120.13.30  wlanChannel as CWChannelMBS

Function: The channel for the network.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)
120.14. class CWNetworkProfileMBS

120.14.1 class CWNetworkProfileMBS

Function: The class for a network profile.
Notes:
Encapsulates an immutable network profile entry.

Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWNetworkProfile class.

120.14.2 Methods

120.14.3 Constructor

Function: Convenience method for getting a CWNetworkProfile object.
See also:

- 120.14.4 Constructor(networkProfile as CWNetworkProfileMBS)

120.14.4 Constructor(networkProfile as CWNetworkProfileMBS)

Function: Convenience method for getting a CWNetworkProfile object initialized with the given CWNetworkProfile object.
See also:

- 120.14.3 Constructor

120.14.5 copy as CWNetworkProfileMBS

Function: Creates a copy of the object.
120.14.6 isEqualToNetworkProfile(networkProfile as CWNetworkProfileMBS) as boolean

**Function:** Comparing network profiles.
**Notes:**

networkProfile: The CWNetworkProfile object with which to compare the receiver.

CWNetworkMBS objects are considered equal if their corresponding ssidData and securityType properties are equal.

120.14.7 mutableCopy as CWMutableNetworkProfileMBS

**Function:** Creates a mutable copy of the object.

120.14.8 networkProfile as CWNetworkProfileMBS

**Function:** Convenience method for getting a CWNetworkProfile object.

120.14.9 networkProfileWithNetworkProfile(networkProfile as CWNetworkProfileMBS) as CWNetworkProfileMBS

**Function:** Convenience method for getting a CWNetworkProfile object initialized with the given CWNetworkProfile object.
**Notes:** networkProfile: The CWNetworkProfile object to use to initialize a new CWNetworkProfile object.

120.14.10 Operator_Compare(networkProfile as CWNetworkProfileMBS) as Integer

**Function:** Compares two network profiles.
120.14.11 Properties

120.14.12 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

120.14.13 security as Integer

Function: The security mode for the network profile.
Notes:
See kCWSecurity* constants.
(Read only property)

120.14.14 ssid as string

Function: The service set identifier (SSID) for the network profile, encoded as a string.
Notes:
If the SSID can not be encoded as a valid UTF-8 or WinLatin1 string, this method returns "".
(Read only property)

120.14.15 ssidData as Memoryblock

Function: The service set identifier (SSID) for the network profile, returned as data.
Notes:
The SSID is 1-32 octets.
(Read only property)
120.15  class CWWiFiClientMBS

120.15.1  class CWWiFiClientMBS

Function: The interface to the Wi-Fi subsystem on OS X.
Notes: Provides access to all Wi-Fi interfaces and allows Wi-Fi clients to setup event notifications.

CWWiFiClientMBS objects are heavy objects, therefore, clients of the CoreWLAN framework should use a
single, long-running instance rather than creating several short-lived instances.

The CWWiFiClientMBS object should be used to instantiate CWInterfaceMBS objects rather than using a
CWInterfaceMBS initializer directly.

MBS Plugin make sure that all events are routed to main thread.

Available on MacOS 10.10 or newer.

120.15.2  Methods

120.15.3  available as boolean

Function: Whether this class is available.
Notes: Returns true on MacOS 10.10 or newer.

120.15.4  Constructor

Function: Initializes a CWWiFiClient object.
Notes: Available on MacOS 10.10 or newer.

120.15.5  Destructor

Function: The destructor.
120.15. CLASS CWIFICLIENTMBS

120.15.6 interfaceNames as String()

**Function:** Returns the list of available Wi-Fi interface names (e.g. "en0").
**Notes:**
An Array of string corresponding to Wi-Fi interface names.
If no Wi-Fi interfaces are available, this method will return an empty array.
Returns nil if an error occurs.

120.15.7 interfaces as CWInterfaceMBS()

**Function:** Returns all available Wi-Fi interfaces.
**Notes:**
If no Wi-Fi interfaces are available, this method will return an empty array.
Returns nil if an error occurs.

120.15.8 interfaceWithName(name as string) as CWInterfaceMBS

**Function:** Get the CWInterface object bound to the Wi-Fi interface with a specific interface name.
**Notes:**
interfaceName: The name of an available Wi-Fi interface.

Use interfaceNames function to get a list of available Wi-Fi interface names.
Returns a CWInterface object for the default Wi-Fi interface if no interface name is specified.

120.15.9 startMonitoring(EventType as integer, byref error as NSErrorMBS) as boolean

**Function:** Register for specific Wi-Fi event notifications.
**Notes:**
type: A CWEventType value.
error: An NSError object passed by reference, which upon return will contain the error if an error occurs.

Return a boolean value indicating whether or not an error occurred. True indicates no error occurred.
120.15.10  stopMonitoring(EventType as integer, byref error as NSErrorMBS) as boolean

Function: Unregister for specific Wi-Fi event notifications.
Notes:
type: A CWEventType value.
error: An NSError object passed by reference, which upon return will contain the error if an error occurs.

Returns a boolean value indicating whether or not an error occurred. true indicates no error occurred.

120.15.11  stopMonitoringAllEvents(byref error as NSErrorMBS) as boolean

Function: Unregister for all Wi-Fi event notifications.
Notes:
error: An NSError object passed by reference, which upon return will contain the error if an error occurs.

Returns a boolean value indicating whether or not an error occurred. true indicates no error occurred.

120.15.12  Properties

120.15.13  CWInterface as CWInterfaceMBS

Function: Returns the CWInterface object for the default Wi-Fi interface.
Notes:
This method is named CWInterface as the name interface would cause an error in Xojo.
(Read only property)

120.15.14  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
120.15. Events

120.15.16 `bssidDidChangeForWiFiInterfaceWithName(interfaceName as String)`

Function: Invoked when the current BSSID changes.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use `startMonitoring` with the CWEventTypeBSSIDDidChange event type to register for BSSID event notifications.
Use `CWInterfaceMBS.bssid` to query the current BSSID.

120.15.17 `clientConnectionInterrupted`

Function: Invoked if the connection to the Wi-Fi subsystem is temporarily interrupted.
Notes:

All event notifications for which the Wi-Fi client has registered will be automatically re-registered if the connection is interrupted.
The Wi-Fi client should re-sync any local state which is updated as a result of Wi-Fi event notifications.

120.15.18 `clientConnectionInvalidated`

Function: Invoked if the connection to the Wi-Fi subsystem is permanently invalidated.

120.15.19 `countryCodeDidChangeForWiFiInterfaceWithName(interfaceName as String)`

Function: Invoked when the currently adopted country code changes.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use `startMonitoring` with the CWEventTypeCountryCodeDidChange event type to register for country code event notifications.
Use CWInterfaceMBS.countryCode to query the currently adopted country code.

120.15.20  linkDidChangeForWiFiInterfaceWithName(interfaceName as String)
Function: Invoked when the Wi-Fi link state changes.
Notes:
interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeLinkDidChange event type to register for link event notifications.

120.15.21  linkQualityDidChangeForWiFiInterfaceWithName(interfaceName as String, rssi as Integer, transmitRate as double)
Function: Invoked when the Wi-Fi link quality changes.
Notes:
interfaceName: The name of the Wi-Fi interface.
rssi: The RSSI value for the currently associated network on the Wi-Fi interface.
transmitRate: The transmit rate for the currently associated network on the Wi-Fi interface.

Use startMonitoring with the CWEventTypeLinkQualityDidChange event type to register for link quality event notifications.
Use CWInterfaceMBS.rssiValue and CWInterfaceMBS.transmitRate to query the current RSSI and transmit rate, respectively.

120.15.22  modeDidChangeForWiFiInterfaceWithName(interfaceName as String)
Function: Invoked when the Wi-Fi operating mode changes.
Notes:
interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeModeDidChange event type to register for interface mode event notifications.
Use CWInterfaceMBS.interfaceMode to query the current operating mode.
powerStateDidChangeForWiFiInterfaceWithName(interfaceName as String)

Function: Invoked when the Wi-Fi power state changes.

Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypePowerDidChange event type to register for power event notifications.
Use CWInterfaceMBS.powerOn to query the current Wi-Fi power state.

rangingReportEventForWiFiInterfaceWithName(interfaceName as String, rangingData() as Dictionary, error as NSErrorMBS)

Function: Invoked when WiFi ranging measurement completed.

Notes:

interfaceName: The name of the Wi-Fi interface.
rangingData: Dictionary containing distance measurement data.

Use startMonitoring with the CWEventTypeRangingReportEvent event type to register for ranging event notifications.

scanCacheUpdatedForWiFiInterfaceWithName(interfaceName as String)

Function: Invoked when the Wi-Fi interface scan cache is updated with new scan results.

Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeScanCacheUpdated event type to register for scan cache event notifications.
Use CWInterfaceMBS.cachedScanResults to query scan cache results from the last scan.
**120.15.26 ssidDidChangeForWiFiInterfaceWithName(interfaceName as String)**

**Function:** Invoked when the current SSID changes.  
**Notes:**  
`interfaceName`: The name of the Wi-Fi interface.

Use `startMonitoring` with the `CWEventTypeSSIDDidChange` event type to register for SSID event notifications.  
Use `CWInterfaceMBS.ssidData` or `CWInterfaceMBS.ssid` to query the current SSID.

**120.15.27 virtualInterfaceStateChangedForWiFiInterfaceWithName(interfaceName as String)**

**Function:** Invoked when any state of WiFi virtual interface changes.  
**Notes:**  
`interfaceName`: The name of the Wi-Fi interface.

Use `startMonitoring` with the `CWEventTypeVirtualInterfaceStateChanged` event type to register for virtual interface state changed notifications.

**120.15.28 Constants**

**120.15.29 CWEventTypeBSSIDDidChange = 3**

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in `CWWiFiClientMBS.startMonitoring`.  
**Notes:** Posted when the current BSSID of any Wi-Fi interface changes.

**120.15.30 CWEventTypeCountryCodeDidChange = 4**

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in `CWWiFiClientMBS.startMonitoring`.  
**Notes:** Posted when the adopted country code of any Wi-Fi interface changes.
120.15.31  **CWEventTypeEnumlinkDidChange = 5**

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
**Notes:** Posted when the link state for any Wi-Fi interface changes.

120.15.32  **CWEventTypeEnumlinkQualityDidChange = 6**

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
**Notes:** Posted when the RSSI or transmit rate for any Wi-Fi interface changes.

120.15.33  **CWEventTypeEnummodeDidChange = 7**

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
**Notes:** Posted when the operating mode of any Wi-Fi interface changes.

120.15.34  **CWEventTypeEnumnone = 0**

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
**Notes:** No event type specified.

120.15.35  **CWEventTypeEnumpowerDidChange = 1**

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
**Notes:** Posted when the power state of any Wi-Fi interface changes.

120.15.36  **CWEventEnumTypeRangingReportEvent = 10**

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
**Notes:** Posted when WiFi ranging measurement completed.
120.15.37 CWEvnetTypeScanCacheUpdated = 8

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
**Notes:** Posted when the scan cache of any Wi-Fi interface is updated with new scan results.

120.15.38 CWEvnetTypeSSIDDidChange = 2

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
**Notes:** Posted when the current SSID of any Wi-Fi interface changes.

120.15.39 CWEvnetTypeVirtualInterfaceStateChanged = 9

MBS MacFrameworks Plugin, Plugin Version: 18.2. **Function:** One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
**Notes:** Posted when any state of any Wi-Fi virtual interface changes.
class CWWirelessProfileMBS

class CWWirelessProfileMBS

Encapsulates a stored wireless profile entry.

Requires Mac OS X 10.6 or newer.

Methods

Constructor

Creates an CWWirelessProfile.

copy as CWWirelessProfileMBS

Creates a copy of this object.

isEqualToProfile(profile as CWWirelessProfileMBS) as boolean

Comparing wireless profiles.

Returns true if both profiles are equal.

Two CWWirelessProfile objects are considered equal if all their corresponding properties are equal.

Operator_Compare(profile as CWWirelessProfileMBS) as Integer

Compares two profiles.
120.16.7 profile as CWWirelessProfileMBS

**Function:** Convenience method for getting a new CWWirelessProfile object.

120.16.8 Properties

120.16.9 description as string

**Function:** The object description.
**Notes:** (Read only property)

120.16.10 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

120.16.11 passphrase as string

**Function:** The passphrase from the default login keychain for the given CWWirelessProfile.
**Notes:**
This method may prompt the user to allow access to their default login keychain.
(Read and Write property)

120.16.12 securityMode as Double

**Function:** Security mode for the given CWWirelessProfile.
**Notes:** (Read and Write property)
120.16. CLASS CWWIRELESSPROFILEMBS

120.16.13  ssid as string

Function: Wireless network name for the given CWWirelessProfile.
Notes: (Read and Write property)

120.16.14  user8021XProfile as CW8021XProfileMBS

Function: User CW8021XProfile for the given CWWirelessProfile.
Notes: (Read and Write property)
120.17 class DarwinPingMBS

120.17.1 class DarwinPingMBS

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to do a ping on Mac OS X. **Deprecated:** This item is deprecated and should no longer be used. **Notes:** This class has still issues, so you may prefer to run ping in the shell class.

120.17.2 Methods

120.17.3 Ping(HostToPing as string, TimeOutMS as Integer, TimeToLife as Integer) as Integer

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Starts a syncron ping. **Notes:** This method does not return until the time passed or the ping response was received. Return value is a platform dependend error code. 0 is successful.

120.17.4 SimplePing(HostToPing as string, NumberOfPacketsToSend as Integer, PingTimeoutInSeconds as Integer, ReturnimmediatelyAfterReply as Integer) as Integer

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Starts an asyncron ping. **Notes:** This method will call the events and return when it finished. This method can be called in a thread. Return value is a platform dependend error code. 0 is successful.

120.17.5 Properties

120.17.6 HostToPing as String

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value used in the Ping command. **Notes:** (Read only property)
120.17.7  **NumberOfPacketsToSend as Integer**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value used in the Ping method.  
**Notes:** (Read only property)

120.17.8  **PingTimeoutInSeconds as Integer**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ping timeout to use.  
**Notes:**  
0 for default.  
(Read only property)

120.17.9  **ReturnimmediatelyAfterReply as Integer**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value used in the Ping method.  
**Notes:** (Read only property)

120.17.10  **TimeToLife as Integer**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time to life value for the ping packets.  
**Notes:**  
a value between 0 and 255.  
(Read only property)

120.17.11  **Events**

120.17.12  **AddressResolved(ip as string)**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The IP for the domain name was resolved.
120.17.13  **Finished(NumberPacketsSent as Integer, NumberPacketsReceived as Integer)**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The pings have finished.

120.17.14  **NextPing(PacketSequenceNumber as Integer)**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
We are starting the next ping now.

120.17.15  **Response(PacketSequenceNumber as Integer, ttl as Integer, RoundTripTimeInMS as Double)**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Got a response for the given packet.

120.17.16  **SentError(PacketSequenceNumber as Integer)**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A packet could not be sent.

120.17.17  **SentSuccess(PacketSequenceNumber as Integer)**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The packet has sent successfully.

120.17.18  **Timeout(PacketSequenceNumber as Integer)**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A timeout was reached for the given packet.
120.18. CLASS DATAGRAMMBS

120.18  class DatagramMBS

120.18.1  class DatagramMBS

120.18.2  Properties

120.18.3  Address as String

**Notes:**  
This is an IPv4.  
(Read and Write property)

120.18.4  Data as String

**Notes:** (Read and Write property)

120.18.5  Length as Integer

**Notes:** (Read and Write property)

120.18.6  Port as Integer

**Notes:** (Read and Write property)
120.18.7  rawAddress as MemoryBlock

**Function:** The raw address.
**Notes:**
This is socket address structure as used in C.
(Read and Write property)
120.19. CLASS DNSLOOKUPMBS

120.19 class DNSLookupMBS

120.19.1 class DNSLookupMBS

MBS Network Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class for the result of a Lookup query.

**Example:**

```vbscript
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName(“www.apple.com”) if d=nil then MsgBox "No DNS Server available?" else MsgBox DNSLookupMBS.FormatIP(d.Address) end if
```

120.19.2 Methods

120.19.3 Addresses(index as Integer) as string

MBS Network Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the address with the given index for this host.

**Example:**

```vbscript
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName(“www.apple.com”) if d=nil then MsgBox ”No DNS Server available?” else dim c as Integer = d.AddressesCount-1 for i as Integer = 0 to c MsgBox d.FormatIP(d.Addresses(i)) next end if
```

**Notes:** Index from 0 to count-1.

120.19.4 Aliases(index as Integer) as string

MBS Network Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the aliasname for the given index.
Example:

dim d as DNSLookupMBS = DNSLookupMBS.LookupHostByName("www.apple.com")

if d=nil then
    MsgBox "No DNS Server available?"
else
    dim c as Integer = d.AliasCount-1
    for i as Integer = 0 to c
        MsgBox d.Aliases(i)
    next
end if

Notes: Index is from 0 to count-1.

120.19.5 FormatIP(ip as string) as string

Function: Formats an IP from binary representation into string representation.
Example:

dim s as string = DNSLookupMBS.ParseIPv4("65.66.67.68")

MsgBox s // in binary representation of that IP

dim t as string = DNSLookupMBS.FormatIP(s)

MsgBox t

Notes:
Formats both IPv4 and IPv6 IP addresses in binary representation into human readable text.
On Windows IPv6 is only supported on Windows Vista and newer.
Returns empty string on failure.

120.19.6 LookupHostbyAddress(HostAddressBinary as string) as DNSLookupMBS

Function: Queries the DNS server for information about a host IP address.
Example:
dim l as DNSLookupMBS
dim a as string

a = DNSLookupMBS.ParseIPv4("17.254.0.91")

// try it...
l = DNSLookupMBS.LookupHostbyAddress(a)

// success...
MsgBox l.Name

Notes:
The address must be a 4 byte IP address like the ones returned by DNSLookupMBS.Address. Returns nil on any error.

120.19.7 LookupHostbyAddressMT(HostAddressBinary as string) as DNSLookupMBS

Function: Queries the DNS server for information about a host IP address.
Example:
dim l as DNSLookupMBS
dim a as string

a = DNSLookupMBS.ParseIPv4("17.254.0.91")

// try it...
l = DNSLookupMBS.LookupHostbyAddressMT(a)

// success...
MsgBox l.Name

Notes:
Same as LookupHostbyAddress, but with additional multithreading. Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.
The address must be a 4 byte IP address like the ones returned by DNSLookupMBS.Address. Returns nil on any error.
120.19.8  LookupHostbyName(HostName as string) as DNSLookupMBS

Function: Queries the DNS server for information about a host name.

Example:

    dim s as DNSLookupMBS = DNSLookupMBS.LookupHostbyName( "www.monkeybreadsoftware.de" )

    dim c as Integer = s.AddressesCount - 1
    for i as Integer = 0 to c
        dim ss as string = s.Addresses(i)
        print str(s.FormatIP(ss))
    next

Notes:

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.

See also:

- 120.19.9 LookupHostbyName(HostName as string, AddressType as Integer) as DNSLookupMBS

120.19.9  LookupHostbyName(HostName as string, AddressType as Integer) as DNSLookupMBS

Function: Queries the DNS server for information about a host name.

Example:

    dim s as DNSLookupMBS = DNSLookupMBS.LookupHostbyName( "ipv6.google.com", DNSLookupMBS.AddressTypeIPv6 )

    if s<>nil then
        dim c as Integer = s.AddressesCount - 1
        for i as Integer = 0 to c
            dim ss as string = s.Addresses(i)
            print str(s.FormatIP(ss))
        next
    end if

    s = DNSLookupMBS.LookupHostbyName("www.six.heise.de", DNSLookupMBS.AddressTypeIPv6)

    if s<>nil then
        dim c as Integer = s.AddressesCount - 1
        for i as Integer = 0 to c
            dim ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
end if

Notes:

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.

IPv6 on Windows does not work with this method.
See also:

• 120.19.8 LookupHostbyName(HostName as string) as DNSLookupMBS

120.19.10  LookupHostbyNameMT(HostName as string) as DNSLookupMBS

Function: Queries the DNS server for information about a host name.
Example:

dim s as DNSLookupMBS = DNSLookupMBS.LookupHostbyNameMT("www.monkeybreadsoftware.de")

dim c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
  dim ss as string = s.Addresses(i)
  print str(s.FormatIP(ss))
next

Notes:

Same as LookupHostbyName, but with additional multithreading.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI
running.

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.
See also:

• 120.19.11 LookupHostbyNameMT(HostName as string, AddressType as Integer) as DNSLookupMBS
120.19.11  LookupHostNameMT(HostName as string, AddressType as Integer) as DNSLookupMBS

**Function:** Queries the DNS server for information about a host name.  

**Example:**

```vbs
dim s as DNSLookupMBS = DNSLookupMBS.LookupHostByNameMT(“ipv6.google.com”, DNSLookupMBS.AddressTypeIPv6)
if s<>nil then
    dim c as Integer = s.AddressesCount-1
    for i as Integer = 0 to c
        dim ss as string = s.Addresses(i)
        print str(s.FormatIP(ss))
    next
end if

s = DNSLookupMBS.LookupHostNameMT(“www.six.heise.de”, DNSLookupMBS.AddressTypeIPv6)
if s<>nil then
    dim c as Integer = s.AddressesCount-1
    for i as Integer = 0 to c
        dim ss as string = s.Addresses(i)
        print str(s.FormatIP(ss))
    next
end if
```

**Notes:**

Same as LookupHostName, but with additional multithreading.  
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)  
Returns nil on any error.

IPv6 on Windows does not work with this method.  
See also:

- 120.19.10 LookupHostNameMT(HostName as string) as DNSLookupMBS
120.19. **CLASS DNSLOOKUPMBS**

120.19.12  **ParseIPv4(ip as string) as string**

**Function:** Parses an IP address in IPv4 format.

**Example:**

```vba
dim s as string = DNSLookupMBS.ParseIPv4("65.66.67.68")
```

MsgBox s // in binary representation of that IP

```vba
dim t as string = DNSLookupMBS.FormatIP(s)
```

MsgBox t

**Notes:**

Returns empty string on failure.
Works only for IPv4 strings.

120.19.13  **ParseIPv6(ip as string) as string**

**Function:** Parses an IP address in IPv6 format.

**Example:**

```vba
dim s as string = DNSLookupMBS.ParseIPv6("2001:0db8:85a3:08d3:1319:8a2e:0370:7344")
```

MsgBox s // in binary representation of that IP

```vba
dim t as string = DNSLookupMBS.FormatIP(s)
```

MsgBox t

**Notes:**

Returns empty string on failure.
Works only for IPv6 strings.
120.19.14 Properties

120.19.15 Address as String

MBS Network Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The primary address of the host.

**Example:**
```vbnet
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
    MsgBox "No DNS Server available?"
else
    MsgBox DNSLookupMBS.FormatIP(d.Address)
end if
```

**Notes:**
On TCP/IP based system the address is 4 bytes long binary string.
(Read and Write property)

120.19.16 AddressesCount as Integer

MBS Network Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The number of addresses for this host.

**Example:**
```vbnet
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
    MsgBox "No DNS Server available?"
else
    MsgBox str(d.AddressesCount)
end if
```

**Notes:** (Read and Write property)

120.19.17 AddressType as Integer

MBS Network Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The type of the address format.
Example:

```vbnet
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostByName("www.apple.com")

if d=nil then
    MsgBox "No DNS Server available?"
else
    MsgBox str(d.AddressType) ' shows 2 for IPv4
end if
```

Notes:
- 2 for IPv2
- 10 for IPv10
(Read and Write property)

### 120.19.18 AliasCount as Integer

MBS Network Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of aliases for this host.

**Example:**

```vbnet
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostByName("www.apple.com")

if d=nil then
    MsgBox "No DNS Server available?"
else
    MsgBox str(d.AliasCount)
end if
```

Notes: (Read and Write property)

### 120.19.19 Name as String

MBS Network Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The name of the host.

**Example:**

```vbnet
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostByName("www.apple.com")

if d=nil then
    MsgBox "No DNS Server available?"
```
else
MsgBox d.Name
end if

Notes: (Read and Write property)

120.19.20  Constants

120.19.21  AddressTypeIPv4 = 2

MBS Network Plugin, Plugin Version: 10.4. **Function:** One of the address types.  
**Notes:** An IPv4 address.

120.19.22  AddressTypeIPv6 = 10

MBS Network Plugin, Plugin Version: 10.4. **Function:** One of the address types.  
**Notes:** An IPv6 address.
120.20. CLASS DNSSERVICEADDRINFOMBS

120.20 class DNSServiceAddrInfoMBS

120.20.1 class DNSServiceAddrInfoMBS

MBS Network Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The class to query IP Address for hostname asynchronously.

**Notes:**
Queries for the IP address of a hostname by using either Multicast or Unicast DNS.
Subclass of the DNNServiceBaseMBS class.

120.20.2 Methods

120.20.3 AddrInfo(IntefaceIndex as Integer, protocol as Integer, HostName as string) as boolean

MBS Network Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries for the IP address of a hostname by using either Multicast or Unicast DNS.

**Notes:**
interfaceIndex: The interface on which to issue the query. Passing 0 causes the query to be sent on all active interfaces via Multicast or the primary interface via Unicast.
protocol: Pass in kDNSServiceProtocolIPv4 to look up IPv4 addresses, or kDNSServiceProtocolIPv6 to look up IPv6 addresses, or both to look up both kinds. If neither flag is set, the system will apply an intelligent heuristic, which is (currently) that it will attempt to look up both, except:
If “hostname” is a wide-area unicast DNS hostname (i.e. not a ”.local.” name) but this host has no routable IPv6 address, then the call will not try to look up IPv6 addresses for “hostname”, since any addresses it found would be unlikely to be of any use anyway. Similarly, if this host has no routable IPv4 address, the call will not try to look up IPv4 addresses for “hostname”.

hostname: The fully qualified domain name of the host to be queried for.

Lasterror is set to kDNSServiceErr_NoError (0) on success (any subsequent, asynchronous errors are delivered to the callback), otherwise returns an error code indicating the error that occurred.

Returns false on any error and true on success. Please check lasterror property when false is returned.

120.20.4 Available as boolean

MBS Network Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Whether this class is available for use.
Notes: Older versions of Bonjour did not have such functions, so there it may not be available.

120.20.5 Events

120.20.6 ServiceAddrInfo(Flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, AddressFamily as Integer, IP as string, SockAddr as MemoryBlock, HostName as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The event called when something is found. **Notes:**

Flags: Possible values are kDNSServiceFlagsMoreComing and kDNSServiceFlagsAdd.
interfaceIndex: The interface to which the answers pertain.
errorCode: Will be kDNSServiceErr_NoError (0) on success, otherwise will indicate the failure that occurred. Other parameters are undefined if errorCode is nonzero.
hostname: The fully qualified domain name of the host to be queried for.
address: IPv4 or IPv6 address.
ttl: If the client wishes to cache the result for performance reasons, the TTL indicates how long the client may legitimately hold onto this result, in seconds. After the TTL expires, the client should consider the result no longer valid, and if it requires this data again, it should be re-fetched with a new query. Of course, this only applies to clients that cancel the asynchronous operation when they get a result. Clients that leave the asynchronous operation running can safely assume that the data remains valid until they get another callback telling them otherwise.

120.20.7 Constants

120.20.8 kAddressFamilyIPv4 = 2

MBS Network Plugin, Plugin Version: 15.0. **Function:** One of the address family constants. **Notes:** IPv4 protocol

120.20.9 kAddressFamilyIPv6 = 30

MBS Network Plugin, Plugin Version: 15.0. **Function:** One of the address family constants. **Notes:** IPv6 protocol
120.20. CLASS DNNSERVICEADDRINFOMBS

120.20.10  kProtocolAuto = 0

MBS Network Plugin, Plugin Version: 15.0. **Function:** One of the protocols constants. **Notes:** Automatic decide.

120.20.11  kProtocolIPv4 = 1

MBS Network Plugin, Plugin Version: 15.0. **Function:** One of the protocols constants. **Notes:** IPv4 protocol

120.20.12  kProtocolIPv6 = 2

MBS Network Plugin, Plugin Version: 15.0. **Function:** One of the protocols constants. **Notes:** IPv6 protocol
120.21  class DNSServiceBaseMBS

120.21.1  class DNSServiceBaseMBS

120.21.2  Methods

120.21.3  Available as boolean

Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

120.21.4  Close

Notes: This is done automatically for you by the destructor.

120.21.5  ConstructFullName(Service as string, regtype as string, domain as string) as string

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. Function: Concatenate a three-part domain name (as returned by the above callbacks) into a properly-escaped full domain name.
Notes: Note that events in the above functions ALREADY ESCAPE strings where necessary.

service: The service name - any dots or backslashes must NOT be escaped. May be "" (to construct a PTR record name, e.g. ".ftp.tcp.apple.com.").
regtype: The service type followed by the protocol, separated by a dot (e.g. ".ftp.tcp").
domain: The domain name, e.g. "apple.com.". Literal dots or backslashes, if any, must be escaped, e.g. "1st\. Floor.apple.com."

Returns 0 on success, -1 on error.
120.21. CLASS DNSSERVICEBASEMBS

120.21.6 GetDaemonVersion as Integer

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries the version of the daemon. **Notes:** Value is zero on any error.

120.21.7 Initialize

MBS Network Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Initializes API. **Notes:**
- On Windows the plugin calls this internally at startup of application.
- Now if your app installs Bonjour while running, you can call this method to let the plugin load the bonjour dll.
- After successful call, the available functions return true.
- Does nothing on Mac OS X or Linux.

120.21.8 Running as boolean

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** True if there is a running request.

120.21.9 Properties

120.21.10 Handle as Integer

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The handle for this request. **Notes:** (Read and Write property)

120.21.11 Lasterror as Integer

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The last error code reported. **Notes:**
- 0 if the function succeeded.
- -1 if the function used was not available.
See the kError constants for possible errors.
(Read and Write property)

120.21.12 Constants

120.21.13 kClassIN = 1
MBS Network Plugin, Plugin Version: 10.1. **Function:** The DNS class for Internet services.

120.21.14 kErrorAlreadyRegistered = -65547
MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.15 kErrorBadFlags = -65543
MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.16 kErrorBadInterfaceIndex = -65552
MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.17 kErrorBadParam = -65540
MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.18 kErrorBadReference = -65541
MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.19 kErrorBadState = -65542
MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.
120.21. CLASS DNNSERVICEBASEMBS

120.21.20 kErrorBadTime = -65559

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.21 kErrorDoubleNAT = -65558

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.22 kErrorFirewall = -65550

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.23 kErrorIncompatible = -65551

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.24 kErrorInvalid = -65549

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.25 kErrorNameConflict = -65548

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.26 kErrorNATTraversal = -65557

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.27 kErrorNoAuth = -65555

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.
120.21.28 **kErrorNoError** = 0

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.29 **kErrorNoMemory** = -65539

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.30 **kErrorNoSuchKey** = -65556

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.31 **kErrorNoSuchName** = -65538

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.32 **kErrorNoSuchRecord** = -65554

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.33 **kErrorNotInitialized** = -65545

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.34 **kErrorRefused** = -65553

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.35 **kErrorUnknown** = -65537

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.
120.21.36  kErrorUnsupported = -65544

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the error constants.

120.21.37  kFlagsAdd = 2

MBS Network Plugin, Plugin Version: 10.1. **Function:** A flag for domain enumeration and browse/query events.
**Notes:** "Default" applies only to enumeration and is only valid in conjunction with "Add". An enumeration callback with the "Add" flag NOT set indicates a "Remove", i.e. the domain is no longer valid.

120.21.38  kFlagsAllowRemoteQuery = &h200

MBS Network Plugin, Plugin Version: 10.1. **Function:** Flag for creating a record for which we will answer remote queries (queries from hosts more than one hop away; hosts not directly connected to the local link).

120.21.39  kFlagsBrowseDomains = &h40

MBS Network Plugin, Plugin Version: 10.1. **Function:** Flags for specifying domain enumeration type in DNSServiceEnumerateDomains.
**Notes:** BrowseDomains enumerates domains recommended for browsing, RegistrationDomains enumerates domains recommended for registration.

120.21.40  kFlagsDefault = 4

MBS Network Plugin, Plugin Version: 10.1. **Function:** A flag for domain enumeration and browse/query events.
**Notes:** "Default" applies only to enumeration and is only valid in conjunction with "Add". An enumeration callback with the "Add" flag NOT set indicates a "Remove", i.e. the domain is no longer valid.

120.21.41  kFlagsForceMulticast = &h400

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the flags.
**Notes:** Flag for signifying that a query or registration should be performed exclusively via multicast DNS, even for a name in a domain (e.g. foo.apple.com.) that would normally imply unicast DNS.
120.21.42 kFlagsLongLivedQuery = & h100

MBS Network Plugin, Plugin Version: 10.1. **Function:** Flag for creating a long-lived unicast query for the QueryRecord call.

120.21.43 kFlagsMoreComing = 1

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the flags used for the events. **Notes:** MoreComing indicates to a callback that at least one more result is queued and will be delivered following immediately after this one. Applications should not update their UI to display browse results when the MoreComing flag is set, because this would result in a great deal of ugly flickering on the screen. Applications should instead wait until MoreComing is not set, and then update their UI. When MoreComing is not set, that doesn’t mean there will be no more answers EVER, just that there are no more answers immediately available right now at this instant. If more answers become available in the future they will be delivered as usual.

120.21.44 kFlagsNoAutoRename = 8

MBS Network Plugin, Plugin Version: 10.1. **Function:** The flag for specifying renaming behavior on name conflict when registering non-shared records. **Notes:** By default, name conflicts are automatically handled by renaming the service. NoAutoRename overrides this behavior - with this flag set, name conflicts will result in a callback. The NoAutorename flag is only valid if a name is explicitly specified when registering a service (i.e. the default name is not used.)

120.21.45 kFlagsRegistrationDomains = & h80

MBS Network Plugin, Plugin Version: 10.1. **Function:** Flags for specifying domain enumeration type in DNSServiceEnumerateDomains. **Notes:** BrowseDomains enumerates domains recommended for browsing, RegistrationDomains enumerates domains recommended for registration.

120.21.46 kFlagsShared = & h10

MBS Network Plugin, Plugin Version: 10.1. **Function:** Flag for registering individual records on a connected DNSService. **Notes:** Shared indicates that there may be multiple records with this name on the network (e.g. PTR records). Unique indicates that the record’s name is to be unique on the network (e.g. SRV records).
120.21.  CLASS DNSSERVICEBASEMBS

120.21.47  kFlagsUnique = &h20

MBS Network Plugin, Plugin Version: 10.1. **Function:** Flag for registering individual records on a connected DNSService.
**Notes:** Shared indicates that there may be multiple records with this name on the network (e.g. PTR records). Unique indicates that the record’s name is to be unique on the network (e.g. SRV records).

120.21.48  kInterfaceIndexAny = 0

MBS Network Plugin, Plugin Version: 10.1. **Function:** The constant to use for interface index to target any interface.

120.21.49  kInterfaceIndexLocalOnly = -1

MBS Network Plugin, Plugin Version: 10.1. **Function:** The constant to use for interface index to target the local interface.

120.21.50  kMaxDomainName = 1005

MBS Network Plugin, Plugin Version: 10.1. **Function:** Maximum length, in bytes, of a domain name represented as an *escaped* C-String including the final trailing dot, and the C-String terminating NULL at the end.

120.21.51  kMaxServiceName = 64

MBS Network Plugin, Plugin Version: 10.1. **Function:** Maximum length, in bytes, of a service name represented as a literal C-String, including the terminating NULL at the end.

120.21.52  kTypeA = 1

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants.
**Notes:** Host address.
120.21.53 \( kTypeA6 = 38 \)

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants.  
**Notes:** IPv6 address (deprecates AAAA)

120.21.78. kTypeMX = 15

MBS Network Plugin, Plugin Version: 10.1. **Function**: One of the DNS Service type constants. **Notes**: Mail routing information.

120.21.79. kTypeNAPTR = 35

MBS Network Plugin, Plugin Version: 10.1. **Function**: One of the DNS Service type constants. **Notes**: Naming Authority PoinTeR

120.21.80. kTypeNIMLOC = 32

MBS Network Plugin, Plugin Version: 10.1. **Function**: One of the DNS Service type constants. **Notes**: Nimrod Locator.
120.21.81 \ kTypeNS = 2

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Authoritative server.

120.21.82 \ kTypeNSAP = 22

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** NSAP address.

120.21.83 \ kTypeNSAP_PTR = 23

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Reverse NSAP lookup (deprecated).

120.21.84 \ kTypeNULL = 10

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Null resource record.

120.21.85 \ kTypeNXT = 30

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Next domain (security).

120.21.86 \ kTypeOPT = 41

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** EDNS0 option (meta-RR)

120.21.87 \ kTypePTR = 12

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Domain name pointer.
120.21. CLASS DNSSERVICEBASEMBS

120.21.88  kTypePX = 26

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** X.400 mail mapping.

120.21.89  kTypeRP = 17

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Responsible person.

120.21.90  kTypeRT = 21

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Router.

120.21.91  kTypeSIG = 24

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Security signature.

120.21.92  kTypeSINK = 40

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Kitchen sink (experimental)

120.21.93  kTypeSOA = 6

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Start of authority zone.

120.21.94  kTypeSRV = 33

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants. **Notes:** Server Selection.
120.21.95  kTypeTKEY = 249

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants.  
**Notes:** Transaction key.

120.21.96  kTypeTSIG = 250

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants.  
**Notes:** Transaction signature.

120.21.97  kTypeTXT = 16

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants.  
**Notes:** One or more text strings.

120.21.98  kTypeWKS = 11

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants.  
**Notes:** Well known service.

120.21.99  kTypeX25 = 19

MBS Network Plugin, Plugin Version: 10.1. **Function:** One of the DNS Service type constants.  
**Notes:** X-25 calling address.
120.22. CLASSE DNSSERVICEBROWSEMBS

120.22  class DNSServiceBrowseMBS

120.22.1  class DNSServiceBrowseMBS

**Notes**:

This class allows you to browse for services on the local network using Rendezvous.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

**common error codes**:

- kDNSServiceErr_NoError = 0
- kDNSServiceErr_Unknown = -65537 (=& hFFFE FFFF)
- kDNSServiceErr_NoSuchName = -65538
- kDNSServiceErr_NoMemory = -65539
- kDNSServiceErr_BadParam = -65540
- kDNSServiceErr_BadReference = -65541
- kDNSServiceErr_BadState = -65542
- kDNSServiceErr_BadFlags = -65543
- kDNSServiceErr_Unsupported = -65544
- kDNSServiceErr_NotInitialized = -65545
- kDNSServiceErr_AlreadyRegistered = -65547
- kDNSServiceErr_NameConflict = -65548
- kDNSServiceErr_Invalid = -65549
- kDNSServiceErr_Incompatible = -65551 (client library incompatible with daemon)
- kDNSServiceErr_BadInterfaceIndex = -65552

Subclass of the DNSServiceBaseMBS class.

120.22.2  Methods

120.22.3  Browse(InterfaceIndex as Integer, servicetype as string, domain as string) as boolean

MBS Network Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function**: Asynchronously create a DNS Service browser to search for matching services in the local network.

**Notes**:

- servicetype:
The type of service.
domain:
The domain in which to find the service.

Returns true if successful.
The ServiceBrowse event may be called till this browse request is closed.

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.

In a perfect application you use DNSServiceDomainEnumerationMBS class to enumerate which domains you should use.

Returns false on any error and true on success. Please check lasterror property when false is returned.

### 120.22.4 Events

#### 120.22.5 ServiceBrowse(Flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, ServiceName as string, RegType as string, Domain as string)

MBS Network Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:**
New service found or lost one.

**Example:**

```vbnet
sub ServiceBrowse(Flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, ServiceName as string, RegType as string, Domain as string)
// example for event implementation

const kDNSServiceFlagsAdd = 2
const kDNSServiceFlagsRemove = 0
const kDNSServiceFlagsMoreComing = 1
const kDNSServiceFlagsFinished = 0

dim Added as boolean = bitwiseAnd(flags, kDNSServiceFlagsAdd) = kDNSServiceFlagsAdd
dim Removed as boolean = bitwiseAnd(flags, kDNSServiceFlagsRemove) = kDNSServiceFlagsRemove

dim MoreComing as boolean = bitwiseAnd(flags, kDNSServiceFlagsMoreComing) = kDNSServiceFlagsMoreComing
dim Finished as boolean = bitwiseAnd(flags, kDNSServiceFlagsFinished) = kDNSServiceFlagsFinished

// work with the booleans to decide what to do.
```
Notes:

Values for flags:

- kDNSServiceFlagsAdd = 2
- kDNSServiceFlagsRemove = 0 (i.e. bit not set)
- kDNSServiceFlagsMoreComing = 1
- kDNSServiceFlagsFinished = 0 (i.e. bit not set)

MoreComing indicates to a Browse callback that another result is queued. Applications should not update their UI to display browse results when the MoreComing flag is set, instead deferring the update until the callback’s flag is Finished.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

InterfaceIndex can be kInterfaceIndexLocalOnly, kInterfaceIndexAny or a positive index for the interface index (1 = first device).
For interface indexes, please also check NetworkInterfaceMBS class.
120.23 class DNSServiceDiscoveryBrowseMBS

120.23.1 class DNSServiceDiscoveryBrowseMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for Apple’s implementation of ZeroConfig named Bonjour. **Deprecated:** This item is deprecated and should no longer be used. You can use DNSServiceBrowseMBS instead. **Notes:**

This class allows you to browse for services on the local network using Bonjour.

Common error codes for Rendevouz:

- kDNSServiceDiscoveryUnknownErr: -65537
- kDNSServiceDiscoveryNoSuchNameErr: -65538
- kDNSServiceDiscoveryNoMemoryErr: -65539
- kDNSServiceDiscoveryBadParamErr: -65540
- kDNSServiceDiscoveryBadReferenceErr: -65541
- kDNSServiceDiscoveryBadStateErr: -65542
- kDNSServiceDiscoveryBadFlagsErr: -65543
- kDNSServiceDiscoveryUnsupportedErr: -65544
- kDNSServiceDiscoveryNotInitializedErr: -65545
- kDNSServiceDiscoveryNoCache: -65546
- kDNSServiceDiscoveryAlreadyRegistered: -65547
- kDNSServiceDiscoveryNameConflict: -65548
- kDNSServiceDiscoveryInvalid: -65549
- kDNSServiceDiscoveryMemFree: -65792

But several other Mac OS error codes may also be there. This class requires Mac OS X 10.2 to work. Use DNSServiceBrowseMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

120.23.2 Methods

120.23.3 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether Bonjour (zeroconfig) is installed. **Notes:** If this function returns true, all the needed stuff is installed and the function have been loaded.
120.23.4 **Browse** (servicetype as string, domain as string) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Asynchronously create a DNS Service browser to search for matching services in the local network.  
**Notes:**

- servicetype: The type of service.
- domain: The domain in which to find the service.

Returns true if successful.
The ServiceBrowse event may be called till this browse request is closed.

120.23.5 **Close**

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the current request and releases all used memory.

120.23.6 **Running as boolean**

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if there is a running request.

120.23.7 **Properties**

120.23.8 **Handle as Integer**

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle for this request.  
**Notes:** (Read only property)
120.23.9 Events

120.23.10 ServiceBrowse(message as Integer, name as string, type as string, domain as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** New service found or lost one.

**Notes:**

If message=0 a new service was found. Message=1 means that a service was removed. Flags=1 means that more data is coming. Flags=0 means the end of the current list of services. But several minutes later when a new Mac connects to the network another ServiceBrowse Event may inform you, even if flags was 0.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
120.24. CLASS DNNSERVICEDISCOVERYDOMAINENUMERATIONMBS

120.24 class DNNServiceDiscoveryDomainEnumerationMBS

120.24.1 class DNNServiceDiscoveryDomainEnumerationMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A class for Apple's implementation of ZeroConfig named Bonjour. Deprecated: This item is deprecated and should no longer be used. You can use DNNServiceDomainEnumerationMBS instead. Notes:

This class allows you to enumerate domains.

Common error codes for Rendevouz:

- kDNNServiceDiscoveryUnknownErr -65537
- kDNNServiceDiscoveryNoSuchNameErr -65538
- kDNNServiceDiscoveryNoMemoryErr -65539
- kDNNServiceDiscoveryBadParamErr -65540
- kDNNServiceDiscoveryBadReferenceErr -65541
- kDNNServiceDiscoveryBadStateErr -65542
- kDNNServiceDiscoveryBadFlagsErr -65543
- kDNNServiceDiscoveryUnsupportedErr -65544
- kDNNServiceDiscoveryNotInitializedErr -65545
- kDNNServiceDiscoveryNoCache -65546
- kDNNServiceDiscoveryAlreadyRegistered -65547
- kDNNServiceDiscoveryNameConflict -65548
- kDNNServiceDiscoveryInvalid -65549
- kDNNServiceDiscoveryMemFree -65572

But several other Mac OS error codes may also be there.
This class requires Mac OS X 10.2 to work. Use DNNServiceDomainEnumerationMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

120.24.2 Methods

120.24.3 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether Bonjour (zeroconfig) is installed. Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.
120.24.4 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the current request and releases all used memory.

120.24.5 EnumerateDomains(domaintype as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Asynchronously create a DNS Domain Enumerator to search for domains in the local network. **Notes:**

- **domaintype:**
  A flag indicating whether you are looking for recommended registration domains (value=1, e.g. equivalent to the AppleTalk zone list in the AppleTalk Control Panel) or recommended browsing domains (value=0, e.g. equivalent to the AppleTalk zone list in the Chooser).

Returns true if successful.
The ServiceDomainEnumeration event may be called till this enumerate request is closed.

120.24.6 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if there is a running request.

120.24.7 Properties

120.24.8 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle for this request. **Notes:** (Read only property)

120.24.9 Events

120.24.10 ServiceDomainEnumeration(message as Integer, domain as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Domains changed.
Notes:

Meaning of message:

0: Domain found.
1: Domain found (and should be selected by default).
2: Domain has been removed from network.

Flags=1 means that more data is coming. Flags=0 means the end of the current list of services. But several minutes later when a new Mac connects to the network another ServiceLookup Event may inform you, even if flags was 0.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
120.25 class DNSServiceDiscoveryRegisterMBS

120.25.1 class DNSServiceDiscoveryRegisterMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for Apple’s implementation of ZeroConfig named Bonjour. **Deprecated:** This item is deprecated and should no longer be used. You can use DNSServiceRegisterMBS instead. **Notes:**

This class allows you to register names on the local network using Bonjour.

Common error codes for Rendevouz:

- `kDNSServiceDiscoveryUnknownErr` -65537
- `kDNSServiceDiscoveryNoSuchNameErr` -65538
- `kDNSServiceDiscoveryNoMemoryErr` -65539
- `kDNSServiceDiscoveryBadParamErr` -65540
- `kDNSServiceDiscoveryBadReferenceErr` -65541
- `kDNSServiceDiscoveryBadStateErr` -65542
- `kDNSServiceDiscoveryBadFlagsErr` -65543
- `kDNSServiceDiscoveryUnsupportedErr` -65544
- `kDNSServiceDiscoveryNotInitializedErr` -65545
- `kDNSServiceDiscoveryNoCache` -65546
- `kDNSServiceDiscoveryAlreadyRegistered` -65547
- `kDNSServiceDiscoveryNameConflict` -65548
- `kDNSServiceDiscoveryInvalid` -65549
- `kDNSServiceDiscoveryMemFree` -65792

But several other Mac OS error codes may also be there. This class requires Mac OS X 10.2 to work. Use DNSServiceRegisterMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

120.25.2 Methods

120.25.3 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether Bonjour (zeroconfig) is installed. **Notes:** If this function returns true, all the needed stuff is installed and the function have been loaded.
120.25.4 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the current request and releases all used memory.

120.25.5 Register(servicename as string, servicetype as string, domain as string, port as Integer, text as string) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Register a named service with DNS Service Discovery. **Notes:**

- **servicename:**
  The name of this service instance (e.g. "Steve's Printer")

- **servicetype:**
  The service type (e.g. "_printer._tcp."
  See RFC 2782 (DNS SRV) and this website:
  http://www.iana.org/assignments/port-numbers

- **domain:**
  The domain in which to register the service (e.g. "apple.com.")

- **port:**
  The local port on which this service is being offered (in network byte order)

- **text:**
  Optional protocol-specific additional information

Returns true if successful.
The ServiceRegistration event may be called till this registration request is closed.

120.25.6 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if there is a running request.
120.25.7  UpdateText(data as string, ttl as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the TXT Record.  
**Notes:**  
data is the TXT Record composed of Pascal Strings.  
ttl = time to live.  
Returns an error code. (0=success)

120.25.8  Properties

120.25.9  Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle for this request.  
**Notes:** (Read only property)

120.25.10  Text as String

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last TXT Record text used.  
**Notes:** (Read only property)

120.25.11  Events

120.25.12  ServiceRegistration(errorcode as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Registration was done.  
**Notes:**  
errorcode is 0 if successfull.  
Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
120.26   class DNSServiceDiscoveryResolveMBS

120.26.1   class DNSServiceDiscoveryResolveMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for Apple’s implementation of ZeroConfig named Bonjour. **Deprecation:** This item is deprecated and should no longer be used. You can use DNSServiceResolveMBS instead. **Notes:**

This class allows you to lookup names on the local network using Bonjour.

Common error codes for Rendezvous:

- kDNSServiceDiscoveryUnknownErr: -65537
- kDNSServiceDiscoveryNoSuchNameErr: -65538
- kDNSServiceDiscoveryNoMemoryErr: -65539
- kDNSServiceDiscoveryBadParamErr: -65540
- kDNSServiceDiscoveryBadReferenceErr: -65541
- kDNSServiceDiscoveryBadStateErr: -65542
- kDNSServiceDiscoveryBadFlagsErr: -65543
- kDNSServiceDiscoveryUnsupportedErr: -65544
- kDNSServiceDiscoveryNotInitializedErr: -65545
- kDNSServiceDiscoveryNoCache: -65546
- kDNSServiceDiscoveryAlreadyRegistered: -65547
- kDNSServiceDiscoveryNameConflict: -65548
- kDNSServiceDiscoveryInvalid: -65549
- kDNSServiceDiscoveryMemFree: -65792

But several other Mac OS error codes may also be there.

This class requires Mac OS X 10.2 to work. Use DNSServiceResolveMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

120.26.2   Methods

120.26.3   Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether Bonjour (zeroconfig) is installed. **Notes:** If this function returns true, all the needed stuff is installed and the function have been loaded.
120.26.4 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the current request and releases all used memory.

120.26.5 Lookup(servicename as string, servicetype as string, domain as string) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resolved a named instance of a service to its address, port, and (optionally) a text description.  
**Notes:**
- **servicename:** The name of the service instance.
- **servicetype:** The type of service.
- **domain:** The domain in which to find the service.

Returns true if successful. The ServiceLookup event may be called till this lookup request is closed.

120.26.6 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if there is a running request.

120.26.7 Properties

120.26.8 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle for this request.  
**Notes:** (Read only property)
120.26.9 Events

120.26.10 ServiceLookup(ip as string, port as Integer, text as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Lookup got something.
**Notes:**
IP is a string like "192.168.1.14".
Flags=1 means that more data is coming. Flags=0 means the end of the current list of services. But several minutes later when a new Mac connects to the network another ServiceLookup Event may inform you, even if flags was 0.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
120.27 class DNSServiceDomainEnumerationMBS

120.27.1 class DNSServiceDomainEnumerationMBS

MBS Network Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** A class for Apple’s implementation of ZeroConfig named Bonjour.  
**Notes:**  
This class allows you to enumerate domains.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

- kDNSServiceErr_NoError = 0
- kDNSServiceErr_Unknown = -65537 (=& hFFFE FFFF)
- kDNSServiceErr_NoSuchName = -65538
- kDNSServiceErr_NoMemory = -65539
- kDNSServiceErr_BadParam = -65540
- kDNSServiceErr_BadReference = -65541
- kDNSServiceErr_BadState = -65542
- kDNSServiceErr_BadFlags = -65543
- kDNSServiceErr_Unsupported = -65544
- kDNSServiceErr_NotInitialized = -65545
- kDNSServiceErr_AlreadyRegistered = -65547
- kDNSServiceErr_NameConflict = -65548
- kDNSServiceErr_Invalid = -65549
- kDNSServiceErr_Incompatible = -65551 (client library incompatible with daemon)
- kDNSServiceErr_BadInterfaceIndex = -65552

Subclass of the DNSServiceBaseMBS class.

120.27.2 Methods

120.27.3 EnumerateDomains(Flags as Integer, InterfaceIndex as Integer) as boolean

MBS Network Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Asynchronously enumerate domains available for browsing and registration.  
**Notes:**  
Note that the names returned are (like all of DNS-SD) UTF-8 strings, and are escaped using standard DNS escaping rules.
A graphical browser displaying a hierarchical tree-structured view should cut the names at the bare dots to yield individual labels, then de-escape each label according to the escaping rules, and then display the resulting UTF-8 text.

Flags for specifying domain enumeration type in DNSServiceEnumerateDomains. BrowseDomains enumerates domains recommended for browsing, RegistrationDomains enumerates domains recommended for registration:

\[
\begin{align*}
\text{kDNSServiceFlagsBrowseDomains} & \quad = 64 \\
\text{kDNSServiceFlagsRegistrationDomains} & \quad = 128
\end{align*}
\]

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.

For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

### 120.27.4 Events

### 120.27.5 ServiceDomainEnumeration(flags as Integer, interfaceIndex as Integer, errorcode as Integer, Domain as string)

MBS Network Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Domains changed.

**Notes:**

Flags uses this flags: kFlagsAdd, kFlagsDefault.

"Default" applies only to enumeration and is only valid in conjunction with "Add"

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

For interface indexes, please also check NetworkInterfaceMBS class.
120.28 class DNSServiceMetaQueryMBS

120.28.1 class DNSServiceMetaQueryMBS

MBS MacOSX Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries all Bonjour services.  
**Notes:** Useful to learn what services are available. This queries the bonjour cache.

120.28.2 Properties

120.28.3 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code.  
**Notes:** (Read and Write property)

120.28.4 Events

120.28.5 AddService(type as string, domain as string, interfaceName as string, rrtype as Integer, rrclass as Integer)

MBS MacOSX Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A service was found.

120.28.6 RemoveService(type as string, domain as string, interfaceName as string, rrtype as Integer, rrclass as Integer)

MBS MacOSX Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A service was removed.  
**Notes:** Remove is only called when a network interface is disabled or if the record expires from the cache. For network efficiency reasons, clients do not send goodbye packets for meta-query PTR records when deregistering a service.
120.29. CLASS DNSSERVICEREGISTERMBS

120.29.1 class DNSServiceRegisterMBS

MBS Network Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
A class for Apple’s implementation of ZeroConfig named Bonjour.

**Notes:**
This class allows you to register names on the local network using Bonjour.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

**common error codes:**

- kDNSServiceErr_NoError = 0
- kDNSServiceErr_Unknown = -65537 (=& hFFE FFFF)
- kDNSServiceErr_NoSuchName = -65538
- kDNSServiceErr_NoMemory = -65539
- kDNSServiceErr_BadParam = -65540
- kDNSServiceErr_BadReference = -65541
- kDNSServiceErr_BadState = -65542
- kDNSServiceErr_BadFlags = -65543
- kDNSServiceErr_Unsupported = -65544
- kDNSServiceErr_NotInitialized = -65545
- kDNSServiceErr_AlreadyRegistered = -65547
- kDNSServiceErr_NameConflict = -65548
- kDNSServiceErr_Invalid = -65549
- kDNSServiceErr_Incompatible = -65551 (client library incompatible with daemon)
- kDNSServiceErr_BadinterfaceIndex = -65552

Subclass of the DNSServiceBaseMBS class.

**120.29.2 Methods**

**120.29.3 AddRecord(rrType as Integer, TXTRecord as string, ttl as Integer)**

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
Add a record to a registered service.

**Notes:**
LastError is set.

The name of the record will be the same as the registered service’s name. The record can later be updated
or deregistered by UpdateRecord() or RemoveRecord().

rrtype: The type of the record (e.g. kTypeTXT, kTypeSRV, etc)
data: The raw rdata to be contained in the added resource record.
ttl: The time to live of the resource record, in seconds. Pass 0 to use a default value.

Returns false on any error and true on success. Please check lasterror property when false is returned.

120.29.4 Register(Flags as Integer, interfaceIndex as Integer, servicename as string, servicetype as string, domain as string, host as string, port as Integer, txtRecord as string) as boolean

MBS Network Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Register a service that is discovered via Browse() and Resolve() calls. **Notes:** Flag for specifying renaming behavior on name conflict when registering non-shared records. NoAutorename is only valid if a name is explicitly specified when registering a service (ie the default name is not used.)

\[ kDNSServiceFlagsNoAutoRename = 8, \]
\[ kDNSServiceFlagsAutoRename = 0 \text{ (i.e. bit not set)} \]

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.

In a perfect application you use DNSServiceDomainEnumerationMBS class to enumerate which domains you should use.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

120.29.5 RemoveRecord

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Remove a record previously added to a service record set via AddTextRecord. **Notes:** Returns false on any error and true on success. Please check lasterror property when false is returned.
120.29.6 UpdateRecord(TXTRecord as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Changes the TXT Record.

**Notes:**

data is the TXT Record composed of Pascal Strings.
ttl = time to live.

Returns false on any error and true on success. Please check lasterror property when false is returned.

120.29.7 Events

120.29.8 ServiceRegistration(flags as Integer, errorcode as Integer, Name as string, RegType as string, Domain as string)

MBS Network Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Registration was done.

**Notes:** Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
120.30 class DNSServiceRegisterRecordMBS

120.30.1 class DNSServiceRegisterRecordMBS

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
A class for Apple’s implementation of ZeroConfig named Bonjour.

**Notes:**
This class is to register a name record with the dns service.
Subclass of the DNSServiceBaseMBS class.

120.30.2 Methods

120.30.3 RegisterRecord(Flags as Integer, interfaceIndex as Integer, fullname as string, rrtype as Integer, rrClass as Integer, data as string, ttl as Integer) as boolean

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
Registers a record on the DNS system.

**Example:**

```c
const kDNSServiceClass_IN = 1
const kDNSServiceType_SRV = 33
const kDNSServiceFlagsShared = & h10
const kDNSServiceFlagsUnique = & h20
```

**Notes:**
flags: Possible values are kDNSServiceFlagsShared or kDNSServiceFlagsUnique (see flag type definitions for details).
interfaceIndex: If non-zero, specifies the interface on which to register the record (the index for a given interface is determined via the if_nametoindex() family of calls.) Passing 0 causes the record to be registered on all interfaces. See ”Constants for specifying an interface index” for more details.
fullname: The full domain name of the resource record.
rrtype: The numerical type of the resource record (e.g. kDNSServiceType_PTR, kDNSServiceType_SRV, etc)
rrclass: The class of the resource record (usually kDNSServiceClass_IN)
data: the raw rdata, as it is to appear in the DNS record.
ttl: The time to live of the resource record, in seconds. Pass 0 to use a default value.

LastError is set. kDNSServiceErr_NoError on success (any subsequent, asynchronous errors are delivered to the event), otherwise returns an error code indicating the error that occurred (the event is never invoked)
You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

120.30.4  **UpdateRecord**(TXTRecord as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Changes the TXT Record.
**Notes:**
data is the TXT Record composed of Pascal Strings.
ttl = time to live.

Returns false on any error and true on success. Please check lasterror property when false is returned.

120.30.5  **Events**

120.30.6  **ServiceRegistration**(flags as Integer, errorcode as Integer)

MBS Network Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Registration was done.
**Notes:** Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
120.31 class DNSServiceResolveMBS

120.31.1 class DNSServiceResolveMBS

MBS Network Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
A class for Apple’s implementation of ZeroConfig named Bonjour.

**Notes:**
This class allows you to lookup names on the local network using Bonjour.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

- kDNSServiceErr_NoError = 0
- kDNSServiceErr_Unknown = -65537 (=& hFFFE FFFF)
- kDNSServiceErr_NoSuchName = -65538
- kDNSServiceErr_NoMemory = -65539
- kDNSServiceErr_BadParam = -65540
- kDNSServiceErr_BadReference = -65541
- kDNSServiceErr_BadState = -65542
- kDNSServiceErr_BadFlags = -65543
- kDNSServiceErr_Unsupported = -65544
- kDNSServiceErr_NotInitialized = -65545
- kDNSServiceErr_AlreadyRegistered = -65547
- kDNSServiceErr_NameConflict = -65548
- kDNSServiceErr_Invalid = -65549
- kDNSServiceErr_Incompatible = -65551 (client library incompatible with daemon)
- kDNSServiceErr_BadInterfaceIndex = -65552

Subclass of the DNSServiceBaseMBS class.

120.31.2 Methods

120.31.3 Resolve(InterfaceIndex as Integer, servicename as string, servicetype as string, domain as string) as boolean

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
Resolves a named instance of a service to its address, port, and (optionally) a text description.

**Notes:**
You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.
If you call this method in response to a browse call, please pass the domain string you got in the Service-Browse event and do not replace it with something else.

For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

**120.31.4 Events**

**120.31.5 ServiceResolve(flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, Fullname as string, Hosttarget as string, Port as Integer, TxtRecord as string)**

**Notes:**

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

For interface indexes, please also check NetworkInterfaceMBS class.
120.32 class NetSNMPMBS

120.32.1 class NetSNMPMBS

Example:

```vbscript
dim s as new NetSNMPMBS
s.Community = "demopublic"
s.IP = "test.net-snmp.org"

dim r as string = s.Query("system.sysUpTime.0")

MsgBox r
```

Notes:
Performs a SNMP GET query.
Using version 1, no authentication and no security options.

120.32.2 Methods

120.32.3 Constructor

120.32.4 Destructor

120.32.5 Query(ObjectID as String) as String

Example:
dim s as new NetSNPMBS

s.Community = "demopublic"
s.IP = "test.net-snmp.org"

dim r as string = s.Query("system.sysUpTime.0")

MsgBox r

Notes:
Please set community and IP properties before.
Lasterror and ErrorMessage properties are set.

120.32.6  QueryMT(ObjectID as String) as String

Example:

dim s as new NetSNPMBS

s.Community = "demopublic"
s.IP = "test.net-snmp.org"

dim r as string = s.Query("system.sysUpTime.0")

MsgBox r

Notes:
Please set community and IP properties before.
Lasterror and ErrorMessage properties are set.

Same as Query, but thread friendly.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.
120.32.7 Properties

120.32.8 Community as String

MBS Network Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The community name to use.  
**Notes:**  
e.g. "public"  
(Read and Write property)

120.32.9 ErrorMessage as String

MBS Network Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The last error message as text.  
**Notes:** (Read and Write property)

120.32.10 IP as String

MBS Network Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The IP and port to connect to.  
**Notes:**  
e.g. "192.168.2.5:1234"  
(Read and Write property)

120.32.11 LastError as Integer

MBS Network Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The last error code.  
**Notes:** (Read and Write property)

120.32.12 MaximumReceiveBufferSize as Integer

MBS Network Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The maximum bytes to allocate for receiving buffer.  
**Notes:**  
By default 100000 bytes.  
(Read and Write property)
120.32. CLASS NETSNMPMBS

120.32.13  Retries as Integer

MBS Network Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** Number of retries.

**Notes:**
Default is -1 to use system default.
(Read and Write property)

120.32.14  TimeOut as Integer

**Notes:**
Default is -1 to use system default.
(Read and Write property)
120.33  **Globals**

120.33.1  **DNSAddressToNameIPv6MBS(HostAddress as string) as string**

MBS Network Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Resolves an IP to it's name.
**Notes:**
Only for IPv6.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.

120.33.2  **DNSAddressToNameMBS(HostAddress as string) as string**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Resolves an IP to it's name.
**Notes:**
Only for IPv4.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.

120.33.3  **DNSNameToAddressIPv6MBS(HostName as string) as string**

MBS Network Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Resolves the IP address for this name.
**Example:**

```c
msgBox dnsnameToAddressIPv6MBS("localhost") + endofLine + dnsnameToAddressMBS("localhost")
```

**Notes:**
Only for IPv6.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.

120.33.4  **DNSNameToAddressMBS(HostName as string) as string**

MBS Network Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Resolves the IP address for this name.
**Example:**

```c
msgBox dnsnameToAddressIPv6MBS("localhost") + endofLine + dnsnameToAddressMBS("localhost")

**Notes:**

Only for IPv4.

Returns "" on any error (like no name known).

Improved in 13.1 plugins to work on all platforms.

This may not work on Windows or Linux with Bonjour host names!

### 120.33.5 OptionReuseAddressMBS(extends s as SocketCore) as Boolean

**Function:** Queries whether to allow reuse of same port.

**Notes:**

Internally this uses SOL_SOCKET/SO_REUSEADDR option.

Raises UnsupportedOperationException in case of failure.

See also:

- 120.33.6 OptionReuseAddressMBS(extends s as SocketCore, assigns value as Boolean)

### 120.33.6 OptionReuseAddressMBS(extends s as SocketCore, assigns value as Boolean)

**Function:** Sets whether to allow reuse of same port.

**Notes:**

Internally this uses SOL_SOCKET/SO_REUSEADDR option.

see also

Raises UnsupportedOperationException in case of failure.

See also:

- 120.33.5 OptionReuseAddressMBS(extends s as SocketCore) as Boolean
120.33.7 OptionReusePortMBS(extends s as SocketCore) as Boolean

**Function:** Query whether reuse of same port and IP is allowed.  
**Notes:**  
Internally this uses SOL_SOCKET/SO_REUSEPORT option.  
On Windows, this is not supported, so this property sets ReuseAddress.  
Raises UnsupportedOperationException in case of failure.  
See also:  
- 120.33.8 OptionReusePortMBS(extends s as SocketCore, assigns value as Boolean)

120.33.8 OptionReusePortMBS(extends s as SocketCore, assigns value as Boolean)

**Function:** Sets whether to allow reuse of same port and IP.  
**Notes:**  
Internally this uses SOL_SOCKET/SO_REUSEPORT option.  
On Windows, this is not supported, so this property sets ReuseAddress.  
Raises UnsupportedOperationException in case of failure.  
See also:  
- 120.33.7 OptionReusePortMBS(extends s as SocketCore) as Boolean

120.33.9 VerifyEmailMBS(email as string, NetworkCheck as boolean) as Integer

**Function:** Checks if an email can be valid.  
**Example:**  
```vbscript  
// should be okay  
dim r1 as Integer = VerifyEmailMBS("testing@monkeybreadsoftware.de", true)  

// should fail  
dim r2 as Integer = VerifyEmailMBS("testing@monkeybreadsoftware.test", true)  
```

**Notes:**  
If NetworkCheck is true, the DNS server is queries for whether an email service is available (MX Record).  
Else we only do a syntax check.
Result is zero for success or one of this error codes:

1. Invalid character in local part of email address.
2. Missing dot in local part of email address.
3. Invalid character in local part of email address.
4. Unescaped special character in local part of email address.
5. No local part in email address.
6. Dot found before @ character.
7. No domain in email address.
8. Domain starting with dot.
9. Domain is not allowed to have two dots.
10. Invalid character in domain of email address.
11. Special character in domain of email address.
12. No dot in domain in email address.
13. Domain longer than allowed in email address.
14. DNS failed to find mail server for the domain in email address. (Windows)
15. DNS failed to find mail server for the domain in email address. (Mac/Linux)
16. DNS did not find a mail server for the domain in email address.
17. DNS failed to find mail server for the domain in email address.
18. DNS server answers try again too often.

IDN support is not included. You may need to preprocess email if you need that.

If you have a DNS server, which will redirect all mistyped domain names to a search website, this won’t really work well and detect too many valid domain names.

120.33.10 ClearOptionsMBS(extends s as SocketCore)

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears all options.

**Notes:**

Works only on BSD Sockets and if the socket handle value is valid. Raises UnsupportedOperationException in case of failure.
120.33.11 OptionKeepAliveMBS(extends s as SocketCore) as Integer

Function: Gets the keep alive.
Notes:
Works only on BSD Sockets and if the socket handle value is valid.
Returns -1 on any error.

Enables the periodic transmission of messages on a connected socket. Should the connected party fail to respond to these messages, the connection is considered broken and processes using the socket are notified via a SIGPIPE signal when attempting to send data.
See also:
- 120.33.12 OptionKeepAliveMBS(extends s as SocketCore, assigns value as Integer)

120.33.12 OptionKeepAliveMBS(extends s as SocketCore, assigns value as Integer)

Function: Sets the keep alive.
Notes:
Works only on BSD Sockets and if the socket handle value is valid.

Enables the periodic transmission of messages on a connected socket. Should the connected party fail to respond to these messages, the connection is considered broken and processes using the socket are notified via a SIGPIPE signal when attempting to send data.
See also:
- 120.33.11 OptionKeepAliveMBS(extends s as SocketCore) as Integer

120.33.13 OptionMaximumSegmentSizeMBS(extends s as SocketCore) as Integer

Function: Queries the maximum segment size.
Example:

```plaintext
dim s as new TCPSocket

s.Port = 0
s.listen

MsgBox str(s.OptionMaximumSegmentSizeMBS)
```
Notes:
Only for TCP sockets.
Raises UnsupportedOperationException in case of failure.
See also:

- 120.33.14 OptionMaximumSegmentSizeMBS(extends s as SocketCore, assigns value as Integer) 17007

120.33.14 OptionMaximumSegmentSizeMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adjusts the maximum segment size. **Notes:** Raises UnsupportedOperationException in case of failure.
See also:

- 120.33.13 OptionMaximumSegmentSizeMBS(extends s as SocketCore) as Integer 17006

120.33.15 OptionMutliCastTTLMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the multicast time to live value. **Notes:** Works only on BSD Sockets and if the socket handle value is valid. Raises UnsupportedOperationException in case of failure.
See also:

- 120.33.16 OptionMutliCastTTLMBS(extends s as SocketCore, assigns value as Integer) 17007

120.33.16 OptionMutliCastTTLMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the multicast time to live value. **Example:**

```plaintext
dim t as new UDPSocket
// create a socket
t.Port=80
t.Connect
```
// wait a second to connect
cp./AppEvents 1000

// shows handle
MsgBox str(t.Handle)

// shows current value
MsgBox str(t.OptionMultiCastTTLMBS)
t.OptionMultiCastTTLMBS=10

// shows new value
MsgBox str(t.OptionMultiCastTTLMBS)

Notes:
Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:
- 120.33.15 OptionMultiCastTTLMBS(extends s as SocketCore) as Integer

120.33.17 OptionReceiveBufferSizeMBS(extends s as SocketCore) as Integer

Function: Queries the receiving buffer size.
Notes:
The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Raises UnsupportedOperationException in case of failure.
See also:
- 120.33.18 OptionReceiveBufferSizeMBS(extends s as SocketCore, assigns value as Integer)

120.33.18 OptionReceiveBufferSizeMBS(extends s as SocketCore, assigns value as Integer)

Function: Adjusts the receiving buffer size.
Notes:
The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
120.33. **GLOBALS**

Raises UnsupportedOperationException in case of failure.

See also:

- 120.33.17 OptionReceiveBufferSizeMBS(extends s as SocketCore) as Integer

---

120.33.19  **OptionSendBufferSizeMBS(extends s as SocketCore) as Integer**

**Function:** Queries the sending buffer size.

**Example:**

```dim s as new UDPSocket
s.Port = 0
s.Connect
MsgBox str(s.OptionSendBufferSizeMBS)
```

**Notes:**

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.

Raises UnsupportedOperationException in case of failure.

See also:

- 120.33.20 OptionSendBufferSizeMBS(extends s as SocketCore, assigns value as Integer)

---

120.33.20  **OptionSendBufferSizeMBS(extends s as SocketCore, assigns value as Integer)**

**Function:** Adjusts the sending buffer size.

**Notes:**

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.

Raises UnsupportedOperationException in case of failure.

See also:

- 120.33.19 OptionSendBufferSizeMBS(extends s as SocketCore) as Integer
120.33.21 OptionTOSMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the type of service value.

**Notes:**
Works only on BSD Sockets and if the socket handle value is valid.
 Raises UnsupportedOperationException in case of failure.
See also:

- 120.33.22 OptionTOSMBS(extends s as SocketCore, assigns value as Integer)

120.33.22 OptionTOSMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the type of service value.

**Notes:**
Works only on BSD Sockets and if the socket handle value is valid.
Possible values:
- IPTOS_MINCOST = 2
- IPTOS_RELIABILITY = 4
- IPTOS_THROUGHPUT = 8
- IPTOS_LOWDELAY = 16

You may want to set it after connecting.
 Raises UnsupportedOperationException in case of failure.
See also:

- 120.33.21 OptionTOSMBS(extends s as SocketCore) as Integer

120.33.23 OptionTTLMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the time to live value.

**Notes:**
Works only on BSD Sockets and if the socket handle value is valid.
 Raises UnsupportedOperationException in case of failure.
See also:

- 120.33.24 OptionTTLMBS(extends s as SocketCore, assigns value as Integer)
120.33.24 **OptionTTLMBSExtends** s as SocketCore, assigns value as Integer

MBS Network Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the time to live value.

**Example:**

```vba
dim t as new TCPSocket

// create a socket
t.Port = 80
t.Address = "www.apple.com"
t.Connect

// wait a second to connect
app.DoEvents 1000

// shows handle
MsgBox str(t.Handle)

// shows current value
MsgBox str(t.OptionTTLMBSExtends) t.OptionTTLMBSExtends = 10

// shows new value
MsgBox str(t.OptionTTLMBSExtends)
```

**Notes:**
Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 120.33.23 **OptionTTLMBSExtends** s as SocketCore as Integer

120.33.25 **OptionTypeMBS** extends s as SocketCore as Integer

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries the type of socket.

**Example:**

```vba
dim u as new UDPSocket

u.Port = 9000
t.Connect

// shows 2 for UDP
```
CHAPTER 120. NETWORK

MsgBox str(u.OptionTypeMBS)

Notes:
Type is 1 for stream socket, 2 for datagram socket, 3 for raw socket, 4 for reliably-delivered message socket and 5 for a sequenced packet stream.
Raises UnsupportedOperationException in case of failure.

120.34 class NetworkInterfaceMBS

120.34.1 class NetworkInterfaceMBS

Function: The class for unix network interfaces.
Example:
// show IPv4 addresses
dim interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces

for each n as NetworkInterfaceMBS in interfaces
MsgBox n.name + ": " + n.IPv4
next

Notes:
For Windows, please use WindowsEthernetMBS class.
The values are not updated for this class. Just when you create the interface objects, you get a snapshot of the current state.

120.34.2 Methods

120.34.3 AllInterfaces(Merge as boolean = true) as NetworkInterfaceMBS()

Function: Returns array with all interfaces.
Example:
// show IPv4 addresses
dim interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces

for each n as NetworkInterfaceMBS in interfaces
MsgBox n.name+" : "+n.IPv4
next

Notes:
By default we merge several records for the same interface.
You may see one record for each protocol (IPv4, IPv6, LINK layer).

120.34.4 IndexMap as Dictionary

Function: Builds a dictionary to map indexes to names.
Example:
	 dim d as Dictionary = NetworkInterfaceMBS.IndexMap
dim lines() as string
for each key as Variant in d.keys
  lines.Append key+" : "+d.Value(key)
next
MsgBox Join(lines,EndOfLine)

Notes:
This is convenient method for the case you need to show list to user.
On Windows requires Windows Vista or newer.

120.34.5 IndexToName(Index as Integer) as string

Function: Queries name for network interface with index.
Example:
	dim Name as string
Name = NetworkInterfaceMBS.IndexToName(1)
msgBox Name

Notes: On Windows requires Windows Vista or newer.
120.34.6 IPv4s as string()

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** All IPv4 addresses for this interface.

120.34.7 IPv6s as string()

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** All IPv6 addresses for this interface.

120.34.8 NameToIndex(Name as String) as Integer

**Example:**

```vbs
dim index as Integer
index = NetworkInterfaceMBS.NameToIndex("en0")
```

**Notes:** On Windows requires Windows Vista or newer.

120.34.9 Properties

120.34.10 Broadcast as Boolean

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** Whether a broadcast address exists for this interface.

**Notes:** (Read and Write property)

120.34.11 BroadcastAddress as String

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The broadcast address.

**Notes:** (Read and Write property)
120.34. CLASS NETWORKINTERFACEMBS

120.34.12 Flags as Integer

MBS Network Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The interface flags.
**Notes:**
See if.h file in C system headers.
(Read and Write property)

120.34.13 Index as Integer

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The index of this interface.
**Notes:** (Read and Write property)

120.34.14 InterfaceIndex as Integer

MBS Network Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The index of this interface.
**Notes:**
Index counts by plugin from 0 on the interfaces.
But this is real index from operation system.
On Windows requires Windows Vista or newer.
(Read and Write property)

120.34.15 IPv4 as String

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The IPv4 address for this interface.
**Example:**
```javascript
// show IPv4 addresses
dim interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces
for each n as NetworkInterfaceMBS in interfaces
MsgBox n.name+"": "+n.IPv4
next
```
**Notes:** (Read and Write property)
120.34.16  IPv4count as Integer

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of IPv4 addresses for this interface. **Notes:** (Read and Write property)

120.34.17  IPv6 as String

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The IPv6 address for this interface. **Notes:** (Read and Write property)

120.34.18  IPv6count as Integer

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of IPv6 addresses for this interface. **Notes:** (Read and Write property)

120.34.19  Loopback as Boolean

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** Whether this interface is the loopback interface. **Notes:** (Read and Write property)

120.34.20  MAC as String

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The ethernet hardware address (MAC). **Notes:** (Read and Write property)

120.34.21  Multicast as Boolean

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** Whether this interface supports multicast. **Notes:** (Read and Write property)
120.34. **CLASS NETWORKINTERFACE**

### Name as String

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The name of the network interface. **Notes:** (Read and Write property)

### Netmask as String

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** The network mask. **Notes:**
- Returns the IPv4 netmask.
- If that one is undefined, returns the IPv6 netmask.
- This property is just kept for compatibility. (Read only property)

### NetmaskIPv4 as String

MBS Network Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The network mask for IPv4. **Notes:** (Read and Write property)

### NetmaskIPv6 as String

MBS Network Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The network mask for IPv6. **Notes:** (Read and Write property)

### Running as Boolean

MBS Network Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** Whether the interface is running (resources allocated). **Notes:** (Read and Write property)
120.34.27  Up as Boolean

MBS Network Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** Whether the interface is up. **Notes:** (Read and Write property)
120.35. **CLASS PACKETSOCKETMBS**

120.35  **class PacketSocketMBS**

120.35.1  **class PacketSocketMBS**

MBS Network Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
An extension to the socket class for easy sending packets through the net.
**Notes:**
A packet is made like this:
+0: Size of data block
+4: 4 byte code string
+8: 4 byte for ID
+12: variable data.

The numbers are send in low endian format so this is crossplatform.

This socket subclass can be easily made in Realbasic code itself. I did it for several of my applications, so if you like it decide between making it yourself or using this one which may even be faster, because it is written in C?

This class is only available in RB 4.0 or newer, because it crashes on RB 3.5.

As the strings are transferred as binary data you need to take care that you send text e.g. as UTF8 and restore this encoding setting on receiving.
Subclass of the TCPSocket class.

120.35.2  **Methods**

120.35.3  **SendPacket(data as string)**

MBS Network Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sends a packet.
**Notes:** Uses ID=0 and code="" as a shortcut for the long SendPacket call.
See also:

- 120.35.4 SendPacket(data as string,code as string) 17020

- 120.35.5 SendPacket(data as string,code as string,ID as Integer) 17020
**SendPacket(data as string, code as string)**

MBS Network Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sends a packet.
**Notes:** Uses ID=0 as a shortcut for the long SendPacket call.
See also:
- 120.35.3 SendPacket(data as string) 17019
- 120.35.5 SendPacket(data as string, code as string, ID as Integer) 17020

**SendPacket(data as string, code as string, ID as Integer)**

MBS Network Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sends a packet.
**Notes:**
- code and ID are optional.
- Code is a 4 byte string to identify the content.
  (e.g. "mess" for a message or "link" for a link.)
See also:
- 120.35.3 SendPacket(data as string) 17019
- 120.35.4 SendPacket(data as string, code as string) 17020

**Events**

**ReceivedPacket(data as string, code as string, ID as Integer)**

MBS Network Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A packet was received.
120.36  class RAWSocketMBS

**120.36.1  class RAWSocketMBS**

**Function:** A class for low level and raw sockets.  
**Example:**

```vba
dim sock as RAWSocketMBS

// create UDP socket
sock = new RAWSocketMBS(RAWSocketMBS.AddressFamilyINet, RAWSocketMBS.SocketTypeDatagram, RAWSocketMBS.ProtocolUDP)
```

**Notes:**

Similar to Xojo’s built in Socket class, but more low level and with more options.  
Raw sockets for things like PING may need root permissions.

**120.36.2  Methods**

**120.36.3  AddressFamilyINet6 as Integer**

**Function:** One of the address family constants.  
**Notes:**

IPv6  
This is a method as value is different.  
Mac 30, Windows 23 and Linux 10.

**120.36.4  Bind(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean**

**Function:** Binds the socket to the given destination address.  
**Notes:**

Set ReuseAddress to bind to an address which already a socket is bound to.  
LastError is set.  
Returns true on success and false on failure.  
Please specify with port and IP in destAddress where to bind against.  
Structure of DestAddress is OS and address family dependent.  
See also:
• 120.36.5 Bind(Port as Integer, IP as string = "")

120.36.5 Bind(Port as Integer, IP as string = "")

**Function:** Binds the socket to the given port.

**Notes:**

If IP is not empty, you can bind the socket to only the given network interface with that IPv4.

Set ReuseAddress to bind to an address which already a socket is bound to.

LastError is set.

See also:

• 120.36.4 Bind(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean

120.36.6 CalcChecksum(data as ptr, ByteCount as Integer) as UInt16

**Function:** Calculates checksum for IP header.

120.36.7 Connect(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean

**Function:** Connects to destination address.

**Notes:**

LastError is set.

Returns true on success and false on failure.

Please specify with port and IP in destAddress where package is sent to.

Structure of DestAddress is OS and address family dependent.

120.36.8 Constructor(AddressFamily as Integer, SocketType as Integer, Protocol as Integer)

**Function:** The constructor.

**Example:**

```vba
dim sock as RAWSocketMBS

// create UDP socket
sock = new RAWSocketMBS(RAWSocketMBS.AddressFamilyINet, RAWSocketMBS.SocketTypeDatagram, RAWSocketMBS.ProtocolUDP)
```
Notes:
Please pass valid combination of OS supported sockets.
Raises exception if creation is not possible.
Raw socket requires root access.

120.36.9 Destructor

MBS Network Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor. **Notes:** Closes the socket.

120.36.10 htonl(value as UInt32) as UInt32

MBS Network Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert 32bit Integer from network to host byte order.

120.36.11 htons(value as UInt16) as UInt16

MBS Network Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert 16bit Integer from network to host byte order.

120.36.12 inet_addr(IPv4 as String) as UInt32

MBS Network Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Converts IPv4 to numerical representation.

120.36.13 inet_pton(IPv4 as UInt32) as String

MBS Network Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Converts IPv4 to string representation.
120.36.14 **ntohl(value as UInt32) as UInt32**

MBS Network Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert 32bit Integer from host to network byte order.

120.36.15 **ntohs(value as UInt16) as UInt16**

MBS Network Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert 16bit Integer from host to network byte order.

120.36.16 **Poll**

MBS Network Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Polls for activity. **Notes:**

Calls events if needed.
This is called automatically via timer by the plugin.

120.36.17 **Read(ByteSize as Integer, peek as boolean = false) as MemoryBlock**

MBS Network Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Read at maximum the given number of bytes in buffer. **Notes:**

Pass true for peek if data should not be removed from receiving buffer.
Lasterror is set.

Be aware that you may not get whole packages here, so data may come in several chunks.
For that, please collect the data and look for whether your package is complete or a required end mark arrived.

120.36.18 **ReadAll(peek as boolean = false) as MemoryBlock**

MBS Network Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Read all bytes in buffer. **Example:**

dim sock as RAWSocketMBS
dim data as MemoryBlock = sock.ReadAll
if data = nil then
// nothing read
else

end if

Notes:
Pass true for peek if data should not be removed from receiving buffer. Lasterror is set.

Be aware that you may not get whole packages here, so data may come in several chunks. For that, please collect the data and look for whether your package is complete or a required end mark arrived.

120.36.19 ReadDatagram(peek as boolean = false) as DatagramMBS

Function: Reads a datagram.
Notes:
If peek is true, the data is not removed from read buffer. On error returns nil.

120.36.20 Send(Data as Ptr, DataByteSize as Integer, Flags as Integer = 0) as Integer

Function: Sends data.
Notes:
Data is sent to address passed with Connect method. Returns number of bytes sent. Lasterror is set.

120.36.21 SendMessage(Data as DatagramMBS) as Integer

Function: Sends a datagram.
Notes:
Please specify with port and address of datagram where package is sent to. Returns number of bytes sent.
Lasterror is set.
See also:

- 120.36.22 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer
- 120.36.23 SendMessage(Data as string, IP as String, Port as Integer) as Integer

**120.36.22  SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer**

**Function:** Sends a datagram.
**Notes:**
Please specify with port and IP where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 120.36.21 SendMessage(Data as DatagramMBS) as Integer
- 120.36.23 SendMessage(Data as string, IP as String, Port as Integer) as Integer

**120.36.23  SendMessage(Data as string, IP as String, Port as Integer) as Integer**

**Function:** Sends data to target.
**Notes:**
Please specify with port and IP where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 120.36.21 SendMessage(Data as DatagramMBS) as Integer
- 120.36.22 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer

**120.36.24  SendTo(Data as Ptr, DataByteSize as Integer, Flags as Integer, DestAddr as Ptr, DestAddrByteSize as Integer) as Integer**

**Function:** Sends data to dest address.
**Example:**
```dim sock as RawSocketMBS
dim Flags as integer```
dim r as Integer

    // port
    dim port as integer = val(iPort.Text)
    if port <= 0 or port >= 65535 then
        break
        MsgBox "Wrong port: " +iPort.Text
        Return
    end if

    // dest address

    ' */
    ' * Socket address, internet style. C declaration for Mac
    ' */
    'struct sockaddr
    '    _uint8_t sin_len; // 1 byte, Mac only
    '    _sa_family_t sin_family; // 1 byte
    '    in_port_t sin_port; // 2 byte in Network byte order
    '    struct in_addr sin_addr; // 4 byte
    '    char sin_zero [ 8 ]; // 8 bytes filler
    ' }

    // convert IPv4 from text to numeric value
    dim IP as Uint32 = RAWSocketMBS.inet_addr(iIP.Text)

    // create destination address. This is for Mac! Windows and Linux have different structures
    dim dest as new MemoryBlock(16)
    dest.UInt8Value(0) = dest.size
    dest.UInt8Value(1) = RAWSocketMBS.AddressFamilyINet
    dest.UInt16Value(2) = RAWSocketMBS.htons(port)
    dest.UInt32Value(4) = IP

    // message
    dim m as string = ConvertEncoding(iMessage.Text, encodings.UTF8)
    dim data as MemoryBlock = m

    // send
    r = sock.SendTo(data, data.size, Flags, dest, dest.size)

Notes:

Please specify with port and IP in destAddress where package is sent to.
Returns number of bytes sent. Structure of DestAddress is OS and address family dependent.
LastError is set.
120.36.25 Properties

120.36.26 AvailableBytes as Integer

Function: Returns number of bytes available for reading.

Notes:
Lasterror is set.
(Read only property)

120.36.27 Broadcast as Boolean

Function: Whether broadcasts are allowed.

Notes:
Set to true before sending a broadcast message.
Internally this uses SOL_SOCKET/SO_BROADCAST option.
Lasterror is set.
(Read and Write property)

120.36.28 Handle as Integer

Function: The internal socket handle.

Notes: (Read and Write property)

120.36.29 IPHeaderIncluded as Boolean

Function: Whether the OS provides IP header or you.

Notes:
Default is false.
Set to true when you include IP header in data.
(Read and Write property)
120.36. CLASS RAWSOCKETMBS

120.36.30  Lasterror as Integer

**Function:** The last error code.
**Notes:**
Platform dependent.
(Read and Write property)

120.36.31  LocalIP as String

**Function:** Queries local IP.
**Notes:**
Can be 0.0.0.0 if unknown.
May only be set if connected or binded.
Lasterror is set.
(Read only property)

120.36.32  LocalPort as Integer

**Function:** Queries local port.
**Notes:**
Lasterror is set.
Can be -1 if unknown.
(Read only property)

120.36.33  ReceiveBufferSize as Integer

**Function:** Queries the receiving buffer size.
**Notes:**
The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_RCVBUF option.
Lasterror is set.
(Read and Write property)
120.36.34 ReuseAddress as Boolean

Function: Allows reuse of same port.
Notes: Internally this uses SOL_SOCKET/SO_REUSEADDR option.

see also http://stackoverflow.com/questions/14388706/socket-options-so-reuseaddr-and-so-reuseport-how-do-they-differ-do-they-mean-t

Lasterror is set.
(Read and Write property)

120.36.35 ReusePort as Boolean

Function: Allow reuse of same port and IP.
Notes: Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Lasterror is set.
(Read and Write property)

120.36.36 SendBufferSize as Integer

Function: The sending buffer size.
Notes: The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_SNDBUF option.
Lasterror is set.
(Read and Write property)

120.36.37 SocketError as Integer

Function: The native socket error.
Notes:
Internally this uses SOL_SOCKET/SO_ERROR option.
Lasterror is set.
(Read only property)

120.36.38  Events

120.36.39  DataAvailable

MBS Network Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called when new data is available.
**Notes:** Requires the socket to be bound.

120.36.40  Error

MBS Network Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called if socket is in error state.

120.36.41  SendComplete

MBS Network Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last write operation is done.

120.36.42  Constants

120.36.43  AddressFamilyINet = 2

MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the address family constants.
**Notes:** IPv4

120.36.44  ProtocolICMP = 1

MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the protocol constants.
**Notes:** ICMP
CHAPTER 120. NETWORK

120.36.45  **ProtocolIP = 0**

MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the protocol constants.  
**Notes:** IPv4

120.36.46  **ProtocolIPv6 = 41**

MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the protocol constants.  
**Notes:** IPv6

120.36.47  **ProtocolRaw = 255**

MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the protocol constants.  
**Notes:** Raw protocol

120.36.48  **ProtocolTCP = 6**

MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the protocol constants.  
**Notes:** TCP

120.36.49  **ProtocolUDP = 17**

MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the protocol constants.  
**Notes:** UDP

120.36.50  **SocketTypeDatagram = 2**

MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the socket types.  
**Notes:** Datagram, e.g. UDP.

120.36.51  **SocketTypeRaw = 3**

MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the socket types.  
**Notes:** Raw socket, requires root permissions.
MBS Network Plugin, Plugin Version: 17.4. **Function:** One of the socket types. **Notes:** Stream socket, e.g. TCP/IP.
120.37 class SSH2ChannelMBS

120.37.1 class SSH2ChannelMBS

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a SSH2 channel. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.37.2 Methods

120.37.3 Close(Wait as Boolean = true)

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Close a channel. **Notes:**

Lasterror is set. Close an active data channel. In practice this means sending an SSH_MSG_CLOSE packet to the remote host which serves as instruction that no further data will be sent to it. The remote host may still send data back until it sends its own close message in response. To wait for the remote end to close its connection as well, follow this command with WaitClosed. Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn’t really a failure per se.

If wait parameter is true, the plugin does a loop to try close until it receives an okay (and not EAGAIN).

120.37.4 Constructor

120.37.5 Destructor

**Function:** Check a channel’s EOF status.

**Example:**

```vba
dim s as string
dim channel as SSH2ChannelMBS // your channel

// read all till end of channel
s = ""
do
app.YieldToNextThread
dim r as string = channel.Read(50000)
s = s + r
if channel.LastError = SSH2SessionMBS.kErrorEagain then
    // no answer yet
    Continue
elseif channel.LastError = SSH2SessionMBS.kErrorNone then
    // we got something
    if channel.EOF then
        // done?
        MsgBox "Result: " + s
        exit
    end if
else
    exit
end if
loop
```

**Notes:**

Check if the remote host has sent an EOF status for the selected stream.
Returns true if the remote host has sent EOF, otherwise false.
LastError is set. On error, this function returns true.

**120.37.7 Execute(command as string)**

**Function:** Executes something on the server.

**Notes:**

LastError is set.
LastError is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn’t
really a failure per se.

120.37.8 Flush

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Flush stream for this channel.  
**Notes:** Lasterror is set.

120.37.9 FlushAll

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Flush all streams for this channel.  
**Notes:** Lasterror is set.

120.37.10 FlushExtendedData

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Flush extended data stream for this channel.  
**Notes:** Lasterror is set.

120.37.11 FlushStdErr

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Flush stderr stream for this channel.  
**Notes:** Lasterror is set.

120.37.12 Read(length as Integer = 65536) as string

**Example:**

```
dim s as string
dim channel as SSH2ChannelMBS // your channel

// read all till end of channel
s = ""
do
```
app.YieldToNextThread

dim r as string = channel.Read(50000)
s = s + r

if channel.LastError = SSH2SessionMBS.kErrorEagain then
    // no answer yet
    Continue
elseif channel.LastError = SSH2SessionMBS.kErrorNone then
    // we got something
    if channel.EOF then
        // done?
        MsgBox "Result: " + s
        exit
    end if
else
    exit
end if

loop

Notes:

LastError is set.
Attempt to read data from a stdout channel stream.
Returns data read.
LastError is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn’t really a failure per se.

120.37.13 ReadStdErr(length as Integer = 65536) as string

Function: Read data from a channel stream.
Notes:

LastError is set.
Attempt to read data from a stderr channel stream.
Returns data read.
LastError is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn’t really a failure per se.

120.37.14 RequestPTY(term as string)

Function: Request a PTY on an established channel.
Notes:

Lasterror is set.
Note that this does not make sense for all channel types and may be ignored by the server despite returning success.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn’t really a failure per se.

120.37.15 SendEOF

Notes:

Lasterror is set.
Tell the remote host that no further data will be sent on the specified channel. Processes typically interpret this as a closed stdin descriptor.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn’t really a failure per se.

120.37.16 SetBlocking(blocking as boolean)

120.37.17 SetEnv(name as string, value as string)

Notes:

Lasterror is set.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn’t really a failure per se.

120.37.18 Shell

Notes:
120.37. CLASS SSH2CHANNELMBS

Let error is set.
Let error is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn’t really a failure per se.

120.37.19  WaitClosed

Function: Wait for the remote to close the channel.
Notes:
Let error is set.

Enter a temporary blocking state until the remote host closes the named channel. Typically sent after Close in order to examine the exit status.
Let error is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn’t really a failure per se.

120.37.20  WaitEOF

Function: Wait for the remote end to acknowledge an EOF request.
Notes:
Let error is set.
May give kErrorEAgain error which means you should try again later.

120.37.21  Write(data as MemoryBlock) as Integer

Function: Write data to a channel stdout stream.
Notes:
Let error is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Let error being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn’t really a failure per se.
See also:
120.37.22  Write(text as string) as Integer

Function: Write data to a channel stdout stream.
Notes:
Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn’t really a failure per se.
See also:

• 120.37.21 Write(data as MemoryBlock) as Integer

120.37.23  WriteStdErr(data as MemoryBlock) as Integer

Function: Write data to a channel stderr stream.
Notes:
Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn’t really a failure per se.
See also:

• 120.37.24 WriteStdErr(text as string) as Integer

120.37.24  WriteStdErr(text as string) as Integer

Function: Write data to a channel stderr stream.
Notes:
Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn’t really a failure per se.

See also:

- 120.37.23 WriteStdErr(data as MemoryBlock) as Integer

120.37.25 Properties

120.37.26 ExitStatus as Integer

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Get the remote exit code. Notes: Returns the exit code raised by the process running on the remote host at the other end of the named channel. Note that the exit status may not be available if the remote end has not yet set its status to closed. Returns 0 on failure, otherwise the Exit Status reported by remote host. (Read only property)

120.37.27 Handle as Integer

120.37.28 LastError as Integer

120.37.29  Session as SSH2SessionMBS

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The session this channel belongs to.  
**Notes:** (Read and Write property)

120.37.30  Tag as Variant

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.  
**Notes:**

A property where you can store any value you like.  
(Read and Write property)
120.38 class SSH2ConnectFailedExceptionMBS

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The exception for an error in the SSH2SessionMBS.Constructor. **Notes:** Subclass of the RuntimeException class.
120.39 class SSH2SessionMBS

120.39.1 class SSH2SessionMBS

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a SSH2 session.

120.39.2 Methods

120.39.3 Banner as string

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the remote banner. **Notes:** Once the session has been setup and Handshake has completed successfully, this function can be used to get the server id from the banner each server presents.

120.39.4 Constructor(IP as string, Port as Integer = 22, TimeOut as Integer = 30)

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor for using a new socket. **Notes:**

The plugin creates a new socket, connects to the given IP& Port and than creates a new session for it. Lasterror is set.
Please check if Handle property is non zero after constructor finishes.

Timeout defines timeout for connection in seconds. While waiting, the plugin yields time to other threads. If timeout is zero, the connection will not yield and take up to the default TCP/IP timeout.

See also:

- 120.39.5 Constructor(socket as TCPSocket)
- 120.39.6 Constructor(socketHandle as Integer, CloseSocketLater as boolean = false)

120.39.5 Constructor(socket as TCPSocket)

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor for using an existing socket. **Notes:**
120.39. CLASS SSH2SESSIONMBS

Initializes a new session.

socket: The socket to use. The plugin keeps reference to this socket in socket property.

You can use a Xojo socket and connect it. Once connected, pass it here, so the session can use this socket for communication.

If you connect the xojo socket in a loop on a thread, be sure to call poll method of socket, so it processes events like connecting. In main thread with timer, you would get this automatically.

See also:

- 120.39.4 Constructor(IP as string, Port as Integer = 22, TimeOut as Integer = 30) 17044
- 120.39.6 Constructor(socketHandle as Integer, CloseSocketLater as boolean = false) 17045

120.39.6 Constructor(socketHandle as Integer, CloseSocketLater as boolean = false)

Function: The constructor for using an existing socket.

Notes:

Initializes a new session.

socketHandle: The socket to use. Can be TCPSocket’s handle property for a Xojo socket. Or a socket connected via declares.

You can put the socket in the socket property to keep it alive as long as session is in memory.

Set CloseSocketLater = true if you pass a socket which can be closed in destructor. For Xojo socket, pass false as Xojo closes socket later.

You can use a Xojo socket and connect it. Once connected, pass it here, so the session can use this socket for communication.

See also:

- 120.39.4 Constructor(IP as string, Port as Integer = 22, TimeOut as Integer = 30) 17044
- 120.39.5 Constructor(socket as TCPSocket) 17044

120.39.7 Destructor

Function: The destructor.

120.39.8 Disconnect(description as string)

Function: Terminate transport layer.
Notes:
Lasterror is set.
description: Human readable reason for disconnection.
See also:

- 120.39.9 Disconnect(reason as Integer, description as string, lang as string = "")

120.39.9 Disconnect(reason as Integer, description as string, lang as string = "")

Function: Terminate transport layer.
Notes:
Lasterror is set.

reason: One of the Disconnect Reason constants.
description: Human readable reason for disconnection.
lang: Localization string describing the language/encoding of the description provided.
See also:

- 120.39.8 Disconnect(description as string)

120.39.10 HostKey(byref Type as Integer) as string

120.39.11 HostKeyHash(HashType as Integer) as string

Notes:
HashType: kHostKeyHashSHA1 or kHostKeyHashMD5.
Returns the computed digest of the remote system’s hostkey. The length of the returned string is hash_type specific (e.g. 16 bytes for MD5, 20 bytes for SHA1).
Computed hostkey hash value, or empty string if the information is not available (either the session has not yet been started up, or the requested hash algorithm was not available). The hash consists of raw binary bytes, not hex digits, so it is not directly printable.
120.39.12 **OpenSession** as **SSH2ChannelMBS**

**Function:** Establish a generic session channel.

**Notes:**
- Lasterror is set.
- Returns nil if the session start fails.

120.39.13 **SessionFlag(Flag as Integer, Value as boolean)**

**Function:** Get/Set a session flag.

**Notes:**
- See kFlag* constants.
- Lasterror is set.

120.39.14 **SessionHandshake**

**Function:** Perform the SSH handshake.

**Notes:**
- Lasterror is set.

120.39.15 **SetBanner(Banner as string)**

**Function:** Set the SSH protocol banner for the local client.

**Notes:**
- Set the banner that will be sent to the remote host when the SSH session is started with Handshake. This is optional; a banner corresponding to the protocol and libssh2 version will be sent by default.
- Lasterror is set.

120.39.16 **UserAuthKeyboardInteractive(UserName as string)**

**Function:** Authenticate a session using keyboard-interactive authentication.

**Notes:**
- username: Name of user to attempt keyboard-interactive authentication for.
Lasterror is set.
Calls KeyboardCallback callback to query input from user.

120.39.17 UserAuthList(username as string) as string

Function: List supported authentication methods.
Notes: username: Username which will be used while authenticating. Note that most server implementations do not permit attempting authentication with different usernames between requests. Therefore this must be the same username you will use on later userauth calls.

Send a SSH_USERAUTHNONE request to the remote host. Unless the remote host is configured to accept none as a viable authentication scheme (unlikely), it will return SSH_USERAUTH_FAILURE along with a listing of what authentication schemes it does support. In the unlikely event that none authentication succeeds, this method with return NULL. This case may be distinguished from a failing case by examining Authenticated.

120.39.18 UserAuthPassword(UserName as string, Password as string)

Function: Authenticate a session with username and password.
Notes: username: Name of user to attempt plain password authentication for.
password: Password to use for authenticating username.

Attempt basic password authentication. Note that many SSH servers which appear to support ordinary password authentication actually have it disabled and use Keyboard Interactive authentication (routed via PAM or another authentication backed) instead.
Lasterror is set.

120.39.19 UserAuthPublicKeyFromFile(UserName as string, publickey as folderitem, privatekey as folderitem, Passphrase as string)

Function: Authenticate a session with a public key, read from a file.
Notes: Lasterror is set.
username: user name to authenticate as.
publickey: Path of the public key file. (e.g. /etc/ssh/hostkey.pub). If libssh2 is built against OpenSSL, this option can be set to ""/nil.

privatekey: Path of the private key file. (e.g. /etc/ssh/hostkey)

passphrase: Passphrase to use when decoding privatekey.

Attempt public key authentication using a PEM encoded private key file stored on disk
See also:

- 120.39.20 UserAuthPublicKeyFromFile(UserName as string, publickey as string, privatekey as string, Passphrase as string)

120.39.20 UserAuthPublicKeyFromFile(UserName as string, publickey as string, privatekey as string, Passphrase as string)

Function: Authenticate a session with a public key, read from a file.
Notes:

Lasterror is set.
username: user name to authenticate as.
publickey: Path of the public key file. (e.g. /etc/ssh/hostkey.pub). If libssh2 is built against OpenSSL, this option can be set to ""/nil.
privatekey: Path of the private key file. (e.g. /etc/ssh/hostkey)
passphrase: Passphrase to use when decoding privatekey.

Attempt public key authentication using a PEM encoded private key file stored on disk
See also:

- 120.39.19 UserAuthPublicKeyFromFile(UserName as string, publickey as folderitem, privatekey as folderitem, Passphrase as string)

120.39.21 UserAuthPublicKeyFromMemory(UserName as string, publickey as string, privatekey as string, Passphrase as string)

Function: Authenticate a session with a public key, read from memory
Notes:

This function allows to authenticate a session with a public key read from memory.
Lasterror is set.

username - Remote user name to authenticate as.
publickeydata - Buffer containing the contents of a public key file. Optional.
privatekeydata - Buffer containing the contents of a private key file.
passphrase - Passphrase to use when decoding private key file.

Keys must have LF as line ending, not CR.

Attempt public key authentication using a PEM encoded private key file stored in memory.

120.39.22 Version as string

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Queries the version for the SSH library. Example:

MsgBox SSH2SessionMBS.Version

120.39.23 WaitSocket

120.39.24 Properties

120.39.25 Authenticated as Boolean

Indicates whether or not the named session has been successfully authenticated. Returns true if authenticated and false if not. (Read only property)

120.39.26 Blocking as Boolean

blocking: Set to a non-zero value to make the channel block, or zero to make it non-blocking.
Set or clear blocking mode on the selected on the session. This will instantly affect any channels associated
with this session. If a read is performed on a session with no data currently available, a blocking session will
wait for data to arrive and return what it receives. A non-blocking session will return immediately with an
empty buffer. If a write is performed on a session with no room for more data, a blocking session will wait
for room. A non-blocking session will return immediately without writing anything.
(Read and Write property)

120.39.27  Handle as Integer

Notes: (Read and Write property)

120.39.28  LastErrNo as Integer

Notes: Returns a numeric error code corresponding to the Error Code constants.
(Read only property)

120.39.29  LastError as Integer

Notes: (Read and Write property)

120.39.30  Socket as TCPSocket

Notes: This is set by constructor if you base the session on an existing session. But you can assign a socket here if you like.
(Read and Write property)
CHAPTER 120. NETWORK

120.39.31 Tag as Variant

Function: The tag value.
Notes:
A property where you can store any value you like.
(Read and Write property)

120.39.32 TimeOut as Integer

Function: The timeout for blocking functions.
Notes:
In milliseconds.
(Read and Write property)

120.39.33 Events

120.39.34 KeyboardCallback(Name as string, Instruction as string, Prompt-Count as Integer, Prompts() as SSH2UserAuthKeyboardInteractivePromptMBS, responses() as SSH2UserAuthKeyboardInteractiveResponseMBS)

Function: Event to ask for user input on a UserAuthKeyboardInteractive run.
Notes:
You can ask user for password, e.g. with a modal dialog.
You find prompt text in SSH2UserAuthKeyboardInteractivePromptMBS object and place answer in SSH2User-
AuthKeyboardInteractiveResponseMBS objects.

120.39.35 Constants

120.39.36 kErrorAgentProtocol = -42

Notes: Invalid agent protocol.
120.39.37  kErrorAlloc = -6

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Out of memory.

120.39.38  kErrorAuthenticationFailed = -18

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Authentication failed.

120.39.39  kErrorBadSocket = -45

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Bad socket handle.

120.39.40  kErrorBadUse = -39

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Bad use.

120.39.41  kErrorBannerRecv = -2

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Failed to receive banner.

120.39.42  kErrorBannerSend = -3

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Failed to send banner.

120.39.43  kErrorBufferTooSmall = -38

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Memory buffer is too small.
**120.39.44**  \( \text{kErrorChannelClosed} = -26 \)

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Channel is already closed.

**120.39.45**  \( \text{kErrorChannelEofSent} = -27 \)

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Channel sent EOF.

**120.39.46**  \( \text{kErrorChannelFailure} = -21 \)

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Generic error on a channel.

**120.39.47**  \( \text{kErrorChannelOutoforder} = -20 \)

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Channel commands out of order.

**120.39.48**  \( \text{kErrorChannelPacketExceeded} = -25 \)

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Channel packet exceeded.

**120.39.49**  \( \text{kErrorChannelRequestDenied} = -22 \)

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Channel request denied.

**120.39.50**  \( \text{kErrorChannelUnknown} = -23 \)

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the SSH error codes.  
**Notes:** Unknown channel.

MBS Network Plugin, Plugin Version: 14.0.  \textbf{Function:} One of the SSH error codes.  
\textbf{Notes:} Timeout.

120.39.82  \texttt{kErrorZlib} = -29

MBS Network Plugin, Plugin Version: 14.0.  \textbf{Function:} One of the SSH error codes.  
\textbf{Notes:} Error with zlib (Compression).

120.39.83  \texttt{kFlagCompress} = 2

\textbf{Notes:}
Set options for the created session. flag is the option to set, while value is typically set to 1 or 0 to enable or disable the option.  
If set - before the connection negotiation is performed - libssh2 will try to negotiate compression enabling for this connection. By default libssh2 will not attempt to use compression.

120.39.84  \texttt{kFlagSigPipe} = 1

\textbf{Notes:}
Set options for the created session. flag is the option to set, while value is typically set to 1 or 0 to enable or disable the option.
If set, libssh2 will not attempt to block SIGPIPEs but will let them trigger from the underlying socket layer.

120.39.85  kHostKeyHashMD5 = 1

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the hash types.  
**Notes:** MD5

120.39.86  kHostKeyHashSHA1 = 2

MBS Network Plugin, Plugin Version: 14.0. **Function:** One of the hash types.  
**Notes:** SHA1
class SSH2UserAuthKeyboardInteractivePromptMBS

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for an interactive keyboard authentication prompt. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

### Methods

#### Constructor

#### Destructor

### Properties

#### Echo as Integer

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The echo flag. **Notes:** (not sure what this is) (Read and Write property)

#### Length as Integer

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The length of the text. **Notes:** (Read and Write property)
120.40.8 Text as String

**Notes:** (Read and Write property)
120.41 class SSH2UserAuthKeyboardInteractiveResponseMBS

120.41.1 class SSH2UserAuthKeyboardInteractiveResponseMBS

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a response with interactive keyboard login. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.41.2 Methods

120.41.3 Constructor

120.41.4 Destructor

120.41.5 Properties

120.41.6 Text as String

MBS Network Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The response text. **Notes:** Usually a password. (Read and Write property)
120.42 class TCPSocket

120.42.1 class TCPSocket

Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Socket class in Realbasic which is the superclass of the PacketSocketMBS class.
120.43.  CLASS TXTRECORDMBS

120.43  class TXTRecordMBS

120.43.1  class TXTRecordMBS

**Function:** The class to represent a DNS-SD TXT record.

**Example:**

```vba
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"
```

MsgBox t.Bytes // show complete record
MsgBox t.Value("Hello") // lookup value

**Notes:** The constructor creates an empty TXTRecord where you can add values using TXTRecordSetValue.

120.43.2  Methods

120.43.3  Bytes as string

**Function:** Allows you to retrieve a copy of to the raw bytes within a TXTRecord.

**Example:**

```vba
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"
```

**Notes:** Returns a string with the raw bytes inside the TXTRecord which you can pass directly to DNNServiceRegisterMBS.Register() or to DNNServiceRegisterMBS.UpdateRecord().

120.43.4  ContainsKey(key as string) as boolean

**Function:** Allows you to determine if a given TXT Record contains a specified key.

**Example:**

```vba
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"
```
if t.ContainsKey("Hello") then
  MsgBox "Hello found."
else
  MsgBox "Hello not found - >bug."
end if

if t.ContainsKey("hallo") then
  MsgBox "hallo found - >bug."
else
  MsgBox "hallo not found."
end if

Notes:

key: An ASCII string containing the key name.

Returns true if the TXT Record contains the specified key. Otherwise, it returns false.

See also:

- 120.43.5 ContainsKey(txtRecord as string, key as string) as boolean

120.43.5 ContainsKey(txtRecord as string, key as string) as boolean

Example:

dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"

dim s as string = t.Bytes // copy record to string

// now search in that string:
if TXTRecordMBS.ContainsKey(s, "Hello") then
  MsgBox "Hello found."
else
  MsgBox "Hello not found - >bug."
end if

if TXTRecordMBS.ContainsKey(s, "hallo") then
  MsgBox "hallo found - >bug."
else
  MsgBox "hallo not found."

Notes:

txtRecord: The txt record to search in as a string.
key: An ASCII string containing the key name.

Returns true if the TXT Record contains the specified key. Otherwise, it returns false.
See also:

- 120.43.4 ContainsKey(key as string) as boolean

120.43.6 Count as Integer

Function: Returns the number of keys stored in the TXT Record.
Example:

dim t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"

MsgBox str(t.Count)

See also:

- 120.43.7 Count(txtRecord as string) as Integer

120.43.7 Count(txtRecord as string) as Integer

Function: Returns the number of keys stored in the TXT Record.
Example:

dim t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"

dim s as string = t.Bytes // copy record
// now count in that record
MsgBox str(TXTRecordMBS.Count(s))

See also:

- 120.43.6 Count as Integer

120.43.8 KeyAtIndex(index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Returns the key with the given index from the txt record. Example:

dim t as new TXTRecordMBS
call t.SetValue "Hello", "World"

MsgBox t.KeyAtIndex(0) + EndOfLine + t.ValueAtIndex(0)

Notes:
index: the index you want in the range from zero to GetCount()-1.

It’s also possible to iterate through keys in a TXT record by simply calling KeyAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid. See also:

- 120.43.9 KeyAtIndex(txtRecord as string, index as Integer) as string

120.43.9 KeyAtIndex(txtRecord as string, index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. Function: Returns the key with the given index from the txt record. Example:

dim t as new TXTRecordMBS
call t.SetValue "Hello", "World"
dim s as string = t.Bytes // copy record to string

// now search in that string:
MsgBox TXTRecordMBS.KeyAtIndex(s,0) +EndOfLine + TXTRecordMBS.ValueAtIndex(s, 0)

Notes:

txtRecord: The txt record to search in as a string.
index: the index you want in the range from zero to GetCount()-1.

It’s also possible to iterate through keys in a TXT record by simply calling KeyAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

• 120.43.8 KeyAtIndex(index as Integer) as string

120.43.10 Length as Integer

Example:

dim t as new TXTRecordMBS
call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"
MsgBox str(t.Length) // shows 42

120.43.11 RemoveValue(key as string)

MBS Network Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. Function: Removes a key from a TXTRecordRef. The "key" must be an ASCII string which exists in the TXTRecord.
Example:

dim t as new TXTRecordMBS
call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"
t.RemoveValue "Hello2"
MsgBox t.Bytes
Notes:
key: A key name which exists in the TXTRecord.

Lasterror is kErrorNoError on success or kErrorNoSuchKey if the "key" does not exist in the TXTRecord.

120.43.12 SetValue(key as string, value as string) as Integer

Example:
dim t as new TXTRecordMBS
call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"

Notes:
If the "key" already exists in the TXTRecord, then the current value will be replaced with the new value.

Keys may exist in four states with respect to a given TXT record:

- Absent (key does not appear at all)
- Present with no value ("key" appears alone)
- Present with empty value ("key=" appears in TXT record)
- Present with non-empty value ("key=value" appears in TXT record)

For more details refer to "Data Syntax for DNS-SD TXT Records" in
http://files.dns-sd.org/draft-cheshire-dnsext-dns-sd.txt

key: A string which only contains printable ASCII values (& h20-& h7E), excluding '=' (& h3D). Keys should be 8 characters or less.
value: Any binary value. For values that represent textual data, UTF-8 is STRONGLY recommended.
Returns kErrorNoError on success. Returns kErrorInvalid if the ”key” string contains illegal characters.
Returns kErrorNoMemory if adding this key would exceed the available storage.

The plugin currently does not create keys with empty value. If you need that, please email us.

120.43.13  Value(key as string) as string

**Function:** Allows you to retrieve the value for a given key from a TXT Record.
**Example:**
```
dim t as new TXTRecordMBS

call t.SetValue ”Hello”, ”World”
MsgBox t.Value(”Hello”) // lookup value
```

**Notes:**

key: The ASCII string containing the key name.

Returns an empty string if the key does not exist in this TXT record, or exists with no value (to differentiate between these two cases use ContainsKey()).
See also:
- 120.43.14 Value(txtRecord as string, key as string) as string

120.43.14  Value(txtRecord as string, key as string) as string

**Function:** Allows you to retrieve the value for a given key from a TXT Record.
**Example:**
```
dim t as new TXTRecordMBS

call t.SetValue ”Hello”, ”World”

dim s as string = t.bytes
MsgBox TXTRecordMBS.Value(s, ”Hello”) // lookup value
```

**Notes:**

txtRecord: Pointer to the received TXT Record bytes.
key: The ASCII string containing the key name.

Returns an empty string if the key does not exist in this TXT record, or exists with no value (to differentiate between these two cases use ContainsKey()).

See also:

- 120.43.13 Value(key as string) as string

120.43.15 ValueAtIndex(index as Integer) as string

Function: Returns the key with the given index from the txt record.

Example:

dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"

MsgBox t.KeyAtIndex(0) + EndOfLine + t.ValueAtIndex(0)

Notes:

index: the index you want in the range from zero to GetCount()-1.

It’s also possible to iterate through values in a TXT record by simply calling ValueAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.

See also:

- 120.43.16 ValueAtIndex(txtRecord as string, index as Integer) as string

120.43.16 ValueAtIndex(txtRecord as string, index as Integer) as string

Function: Returns the key with the given index from the txt record.

Example:

dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"

dim s as string = t.Bytes // copy record to string

// now search in that string:
MsgBox TXTRecordMBS.KeyAtIndex(s,0) + EndOfLine + TXTRecordMBS.ValueAtIndex(s,0)
Notes:

txtRecord: The txt record to search in as a string.
index: the index you want in the range from zero to GetCount()-1.

It’s also possible to iterate through values in a TXT record by simply calling GetValueAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

• 120.43.15 ValueAtIndex(index as Integer) as string
120.44 class UDPSocketMBS

120.44.2 Methods

120.44.3 AddMembership(MultiAddress as string, InterfaceAddress as string = ””)

MultiAddress: The IPv4 address of the group to join. InterfaceAddress: The IPv4 address of the network interface to use. Can be empty for any interface.

120.44.4 Bind(Port as Integer, IP as string = ””)

MBS Network Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Binds the socket to the given port. Notes: If IP is not empty, you can bind the socket to only the given network interface with that IPv4. Set ReuseAddress to bind to an address which already a socket is bound to. Lasterror is set.

120.44.5 Constructor

120.44. CLASS UDPSOCKETMBS

120.44.6 Destructor

**Notes:** Closes the socket.

120.44.7 DropMembership(MultiAddress as string, InterfaceAddress as string = ””)

**Notes:**  
Internally this uses IPPROTO_IP/IP_DROP_MEMBERSHIP option.  
LastError is set.  
MultiAddress: The IPv4 address of the group to join.  
InterfaceAddress: The IPv4 address of the network interface to use. Can be empty for any interface.

120.44.8 Poll

**Notes:**  
Calls events if needed.  
This is called automatically via timer by the plugin.

120.44.9 Read(peek as boolean = false) as DatagramMBS

**Notes:**  
If peek is true, the data is not removed from read buffer.  
On error returns nil.
120.44.10  **SendMessage(Data as DatagramMBS) as Integer**

**Function:** Sends a datagram.  
**Notes:**  
Please specify with port and address of datagram where package is sent to.  
Returns number of bytes sent.  
LastError is set.  
See also:  
- 120.44.11 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer  
- 120.44.12 SendMessage(Data as string, IP as String, Port as Integer) as Integer

120.44.11  **SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer**

**Function:** Sends a datagram.  
**Notes:**  
Please specify with port and IP where package is sent to.  
Returns number of bytes sent.  
LastError is set.  
See also:  
- 120.44.10 SendMessage(Data as DatagramMBS) as Integer  
- 120.44.12 SendMessage(Data as string, IP as String, Port as Integer) as Integer

120.44.12  **SendMessage(Data as string, IP as String, Port as Integer) as Integer**

**Function:** Sends a datagram.  
**Notes:**  
Please specify with port and IP where package is sent to.  
Returns number of bytes sent.  
LastError is set.  
See also:  
- 120.44.10 SendMessage(Data as DatagramMBS) as Integer  
- 120.44.11 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer
120.44. CLASS UDPSOCKETMBS

120.44.13 Properties

120.44.14 AvailableBytes as Integer

Function: Returns number of bytes available for reading.
Notes:
Lasterror is set.
(Read only property)

120.44.15 BindAddress as String

Function: The IP used for bind operation.
Notes:
This is set by Bind on success.
(Read and Write property)

120.44.16 BindPort as Integer

Function: The port used for bind operation.
Notes:
This is set by Bind on success.
(Read and Write property)

120.44.17 Broadcast as Boolean

Function: Whether broadcasts are allowed.
Notes:
Set to true before sending a broadcast message.
Internally this uses SOL_SOCKET/SO_BROADCAST option.
Lasterror is set.
(Read and Write property)
120.44.18 Handle as Integer

MBS Network Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal socket handle. **Notes:** (Read and Write property)

120.44.19 Lasterror as Integer

MBS Network Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last error code. **Notes:** Platform dependent. (Read and Write property)

120.44.20 LocalIP as String

MBS Network Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries local IP. **Notes:**

Can be 0.0.0.0 if unknown.
May only be set if connected or binded.
Lasterror is set.
(Read only property)

120.44.21 LocalPort as Integer

MBS Network Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries local port. **Notes:**

Lasterror is set.
Can be -1 if unknown.
(Read only property)

120.44.22 MulticastInterface as String

MBS Network Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The interface to use for multicast. **Notes:**
120.44. CLASS UDP_SOCKET_MBS

Internally this uses IPPROTO/IP/IP_MULTICAST_IF option. Lasterror is set.

Assign empty string to use all interfaces. May return 0.0.0.0 to indicate all interfaces. (Read and Write property)

120.44.23 MulticastLoop as Boolean

**Function:** Whether multicast packets are also sent to the sending socket. 
**Notes:**
Internally this uses IPPROTO/IP/IP_MULTICAST_LOOP option. Lasterror is set. (Read and Write property)

120.44.24 MulticastTimeToLive as Integer

**Function:** The multicast time to live value. 
**Notes:**
Internally this uses IPPROTO/IP/IP_MULTICAST_TTL option. Lasterror is set. Range from 0 to 255. (Read and Write property)

120.44.25 ReceiveBufferSize as Integer

**Function:** Queries the receiving buffer size. 
**Notes:**
The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values. Internally this uses SOL_SOCKET/SO_RCVBUF option. Lasterror is set. (Read and Write property)
120.44.26 ReuseAddress as Boolean

Function: Allows reuse of same port.
Notes:
Internally this uses SOL_SOCKET/SO_REUSEADDR option.

see also

Lasterror is set.
(Read and Write property)

120.44.27 ReusePort as Boolean

Function: Allow reuse of same port and IP.
Notes:
Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Lasterror is set.
(Read and Write property)

120.44.28 SendBufferSize as Integer

Function: The sending buffer size.
Notes:
The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_SNDBUF option.
Lasterror is set.
(Read and Write property)

120.44.29 SocketError as Integer

Function: The native socket error.
**120.44. CLASS UDPSOCKETMBS**

**Notes:**
Internally this uses SOL_SOCKET/SO_ERROR option.
LastError is set.
(Read only property)

**120.44.30 TimeToLive as Integer**

**Function:** The time to live value.
**Notes:**
Internally this uses IPPROTO_IP/IP_TTL option.
LastError is set.
Range from 0 to 255.
(Read and Write property)

**120.44.31 Type as Integer**

**Function:** Socket type.
**Notes:**
Always 2 as this is a datagram socket.
Internally this uses SOL_SOCKET/SO_TYPE option.
LastError is set.
(Read only property)

**120.44.32 TypeOfService as Integer**

**Function:** The type of service value.
**Notes:**
Works only on BSD Sockets.

Possible values:
IPTOS_MINCOST = 2
IPTOS_RELIABILITY = 4
IPTOS_THROUGHPUT = 8
IPTOS_LOWDELAY = 16
Internally this uses IPPROTO_IP/IP_TOS option.
(May not work on Windows.

Lasterror is set.
(Read and Write property)

120.44.33 Events

120.44.34 DataAvailable

MBS Network Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called when new data is available. 
**Notes:** Requires the socket to be bound.

120.44.35 Error

MBS Network Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called if socket is in error state.

120.44.36 SendComplete

MBS Network Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last write operation is done.
120.45 module WebSocketHelperMBS

120.45.1 module WebSocketHelperMBS

Function: Helper functions for implementing web sockets.
Example:

// short packet
dim s as string = WebSocketHelperMBS.AddHeader("Hello")
dim b as Boolean = WebSocketHelperMBS.FrameMasked(s)
dim t as string = WebSocketHelperMBS.Unmask(s)

// long packet
dim text as string = "Hello World. This is just a sample text with a little bit more characters to make it at least 127 characters long for this test."
dim s2 as string = WebSocketHelperMBS.AddHeader(text)
dim b2 as Boolean = WebSocketHelperMBS.FrameMasked(s2)
dim t2 as string = WebSocketHelperMBS.Unmask(s2)

Break // look in debugger

Deprecated: This item is deprecated and should no longer be used. You can use WebSocketMBS instead.

120.45.2 Methods

120.45.3 AddHeader(data as Memoryblock, opCode as Integer = 7) as Memoryblock

Function: Adds header to a frame.
Notes: Depending on the length of the frame we add two to ten bytes in front with the opcode included and the length information.
See also:

• 120.45.4 AddHeader(data as string, opCode as Integer = 7) as string

120.45.4 AddHeader(data as string, opCode as Integer = 7) as string

Function: Adds header to a frame.
Notes: Depending on the length of the frame we add two to ten bytes in front with the opcode included and the length information.
120.45.5  FrameMasked(data as Memoryblock) as boolean

Function: Whether the frame is masked or not.
Notes: Returns true if the first bit of the first byte is set.
See also:

- 120.45.6 FrameMasked(data as string) as boolean

120.45.6  FrameMasked(data as string) as boolean

Function: Whether the frame is masked or not.
Notes: Returns true if the first bit of the first byte is set.
See also:

- 120.45.5 FrameMasked(data as Memoryblock) as boolean

120.45.7  Unmask(data as Memoryblock) as Memoryblock

Function: Unmasks a data packet.
Notes:
Does the reverse of AddHeader.
The string returned has no encoding defined.
For a text frame, you should use DefineEncoding with UTF-8.
See also:

- 120.45.8 Unmask(data as Memoryblock, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as Memoryblock

- 120.45.9 Unmask(data as string) as string

- 120.45.10 Unmask(data as string, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as string
120.45.8  Unmask(data as Memoryblock, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as Memoryblock

**Function:** Unmasks a data packet.  
**Notes:**  
Does the reverse of AddHeader.  
The string returned has no encoding defined.  
For a text frame, you should use DefineEncoding with UTF-8.  
This method also sets Offset, Length and TotalLength parameters.  
See also:  
- 120.45.7 Unmask(data as Memoryblock) as Memoryblock  
- 120.45.9 Unmask(data as string) as string  
- 120.45.10 Unmask(data as string, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as string

120.45.9  Unmask(data as string) as string

**Function:** Unmasks a data packet.  
**Notes:**  
Does the reverse of AddHeader.  
The string returned has no encoding defined.  
For a text frame, you should use DefineEncoding with UTF-8.  
See also:  
- 120.45.7 Unmask(data as Memoryblock) as Memoryblock  
- 120.45.8 Unmask(data as Memoryblock, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as Memoryblock  
- 120.45.10 Unmask(data as string, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as string

120.45.10  Unmask(data as string, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as string

**Function:** Unmasks a data packet.  
**Notes:**  
Does the reverse of AddHeader.  
The string returned has no encoding defined.
120.45.7 Unmask(data as Memoryblock) as Memoryblock
120.45.8 Unmask(data as Memoryblock, byref Offset as Integer, byref Length as Integer, byref Total-Length as Integer) as Memoryblock
120.45.9 Unmask(data as string) as string

120.45.11 Constants

120.45.12 kOpCodeBinaryFrame = 2

120.45.13 kOpCodeClose = 8

120.45.15 kOpCodeEnd = 7

120.45.16 kOpCodePing = 9
120.45.17  kOpCodePong = 10

MBS Network Plugin, Plugin Version: 12.5. **Function:** One of the OpCode values.  
**Notes:** Pong

120.45.18  kOpCodeTextFrame = 1

MBS Network Plugin, Plugin Version: 12.5. **Function:** One of the OpCode values.  
**Notes:** Text frame
class WindowsDNSRecordAAAAMBS

class WindowsDNSRecordAAAAMBS

Notes: Be aware that IPv6 is not available on Windows XP and older.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

Methods

Constructor

Notes: This constructor makes sure you don’t create useless WindowsDNSRecordAAAAMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

Properties

Address as String

Notes: (Read and Write property)

RawAddress as String

Notes: (Read and Write property)
120.47 class WindowsDNSRecordAMBS

120.47.1 class WindowsDNSRecordAMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a DNS address (A) record. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.47.2 Methods

120.47.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor. **Notes:** This constructor makes sure you don’t create useless WindowsDNSRecordAMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy. This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

120.47.4 Properties

120.47.5 Address as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The IPv4 address as a string. **Notes:** (Read and Write property)

120.47.6 IPAddress as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The raw address as an integer. **Notes:** (Read and Write property)
120.48  class WindowsDNSRecordMBS

120.48.1  class WindowsDNSRecordMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for DNS query results on Windows. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.48.2  Methods

120.48.3  Constructor

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor. **Notes:** This constructor makes sure you don’t create useless WindowsDNSRecordMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy. This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

120.48.4  Query(name as string, type as Integer, options as Integer = 0) as WindowsDNSRecordMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Performs a DNS query on Windows. **Notes:** The DnsQuery function type is the generic query interface to the DNS namespace, and provides application developers with a DNS query resolution interface.

name: a string that represents the name of the owner of the record set that is queried.
type: A value that represents the RR DNS Record Type that is queried.
Options: A value that contains a combination of kDNSQuery* constants.

Returns the record chain on success.

Applications that call the DnsQuery function build a query using a fully-qualified DNS name and Resource Record (RR) type, and set query options depending on the type of service desired. When the kDNSQuery-Standard option is set, DNS uses the resolver cache, queries first with UDP, then retries with TCP if the response is truncated, and requests that the server to perform recursive resolution on behalf of the client to
Note When calling one of the DnsQuery function types, be aware that a DNS server may return multiple records in response to a query. A computer that is multihomed, for example, will receive multiple A records for the same IP address. The caller must use as many of the returned records as necessary.

Consider the following scenario, in which multiple returned records require additional activity on behalf of the application: A Query function call is made for a multihomed computer and the application finds that the address associated with the first A record is not responding. The application should then attempt to use other IP addresses specified in the (additional) A records returned from the Query function call.

120.48.5 Properties

120.48.6 A as WindowsDNSRecordAMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The address record. **Notes:** (Read and Write property)

120.48.7 AAAA as WindowsDNSRecordAAAAMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The IPv6 address record. **Notes:** (Read and Write property)

120.48.8 AFSDB as WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data record. **Notes:** (Read and Write property)

120.48.9 CharSet as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This value specifies the character set used in the associated function call. **Notes:** (Read and Write property)
120.48.10  CNAME as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The data record.
**Notes:** (Read and Write property)

120.48.11  DataLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The length, in bytes, of Data.
**Notes:** (Read and Write property)

120.48.12  HINFO as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The data record.
**Notes:** (Read and Write property)

120.48.13  ISDN as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The data record.
**Notes:** (Read and Write property)

120.48.14  MB as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The data record.
**Notes:** (Read and Write property)

120.48.15  MD as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The data record.
**Notes:** (Read and Write property)
120.48.16  **MF as WindowsDNSRecordPTRMBS**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data record. **Notes:** (Read and Write property)

120.48.17  **MG as WindowsDNSRecordPTRMBS**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data record. **Notes:** (Read and Write property)

120.48.18  **MINFO as WindowsDNSRecordMInfoMBS**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data record. **Notes:** (Read and Write property)

120.48.19  **MR as WindowsDNSRecordPTRMBS**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data record. **Notes:** (Read and Write property)

120.48.20  **MX as WindowsDNSRecordMXMBS**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data record. **Notes:** (Read and Write property)

120.48.21  **Name as String**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A pointer to a string that represents the domain name of the record set. **Notes:** (Read and Write property)
120.48.22  NextRecord as WindowsDNSRecordMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The next record in the answer. Notes: (Read and Write property)

120.48.23  NS as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The data record. Notes: (Read and Write property)

120.48.24  Null as WindowsDNSRecordNullMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The data record. Notes: (Read and Write property)

120.48.25  RawData as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: the RAW data of this record. Notes: For debugging. (Read and Write property)

120.48.26  RP as WindowsDNSRecordMInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The data record. Notes: (Read and Write property)

120.48.27  RT as WindowsDNSRecordMXMBS

120.48.28 Section as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This value specifies the section of interest returned from the DnsQuery function call.  
**Notes:** (Read and Write property)

120.48.29 SOA as WindowsDNSRecordSOAMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data record.  
**Notes:** (Read and Write property)

120.48.30 TTL as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The DNS RR’s Time To Live value (TTL), in seconds.  
**Notes:** (Read and Write property)

120.48.31 TXT as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data record.  
**Notes:** (Read and Write property)

120.48.32 Type as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The DNS record type for this record.  
**Notes:** If type is kDNSTypeA, the A property is filled.  
(Read and Write property)
120.48.33  X25 as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data record.  
**Notes:** (Read and Write property)

120.48.34  Constants

120.48.35  kCharSetAnsi = 3

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the CharSet property.  
**Notes:** The character set is ANSI.

120.48.36  kCharSetUnicode = 1

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the CharSet property.  
**Notes:** The character set is Unicode.

120.48.37  kCharSetUnknown = 0

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the CharSet property.  
**Notes:** The character set is unknown.

120.48.38  kCharSetUtf8 = 2

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the CharSet property.  
**Notes:** The character set is UTF8.

120.48.39  kDNSClassAll = & h00ff

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the DNS classes in native byte order (little endian on Windows).
120.48. CLASS WINOUSDNSRECORDMBS

120.48.40 kDNSClassAny = & h00ff

MBS Win Plugin, Plugin Version: 10.4. **Function**: One of the DNS classes in native byte order (little endian on Windows).

120.48.41 kDNSClassCHAOS = & h0003

MBS Win Plugin, Plugin Version: 10.4. **Function**: One of the DNS classes in native byte order (little endian on Windows).

120.48.42 kDNSClassCSNET = & h0002

MBS Win Plugin, Plugin Version: 10.4. **Function**: One of the DNS classes in native byte order (little endian on Windows).

120.48.43 kDNSClassHESIOD = & h0004

MBS Win Plugin, Plugin Version: 10.4. **Function**: One of the DNS classes in native byte order (little endian on Windows).

120.48.44 kDNSClassInternet = & h0001

MBS Win Plugin, Plugin Version: 10.4. **Function**: One of the DNS classes in native byte order (little endian on Windows).

120.48.45 kDNSClassNone = & h00fe

MBS Win Plugin, Plugin Version: 10.4. **Function**: One of the DNS classes in native byte order (little endian on Windows).

120.48.46 kDNSQueryAcceptTruncatedResponse = & h00000001

MBS Win Plugin, Plugin Version: 10.4. **Function**: One of the possible flags for the Query function. **Notes**: Returns truncated results. Does not retry under TCP.
120.48.47  kDNSQueryBypassCache = & h00000008

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function. **Notes:** Bypasses the resolver cache on the lookup.

120.48.48  kDNSQueryDontResetTTLValues = & h00100000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function. **Notes:** If set, and if the response contains multiple records, records are stored with the TTL corresponding to the minimum value TTL from among all records. When this option is set, "Do not change the TTL of individual records" in the returned record set is not modified.

120.48.49  kDNSQueryMulticastOnly = & h00000400

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function. **Notes:** Prevents the query from using DNS and uses only Local Link Multicast Name Resolution (LLMNR). Windows Vista and Windows Server 2008 or later.: This value is supported.

120.48.50  kDNSQueryNoHostsFile = & h00000040

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function. **Notes:** Prevents the DNS query from consulting the HOSTS file. Windows 2000 Server and Windows 2000 Professional: This value is not supported.

120.48.51  kDNSQueryNoLocalName = & h00000020

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function. **Notes:** Directs DNS to ignore the local name. Windows 2000 Server and Windows 2000 Professional: This value is not supported.
120.48.52 kDNSQueryNoMulticast = & h00000800

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.

**Notes:**

120.48.53 kDNSQueryNoNetBT = & h00000080

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.  
**Notes:**
Prevents the DNS query from using NetBT for resolution.  
Windows 2000 Server and Windows 2000 Professional: This value is not supported.

120.48.54 kDNSQueryNoRecursion = & h00000004

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.  
**Notes:** Directs the DNS server to perform an iterative query (specifically directs the DNS server not to perform recursive resolution to resolve the query).

120.48.55 kDNSQueryNoWireQuery = & h00000010

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.  
**Notes:** Directs DNS to perform a query on the local cache only.

120.48.56 kDNSQueryReserved = & hff000000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.  
**Notes:** Reserved.

120.48.57 kDNSQueryReturnMessage = & h00000200

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.  
**Notes:**
Directs DNS to return the entire DNS response message.  
Windows 2000 Server and Windows 2000 Professional: This value is not supported.
120.48.58  kDNSQueryStandard = & h00000000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.  
**Notes:** Standard query.

120.48.59  kDNSQueryTreatAsFQDN = & h00001000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.  
**Notes:** Prevents the DNS response from attaching suffixes to the submitted name in a name resolution process.

120.48.60  kDNSQueryUseTCPOnly = & h00000002

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.  
**Notes:** Uses TCP only for the query.

120.48.61  kDNSQueryWireOnly = & h00000100

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible flags for the Query function.  
**Notes:** Directs DNS to perform a query using the network only, bypassing local information.  
Windows 2000 Server and Windows 2000 Professional: This value is not supported.

120.48.62  kDNSRClassAll = & hff00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the DNS classes in network byte order.

120.48.63  kDNSRClassAny = & hff00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the DNS classes in network byte order.

120.48.64  kDNSRClassCHAOS = & h0300

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the DNS classes in network byte order.
120.48. CLASS WINODS/DNSRECORDMBS

120.48.65  kDNSRClassCSNET = & h0200

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the DNS classes in network byte order.

120.48.66  kDNSRClassHESIOD = & h0400

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the DNS classes in network byte order.

120.48.67  kDNSRClassInternet = & h0100

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the DNS classes in network byte order.

120.48.68  kDNSRClassNone = & h0e00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the DNS classes in network byte order.

120.48.69  kDNSRTypeA = & h0100

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.70  kDNSRTypeAAAA = & h1c00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.71  kDNSRTypeAFSDB = & h1200

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).
120.48.72  kDNSRTypeALL = \& hff00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.73  kDNSRTypeANY = \& hff00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.74  kDNSRTypeATMA = \& h2200

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.75  kDNSRTypeAXFR = \& hfc00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.76  kDNSRTypeCNAME = \& h0500

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.77  kDNSRTypeGPOS = \& h1b00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.78  kDNSRTypeHINFO = \& h0d00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).
120.48. CLASS WINDOWSDNSRECORDMBS

120.48.79 kDNSRTypeISDN = & h1400

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.80 kDNSRTypeIXFR = & hfb00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.81 kDNSRTypeKEY = & h1900

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.82 kDNSRTypeLOC = & h1d00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.83 kDNSRTypeMAILA = & hfe00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.84 kDNSRTypeMAILB = & hfd00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.85 kDNSRTypeMB = & h0700

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).
120.48.86  kDNSRTypeMD = & h0300

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.87  kDNSRTypeMF = & h0400

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.88  kDNSRTypeMG = & h0800

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.89  kDNSRTypeMINFO = & h0e00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.90  kDNSRTypeMR = & h0900

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.91  kDNSRTypeMX = & h0f00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.92  kDNSRTypeNS = & h0200

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).
120.48.93  kDNSRTypeNSAP = & h1600

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.94  kDNSRTypeNSAPPTR = & h1700

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.95  kDNSRTypeNULL = & h0a00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.96  kDNSRTypeNXT = & h1e00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.97  kDNSRTypePTR = & h0c00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.98  kDNSRTypePX = & h1a00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.99  kDNSRTypeRP = & h1100

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).
120.48.100  kDNSRTypeRT = & h1500

MBS Win Plugin, Plugin Version: 10.4.  **Function:** One of the possible DNS record type constants (in network byte order).

120.48.101  kDNSRTypeSIG = & h1800

MBS Win Plugin, Plugin Version: 10.4.  **Function:** One of the possible DNS record type constants (in network byte order).

120.48.102  kDNSRTypeSOA = & h0600

MBS Win Plugin, Plugin Version: 10.4.  **Function:** One of the possible DNS record type constants (in network byte order).

120.48.103  kDNSRTypeSRV = & h2100

MBS Win Plugin, Plugin Version: 10.4.  **Function:** One of the possible DNS record type constants (in network byte order).

120.48.104  kDNSRTypeTEXT = & h1000

MBS Win Plugin, Plugin Version: 10.4.  **Function:** One of the possible DNS record type constants (in network byte order).
120.48.105  kDNSRTypeTKEY = & hf900

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.106  kDNSRTypeTSIG = & hfa00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.107  kDNSRTypeWINS = & h01ff

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.108  kDNSRTypeWINSR = & h02ff

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.109  kDNSRTypeWKS = & h0b00

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.110  kDNSRTypeX25 = & h1300

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in network byte order).

120.48.111  kDNSTypeA = & h0001

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).
120.48.112  kDNSTypeAAAA = & h001c

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.113  kDNSTypeAFSDB = & h0012

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.114  kDNSTypeALL = & h00ff

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.115  kDNSTypeANY = & h00ff

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.116  kDNSTypeATMA = & h0022

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.117  kDNSTypeAXFR = & h00fc

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.118  kDNSTypeCNAME = & h0005

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).
120.48.119  kDNSTypeGPOS = & h001b

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.120  kDNSTypeHINFO = & h000d

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.121  kDNSTypeISDN = & h0014

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.122  kDNSTypeIXFR = & h00fb

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the possible DNS record type constants (in native byte order).

120.48.155  kSectionAddtional = 3

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the Section Property. **Notes:** The DNS section specified is additional DNS information.

120.48.156  kSectionAnswer = 1

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the Section Property. **Notes:** The DNS section specified is a DNS answer.

120.48.157  kSectionAuthority = 2

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the Section Property. **Notes:** The DNS section specified indicates a DNS authority.

120.48.158  kSectionQuestion = 0

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the Section Property. **Notes:** The DNS section specified is a DNS question.
120.49. **CLASS WINDOWS\DNSRECORD\MINFO\MBS**

120.49  **class** WindowsDNSRecordMInfoMBS

120.49.1  **class** WindowsDNSRecordMInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a DNS mail information (MINFO) record. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.49.2  **Methods**

120.49.3  **Constructor**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor. **Notes:** This constructor makes sure you don’t create useless WindowsDNSRecordMInfoMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy. This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

120.49.4  **Properties**

120.49.5  **NameErrorsMailbox as String**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string that represents the FQDN of the mailbox to receive error messages related to the mailing list. **Notes:** (Read and Write property)

120.49.6  **NameMailbox as String**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string that represents the fully qualified domain name (FQDN) of the mailbox responsible for the mailing list or mailbox specified in the record’s owner name. **Notes:** (Read and Write property)
120.50 class WindowsDNSRecordMXMBS

120.50.1 class WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for a DNS mail exchanger (MX) record.
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

120.50.2 Methods

120.50.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The private constructor.
**Notes:**
This constructor makes sure you don’t create useless WindowsDNSRecordMXMBS objects by error. The
only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don’t create an object from this class by error. Please use
designated functions to create objects.

120.50.4 Properties

120.50.5 NameExchange as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The string that represents the fully qualified domain name (FQDN) of the host willing to act as a mail
exchange.
**Notes:** (Read and Write property)

120.50.6 Preference as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A preference given to this resource record among others of the same owner. Lower values are preferred.
**Notes:** (Read and Write property)
120.51 class WindowsDNSRecordNullMBS

120.51.1 class WindowsDNSRecordNullMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a NULL data DNS resource record

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.51.2 Methods

120.51.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor.

**Notes:**
This constructor makes sure you don’t create useless WindowsDNSRecordNullMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

120.51.4 Properties

120.51.5 ByteCount as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of bytes represented in Data.

**Notes:** (Read and Write property)

120.51.6 Data as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The raw data as a string.

**Notes:** (Read and Write property)
120.52  class WindowsDNSRecordPTRMBS

120.52.1  class WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a DNS pointer (PTR) record.
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.52.2  Methods

120.52.3  Constructor

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor.
**Notes:** This constructor makes sure you don’t create useless WindowsDNSRecordPTRMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy. This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

120.52.4  Properties

120.52.5  NameHost as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The named host.
**Notes:** (Read and Write property)
120.53  class WindowsDNSRecordSOAMBS

120.53.1  class WindowsDNSRecordSOAMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a DNS start of authority (SOA) record.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.53.2  Methods

120.53.3  Constructor

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor.  
**Notes:**  
This constructor makes sure you don’t create useless WindowsDNSRecordSOAMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.  
This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

120.53.4  Properties

120.53.5  DefaultTTL as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The lower limit on the time, in seconds, that a DNS server or caching resolver are allowed to cache any resource records (RR) from the zone to which this record belongs.  
**Notes:** (Read and Write property)

120.53.6  Expire as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The time, in seconds, before an unresponsive zone is no longer authoritative.  
**Notes:** (Read and Write property)
120.53.7 NameAdministrator as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The string that represents the name of the responsible party for the zone to which the record belongs.
**Notes:** (Read and Write property)

120.53.8 NamePrimaryServer as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The string that represents the name of the authoritative DNS server for the zone to which the record belongs.
**Notes:** (Read and Write property)

120.53.9 Refresh as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The time, in seconds, before the zone containing this record should be refreshed.
**Notes:** (Read and Write property)

120.53.10 Retry as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The time, in seconds, before retrying a failed refresh of the zone to which this record belongs.
**Notes:** (Read and Write property)

120.53.11 SerialNo as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The serial number of the SOA record.
**Notes:** (Read and Write property)
**120.54. CLASS WINDOWS\DNSRECORD\TXTMBS**

**120.54  class WindowsDNSRecordTXTMBS**

**120.54.1  class WindowsDNSRecordTXTMBS**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a DNS text (TXT) record.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

**120.54.2  Methods**

**120.54.3  Constructor**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor.  
**Notes:** This constructor makes sure you don’t create useless WindowsDNSRecordTXTMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy. This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

**120.54.4  Strings as String()**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An array of strings representing the descriptive text of the TXT resource record.

**120.54.5  Properties**

**120.54.6  StringCount as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of strings represented in Strings array.  
**Notes:** (Read and Write property)
120.55 class WindowsEthernetAdapterMBS

120.55.1 class WindowsEthernetAdapterMBS

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for the properties of an ethernet adapter.

**120.55.2 Methods**

**120.55.3 Gateway(index as Integer) as WindowsIPAddressMBS**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns one of the IP address of the default gateway for this adapter. 
**Notes:** Index goes from 0 to GatewayGount-1.

**120.55.4 IP(index as Integer) as WindowsIPAddressMBS**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns one of the IP addresses associated with this adapter. 
**Notes:** Index goes from 0 to IPcount-1.

**120.55.5 Properties**

**120.55.6 AdapterName as String**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Name of the adapter. 
**Notes:** (Read and Write property)

**120.55.7 Address as String**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Hardware address for the adapter. 
**Notes:** (Read and Write property)
120.55. CLASS WINDOWSETHERNETADAPTERMBS

120.55.8 CurrentIpAddress as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current IP from within the IP list.

**Notes:**
This field is currently normally nil, but in the future it may point to the current IP inside the IP list. But currently on Windows 2000 it seems to be always nil.
(Read and Write property)

120.55.9 Description as String

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Description for the adapter.

**Notes:** (Read and Write property)

120.55.10 DhcpEnabled as Boolean

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies whether dynamic host configuration protocol (DHCP) is enabled for this adapter.

**Notes:** (Read and Write property)

120.55.11 DhcpServer as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** IP address of the DHCP server for this adapter.

**Notes:** (Read and Write property)

120.55.12 Gatewaycount as Integer

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** How many gateway IPs are allocated for this adapter.

**Notes:** (Read and Write property)

120.55.13 HaveWins as Boolean

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies whether this adapter uses Windows Internet Name Service (WINS).
120.55.14  **Index as Integer**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adapter index.
**Notes:** (Read and Write property)

120.55.15  **IPcount as Integer**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** How many IPs are allocated for this adapter.
**Notes:** (Read and Write property)

120.55.16  **LeaseExpires as Integer**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Time when the current DHCP lease expires.
**Notes:** (Read and Write property)

120.55.17  **LeaseObtained as Integer**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Time when the current DHCP lease was obtained.
**Notes:** (Read and Write property)

120.55.18  **PrimaryWinsServer as WindowsIPAddressMBS**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** IP address of the primary WINS server.
**Notes:** (Read and Write property)

120.55.19  **SecondaryWinsServer as WindowsIPAddressMBS**

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** IP address of the secondary WINS server.
120.55.  CLASS WINDOWSETHERNETADAPTERMBS

Notes: (Read and Write property)

120.55.20  Type as Integer

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adapter type.

Notes:

The type must be of the following values:

<table>
<thead>
<tr>
<th>MIB_IF_TYPE_OTHER</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIB_IF_TYPE ETHERNET</td>
<td>6</td>
</tr>
<tr>
<td>MIB_IF_TYPE_TOKENRING</td>
<td>9</td>
</tr>
<tr>
<td>MIB_IF_TYPE_FDDI</td>
<td>15</td>
</tr>
<tr>
<td>MIB_IF_TYPE_PPP</td>
<td>23</td>
</tr>
<tr>
<td>MIB_IF_TYPE_LOOPBACK</td>
<td>24</td>
</tr>
<tr>
<td>MIB_IF_TYPE_SLIP</td>
<td>28</td>
</tr>
</tbody>
</table>

(Read and Write property)
120.56  class WindowsEthernetMBS

120.56.1  class WindowsEthernetMBS

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A list of the Windows Ethernet Interfaces.  
**Notes:**  
Requires Windows 98 or 2000 or newer.  
Reports count=0 on Windows 95 and NT 4.0.  

Only activate adapters are listed.

120.56.2  Methods

120.56.3  Item(index as Integer) as WindowsEthernetAdapterMBS

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the Ethernet Adapter object for the given index.  
**Notes:** Index goes from 0 to count-1.

120.56.4  Update

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Updates the list.  
**Notes:** Calls the Destructor and than the Constructor so the list is completly rebuilt.

120.56.5  Properties

120.56.6  Count as Integer

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** How much ethernet adapters are available.  
**Notes:**  
Note that there may be dummy or virtual adapters.  
(Read and Write property)
120.57. CLASS WINDOWSIPADDRESSMBS

120.57 class WindowsIPAddressMBS

120.57.1 class WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
An IP address.

120.57.2 Properties

120.57.3 IP as String

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The IP as a string.
**Notes:**
Maximum 15 bytes long.
e.g. "192.168.0.1"
(Read and Write property)

120.57.4 Mask as String

MBS Network Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The mask for the IP.
**Notes:**
e.g. "255.255.255.0"
(Read and Write property)
class WindowsProxyMBS

120.58.1 class WindowsProxyMBS

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to query the current windows proxy settings.

### Properties

120.58.2 Properties

120.58.3 ByPass as String

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The proxy

Notes:

Example values:
"testserver:1234 apple.de <local>"
or
"testserver3:1234 testserver4:1234 testserver1:1234 testserver2:1234 apple.de <local>"
(Read and Write property)

120.58.4 Proxy as String

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The current proxy setting.

Notes:

Example values:
"testserver:1234"
or
"https=testserver2:1234 http=testserver1:1234 gopher=testserver4:1234 ftp=testserver3:1234"
(Read and Write property)

120.58.5 UsingProxy as Boolean

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether a proxy is in use.

Notes: (Read and Write property)
120.59. class WindowsQOSMBS

120.59.1. class WindowsQOSMBS

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for Quality Windows Audio/Video Experience (qWAVE).
**Notes:**
Quality Windows Audio/Video Experience (qWAVE) is the next generation Quality of Service (QOS) platform introduced in Windows Vista.
qWAVE provides new features focused on streaming multimedia and real-time content over variable bandwidth networks. These features include the following.

- Auto-discovery of end-to-end QOS compatibility.
- End-to-end bandwidth estimation of maximum link capacity (bottleneck bandwidth) and real-time available bandwidth.
- Intelligent packet prioritization.
- Congestion notification.
- Flow shaping.
- Distributed admission control, including caching to improve performance and minimize latency.

Requires Windows 6 (Vista).

120.59.2. Methods

120.59.3. AddSocketToFlow(Socket as Integer, DestAddr as string, DestPort as Integer, TrafficType as Integer, Flags as Integer, byref FlowId as UInt32) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Adds a socket to a flow.
**Notes:**
Socket: Identifies the socket that the application will use to flow traffic.
DestAddr: The destination IP address to which the application will send traffic. DestAddr and DestPort are optional if the socket is already connected. If this parameter is specified, the remote IP address and port must match those used in the socket’s connect call.
If the socket is not connected, this parameter must be specified. If the socket is already connected, this parameter does not need to be specified. In this case, if the parameter is still specified, the destination host and port must match what was specified during the socket connect call.
Since, under TCP, the socket connect call can be delayed, AddSocketToFlow can be called before a connection is established, passing in the remote system’s IP address and port number in the DestAddr parameter. 

DestPort: The port for the connection. 

TrafficType: A QOSTrafficType* constant that specifies the type of traffic for which this flow will be used. 

Flags: Optional flag values. Can be QOSNonAdaptiveFlow. 

FlowID: Receives a flow identifier. On input, this value must be 0. On output, the buffer contains a flow identifier if the call succeeds. 

If a socket is being added to an existing flow, this parameter will be the identifier of that flow. 

An application can make use of this parameter if multiple sockets used can share the same QoS flow properties. The QoS subsystem, then does not have to incur the overhead of provisioning new flows for subsequent sockets with the same properties. Note that only non-adaptive flows can have multiple sockets attached to an existing flow. 

A FlowID is an unsigned 32-bit integer. 

The use of IPv4/v6 mixed addresses is not supported in qWAVE. The address specified by the DestAddr parameter must be either IPv4 or IPv6. 

If there is a requirement for network experiments over a specific network interface, the socket must be bound to that particular interface. Otherwise the most appropriate interface for the experiment, as indicated by the network stack, is assigned by the qWAVE subsystem. 

Network traffic associated with this flow is not affected by making this call alone. For example, packet prioritization does not occur immediately. 

There are two categories of applications that use this function: adaptive and non-adaptive. An adaptive application makes use of notifications and information in the FlowFundamentals for adapting to network changes such as congestion. The qWAVE service uses Link Layer Topology Discovery (LLTD) QoS extensions for adaptive flows which can be present on the destination device. 

After calling this function adaptive A/V applications should call the SetFlowRate function to affect network traffic. 

A non-adaptive application either does not adapt to changing network characteristics or is sending traffic to an endpoint that does not support adaptive capabilities as indicated by ERROR_NOT_SUPPORTED. 

Non-adaptive applications, or adaptive applications making non-adaptive flows, should call this function with the QOSNonAdaptiveFlow flag. After calling this function A/V applications should call the setOutgoingDSCPValue, setOutgoingRate or setTrafficType function with a Operation. They do not need to be called unless shaping is desired.

120.59.4 AddSocketToFlow(Socket as Integer, TrafficType as Integer, Flags as Integer, byref FlowId as UInt32) as boolean 

Notes:
Socket: Identifies the socket that the application will use to flow traffic.
DestAddr: The destination IP address to which the application will send traffic. DestAddr and DestPort are optional if the socket is already connected. If this parameter is specified, the remote IP address and port must match those used in the socket’s connect call.
If the socket is not connected, this parameter must be specified. If the socket is already connected, this parameter does not need to be specified. In this case, if the parameter is still specified, the destination host and port must match what was specified during the socket connect call.
Since, under TCP, the socket connect call can be delayed, AddSocketToFlow can be called before a connection is established, passing in the remote system’s IP address and port number in the DestAddr parameter.
DestPort: The port for the connection.
TrafficType: A QOSTrafficType* constant that specifies the type of traffic for which this flow will be used.
Flags: Optional flag values. Can be QOSNonAdaptiveFlow.
FlowID: Receives a flow identifier. On input, this value must be 0. On output, the buffer contains a flow identifier if the call succeeds.
If a socket is being added to an existing flow, this parameter will be the identifier of that flow.
An application can make use of this parameter if multiple sockets used can share the same QoS flow properties. The QoS subsystem, then does not have to incur the overhead of provisioning new flows for subsequent sockets with the same properties. Note that only non-adaptive flows can have multiple sockets attached to an existing flow.
A FlowID is an unsigned 32-bit integer.

LastError is set.

The use of IPv4/IPv6 mixed addresses is not supported in qWAVE. The address specified by the DestAddr parameter must be either IPv4 or IPv6.
If there is a requirement for network experiments over a specific network interface, the socket must be bound to that particular interface. Otherwise, the most appropriate interface for the experiment, as indicated by the network stack, is assigned by the qWAVE subsystem.
Network traffic associated with this flow is not affected by making this call alone. For example, packet prioritization does not occur immediately.
There are two categories of applications that use this function: adaptive and non-adaptive. An adaptive application makes use of notifications and information in the FlowFundamentals for adapting to network changes such as congestion. The qWAVE service uses Link Layer Topology Discovery (LLTD) QoS extensions for adaptive flows which can be present on the destination device.
After calling this function adaptive A/V applications should call the SetFlowRate function to affect network traffic.
A non-adaptive application either does not adapt to changing network characteristics or is sending traffic to an endpoint that does not support adaptive capabilities as indicated by ERROR_NOT_SUPPORTED.
Non-adaptive applications, or adaptive applications making non-adaptive flows, should call this function with the QOSNonAdaptiveFlow flag. After calling this function A/V applications should call the setOutgoingDSCPValue, setOutgoingRate or setTrafficType function with a Operation. They do not need to be called unless shaping is desired.

- 120.59.3 AddSocketToFlow(Socket as Integer, DestAddr as string, DestPort as Integer, TrafficType as Integer, Flags as Integer, byref FlowId as UInt32) as boolean
120.59.5 Constructor

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This function initializes the QOS subsystem.

**Notes:**
On success Handle property is not zero.
Lasterror is set.

Every process intending to use qWAVE must first call Constructor.
If a machine enters a power save mode that interrupts connectivity such as sleep or standby, existing and active network experiments such as QOSStartTrackingClient must be reinitiated. This recreation of the flow mirrors the cleanup and creation activities also necessary for existing sockets. A new handle must be created, and the flow must be recreated and readmitted.

120.59.6 getFlowFundamentals(FlowID as Integer, byref BottleneckBandwidthSet as boolean, byref BottleneckBandwidth as UInt64, byref AvailableBandwidthSet as boolean, byref AvailableBandwidth as UInt64, byref RTTSet as boolean, byref RTT as UInt32, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries flow fundamentals.

**Notes:**
FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Flags: Optional, can be QOSQueryFlowFresh.
BottleneckBandwidthSet: This Boolean value is set to true if the BottleneckBandwidth field contains a value.
BottleneckBandwidth: Indicates the maximum end-to-end link capacity between the source and sink device, in bits.
AvailableBandwidthSet: Set to true if the AvailableBandwidth field contains a value.
AvailableBandwidth: Indicates how much bandwidth is available for submitting traffic on the end-to-end network path between the source and sink device, in bits.
RTTSet: Set to true if the RTT field contains a value.
RTT: Measures the round-trip time between the source and sink device, in microseconds.

Lasterror is set. Returns true on success or false on failure.
120.59.7  getOutgoingRate(FlowID as Integer, byref Bandwidth as UInt64, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries flow rate.

**Notes:**
FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Bandwidth: will contain a UINT64 value that indicates the flow rate specified when requesting the contract, in bits per second.
Flags: Optional, can be QOSQueryFlowFresh.
Lasterror is set. Returns true on success or false on failure.

120.59.8  getPacketPriority(FlowID as Integer, byref ConformantDSCPValue as Integer, byref NonConformantDSCPValue as Integer, byref ConformantL2Value as Integer, byref NonConformantL2Value as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries packet priorities.

**Notes:**
FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Flags: Optional, can be QOSQueryFlowFresh.

ConformantDSCPValue: Differential Services Code Point (DSCP) mark used for flow traffic that conforms to the specified flow rate.
NonConformantDSCPValue: DSCP marking used for flow traffic that exceeds the specified flow rate. Non-conformant DSCP values are only applicable only if value is QOSUseNonConformantMarkings.
ConformantL2Value: Layer-2 (L2) tag used for flow traffic that conforms to the specified flow rate. L2 tags will not be added to packets if the end-to-end path between source and sink does not support them.
NonConformantL2Value: L2 tag used for flow traffic that exceeds the specified flow rate. Non-conformant L2 values are only applicable if value is QOSUseNonConformantMarkings.

Lasterror is set. Returns true on success or false on failure.

120.59.9  RemoveAllSocketsFromFlow(FlowID as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The RemoveSocketFromFlow function notifies the QOS subsystem that a previously added flow has been terminated by the application, and that the subsystem must update its internal information accordingly.

**Notes:**
FlowId: A flow identifier. A QOS_FLOWID is an unsigned 32-bit integer.

LastError is set. Returns true on success or false on failure.
The plugin closes all flows in destructor.

120.59.10  RemoveSocketFromFlow(socketHandle as Integer, FlowID as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The RemoveSocketFromFlow function notifies the QOS subsystem that a previously added flow has been
terminated by the application, and that the subsystem must update its internal information accordingly.
**Notes:**
Socket: Socket to be removed from the flow.
Only flows created with the QOSNonAdaptiveFlow flag may have multiple sockets added to the same flow.
By passing the Socket parameter in this call, each socket can be removed individually. If the Socket param-
eter is not passed, the entire flow will be destroyed. If only one socket was attached to the flow, passing this
socket as a parameter to this function and passing 0 as a socket are equivalent calls.
FlowId: A flow identifier. A QOS_FLOWID is an unsigned 32-bit integer.

LastError is set. Returns true on success or false on failure.
The plugin closes all flows in destructor.

120.59.11  setOutgoingDSCPValue(FlowID as Integer, OutgoingDSCPValue as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Sets the outgoing DSCP value.
**Notes:**
FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.

LastError is set. Returns true on success or false on failure.

If StartTrackingClient has not already been called, calling QOSSetFlow will cause the QOS subsystem to perform the following:

- Discover whether the end-to-end network path supports prioritization.
- Track end-to-end network characteristics by way of network experiments. These experiments do not
  place any noteworthy stress on the network.
120.59.12 setOutgoingRate(FlowID as Integer, Bandwidth as UInt64, ShapingBehavior as Integer, Reason as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Sets a new outgoing rate.

**Notes:**
FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Bandwidth: The rate at which data should be sent, in units of bits per second.
Note Traffic on the network is measured at the IP level, and not at the application level. The rate that is specified should account for the IP and protocol headers.
ShapingBehavior: A shaping constant that defines the shaping behavior of the flow.
Reason: A QOSFlowRate* constant that indicates the reason for a flow rate change.
Lasterror is set. Returns true on success or false on failure.

If StartTrackingClient has not already been called, calling QOSSetFlow will cause the QOS subsystem to perform the following.

- Discover whether the end-to-end network path supports prioritization.
- Track end-to-end network characteristics by way of network experiments. These experiments do not place any noteworthy stress on the network.

120.59.13 setTrafficType(FlowID as Integer, TrafficType as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Sets the type of traffic

**Notes:**
FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
TrafficType: One of the traffic type constants.
Lasterror is set. Returns true on success or false on failure.

If StartTrackingClient has not already been called, calling QOSSetFlow will cause the QOS subsystem to perform the following.

- Discover whether the end-to-end network path supports prioritization.
- Track end-to-end network characteristics by way of network experiments. These experiments do not place any noteworthy stress on the network.
120.59.14  **StartTrackingClient**(*DestAddr* as string, *flags* as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The *StartTrackingClient* function notifies the QoS subsystem of the existence of a new client. **Notes:**

Calling this function increases the likelihood that the QoS subsystem will have gathered sufficient information on the network path to assist when calling QOSSetFlow to set the flow.

Note This call is not required to add a flow with the QOSSetSocketToFlow function although it is highly recommended. Not calling this function may require network experiments to be started during the QOSSetFlow call and can result in QOSSetFlow failing with **ERROR_NETWORK_BUSY** on initial use.

*DestAddr:* The IP address of the client device. Clients are identified by their IP address and address family. Any port number specified in the sockaddr structure will be ignored.

*Flags:* Reserved for future use. Must be set to 0.

On receipt of a QOSStartTrackingClient call the QoS subsystem begins gathering information about the client such as the QoS capabilities and available bandwidth on the end-to-end path.

An application should call this function as soon as it becomes aware of a client device that may need QoS flow. For example this function should be called when a media player device first connects to a media server application.

Network experiments performed by QOSStartTrackingClient do not introduce noteworthy load on the network even if no stream is started for a long period of time. The qWAVE service dynamically adjusts experiment traffic based on QoS subsystem activity.

Link Layer Topology Discovery (LLTD) must be implemented on the sink PC or device for this function to work.

_Lasterror_ is set. Returns true on success or false on failure.

120.59.15  **StopTrackingClient**(*DestAddr* as string, *flags* as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The *StopTrackingClient* function notifies the QoS subsystem to stop tracking a client that has previously used the *StartTrackingClient* function. **Notes:**

If a flow is currently in progress, this function will not affect it.

*DestAddr:* The IP address of the client device. Clients are identified by their IP address and address family. A port number is not required and will be ignored.

*Flags:* Reserved for future use.
Lasterror is set. Returns true on success or false on failure.

120.59.16 Properties

120.59.17 Handle as Integer

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

120.59.18 Lasterror as Integer

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code. **Notes:** (Read and Write property)

120.59.19 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The generic window error message for the error in lasterror property. **Notes:** (Read and Write property)

120.59.20 Constants

120.59.21 QOSFlowRateCongestion = 2

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the flow reason constants. **Notes:** Indicates that the flow has changed due to congestion.

120.59.22 QOSFlowRateContentChange = 1

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the flow reason constants. **Notes:** Indicates that the content of a flow has changed.
120.59.23 QOSFlowRateHigherContentEncoding = 3
Notes: Indicates that the user has caused the flow to change.

120.59.24 QOSFlowRateNotApplicable = 0
Notes: Indicates that there has not been a change in the flow.

120.59.25 QOSFlowRateUserCaused = 4
Notes: Indicates that the user has caused the flow to change.

120.59.26 QOSNonAdaptiveFlow = 2
MBS Win Plugin, Plugin Version: 13.5. Function: One of the flags.
Notes: If specified, the QoS subsystem will not gather data about the network path for this flow. As a result, functions which rely on bandwidth estimation techniques will not be available. For example, this would block QOSQueryFlow with an Operation value of QOSQueryFlowFundamentals and QOSNotifyFlow with an Operation value of QOSNotifyCongested, QOSNotifyUncongested, and QOSNotifyAvailable.

120.59.27 QOSQueryFlowFresh = 1
MBS Win Plugin, Plugin Version: 13.5. Function: One of the flags.
Notes:
The QOS subsystem will only return fresh, not cached, data. If fresh data is unavailable, it will try to obtain such data, at the expense of possibly taking more time. If this is not possible, the call will fail with the error code ERROR RETRY.
This flag is only applicable when the Operation parameter is set to QOSQueryFlowFundamentals.

120.59.28 QOSShapeAndMark = 1
MBS Win Plugin, Plugin Version: 13.5. Function: One of the constants for shaping behavior of a flow.
Notes: Indicates that the Windows Scheduler will be used to enforce the requested flow rate. Data packets
exceeding the rate are delayed accordingly. Packets receive conformant priority values.

120.59.29 QOSShapeOnly = 0

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the constants for shaping behavior of a flow. **Notes:** Indicates that the Windows packet scheduler (Pacer) will be used to enforce the requested flow rate. Data packets that exceed the rate are delayed until appropriate in order to maintain the specified flow rate. If the network supports prioritization, packets will always receive conformant priority values when QOSShapeFlow is specified.

120.59.30 QOSTrafficTypeAudioVideo = 3

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the traffic type constants. **Notes:**

Flow traffic has a network priority higher than QOSTrafficTypeExcellentEffort, yet lower than QOSTrafficTypeVoice. This traffic type should be used for A/V streaming scenarios such as MPEG2 streaming. Sent traffic will contain a DSCP mark with a value of 0x28 and an 802.1p tag with a value of 5.

120.59.31 QOSTrafficTypeBackground = 1

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the traffic type constants. **Notes:**

Flow traffic has a network priority lower than that of QOSTrafficTypeBestEffort. This traffic type could be used for traffic of an application doing data backup. Sent traffic will contain a DSCP mark with a value of 0x08 and an 802.1p tag with a value of 2.

120.59.32 QOSTrafficTypeBestEffort = 0

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the traffic type constants. **Notes:**

Flow traffic has the same network priority as regular traffic not associated with QOS. This traffic type is the same as not specifying priority, and as a result, the DSCP mark and 802.1p tag are not added to sent traffic.
120.59.33  **QOSTrafficTypeControl** = 5

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the traffic type constants.

**Notes:**

Flow traffic has the highest network priority. This traffic type should only be used for the most critical of data. For example, it may be used for data carrying user inputs. Sent traffic will contain a DSCP mark with a value of 0x38 and an 802.1p tag with a value of 7.

120.59.34  **QOSTrafficTypeExcellentEffort** = 2

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the traffic type constants.

**Notes:**

Flow traffic has a network priority higher than QOSTrafficTypeBestEffort, yet lower than QOSTrafficTypeAudioVideo. This traffic type should be used for data traffic that is more important than normal end-user scenarios, such as email. Sent traffic will contain a DSCP mark with value of 0x28 and 802.1p tag with a value of 5.

120.59.35  **QOSTrafficTypeVoice** = 4

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the traffic type constants.

**Notes:**

Flow traffic has a network priority higher than QOSTrafficTypeAudioVideo, yet lower than QOSTrafficTypeControl. This traffic type should be used for realtime voice streams such as VOIP. Sent traffic will contain a DSCP mark with a value of 0x38 and an 802.1p tag with a value of 7.

120.59.36  **QOSUseNonConformantMarkings** = 2

MBS Win Plugin, Plugin Version: 13.5. **Function:** One of the constants for shaping behavior of a flow.

**Notes:** Indicates that the flow rate requested will not be enforced. Data packets that would exceed the flow rate will receive a priority that indicates they are non-conformant. This may lead to lost and reordered packets.
class WinHTTPClientAutoProxyOptionsMBS

**Function:**
The WinHTTPClientAutoProxyOptionsMBS class is used to indicate to the WinHttpGetProxyForURL function whether to specify the URL of the Proxy Auto-Configuration (PAC) file or to automatically locate the URL with DHCP or DNS queries to the network.

**Notes:**

**Methods**

**Constructor**

The constructor.

**Properties**

**AutoConfigUrl as String**

The URL for the config URL.

**Notes:**
If Flags includes the kAutoProxyConfigURL flag, the AutoConfigUrl contains the URL of the proxy auto-configuration (PAC) file.
If Flags does not include the kAutoProxyConfigURL flag, then AutoConfigUrl must be "".
(Read and Write property)

**AutoDetectFlags as Integer**

The flags for auto detecting.

**Notes:**
If Flags includes the kAutoProxyAutoDetect flag, then AutoDetectFlags specifies what protocols are to be used to locate the PAC file. If both the DHCP and DNS auto detect flags are specified, then DHCP is used first; if no PAC URL is discovered using DHCP, then DNS is used.
If Flags does not include the kAutoProxyAutoDetect flag, then AutoDetectFlags must be zero.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>kAutoDetectTypeDHCP</td>
<td>Use DHCP to locate the proxy auto-configuration file.</td>
</tr>
<tr>
<td>kAutoDetectTypeDNSA</td>
<td>Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.</td>
</tr>
</tbody>
</table>

(Read and Write property)

120.60.7 AutoLogonIfChallenged as Boolean

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies whether the client’s domain credentials should be automatically sent in response to an NTLM or Negotiate Authentication challenge when WinHTTP requests the PAC file. 
**Notes:** If this flag is true, credentials should automatically be sent in response to an authentication challenge. If this flag is false and authentication is required to download the PAC file, the WinHttpGetProxyForUrl function fails.
(Read and Write property)

120.60.8 Flags as Integer

**Notes:** (Read and Write property)

120.60.9 Constants

120.60.10 kAutoDetectTypeDHCP = 1

MBS Win Plugin, Plugin Version: 14.1. **Function:** The flags for auto detection types. 
**Notes:** Use DHCP to locate the proxy auto-configuration file.

120.60.11 kAutoDetectTypeDNSA = 2

MBS Win Plugin, Plugin Version: 14.1. **Function:** The flags for auto detection types. 
**Notes:** Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the
120.60. CLASS WINHTTPCLIENTAUTOPROXYOPTIONSMBS

domain of the local computer.

120.60.12  kAutoProxyAutoDetect = 1

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the proxy flags. **Notes:** Attempt to automatically discover the URL of the PAC file using both DHCP and DNS queries to the local network.

120.60.13  kAutoProxyConfigURL = 2

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the proxy flags. **Notes:** Download the PAC file from the URL specified by AutoConfigUrl in the WinHTTPClientAutoProxyOptionsMBS class.
120.61 class WinHTTPClientCurrentUserIEProxyConfigMBS

120.61.1 class WinHTTPClientCurrentUserIEProxyConfigMBS

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for Internet Explorer proxy configuration information.

**Notes:**
see also
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.61.2 Methods

120.61.3 Constructor

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The private constructor.

120.61.4 Properties

120.61.5 AutoConfigUrl as String

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The auto-configuration URL.

**Notes:**
The auto-configuration URL if the Internet Explorer proxy configuration for the current user specifies "Use automatic proxy configuration".
(Read and Write property)

120.61.6 AutoDetect as Boolean

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether to auto detect proxy settings.

**Notes:**
If true, indicates that the Internet Explorer proxy configuration for the current user specifies "automatically detect settings".
(Read and Write property)
120.61.7 Proxy as String

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Contains the proxy URL if the Internet Explorer proxy configuration for the current user specifies "use a proxy server".
**Notes:** (Read and Write property)

120.61.8 ProxyBypass as String

**Notes:** (Read and Write property)
120.62 class WinHTTPClientMBS

120.62.1 class WinHTTPClientMBS

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for Windows to do http requests.
**Notes:**
The plugin only implements proxy related functions.
But this class could be extended to work like HTTPSocket.

120.62.2 Methods

120.62.3 Close as boolean

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Closes the session.

120.62.4 Constructor

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor.

120.62.5 CrackUrl(URL as string, Flags as Integer = 0) as WinHTTPClientURLComponentsMBS

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Separates a URL into its component parts such as host name and path.
**Notes:**
URL: the canonical URL to separate. WinHttpCrackUrl does not check this URL for validity or correct format before attempting to crack it.

see also
120.62.6 DetectAutoProxyConfigUrl(AutoDetectFlags as Integer, byref AutoConfigUrl as string) as Boolean

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Finds the URL for the Proxy Auto-Configuration (PAC) file. **Notes:** This function reports the URL of the PAC file, but it does not download the file.

AutoDetectFlags: A data type that specifies what protocols to use to locate the PAC file. If both the DHCP and DNS auto detect flags are set, DHCP is used first; if no PAC URL is discovered using DHCP, then DNS is used.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>kAutoDetectTypeDHCP</td>
<td>Use DHCP to locate the proxy auto-configuration file.</td>
</tr>
<tr>
<td>kAutoDetectTypeDNSA</td>
<td>Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.</td>
</tr>
</tbody>
</table>

AutoConfigUrl: String that contains the configuration URL that receives the proxy data.

Returns true if successful, or false otherwise. For extended error information, call LastError. Among the error codes returned are the following.

WinHTTP implements the Web Proxy Auto-Discovery (WPAD) protocol, often referred to as autoproxy. For more information about well-known locations, see the Discovery Process section of the WPAD protocol document. Note that because the DetectAutoProxyConfigUrl function takes time to complete its operation, it should not be called from a UI thread.

120.62.7 GetDefaultProxyConfiguration as WinHTTPClientProxyInfoMBS

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the default WinHTTP proxy configuration from the registry. **Notes:** Returns the default proxy configuration.

120.62.8 GetIEProxyConfigForCurrentUser as WinHTTPClientCurrentUserIProxyConfigMBS

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the Internet Explorer proxy configuration for the current user.
Notes:
Queries the Internet Explorer proxy settings for the current active network connection (for example, LAN, dial-up, or VPN connection).

see also

120.62.9 GetProxyForHost(URL as string, Host as string, byref proxy as string, byref proxyPort as string, AutoConfigURL as string = ””) as boolean

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Queries the proxy for a host.
**Notes:**
This is an universal functions using InternetGetProxyInfo, DetectAutoProxyUrl and InternetQueryOption.

URL: The target URL.
Host: The hostname of the target server.

Returns true on success and sets proxy and port. Returns false on failure.
AutoConfigURL is only used on first call instead of a configured auto config URL in Internet Explorer.

120.62.10 GetProxyForUrl(URL as string, AutoProxyOptions as WinHTTP-ClientAutoProxyOptionsMBS, byref ProxyInfo as WinHTTPClientProxyInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Retrieves the proxy data for the specified URL.
**Notes:**
Url: Contains the URL of the HTTP request that the application is preparing to send.
AutoProxyOptions: Specifies the auto-proxy options to use.
ProxyInfo: Receives the proxy setting.

If the function succeeds, the function returns true.
If the function fails, it returns false. Lasterror is set.

This function implements the Web Proxy Auto-Discovery (WPAD) protocol for automatically configuring the proxy settings for an HTTP request. The WPAD protocol downloads a Proxy Auto-Configuration (PAC) file, which is a script that identifies the proxy server to use for a given target URL. PAC files are typically deployed by the IT department within a corporate network environment. The URL of the PAC file can
either be specified explicitly or GetProxyForUrl can be instructed to automatically discover the location of the PAC file on the local network.

GetProxyForUrl supports only ECMAScript-based PAC files. GetProxyForUrl must be called on a per-URL basis, because the PAC file can return a different proxy server for different URLs. This is useful because the PAC file enables an IT department to implement proxy server load balancing by mapping (hashing) the target URL (specified by the lpcwszUrl parameter) to a certain proxy in a proxy server array. GetProxyForUrl caches the autoproxy URL and the autoproxy script when auto-discovery is specified in the dwFlags member of the pAutoProxyOptions structure. For more information, see Autoproxy Cache.

see also

120.62.11 InternetGetProxyInfo(URL as string, Host as string) as String

Notes:
This function can only be called by dynamically linking to "JSProxy.dll" (plugin loads this for you). For better autoproxy support, use HTTP Services (WinHTTP) version 5.1 instead.

Url: Specifies the URL of the target HTTP resource.
HostName: Specifies the host name of the target URL.

Returns the URL of the proxy to use in an HTTP request for the specified resource.
Returns empty string on any error.

120.62.12 Open(UserAgent as string, AccessType as Integer, ProxyName as string = "", ProxyByPass as string = "") as boolean

Notes:
IUserAgent: Specifies the name of the application or entity calling the WinInet functions. This name is used as the user agent in the HTTP protocol.
AccessType: Type of access required. This parameter can be one of the following values.

ProxyName: String that specifies the name of the proxy server(s) to use when proxy access is specified
by setting `dwAccessType` to `INTERNET_OPEN_TYPE_PROXY`. Do not use an empty string, because `InternetOpen` will use it as the proxy name. The WinInet functions recognize only CERN type proxies (HTTP only) and the TIS FTP gateway (FTP only). If Microsoft Internet Explorer is installed, these functions also support SOCKS proxies. FTP requests can be made through a CERN type proxy either by changing them to an HTTP request or by using `InternetOpenUrl`. If `dwAccessType` is not set to `INTERNET_OPEN_TYPE_PROXY`, this parameter is ignored and should be NULL. For more information about listing proxy servers, see the Listing Proxy Servers section of Enabling Internet Functionality.

By default, WinInet will bypass the proxy for requests that use the host names "localhost", "loopback", "127.0.0.1", or " [::1] ". This behavior exists because a remote proxy server typically will not resolve these addresses properly.

Internet Explorer 9: You can remove the local computer from the proxy bypass list using the "<loopback>" macro.

If `dwAccessType` is not set to `INTERNET_OPEN_TYPE_PROXY`, this parameter is ignored and should be NULL.

Flags: Options. This parameter can be a combination of the following values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>INTERNET_FLAG_ASYNC</code></td>
<td>Makes only asynchronous requests on handles descended from the handle returned from this function.</td>
</tr>
<tr>
<td><code>INTERNET_FLAG_FROM_CACHE</code></td>
<td>Does not make network requests. All entities are returned from the cache. If the requested item is not in the cache, a suitable error, such as ERROR_FILE_NOT_FOUND, is returned.</td>
</tr>
<tr>
<td><code>INTERNET_FLAG_OFFLINE</code></td>
<td>Identical to <code>INTERNET_FLAG_FROM_CACHE</code>. Does not make network requests. All entities are returned from the cache. If the requested item is not in the cache, a suitable error, such as ERROR_FILE_NOT_FOUND, is returned.</td>
</tr>
</tbody>
</table>

Returns a valid handle that the application passes to subsequent WinInet functions. If Open fails, it returns false. To retrieve a specific error message, call `GetLastError`.

see also
120.62. CLASS WINHTTPCLIENTMBS

120.62.13 SetDefaultProxyConfiguration(info as WinHTTPClientProxyInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Sets the default WinHTTP proxy configuration in the registry.
**Notes:**
see also

SetDefaultProxyConfiguration changes the proxy configuration set by ProxyCfg.exe.
The default proxy configuration set by this function can be overridden for an existing WinHTTP session by
calling SetOption and specifying the OptionProxy flag. The default proxy configuration can be overridden
for a new session by specifying the configuration with the WinHttpOpen function.
The dwAccessType member of the WinHTTPClientProxyInfoMBS structure pointed to by pProxyInfo
should be set to kAccessTypeNamedProxy if a proxy is specified. Otherwise, it should be set to kAc-
cessTypeDefaultProxy.

Any new sessions created after calling this function use the new default proxy configuration.
Even when WinHTTP is used in asynchronous mode (that is, when WINHTTP
FLAG ASYNC has been
set in WinHttpOpen), this function operates synchronously. The return value indicates success or failure.
To get extended error information, call GetLastError.
Note For Windows XP and Windows 2000, see the Run-Time Requirements section of the WinHTTP start
page.

120.62.14 Properties

120.62.15 Handle as Integer

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal reference.
**Notes:**
This is a HINTERNET type.
(Read and Write property)

120.62.16 Lasterror as Integer

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error.
**Notes:**
see also error list:
(Read and Write property)
120.62.17  **LasterrorString as String**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The error message for the last error.  
**Notes:** (Read and Write property)

120.62.18  **OptionConnectTimeOut as Integer**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Get or set the connect timeout.  
**Notes:**  
Lasterror is set.  
Sets or retrieves an unsigned long integer value that contains the time-out value, in milliseconds. Setting this option to infinite (-1) will disable this timer. If a TCP connection request takes longer than this time-out value, the request is canceled. The default timeout is 60 seconds. When you are attempting to connect to multiple IP addresses for a single host (a multihomed host), the timeout limit is for each individual connection.  
(Read and Write property)

120.62.19  **OptionProxyPassword as String**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Get or set the proxy password.  
**Notes:**  
Sets or retrieves a string value that contains the password used to access the proxy. Lasterror is set.  
(Read and Write property)

120.62.20  **OptionProxyUsername as String**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Get or set the proxy user name.  
**Notes:**  
Sets or retrieves a string value that contains the user name used to access the proxy. Lasterror is set.
120.62.21 Constants

120.62.22 kAccessTypeDefaultProxy = 0

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the proxy access types. **Notes:** Applies only when setting proxy information.

120.62.23 kAccessTypeNamedProxy = 3

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the proxy access types. **Notes:** Internet accessed using a proxy.

120.62.24 kAccessTypeNoProxy = 1

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the proxy access types. **Notes:** Internet accessed through a direct connection.

120.62.25 kAutoDetectTypeDHCP = 1

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the auto detect type flags. **Notes:** Use DHCP to locate the proxy auto-configuration file.

120.62.26 kAutoDetectTypeDNSA = 2

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the auto detect type flags. **Notes:** Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.

120.62.27 kInternetSchemeHTTP = 1

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the scheme type constants. **Notes:** HTTP scheme.
MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the scheme type constants. **Notes:** HTTPS scheme.
120.63  class WinHTTPClientProxyInfoMBS

120.63.1  class WinHTTPClientProxyInfoMBS

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for the session or default proxy configuration.
**Notes:**
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.63.2  Methods

120.63.3  Constructor

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The private constructor.

120.63.4  Properties

120.63.5  AccessType as Integer

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The access type.
**Notes:**
Can be kAccessTypeDefaultProxy, kAccessTypeNamedProxy or kAccessTypeNoProxy.
(Read and Write property)

120.63.6  Proxy as String

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The proxy server list.
**Notes:** (Read and Write property)
120.63.7 ProxyBypass as String

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The proxy bypass list. **Notes:** (Read and Write property)

120.63.8 Constants

120.63.9 kAccessTypeDefaultProxy = 0

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the proxy access types. **Notes:** Applies only when setting proxy information.

120.63.10 kAccessTypeNamedProxy = 3

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the proxy access types. **Notes:** Internet accessed using a proxy.

120.63.11 kAccessTypeNoProxy = 1

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the proxy access types. **Notes:** Internet accessed through a direct connection.
120.64.  **class WinHTTPClientURLComponentsMBS**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The class containing the constituent parts of an URL.

**Notes:**
see also
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

120.64.2  **Methods**

120.64.3  **Constructor**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: No, Mac: No, Win: Yes, Linux: No.  **Function:**
The private constructor.

120.64.4  **Properties**

120.64.5  **ExtraInfo as String**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The extra information, for example, ?something or # something.

**Notes:** (Read and Write property)

120.64.6  **ExtraInfoLength as Integer**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The length of the extra information, in characters.

**Notes:** (Read and Write property)

120.64.7  **HostName as String**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The host name.

**Notes:** (Read and Write property)
**120.64.8 HostNameLength as Integer**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Length of the host name, in characters.
**Notes:** (Read and Write property)

**120.64.9 Password as String**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The password.
**Notes:** (Read and Write property)

**120.64.10 PasswordLength as Integer**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Length of the password, in characters.
**Notes:** (Read and Write property)

**120.64.11 Port as Integer**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Port number.
**Notes:** (Read and Write property)

**120.64.12 Scheme as String**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The scheme name.
**Notes:** (Read and Write property)

**120.64.13 SchemeID as Integer**

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Internet protocol scheme.
**Notes:**
Normally 1 for HTTP and 2 for HTTPS.
(Read and Write property)
120.64.14  SchemeLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Length of the scheme name, in characters.
**Notes:** (Read and Write property)

120.64.15  UrlPath as String

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The URL path.
**Notes:** (Read and Write property)

120.64.16  UrlPathLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Length of the URL path, in characters.
**Notes:** (Read and Write property)

120.64.17  UserName as String

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The user name.
**Notes:** (Read and Write property)

120.64.18  UserNameLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Length of the user name, in characters.
**Notes:** (Read and Write property)
Chapter 121

Nikon Cameras

121.1 class NikonCapInfoMBS

121.1.1 class NikonCapInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The class for Capability Information.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

121.1.2 Methods

121.1.3 Constructor

121.1.4 Properties

121.1.5 Description as String

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The description of this capability.  
**Notes:** (Read only property)
121.1.6  ID as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The ID of this property.

**Notes:**
See eNkMAIDCapability in Nikon’s documentation.
(Read only property)

121.1.7  Operations as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The supported operations for this capability.

**Notes:**
See eNkCapOperations in Nikon’s documentation.
(Read only property)

121.1.8  OperationsString as String

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The operation value as a string for displaying.

**Notes:** (Read only property)

121.1.9  Type as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The type of this capability.

**Notes:**
See eNkMAIDCababilityType in Nikon’s documentation.
(Read only property)

121.1.10  TypeString as String

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The type value as a string for displaying.

**Notes:** (Read only property)
121.1. CLASS NIKONCAPINFOMBS

121.1.11 Visibility as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The visibility of this capability.  
**Notes:**  
See eNkCapVisibility in Nikon’s documentation.  
(Read only property)

121.1.12 VisibilityString as String

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The visibility value as a string for displaying.  
**Notes:** (Read only property)
121.2 class NikonFileInfoMBS

121.2.1 class NikonFileInfoMBS

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

121.2.2 Methods

121.2.3 Constructor

121.2.4 Properties

121.2.5 DiskFile as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** True if the file is delivered on disk.  
**Notes:** (Read and Write property)

121.2.6 FileDataType as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** One of eNkMAIDFileDataTypes.  
**Notes:** Possible values:

- kNkMAIDFileType_NotSpecified: 0
- kNkMAIDFileType_JPEG: 1
- kNkMAIDFileType_TIFF: 2
- kNkMAIDFileType_FlashPix: 3
- kNkMAIDFileType_NIF: 4
- kNkMAIDFileType_QuickTime: 5
- kNkMAIDFileType_UserType: & h100
121.2. **CLASS NIKONFILEINFOMBS**

(Read and Write property)

### 121.2.7 Length as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function**: Number of bytes in this delivery.
**Notes**: (Read and Write property)

### 121.2.8 RemoveObject as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function**: True if the object should be removed.
**Notes**: (Read and Write property)

### 121.2.9 Start as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function**: Index of starting byte (0-based)
**Notes**: (Read and Write property)

### 121.2.10 TotalLength as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function**: Total number of bytes to be transferred.
**Notes**: (Read and Write property)
121.3 class NikonImageInfoMBS

121.3.1 class NikonImageInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The class for the Image Data Delivery structure. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

121.3.2 Methods

121.3.3 Bits(index as Integer) as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Number of bits per plane per pixel. **Notes:** Index from 0 to 3.

121.3.4 Constructor

121.3.5 Properties

121.3.6 ColorSpace as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The colorspace. **Notes:** Possible values:

(Read and Write property)

121.3.7 Plane as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The plane configuration.
121.3. **CLASS NIKONIMAGEINFOMBS**

**Notes:** (Read and Write property)

### 121.3.8 Rect as NikonRectMBS

**Notes:** (Read and Write property)

### 121.3.9 RemoveObject as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** True if the object should be removed.  
**Notes:** (Read and Write property)

### 121.3.10 RowBytes as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Number of bytes per row of pixels.  
**Notes:** (Read and Write property)

### 121.3.11 TotalPixels as NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Total size of image to be transferred.
Notes: (Read and Write property)
121.4. **CLASS NIKONLIVEIMAGEMBS**

### 121.4 class NikonLiveImageMBS

#### 121.4.1 class NikonLiveImageMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The class for the live image data structure. **Notes:** As there are 5 variants of the data structure for the different camera SDKs, some fields may not be filled for the camera you have.

#### 121.4.2 Methods

**121.4.3 AFframes(index as UInt32) as NikonRectMBS**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The auto focus frames array. **Notes:**

- Index from 0 to 34 (fixed to 0 for D5100)
- Area of the AF frame size and the AF frame center coordinates for thirty-five persons

#### 121.4.4 Properties

**121.4.5 AFAreaIndex as Integer**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The Autofocus area index. **Notes:**

- From 0 to 34 (fixed to 0 for D5100)
- (Read and Write property)

**121.4.6 AFstate as Integer**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** AF mode status of the face detection system. **Notes:**

- 0: The face detection system is not set to AF.
- 1: The face detection system is set to AF.
- (Read and Write property)
121.4.7 Aperture as Double

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The aperture value.
**Notes:**
Aperture = F number*100
Only for type 2 and 3.
(Read only property)

121.4.8 AutoFocusHeight as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The height of the auto focus area.
**Notes:** (Read and Write property)

121.4.9 AutoFocusWidth as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The width of the auto focus area.
**Notes:** (Read and Write property)

121.4.10 AutoFocusX as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The x coordinate of the auto focus area.
**Notes:** (Read and Write property)

121.4.11 AutoFocusY as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The y coordinate of the auto focus area.
**Notes:** (Read and Write property)

121.4.12 CountDownTime as Integer

121.4. CLASS NIKONLIVEIMAGEMBS

Notes:
Countdown every one second starting from 3600 (one hour); countdown starting from thirty seconds with a rise in temperature.
(Read and Write property)

121.4.13 **DirectionOfRotation as Integer**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The Rotation direction. **Notes:** (Read and Write property)

121.4.14 **DisplayCenterX as Integer**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Display center coordinate. **Notes:** (Read and Write property)

121.4.15 **DisplayCenterY as Integer**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Display center coordinate. **Notes:** (Read and Write property)

121.4.16 **DisplayHeight as Integer**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The height of the display area size. **Notes:** (Read and Write property)

121.4.17 **DisplayWidth as Integer**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The width of the display area size. **Notes:** (Read and Write property)
CHAPTER 121. NIKON CAMERAS

121.4.18 FaceDetectionCount as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The number of persons whose faces are detected by the system. **Notes:** From 0 to 35 (Thirty-five is the maximum number of persons for D5100.) (Read and Write property)

121.4.19 FacePriorityAFMode as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Face priority AF mode. **Notes:**
0: Face priority AF is not active.
1: Face priority AF is active.
(Read and Write property)

121.4.20 FocusDriveState as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Focus driving status. **Notes:**
0: Not driving
1: Driving
(Read and Write property)

121.4.21 FocusResult as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Focusing judgment result. **Notes:**
0: No information
1: Not focused
2: Focused
(Read and Write property)
121.4. **CLASS NIKONLIVEIMAGEMBS**

### 121.4.22 Height as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Height of the JPEG image.  
**Notes:** (Read and Write property)

### 121.4.23 JPEGData as MemoryBlock

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The JPEG data of the live image.  
**Notes:**  
You can use JPEGStringToPictureMBS to decode it.  
(Read and Write property)

### 121.4.24 MovieRecordingInformation as Integer

**Notes:**  
0: During LV execution  
1: During movie recording  
(Read and Write property)

### 121.4.25 RawData as MemoryBlock

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The raw data used to build this image object and the fill the properties.  
**Notes:** (Read and Write property)

### 121.4.26 RemainingMovieRecordingTime as Integer

**Notes:**  
From 0 to 1200000 [ msec ].  
It is valid during the movie recording state.  
(Read and Write property)
121.4.27 SelectedFocusPoint as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The number of the selected focus area. **Notes:**
Range from 0 to 11. (Read and Write property)

121.4.28 ShutterSpeed as Double

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The shutter speed. **Notes:**
Only for type 2 and 3. (Read only property)

121.4.29 TotalHeight as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The total size of the image. **Notes:** (Read and Write property)

121.4.30 TotalWidth as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The total size of the image. **Notes:** (Read and Write property)

121.4.31 Width as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Width of the JPEG image. **Notes:** (Read and Write property)
121.4.32 Constants

121.4.33 kAFStateDriveImpossibility = 0

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the values for state that AF can be driven.  
**Notes:** AF drive impossibility.

121.4.34 kAFStateDrivePossible = 1

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the values for state that AF can be driven.  
**Notes:** AF drive possible.

121.4.35 kDirectionClockWise = 2

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the constants for rotation direction.  
**Notes:** Rotate clockwise

121.4.36 kDirectionCounterClockWise = 1

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the constants for rotation direction.  
**Notes:** Rotate counterclockwise

121.4.37 kDirectionNone = 0

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the constants for rotation direction.  
**Notes:** No rotation

121.4.38 kFacePriorityAFModeActive = 1

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the auto focus modes.  
**Notes:** Active
121.4.39  kFacePriorityAFModeNotActive = 0

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the auto focus modes.
**Notes:** Inactive

121.4.40  kFocusDriveStateDriving = 0

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the focus driving values.
**Notes:** Driving

121.4.41  kFocusDriveStateNotDriving = 1

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the focus driving values.
**Notes:** Not driving.

121.4.42  kFocusResultInFocus = 2

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the focus result values.
**Notes:** In Focus

121.4.43  kFocusResultNoInformation = 0

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the focus result values.
**Notes:** Focused

121.4.44  kFocusResultOutOfFocus = 1

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the focus result values.
**Notes:** Not focused.
121.5  CLASS NIKONMBS

121.5  class NikonMBS

121.5.1  class NikonMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The class to talk to a Nikon camera. **Notes:** You need to get the SDKs yourself for the various cameras, so you have the PDF manuals, the C header files and the shared libraries.

121.5.2  Methods

121.5.3  Acquire as boolean

121.5.4  Async as boolean

121.5.5  AutoFocus as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Performs autofocus. **Notes:** Performs operation kNkMAIDCapability_AutoFocus.

121.5.6  AvailableDatatypes as UInt32

121.5.7  Capabilities(what as Integer) as NikonCapInfoMBS()

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries the list of capabilities.
CHAPTER 121. NIKON CAMERAS

Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.8 CapabilitiesCount(what as Integer) as UInt32

Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.9 Capability(what as Integer, ID as Integer) as NikonCapInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. Function: Queries the capability with given ID.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.10 Capture as boolean

Notes: Performs operation kNkMAIDCapability.Capture.

121.5.11 CloseData

121.5.12 CloseItem

121.5.13 CloseModule

121.5. CLASS NIKONMBS

121.5.14 CloseSource

121.5.15 GetCapBoolean(what as Integer, ID as Integer) as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with a boolean value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.16 GetCapDefaultBoolean(what as Integer, ID as Integer) as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries the default value for a capability with a boolean value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.17 GetCapDefaultDouble(what as Integer, ID as Integer) as Double

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries the default value for a capability with a double value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.18 GetCapDefaultInt32(what as Integer, ID as Integer) as Int32

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries the default value for a capability with an Int32 value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.19 GetCapDefaultPoint(what as Integer, ID as Integer) as NikonPointMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries the default value for a capability with a point value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.
121.5.20  GetCapDefaultRect(what as Integer, ID as Integer) as NikonRectMBS

121.5.21  GetCapDefaultSize(what as Integer, ID as Integer) as NikonSizeMBS

121.5.22  GetCapDefaultString(what as Integer, ID as Integer) as String

121.5.23  GetCapDefaultUInt32(what as Integer, ID as Integer) as UInt32

121.5.24  GetCapDouble(what as Integer, ID as Integer) as Double

121.5.25  GetCapEnumPacketString(what as Integer, ID as Integer, byref current as UInt32) as string()

121.5. CLASS NIKONMBS

121.5.26 GetCapEnumString(what as Integer, ID as Integer, byref current as UInt32) as string()

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with a string enum value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.27 GetCapEnumUInt32(what as Integer, ID as Integer, byref current as UInt32) as UInt32()

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with an enum UInt32 value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.28 GetCapInt32(what as Integer, ID as Integer) as Int32

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with an Int32 value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.29 GetCapPoint(what as Integer, ID as Integer) as NikonPointMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with a point value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.30 GetCapRange(what as Integer, ID as Integer, byref Value as Double, byref DefaultValue as Double, byref ValueIndex as UInt32, byref DefaultValueIndex as UInt32, byref LowerValue as Double, byref UpperValue as Double, byref Steps as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with a range value. **Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.
121.5.31 GetCapRect(what as Integer, ID as Integer) as NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with a rectangle value.  
**Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.32 GetCapSize(what as Integer, ID as Integer) as NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with a size value.  
**Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.33 GetCapString(what as Integer, ID as Integer) as String

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with a string value.  
**Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.34 GetCapUInt32(what as Integer, ID as Integer) as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a capability with an(UInt32) value.  
**Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.35 GetItemCount as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries number of items.

121.5.36 GetLiveViewImage(type as Integer) as NikonLiveImageMBS

**Notes:** Performs kNkMAIDCapability_GetLiveViewImage and decodes data returned into a NikonLiveImageMBS object.
121.5. CLASS NIKONMBS

Type: Which type of device you have. Value from 1 to 5.

121.5.37 GetSourceCount as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries the number of sources (cameras).

121.5.38 GetVideoImageData(Offset as UInt32, BlockSize as UInt32) as String

MBS Cameras Plugin, Plugin Version: 13.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries data of a video file. **Notes:** Please use OpenData before to open the video.

121.5.39 GetVideoImageDataSize as UInt32

MBS Cameras Plugin, Plugin Version: 13.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries data size of a video. **Notes:** Please use OpenData before to open the video.

121.5.40 LoadLibrary(file as folderitem) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Loads the Nikon shard library. **Notes:** Returns true on success. Please pass folderitem pointing to dll on Windows and dylib on Mac OS X. See also:

- 121.5.41 LoadLibrary(path as string) as boolean

121.5.41 LoadLibrary(path as string) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Loads the Nikon shard library. **Notes:** Returns true on success. Please pass string path pointing to dll on Windows and dylib on Mac OS X. See also:
**121.5.42 OpenData(type as UInt32) as boolean**

**Notes:**

**121.5.43 OpenItem(index as UInt32) as boolean**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Opens the item with the given index.

**Notes:** Index is zero based.

**121.5.44 OpenModule as boolean**

**121.5.45 OpenSource(index as UInt32) as boolean**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Opens the source with the given index.

**Notes:** Index is zero based.

**121.5.46 PreCapture as boolean**

**Notes:** Performs operation kNkMAIDCapability_PreCapture.

**121.5.47 SetCapBoolean(what as Integer, ID as Integer, value as Boolean)**

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Sets a capability with a boolean value.

**Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.
121.5.48  SetCapDouble(what as Integer, ID as Integer, value as Double)

**Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.49  SetCapEnumPackedString(what as Integer, ID as Integer, EnumIndex as UInt32) as boolean

**Notes:**
What: Selects what to query. Can be kModule, kSource, kItem or kData.
You first query the enum to get the list of options, than you can set a new one by passing index here.

121.5.50  SetCapEnumUInt32(what as Integer, ID as Integer, Value as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Sets a capability with an enum UInt32 value.
**Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.51  SetCapInt32(what as Integer, ID as Integer, value as Int32)

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Sets a capability with an Int32 value.
**Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.

121.5.52  SetCapPoint(what as Integer, ID as Integer, value as NikonPointMBS)

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Sets a capability with a point value.
**Notes:** What: Selects what to query. Can be kModule, kSource, kItem or kData.
121.5.53 SetCapRange(what as Integer, ID as Integer, Value as Double, ValueIndex as UInt32) as boolean

121.5.54 SetCapRect(what as Integer, ID as Integer, value as NikonRectMBS)

121.5.55 SetCapSize(what as Integer, ID as Integer, value as NikonSizeMBS)

121.5.56 SetCapString(what as Integer, ID as Integer, value as String)

121.5.57 SetCapUInt32(what as Integer, ID as Integer, value as UInt32)

121.5.58 Properties

121.5.59 FunctionPtr as Integer

121.5.60 Lasterror as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The last error code.
**Notes:** (Read only property)

121.5.61 LoadErrorMessage as String

MBS Cameras Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The error message from loading library.
**Notes:**
Set by LoadLibrary methods to help debugging.

Windows error 193 means that 64-bit Xojo app tried to load 32-bit library or 32-bit Xojo app tried to load 64-bit library. The bit level must match between app and library. For Mac OS X the error message will tell you about wrong architecture.
(Read only property)

121.5.62 Events

121.5.63 FileDownloadComplete(info as NikonFileInfoMBS, data as Memoryblock, length as Integer)

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Informs you about a finished file download.

121.5.64 ImageDownloadComplete(info as NikonImageInfoMBS, data as Memoryblock, length as Integer)

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event informs you about a finished event.
121.5.65  Progress(Command as Integer, Param as Integer, Done as UInt32, Total as UInt32, Percent as Double)

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event informs you about progress of an ongoing operation.

121.5.66  Constants

121.5.67  kData = 8

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the selector constants. **Notes:** Apply to data.

121.5.68  kDataObjTypeFile = 16

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the data object types. **Notes:** Other file

121.5.69  kDataObjTypeImage = 1

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the data object types. **Notes:** Image file

121.5.70  kDataObjTypeSound = 2

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the data object types. **Notes:** Sound file

121.5.71  kDataObjTypeThumbnail = 8

MBS Cameras Plugin, Plugin Version: 13.1. **Function:** One of the data object types. **Notes:** Picture thumbnail
121.5.72 \( \text{kDataObjTypeVideo} = 4 \)

MBS Cameras Plugin, Plugin Version: 13.1. **Function**: One of the data object types. 
**Notes**: Video file

121.5.73 \( \text{kDevice} = 2 \)

MBS Cameras Plugin, Plugin Version: 13.1. **Function**: One of the selector constants. 
**Notes**: Apply to device/source.

121.5.74 \( \text{kItem} = 4 \)

MBS Cameras Plugin, Plugin Version: 13.1. **Function**: One of the selector constants. 
**Notes**: Apply to item.

121.5.75 \( \text{kModule} = 1 \)

MBS Cameras Plugin, Plugin Version: 13.1. **Function**: One of the selector constants. 
**Notes**: Apply to module.

121.5.76 \( \text{kSource} = 2 \)

MBS Cameras Plugin, Plugin Version: 13.1. **Function**: One of the selector constants. 
**Notes**: Apply to device/source.
121.6  class NikonPointMBS

121.6.1  class NikonPointMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No.  **Function:**  The class for a point.

121.6.2  Methods

121.6.3  Constructor(x as Integer = 0, y as Integer = 0)

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No.  **Function:**  The constructor.

121.6.4  Operator_Convert as String

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No.  **Function:**  Converts the point to a string for displaying.

121.6.5  Properties

121.6.6  x as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No.  **Function:**  The x coordinate.
**Notes:**  (Read and Write property)

121.6.7  y as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No.  **Function:**  The y coordinate.
**Notes:**  (Read and Write property)
121.7  class NikonRectMBS

121.7.1  class NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The class for a rectangle.

121.7.2  Methods

121.7.3  Constructor(x as Integer = 0, y as Integer = 0, w as Integer = 0, h as Integer = 0)

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The constructor.

121.7.4  Operator_Convert as String

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts the rectangle to a string for displaying.

121.7.5  Properties

121.7.6  h as Integer

**Notes:** (Read and Write property)

121.7.7  w as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The width of the rectangle.  
**Notes:** (Read and Write property)
121.7.8  x as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The x coordinate of the rectangle.  
**Notes:** (Read and Write property)

121.7.9  y as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The y coordinate of the rectangle.  
**Notes:** (Read and Write property)
121.8. CLASS NIKONSIZEMBS

121.8  class NikonSizeMBS

121.8.1  class NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The class for a size.

121.8.2  Methods

121.8.3  Constructor(w as Integer = 0, h as Integer = 0)

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The constructor.

121.8.4  Operator_Convert as String

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Converts the size to a string for displaying.

121.8.5  Properties

121.8.6  h as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The height of the size object. 
**Notes:** (Read and Write property)

121.8.7  w as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The width of the size object. 
**Notes:** (Read and Write property)
Chapter 122

Notifications

122.1 class MacNotificationMBS

122.1.1 class MacNotificationMBS

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: A class to notify the user.

122.1.2 Methods

122.1.3 Show

Example:

```
    dim n as MacNotificationMBS ' in the window
    n=new MacNotificationMBS ' in the open event
    n.message="Hello world"
    n.show
```
122.1.4 Properties

122.1.5 FlashIcon as boolean

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Should the icon flash in the menubar?

**Example:**

```vbnet
dim n as MacNotificationMBS // in the window
n=new MacNotificationMBS // in the open event
n.message="Hello world"
n.FlashIcon=true
n.show
```

**Notes:** (Read and Write property)

122.1.6 IconID as Integer

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An ID of a SICN Ressource in the app’s ressources to use when flashing the icon.

**Example:**

```vbnet
dim n as MacNotificationMBS // in the window
n=new MacNotificationMBS // in the open event
n.message="Hello world"
n.flashicon=true
n.iconid=128
n.show
```

**Notes:** (Read and Write property)

122.1.7 mark as boolean

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Should the app be marked in the application menu?

**Example:**

```vbnet
dim n as MacNotificationMBS // in the window
```
122.1. CLASS MACNOTIFICATIONMBS

n=new MacNotificationMBS // in the open event
n.message="Hello world"
n.mark=true
n.show

Notes: (Read and Write property)

122.1.8 Message as string

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The text to be displayed to the user.

**Example:**

```pascal
dim n as MacNotificationMBS // in the window
n=new MacNotificationMBS // in the open event
n.message="Hello world"
n.show
```

Notes:
May be empty to just bounce the Icon in the dock.
(Read and Write property)

122.1.9 PlaySystemSound as boolean

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Plays the system sound when the dialog is shown.

**Example:**

```pascal
dim n as MacNotificationMBS // in the window
n=new MacNotificationMBS // in the open event
n.PlaySystemSound=true
n.message="Hello world"
n.show
```

Notes:
other sounds will be supported in the next release.
(Read and Write property)
122.2. class NotificationCenterMBS

122.2.1 class NotificationCenterMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for notifications sent on Mac OS X.

**Notes:**

From Apple’s help, but modified:

Distributed notifications allow an application to broadcast a message to any number of other applications without needing to know who those other applications are, or even if the other applications exist. Every application type Cocoa, Carbon, BSD can use distributed notifications.

An application, the target application in this case, expresses an interest in receiving a broadcasted message by registering itself with the system’s distributed notification center, identifying exactly what message, or notification type, it wants to receive. The notification type is defined by an arbitrary string agreed upon by the sender and receiver of the notification. As an example, Cocoa’s NSWindow class defines the notification type "NSWindowDidCloseNotification", which an NSWindow instance broadcasts when its window closes. Any other object can register to receive this notification. (This notification, however, is internal to a single application and is not distributed to the rest of the system.)

In addition to the message, the application can identify the particular object sending the message. When the sender and receiver are in the same application in other words, using nondistributed notificationsthe observed object can be anything. When using distributed notifications, though, the object must be a string. A useful choice for the observed string is the bundle identifier of the target application.

In registering for the notification, the application provides a class with an Receive event, which will later be called.

Next, the broadcasting application your preference pane sends the notification. It calls the system’s notification center, tells the center what notification to send, and optionally passes a dictionary containing additional information. The dictionary can be used to pass the modified preferences directly to the application. Or, the preference pane can choose not to use the dictionary and instead write the changes out to disk. The notification is then used to tell the application to update its preferences from the disk.

The notification center looks up all the applications that registered to receive the given notification type from the particular instance. It then notifies each application’s run loop of the notification and gives it a copy of the dictionary. The selected callback function or method is executed during the application’s next pass through its run loop.

When using Preference Services, be certain to flush changes to the disk with the appropriate synchronize functions before sending notifications of changes. Otherwise, due to the caching performed by Preference...
Services, the disk may not accurately reflect the changes when the target receives the notification. Likewise, the target application must resynchronize its preferences after receiving the notification.

### 122.2.2 Methods

#### 122.2.3 Add(name as CFStringMBS, obj as CFObjectMBS, flags as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a new callback. **Notes:**

This function costs around 24 bytes of memory per call which are never released (needed for the callback between framework and RB).

Values for the flags:

<table>
<thead>
<tr>
<th>CFNotificationSuspensionBehaviorDrop</th>
<th>1. The server will not queue any notifications with this name and object while the process/app is in the background.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CFNotificationSuspensionBehaviorCoalesce</td>
<td>2. The server will only queue the last notification of the specified name and object; earlier notifications are dropped.</td>
</tr>
<tr>
<td>CFNotificationSuspensionBehaviorHold</td>
<td>3. The server will hold all matching notifications until the queue has been filled (queue size determined by the server) at which point the server may flush queued notifications.</td>
</tr>
<tr>
<td>CFNotificationSuspensionBehaviorDeliverImmediately</td>
<td>4. The server will deliver notifications matching this registration whether or not the process is in the background. When a notification with this suspension behavior is matched, it has the effect of first flushing any queued notifications.</td>
</tr>
</tbody>
</table>

#### 122.2.4 close(name as CFStringMBS, obj as CFObjectMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the given callback.

#### 122.2.5 closeAll

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes all registered callbacks. **Notes:** This is called by the destructor.
122.2. CLASS NOTIFICATIONCENTERMBS

122.2.6 Post(name as CFStringMBS, obj as CFObj ectMBS, userinfo as CFDictionaryMBS, deliverImmediately as Boolean)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Posts a new notification.
**Notes:** Obj and userinfo may be nil.

See also:

- 122.2.7 Post(name as CFStringMBS, obj as CFObj ectMBS, userinfo as CFDictionaryMBS, options as Integer)

122.2.7 Post(name as CFStringMBS, obj as CFObj ectMBS, userinfo as CFDictionaryMBS, options as Integer)

MBS MacCF Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Posts a new notification.
**Example:**
```
dim n as new NotificationCenterMBS
n.Post(NewCFStringMBS("test"), nil, nil, n.kCFNotificationPostToAllSessions + n.kCFNotificationDeliverImmediately)
```

**Notes:**
Obj and userinfo may be nil.
Requires Mac OS X 10.3.
For options you can use a combination with kCFNotificationDeliverImmediately=1 and kCFNotificationPostToAllSessions=2.

See also:

- 122.2.6 Post(name as CFStringMBS, obj as CFObj ectMBS, userinfo as CFDictionaryMBS, deliverImmediately as Boolean)

122.2.8 Properties

122.2.9 Available as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the needed framework was successfully loaded.
**Notes:** (Read only property)
122.2.10 Events

122.2.11 Received(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS)

MBS MacCF Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A notification was received. **Notes:** All parameters may be for any reason nil.

122.2.12 Constants

122.2.13 kCFNotificationDeliverImmediately = 1

MBS MacCF Plugin, Plugin Version: 7.4. **Function:** One of the constant you can use for the Post Method.

122.2.14 kCFNotificationPostToAllSessions = 2

MBS MacCF Plugin, Plugin Version: 7.4. **Function:** One of the constant you can use for the Post Method.
122.3.  CLASS NOTIFICATIONMBS

122.3  class NotificationMBS

122.3.1  class NotificationMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The class for an application internal notification.
Example:

```
dim n as new NotificationMBS("DatabaseChangedNotification")
NotificationMBS.send(n)
```

Notes:

The point of notifications is to inform some other part of your application about something. For example a
chart updating if the user enters data in textfields.

So you register for notifications in existing classes/windows with the NotificationReceiverMBS interface. Or
you create a subclass of the NotificationObserverMBS class to receive notifications

All notifications are delivered on the same thread as the send method. If needed we could have an asyncron
notification system. Please email for that.

Other notifications:

NSNotification: Notifications send from the Cocoa frameworks within your application over NSNotificationCenterMBS class or send across all applications with NSDistributedNotificationCenterMBS.

MacNotificationMBS: A notification message to the user which may have a sound, a message box and/or a
jumping dock icon.

122.3.2  Methods

122.3.3  Constructor(name as string = "", ref as Variant = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new notification with the given values.
Example:

```
dim n as new NotificationMBS("DatabaseChangedNotification")
NotificationMBS.send(n)
```
122.3.4 RegisterReceiver(target as NotificationReceiverMBS, name as string = "", ref as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Registers a receiver.
Notes:
You have a class/window and you add NotificationReceiverMBS to the interfaces. Real Studio will add a ReceivedNotification method which looks like this:

ReceivedNotification(name as string, ref as Variant, tag as Variant, notification as NotificationMBS)

Don’t forget to call UnregisterReceiver later in the Close event or destructor.

If you register with name = "" and ref = nil, you receive all notifications. If you have a name, you get only notifications matching the name (case sensitive compare). If you have a reference object, you receive only objects for that object. And you can use both name and object.

122.3.5 Send(name as string, ref as object = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sends a notification.
Example:
NotificationMBS.Send("DatabaseChangedNotification")

Notes:
This is a convenience method which creates a new NSNotificationMBS object and sends it.

All registered receivers will get the ReceivedNotification method called as well as all registered observers will get an ReceivedNotification event.
Of course notifications are filtered by name and/or referenced object.
See also:

• 122.3.6 Send(notification as NotificationMBS)
122.3. CLASS NOTIFICATIONMBS

122.3.6 Send(notification as NotificationMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sends a notification.
Example:

```vbg
dim n as new NotificationMBS("DatabaseChangedNotification")
NotificationMBS.send(n)
```

Notes:
All registered receivers will get the ReceivedNotification method called as well as all registered observers will
get an ReceivedNotification event.
Of course notifications are filtered by name and/or referenced object.
See also:

- 122.3.5 Send(name as string, ref as object = nil, tag as Variant = nil)

122.3.7 SendDelayed(name as string, ref as object = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sends a notification.
Example:

```vbg
NotificationMBS.SendDelayed("DatabaseChangedNotification")
```

Notes: Same as Send method, but the notification will be delivered later on the main thread. The notification
is queued and will wait until there is free CPU time.
See also:

- 122.3.8 SendDelayed(notification as NotificationMBS)

122.3.8 SendDelayed(notification as NotificationMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sends a notification.
Example:

```vbg
dim n as new NotificationMBS("DatabaseChangedNotification", window1, "test")
NotificationMBS.SendDelayed(n)
```

Notes: Same as Send method, but the notification will be delivered later on the main thread. The notification
is queued and will wait until there is free CPU time.
122.3.9  **SendNotification**

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sends this notification.
Example:

```vbs
dim n as new NotificationMBS("DatabaseChangedNotification")
n.SendNotification
```

Notes:
All registered receivers will get the ReceivedNotification method called as well as all registered observers will get an ReceivedNotification event.
Of course notifications are filtered by name and/or referenced object.

122.3.10  **SendNotificationDelayed**

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sends a notification.
Example:

```vbs
dim n as new NotificationMBS("DatabaseChangedNotification")
n.SendNotificationDelayed
```

Notes: Same as SendNotification method, but the notification will be delivered later on the main thread.
The notification is queued and will wait until there is free CPU time.

122.3.11  **UnregisterReceiver(target as NotificationReceiverMBS)**

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Unregisters an receiver.
122.3.12 Properties

122.3.13 Name as String

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The name for the notification.
Example:
```vbnet
dim n as new NotificationMBS(”DatabaseChangedNotification”, window1, ”test”)
MsgBox n.Name
```
Notes: (Read and Write property)

122.3.14 Ref as Variant

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The reference object.
Notes:
Defines which object the notification references. If nil, you target all objects.
(Read and Write property)

122.3.15 Tag as Variant

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The attached value.
Example:
```vbnet
dim n as new NotificationMBS
n.Tag = ”Hello World”
```
Notes:
You can use this property as you like.
This value is sent to the receivers. It allows you to pass an additional value without needing to write a subclass of the NotificationMBS class.
(Read and Write property)
122.4 class NotificationObserverMBS

122.4.1 class NotificationObserverMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. 
**Function:** The class for receiving notifications.

122.4.2 Methods

122.4.3 Constructor(name as string = "", ref as object = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. 
**Function:** Creates a new notification observer. 
**Notes:** If you register with name = "" and ref = nil, you receive all notifications. If you have a name, you get only notifications matching the name (case sensitive compare). If you have a reference object, you receive only objects for that object. And you can use both name and object.

122.4.4 Properties

122.4.5 Name as String

**Function:** The name of the notification to listen for. 
**Notes:** (Read only property)

122.4.6 Ref as Object

**Function:** The target object to listen for. 
**Notes:** (Read only property)
122.4.7 Events

122.4.8 ReceivedNotification(name as string, ref as Variant, tag as Variant, notification as NotificationMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.
Function: The event called if a notification was received.
Notes:
This event is registered automatically, so do not call RegisterReceiver with the NotificationObserverMBS object.

If you register with name = "" and ref = nil, you receive all notifications. If you have a name, you get only notifications matching the name (case sensitive compare). If you have a reference object, you receive only objects for that object. And you can use both name and object.
122.5 class NSDistributedNotificationCenterMBS

122.5.1 class NSDistributedNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The NSDistributedNotificationCenter class provides a way to send notifications to objects in other tasks.
**Notes:**
It takes NSNotification objects and broadcasts them to any objects in other tasks that have registered for
the notification with their task’s default distributed notification center.

The NSDistributedNotificationCenter class implements a notification center that can distribute notifications
asynchronously to tasks other than the one in which the notification was posted. An instance of this class
are known as a distributed notification center.

Each task has a default distributed notification center that you access with the defaultCenter class method.
There may be different types of distributed notification centers. Currently there is a single typeNSLocal-
NotificationCenterType. This type of distributed notification center handles notifications that can be sent
between tasks on a single computer. For communication between tasks on different computers, use Dis-
tributed Objects Programming Topics.

Posting a distributed notification is an expensive operation. The notification gets sent to a system-wide
server that distributes it to all the tasks that have objects registered for distributed notifications. The la-
tency between posting the notification and the notification’s arrival in another task is unbounded. In fact,
when too many notifications are posted and the server’s queue fills up, notifications may be dropped.
Subclass of the NSNotificationCenterMBS class.

122.5.2 Methods

122.5.3 addObserver(observer as NSNotificationObserverMBS, name as string,
theObject as Variant, suspensionBehavior as Integer)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Adds an entry to the receiver’s dispatch table with a specific observer and suspended-notifications behavior,
and optional notification name and sender.
**Notes:**
observer: Object registering as an observer. Must not be nil.
name: The name of the notification for which to register the observer; that is, only notifications with this
name are delivered to the observer. When nil, the notification center doesn’t use a notification’s name to
decide whether to deliver it to the observer.
theObject: The object whose notifications the observer wants to receive; that is, only notifications sent by
this sender are delivered to the observer. When nil, the notification center doesn’t use a notification’s sender
to decide whether to deliver it to the observer.
suspensionBehavior: Notification posting behavior when notification delivery is suspended.

The receiver does not retain notificationObserver. Therefore, you should always send removeObserver to the receiver before releasing notificationObserver.

122.5.4 Constructor

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new instance with the default distributed notification center, representing the local notification center for the computer.

**Notes:**

Default distributed notification center for the computer.

This method calls notificationCenterForType: with an argument of NSLocalNotificationCenterType.

122.5.5 defaultCenter as NSDistributedNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default distributed notification center, representing the local notification center for the computer.

**Notes:**

Default distributed notification center for the computer.

This method calls notificationCenterForType: with an argument of NSLocalNotificationCenterType.

122.5.6 notificationCenterForType(name as string) as NSDistributedNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the distributed notification center for a particular notification center type.

**Notes:**

name: Notification center type being inquired about.

Currently only one type, NSLocalNotificationCenterType, is supported.
122.5.7 **NSLocalNotificationCenterType as string**

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
This constant specifies the notification center type.
**Notes:** Distributes notifications to all tasks on the sender’s computer.

122.5.8 **postNotificationName(name as string, theObject as string, userInfo as dictionary, deliverImmediately as boolean)**

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a notification with information and an immediate-delivery specifier, and posts it to the receiver.
**Notes:**
name: Name of the notification to post. Must not be nil.
theObject: Sender of the notification. May be "".
userInfo: Dictionary containing additional information. May be nil.
deliverImmediately: Specifies when to deliver the notification. When false, the receiver delivers notifications to their observers according to the suspended-notification behavior specified in the corresponding dispatch table entry. When true, the receiver delivers the notification immediately to its observers.

This is the preferred method for posting notifications.
The notificationInfo dictionary is serialized as a property list, so it can be passed to another task. In the receiving task, it is deserialized back into a dictionary. This serialization imposes some restrictions on the objects that can be placed in the notificationInfo dictionary. See XML Property Lists for details.
**See also:**
- 122.5.9 postNotificationName(name as string, theObject as string, userInfo as dictionary, options as UInt32)

122.5.9 **postNotificationName(name as string, theObject as string, userInfo as dictionary, options as UInt32)**

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a notification with information, and posts it to the receiver.
**Example:**
```dim notifyData as string = "Hello World"
dim notifyName as string = "Test"
Dim notifyDict As New Dictionary
notifyDict.Value("nData")=notifyData
NSDistributedNotificationCenterMBS.DefaultCenter.postNotificationName(notifyName, "", notifyDict, 2)```
name: Name of the notification to post. Must not be nil.
theObject: Sender of the notification. May be "".
userInfo: Dictionary containing additional information. May be nil.
options: Specifies how the notification is posted to the task and when to deliver it to its observers.

The userInfo dictionary is serialized as a property list, so it can be passed to another task. In the receiving
task, it is deserialized back into a dictionary. This serialization imposes some restrictions on the objects that
can be placed in the notificationInfo dictionary. See XML Property Lists for details.
See also:

- 122.5.8 postNotificationName(name as string, theObject as string, userInfo as dictionary, deliverImmediately as boolean)

122.5.10 Properties

122.5.11 suspended as boolean

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A boolean value that indicates whether notification delivery is suspended.

**Notes:**
The NSApplication class automatically suspends distributed notification delivery when the application is
not active. Applications based on the Application Kit framework should let AppKit manage the suspension
of notification delivery. Foundation-only programs may have occasional need to use this method.
(Read and Write computed property)

122.5.12 Constants

122.5.13 NSNotificationDeliverImmediately = 1

MBS MacBase Plugin, Plugin Version: 9.7. **Function:** One of the option constants to specify the behavior
of notifications posted using the postNotificationName method.

**Notes:** When set, the notification is delivered immediately to all observers, regardless of their suspension
behavior or suspension state. When not set, allows the normal suspension behavior of notification observers
to take place.

122.5.14 NSNotificationPostToAllSessions = 2

MBS MacBase Plugin, Plugin Version: 9.7. **Function:** One of the option constants to specify the behavior
of notifications posted using the postNotificationName method.
Notes: When set, the notification is posted to all sessions. When not set, the notification is sent only to applications within the same login session as the posting task.

122.5.15 NSNotificationSuspensionBehaviorCoalesce = 2

MBS MacBase Plugin, Plugin Version: 9.7. Function: One of the constants to specify the types of notification delivery suspension behaviors.
Notes: The server only queues the last notification of the specified name and object; earlier notifications are dropped. In cover methods for which suspension behavior is not an explicit argument, NSNotificationSuspensionBehaviorCoalesce is the default.

122.5.16 NSNotificationSuspensionBehaviorDeliverImmediately = 4

MBS MacBase Plugin, Plugin Version: 9.7. Function: One of the constants to specify the types of notification delivery suspension behaviors.
Notes: The server delivers notifications matching this registration irrespective of whether Suspended is set to true. When a notification with this suspension behavior is matched, it has the effect of first flushing any queued notifications. The effect is as if setSuspended: with an argument of false were first called if the application is suspended, followed by the notification in question being delivered, followed by a transition back to the previous suspended or unsuspended state.

122.5.17 NSNotificationSuspensionBehaviorDrop = 1

MBS MacBase Plugin, Plugin Version: 9.7. Function: One of the constants to specify the types of notification delivery suspension behaviors.
Notes: The server does not queue any notifications with this name and object until Suspended is set to false.

122.5.18 NSNotificationSuspensionBehaviorHold = 3

MBS MacBase Plugin, Plugin Version: 9.7. Function: One of the constants to specify the types of notification delivery suspension behaviors.
Notes: The server holds all matching notifications until the queue has been filled (queue size determined by the server), at which point the server may flush queued notifications.
122.6 class NSNotificationCenterMBS

122.6.1 class NSNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSNotificationCenter object (or simply, notification center) provides a mechanism for broadcasting information within a task.

**Notes:**

An NSNotificationCenter object is essentially a notification dispatch table.

This is for sending broadcast messages from one application to other application on same computer. For the notification center in Mac OS X 10.8, please use NSUserNotificationMBS class.

122.6.2 Methods

122.6.3 addObserver(observer as NSNotificationObserverMBS, name as string="", theObject as Variant=nil)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an entry to the receiver’s dispatch table with an observer and optional criteria: notification name and sender.

**Notes:**

observer: Object registering as an observer. This value must not be nil.
name: The name of the notification for which to register the observer; that is, only notifications with this name are delivered to the observer. If you pass nil, the notification center doesn’t use a notification’s name to decide whether to deliver it to the observer.
theObject: The object whose notifications the observer wants to receive; that is, only notifications sent by this sender are delivered to the observer. If you pass nil, the notification center doesn’t use a notification’s sender to decide whether to deliver it to the observer.

122.6.4 Constructor

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new instance of notification center pointing to the default notification center.

**Notes:** The current task’s default notification center, which is used for system notifications.
122.6.5 defaultCenter as NSNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the task’s default notification center.
**Notes:** The current task’s default notification center, which is used for system notifications.

122.6.6 postNotification(notification as NSNotificationMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Posts a given notification to the receiver.
**Notes:** notification: The notification to post. This value must not be nil.

122.6.7 postNotificationName(name as string)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a notification with a given name and sender and posts it to the receiver.
**Notes:**
name: The name of the notification.
theObject: The object posting the notification.
See also:
- 122.6.8 postNotificationName(name as string, theObject as Variant) 17216
- 122.6.9 postNotificationName(name as string, theObject as Variant, userInfo as dictionary) 17217

122.6.8 postNotificationName(name as string, theObject as Variant)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a notification with a given name and sender and posts it to the receiver.
**Notes:**
name: The name of the notification.
theObject: The object posting the notification.
See also:
- 122.6.7 postNotificationName(name as string) 17216
- 122.6.9 postNotificationName(name as string, theObject as Variant, userInfo as dictionary) 17217
### 122.6.9 postNotificationName(name as string, theObject as Variant, userInfo as dictionary)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a notification with a given name, sender, and information and posts it to the receiver.

**Notes:**
- name: The name of the notification.
- theObject: The object posting the notification.
- userInfo: Information about the the notification. May be nil.

This method is the preferred method for posting notifications. 
See also:

- 122.6.7 postNotificationName(name as string)
- 122.6.8 postNotificationName(name as string, theObject as Variant)

### 122.6.10 removeObserver(observer as NSNotificationObserverMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all the entries specifying a given observer from the receiver’s dispatch table.

**Notes:**
- observer: The observer to remove. Must not be nil.

Be sure to invoke this method before notificationObserver or any object specified in addObserver is deallocated.
See also:

- 122.6.11 removeObserver(observer as NSNotificationObserverMBS, name as string, theObject as Variant=\text{nil})

### 122.6.11 removeObserver(observer as NSNotificationObserverMBS, name as string, theObject as Variant=\text{nil})

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes matching entries from the receiver’s dispatch table.

**Notes:**
- notificationObserver: Observer to remove from the dispatch table. Specify an observer to remove only entries for this observer. Must not be nil, or message will have no effect.
- notificationName: Name of the notification to remove from dispatch table. Specify a notification name to remove only entries that specify this notification name. When nil, the receiver does not use notification names as criteria for removal.
notificationSender: Sender to remove from the dispatch table. Specify a notification sender to remove only entries that specify this sender. When nil, the receiver does not use notification senders as criteria for removal.

Be sure to invoke this method before the observer object or any object specified in addObserver is deallocated. See also:

- 122.6.10 removeObserver(observer as NSNotificationObserverMBS)

122.6.12 Properties

122.6.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the notification center. **Notes:** (Read and Write property)
122.7 class NSNotificationMBS

122.7.1 class NSNotificationMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSNotification objects encapsulate information so that it can be broadcast to other objects by an NSNotificationCenter object. **Notes:**

An NSNotification object (referred to as a notification) contains a name, an object, and an optional dictionary. The name is a tag identifying the notification. The object is any object that the poster of the notification wants to send to observers of that notification (typically, it is the object that posted the notification). The dictionary stores other related objects, if any. NSNotification objects are immutable objects.

You can create a notification object with the class method notificationWithName. However, you don’t usually create your own notifications directly. The NSNotificationCenter method postNotificationName allow you to conveniently post a notification without creating it first.

On Windows you can use WinNotificationMBS class for similar functionality.

This is for sending broadcast messages from one application to other application on same computer. For the notification center in Mac OS X 10.8, please use NSUserNotificationMBS class.

122.7.2 Methods

122.7.3 Constructor(handle as Integer)

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a notification object with a NSNotification reference. **Notes:** The object is retained and later in destructor it is released.

See also:

- 122.7.4 Constructor(name as string, theObject as Variant = nil, userInfo as dictionary = nil)

122.7.4 Constructor(name as string, theObject as Variant = nil, userInfo as dictionary = nil)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a notification object with a specified name, object, and user information. **Example:**

```dim n as new NSNotificationMBS("Hello") MsgBox n.name```
Notes:
name: The name for the new notification. May not be nil.
theObject: The object for the new notification. Can be nil.
userInfo: The user information dictionary for the new notification. May be nil.
See also:
- 122.7.3 Constructor(handle as Integer)

122.7.5 notificationWithName(name as string, theObject as Variant = nil, userInfo as dictionary = nil) as NSNotificationMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a notification object with a specified name, object, and user information.

**Example:**

dim n as NSNotificationMBS = NSNotificationMBS.notificationWithName(“Hello”) 
MsgBox n.name

Notes:
name: The name for the new notification. May not be nil.
theObject: The object for the new notification. Can be nil.
userInfo: The user information dictionary for the new notification. May be nil.

122.7.6 Print

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes description for this event descriptor to the console.

**Notes:** You can see result in Console.app.

122.7.7 Properties

122.7.8 description as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The descriptor for this notification.

**Example:**
dim n as NSNotificationMBS = NSNotificationMBS.notificationWithName("Hello")
MsgBox n.description

Notes:
This is a text representation for debugging.
(Read only property)

### 122.7.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal reference to the NSNotification object.
Notes: (Read and Write property)

### 122.7.10 name as string

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the name of the notification.
Notes:
The name of the notification. Typically you use this method to find out what kind of notification you are dealing with when you receive a notification.
Notification names can be any string. To avoid name collisions, you might want to use a prefix that’s specific to your application.
(Read only property)

### 122.7.11 objectHandle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The reference to the object.
Notes:
May be useful for declares.
(Read only property)

### 122.7.12 objectVariant as Variant

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the object associated with the notification.
CHAPTER 122. NOTIFICATIONS

Notes:
The object associated with the notification. This is often the object that posted this notification. It may be nil.
Typically you use this method to find out what object a notification applies to when you receive a notification.

See the FAQ for the list of supported NSObject types for variant conversion.
(Read only property)

122.7.13 userInfo as dictionary

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the user information dictionary associated with the receiver.
Example:

// tests dictionary conversion:

dim d as new Dictionary

dim x as new Dictionary
x.Value("Hello") = "World"

dim b as Boolean = true
dim s as Single = 2.3
dim dd as Double = 3.4
dim h as int64 = 1234

d.Value(1) = 1
d.Value(2) = 2.0
d.Value(3) = x
d.Value(4) = "Hello"
d.Value(5) = b
d.Value(6) = s
d.Value(7) = dd
d.Value(8) = h

dim n as new NSNotificationMBS("test", nil, d)

dim nd as Dictionary = n.userInfo

// check nd object
break

Notes:
122.7. CLASS NSNOTIFICATIONMBS

Returns the user information dictionary associated with the receiver. May be nil. The user information dictionary stores any additional objects that objects receiving the notification might use.

(Read only property)
122.8   class NSNotificationObserverMBS

122.8.1   class NSNotificationObserverMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
The notification class which you use to receive notifications.

**Notes:**
To use this class, please create a subclass. There you can put code in the event handler to do whatever you
need in case your notification is received.

Than you create in code objects form this class. Normally only one. And you call addObserver on the NSNoti-
ficationCenterMBS or NSDistributedNotificationCenterMBS objects you have to tell the system which no-
tifications you want to receive.

Do not forget to call removeObserver on the notification center for all your observers to avoid crashes.

122.8.2   Methods

122.8.3   Constructor

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
The constructor which creates the observer.

**Notes:** On success the handle property is not zero.

122.8.4   Destructor

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
The Destructor.

**Notes:** Removes in plugin version 12.3 and newer the observer from the NSNotificationCenterMBS and
NSDistributedNotificationCenterMBS to avoid crashes.

122.8.5   Properties

122.8.6   Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
The internal handle to the observer object.

**Notes:** (Read and Write property)
122.8.7  Events

122.8.8  GotNotification(notification as NSNotificationMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called if a new notification is received. **Notes:** The MBS Plugin makes sure you receive this event always on the main thread.
122.9 class WinNotificationMBS

122.9.1 class WinNotificationMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: This is a class to send broadcast message to all windows applications listening for this notification. Notes: If you have several applications, you can send notifications from one to another.

Windows Desktop application: Sending and receiving notification works. Windows Console application: Sending works. Windows Web application: Sending works. Receives notification of own application, but of others.

This class is useful to tell other instance of your application or other application about something. Like for example whether background process is done.

On Mac OS X you can use NSNotificationMBS class for similar functionality.

With 14.2 plugins we added possibility to listen for any windows broadcast message. Like for example for WM_TIMECHANGE.

122.9.2 Methods

122.9.3 Constructor

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: The default constructor. Notes: Creates an invisible dummy window to listen for notifications. See also:

- 122.9.4 Constructor(control as RectControl) 17226
- 122.9.5 Constructor(Window as window) 17227
- 122.9.6 Constructor(WindowHandle as Integer) 17227

122.9.4 Constructor(control as RectControl)

MBS Win Plugin, Plugin Version: 17.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: The control constructor. Notes:
122.9.  **CLASS WINNOTIFICATIONMBS**

Takes an existing Xojo control and intercepts messages going there to listen for the notifications you are interested for. The class keeps a reference to the control to make sure it is not destroyed before this object is destroyed. See also:

- 122.9.3 Constructor
- 122.9.5 Constructor(Window as window)
- 122.9.6 Constructor(WindowHandle as Integer)

### 122.9.5 Constructor(Window as window)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The window constructor. **Notes:**

Takes an existing Xojo Window and intercepts messages going there to listen for the notifications you are interested for. If you listen for global notifications sent to all windows, we prefer the other constructor. The class keeps a reference to the window to make sure it is not destroyed before this object is destroyed. See also:

- 122.9.3 Constructor
- 122.9.4 Constructor(control as RectControl)
- 122.9.6 Constructor(WindowHandle as Integer)

### 122.9.6 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The window constructor. **Notes:**

Takes an existing window and intercepts messages going there to listen for the notifications you are interested for. If you listen for global notifications sent to all windows, we prefer the other constructor. The class keeps a reference to the window to make sure it is not destroyed before this object is destroyed. See also:

- 122.9.3 Constructor
- 122.9.4 Constructor(control as RectControl)
- 122.9.5 Constructor(Window as window)
122.9.7 IsListeningFor(MessageID as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this object is listening for the given message ID.  
**Example:**

```vba
dim w as new WinNotificationMBS

const WM_TIMECHANGE = & h001E
if w.ListenForMessage(WM_TIMECHANGE) then
    MsgBox str(w.IsListeningFor(WM_TIMECHANGE))
end if
```

**Notes:** Returns true if we listen for this notification name or false if not.  
See also:

- 122.9.8 IsListeningFor(name as string) as boolean

122.9.8 IsListeningFor(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this object is listening for the given notification.  
**Example:**

```vba
dim w as new WinNotificationMBS

if w.ListenForMessage("Hello") then
    MsgBox str(w.IsListeningFor("Hello"))
end if
```

**Notes:** Returns true if we listen for this notification name or false if not.  
See also:

- 122.9.7 IsListeningFor(MessageID as Integer) as boolean

122.9.9 ListenForMessage(MessageID as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Listens for given notification message id.  
**Notes:** Returns true on success and false on failure.  
See also:

- 122.9.10 ListenForMessage(name as string) as boolean
122.9. **CLASS WINNOTIFICATIONMBS**

122.9.10 **ListenForMessage(name as string) as boolean**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Listens for given notification name. **Notes:** Returns true on success and false on failure. **See also:**

- 122.9.9 ListenForMessage(MessageID as Integer) as boolean

122.9.11 **SendMessage(byref result as Integer, MessageID as Integer, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean**

MBS Win Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends a message to all applications listening for it. **Notes:** Sends a message with given message ID. You can pass two integer parameters. Returns true if event was sent or false if it failed. This doesn't tell you whether it was received by someone, but your own application receives it, too. Timeout is in milliseconds and counts per receiving window. Result returns the result code from the message. **See also:**

- 122.9.12 SendMessage(name as string, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean

122.9.12 **SendMessage(name as string, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends a message to all applications listening for it. **Notes:** You can pass two integer parameters. Returns true if event was sent or false if it failed. This doesn't tell you whether it was received by someone, but your own application receives it, too. Timeout is in milliseconds and counts per receiving window. **See also:**

- 122.9.11 SendMessage(byref result as Integer, MessageID as Integer, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean
122.9.13  SendMessageToWindow(WindowHandle as Integer, byref result as Integer, MessageID as Integer, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean

MBS Win Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends a message to all applications listening for it.  
**Notes:**  
Like SendMessage, but with a target window.  
You can pass two integer parameters.  
Returns true if event was sent or false if it failed.  
This doesn’t tell you whether it was received by someone, but your own application receives it, too.  
Timeout is in milliseconds and counts per receiving window.

122.9.14  StopListeningForMessage(MessageID as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Stops listening for a given message ID.  
**Example:**

```vbscript
dim w as new WinNotificationMBS

const WM_TIMECHANGE = &h001E
if w.ListenForMessage(WM_TIMECHANGE) then
    if w.StopListeningForMessage(WM_TIMECHANGE) then
        MsgBox "OK"
    end if
end if
```

See also:

- 122.9.15 StopListeningForMessage(name as string) as boolean

122.9.15  StopListeningForMessage(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Stops listening for a given notification name.  
**Example:**

```vbscript
dim w as new WinNotificationMBS

if w.ListenForMessage("Hello") then
    if w.StopListeningForMessage("Hello") then
        MsgBox "OK"
    end if
end if
```
122.9. CLASS WINNOTIFICATIONMBS

end if
end if

See also:

- 122.9.14 StopListeningForMessage(MessageID as Integer) as boolean

122.9.16 Properties

122.9.17 WindowHandle as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal window handle.
**Notes:** (Read only property)

122.9.18 Events

122.9.19 GotNotification(Message as Integer, Name as string, Value1 as Integer, Value2 as Integer, byref Result as Integer, byref Handled as boolean)

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
A notification was received.
**Notes:**
Message: The message ID.
Name: If you registered by name, this is the name for the message ID.
Value1 and Value2 are parameters provided with message. (WPARAM and LPARAM)

If Handled is set to true, we pass back Result to the Windows system (LRESULT).
Else the default handler is called.
Chapter 123

OCR

123.1  class TesseractChoiceIteratorMBS

123.1.1  class TesseractChoiceIteratorMBS

123.1.2  Methods

123.1.3  Confidence as Double

Notes: The number should be interpreted as a percent probability. (0.0 - 100.0)

123.1.4  Constructor(result as TesseractResultIteratorMBS)

Notes: Construction is from a ResultIterator that points to the symbol of interest. The ChoiceIterator allows a one-shot iteration over the choices for this symbol and after that is is useless.
123.1.5  NextItem as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Moves to the next choice for the symbol and returns false if there are none left.

123.1.6  Text as string

123.1.7  Properties

123.1.8  Handle as Integer

**Notes:** (Read only property)

123.1.9  Parent as TesseractResultIteratorMBS

**Notes:** (Read only property)
123.2. class TesseractErrorExceptionMBS

123.2.1 class TesseractErrorExceptionMBS

123.3  class TesseractMBS

123.3.1  class TesseractMBS

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The plugin class to provide OCR by using the tesseract open source library. **Notes:** See example projects on how to use it.

123.3.2  Methods

123.3.3  Clear

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Free up recognition results and any stored image data, without actually freeing any recognition data that would be time-consuming to reload. **Notes:** Afterwards, you must call SetImage or TesseractRect before doing any Recognize or Get* operation.

123.3.4  ClearAdaptiveClassifier

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Call between pages or documents etc to free up memory and forget adaptive data.

123.3.5  Constructor

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Constructor which calls only InitForAnalysePage. See also:

- 123.3.6 Constructor(folder as folderitem, lang as string) 17236
- 123.3.7 Constructor(path as string, lang as string) 17237

123.3.6  Constructor(folder as folderitem, lang as string)

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initializes tesseract. **Notes:** Same as Init method. Pass folderitem to parent folder of tessdata folder and language you need.
Instances are now mostly thread-safe and totally independent, but some global parameters remain. Basically it is safe to use multiple TessBaseAPIs in different threads in parallel, UNLESS: you use SetVariable on some of the Params in classify and textord. If you do, then the effect will be to change it for all your instances.

Note that the only members that may be called before Init are: SetInputName, SetOutputName, SetVariable, Get*Variable and PrintVariables.

The language is (usually) an ISO 639-3 string or "" will default to eng.
To use multiple languages, please concat them with plus sign: e.g. "eng+deu"
See also:

• 123.3.5 Constructor
• 123.3.7 Constructor(path as string, lang as string)

123.3.7 Constructor(path as string, lang as string)

**Notes:**
Same as Init method.
Pass path to parent folder of tessdata folder and language you need.

Instances are now mostly thread-safe and totally independent, but some global parameters remain. Basically it is safe to use multiple TessBaseAPIs in different threads in parallel, UNLESS: you use SetVariable on some of the Params in classify and textord. If you do, then the effect will be to change it for all your instances.

Note that the only members that may be called before Init are: SetInputName, SetOutputName, SetVariable, Get*Variable and PrintVariables.

The language is (usually) an ISO 639-3 string or "" will default to eng.
To use multiple languages, please concat them with plus sign: e.g. "eng+deu"
See also:

• 123.3.5 Constructor
• 123.3.6 Constructor(folder as folderitem, lang as string)

123.3.8 GetBoolVariable(name as string, byref value as boolean) as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries a variable as boolean value.
**Notes:**
123.3.9 GetBoxText(page as Integer) as string

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The recognized text is returned as a char* which is coded in the same format as a box file used in training.
Notes: Constructs coordinates in the original image - not just the rectangle. page is a 0-based page index that will appear in the box file.

123.3.10 GetDoubleVariable(name as string, byref value as Double) as boolean

Notes: Returns true if the parameter was found among Tesseract parameters. Fills in value with the value of the parameter.

123.3.11 GetHOCRText(page as Integer) as string

Notes: Page is 0-based but will appear in the output as 1-based.

123.3.12 GetIntVariable(name as string, byref value as Integer) as boolean

Notes: Returns true if the parameter was found among Tesseract parameters. Fills in value with the value of the parameter.

123.3.13 GetLastInitLanguage as string

123.3.14 GetStringVariable(name as string) as string

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries variable’s value as string.

123.3.15 GetText as string

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns recognized text. **Notes:** Calls Recognize if needed internally.

123.3.16 GetVariableAsString(name as string) as string

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get value of named variable as a string, if it exists.

123.3.17 Init(folder as folderitem, lang as string)

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initializes tesseract. **Notes:**

Pass folderitem to parent folder of tessdata folder and language you need.

Instances are now mostly thread-safe and totally independent, but some global parameters remain. Basically it is safe to use multiple TessBaseAPIs in different threads in parallel, UNLESS: you use SetVariable on some of the Params in classify and textord. If you do, then the effect will be to change it for all your instances.

Start tesseract. Returns zero on success and -1 on failure.

Note that the only members that may be called before Init are: SetInputName, SetOutputName, SetVariable, Get*Variable and PrintVariables.

The language is (usually) an ISO 639-3 string or "" will default to eng.

See also:

- 123.3.18 Init(path as string, lang as string)
123.3.18  Init(path as string, lang as string)

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Initializes tesseract.

**Notes:**
Pass path to parent folder of tessdata folder and language you need.

Instances are now mostly thread-safe and totally independent, but some global parameters remain. Basically it is safe to use multiple TessBaseAPIs in different threads in parallel, UNLESS: you use SetVariable on some of the Params in classify and textord. If you do, then the effect will be to change it for all your instances.

Start tesseract. Returns zero on success and -1 on failure.

Note that the only members that may be called before Init are: SetInputName, SetOutputName, SetVariable, Get*Variable and PrintVariables.

The language is (usually) an ISO 639-3 string or "" will default to eng.
See also:

- 123.3.17 Init(folder as folderitem, lang as string)

123.3.19  InitForAnalysePage

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Init only for page layout analysis.

**Notes:** Use only for calls to SetImage and AnalysePage. Calls that attempt recognition will generate an error.

123.3.20  MeanTextConf as Integer

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the (average) confidence value between 0 and 100.

123.3.21  NumDawgs as Integer

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Return the number of dawgs loaded.

**Notes:** Should be bigger than 0 if data files have been loaded.
123.3. CLASS TESSERACTMBS

123.3.22 PrintVariablesToStdErr

123.3.23 PrintVariablesToStdOut

123.3.24 Recognize as Integer

123.3.25 RecognizeMT as Integer

MBS Images Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Recognize the image. Notes: Returns 0 on success. Optional. The Get*Text functions below will call Recognize if needed. After Recognize, the output is kept internally until the next SetImage. Same as Recognize, but thread friendly. Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

123.3.26 ResultIterator as TesseractResultIteratorMBS

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Get an iterator to the results of LayoutAnalysis and/or Recognize. Notes: This object points to data held within the TesseractMBS class, and therefore can only be used while the TesseractMBS class still exists and has not been subjected to a call of Init, SetImage, Recognize, Clear,
123.3.27  SetImage(buffer as memoryblock, width as Integer, height as Integer, BytesPerPixel as Integer, BytesPerLine as Integer) as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Provide an image for Tesseract to recognize as a memoryblock. **Notes:** Returns true on success and false on failure. **See also:**

- 123.3.28 SetImage(Pic as Picture) as boolean

123.3.28  SetImage(Pic as Picture) as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Provide an image for Tesseract to recognize. **Notes:**

The plugin makes a copy of the picture.

Returns true on success and false on failure. **See also:**

- 123.3.27 SetImage(buffer as memoryblock, width as Integer, height as Integer, BytesPerPixel as Integer, BytesPerLine as Integer) as boolean

123.3.29  SetInputName(name as string)

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the name of the input file. Needed only for training and reading a UNLV zone file.

123.3.30  SetOutputName(name as string)

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the name of the bonus output files. Needed only for debugging.

123.3.31  SetRectangle(left as Integer, top as Integer, width as Integer, height as Integer)

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Restrict recognition to a sub-rectangle of the image.
Notes: Call after SetImage. Each SetRectangle clears the recognition results so multiple rectangles can be recognized with the same image.

123.3.32  SetResolution(Resolution as Integer)

MBS Images Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the resolution of the source image in pixels per inch so font size information can be calculated in results.
**Notes:** Call this after SetImage.

123.3.33  SetVariable(name as string, value as string) as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the value of an internal "parameter."
**Notes:**
Supply the name of the parameter and the value as a string, just as you would in a config file.
Returns false if the name lookup failed.
E.g. SetVariable("tessedit_char_blacklist", "xyz"); to ignore x, y and z.
Or SetVariable("classify_blh_numeric_mode", "1"); to set numeric-only mode.
SetVariable may be used before Init, but settings will revert to defaults on End().

Note: Must be called after Init(). Only works for non-init variables (init variables should be passed to Init()).

123.3.34  Version as string

123.3.35  Properties

123.3.36  Handle as Integer

**Notes:** (Read only property)
123.3.37  PageSegMode as Integer

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The current page segmentation mode.

**Notes:**
Defaults to kPageSegModeSingleBlock.
The mode is stored as an IntParam so it can also be modified by ReadConfigFile or SetVariable("tessedit_pageseg_mode", mode as string).
(Read and Write computed property)

123.3.38  Constants

123.3.39  kPageSegModeAuto = 3

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants.
**Notes:** Fully automatic page segmentation, but no OSD.

123.3.40  kPageSegModeAutoOnly = 2

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants.
**Notes:** Automatic page segmentation, but no OSD, or OCR.

123.3.41  kPageSegModeAutoOSD = 1

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants.
**Notes:** Automatic page segmentation with orientation and script detection. (OSD)

123.3.42  kPageSegModeCircleWord = 9

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants.
**Notes:** Treat the image as a single word in a circle.

123.3.43  kPageSegModeOSDOnly = 0

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants.
**Notes:** Orientation and script detection only.
123.3. CLASS TESSERACTMBS

123.3.44 kPageSegModeSingleBlock = 6

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants. **Notes:** Assume a single uniform block of text. (Default.)

123.3.45 kPageSegModeSingleBlockVerticalText = 5

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants. **Notes:** Assume a single uniform block of vertically aligned text.

123.3.46 kPageSegModeSingleChar = 10

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants. **Notes:** Treat the image as a single character.

123.3.47 kPageSegModeSingleColumn = 4

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants. **Notes:** Assume a single column of text of variable sizes.

123.3.48 kPageSegModeSingleLine = 7

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants. **Notes:** Treat the image as a single text line.

123.3.49 kPageSegModeSingleWord = 8

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the page segmentation mode constants. **Notes:** Treat the image as a single word.
123.4  class TesseractNotInitializedExceptionMBS

123.4.1  class TesseractNotInitializedExceptionMBS

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The exception to report about calling tesseract methods without initialization.  
**Notes:** Subclass of the TesseractErrorExceptionMBS class.
123.5. class TesseractResultIteratorMBS

123.5.1. class TesseractResultIteratorMBS

**MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:** Class to iterate over tesseract results, providing access to all levels of the page hierarchy, without including any tesseract headers or having to handle any tesseract structures.

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

123.5.2. Methods

123.5.3. Begin

**MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:** Moves the iterator to point to the start of the page to begin an iteration.

123.5.4. BoundingBox(Level as Integer, byref left as Integer, byref top as Integer, byref right as Integer, byref bottom as Integer) as boolean

**MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:** Returns the bounding rectangle of the current object at the given level.

**Notes:**
Returns false if there is no such object at the current position.
The returned bounding box is guaranteed to match the size and position of the image returned by GetBinaryImage, but may clip foreground pixels from a grey image. The padding argument to GetImage can be used to expand the image to include more foreground pixels. See GetImage.

Coordinate system:
Integer coordinates are at the cracks between the pixels.
The top-left corner of the top-left pixel in the image is at (0,0).
The bottom-right corner of the bottom-right pixel in the image is at (width, height).
Every bounding box goes from the top-left of the top-left contained pixel to the bottom-right of the bottom-right contained pixel, so the bounding box of the single top-left pixel in the image is: (0,0)->(1,1).
If an image rectangle has been set in the API, then returned coordinates relate to the original (full) image, rather than the rectangle.
123.5.5 Confidence(Level as Integer) as Double

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the mean confidence of the current object at the given level. **Notes:** The number should be interpreted as a percent probability. (0.0 - 100.0)

123.5.6 Constructor

123.5.7 IsAtBeginningOf(Level as Integer) as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if the iterator is at the start of an object at the given level. **Notes:** Possible uses include determining if a call to `Next(kLevelWord)` moved to the start of a `kLevelParagraph`.

123.5.8 IsAtFinalElement(Level as Integer, element as Integer) as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns whether the iterator is positioned at the last element in a given level. **Notes:** (e.g. the last word in a line, the last line in a block)

123.5.9 NextItem(Level as Integer) as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Moves to the start of the next object at the given level in the page hierarchy, and returns false if the end of the page was reached. **Notes:**

NOTE that `kLevelSymbol` will skip non-text blocks, but all other level values will visit each non-text block once. 
Think of non text blocks as containing a single paragraph, with a single line, with a single imaginary word. 
Calls to `Next` with different levels may be freely intermixed. 
This function iterates words in right-to-left scripts correctly, if the appropriate language has been loaded into Tesseract.
123.5.10  SymbolIsDropcap as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if the current symbol is a dropcap. **Notes:** If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.

123.5.11  SymbolIsSubscript as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if the current symbol is a subscript. **Notes:** If iterating at a higher level object than symbols, e.g. words, then this will return the attributes of the first symbol in that word.

123.5.12  SymbolIsSuperscript as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if the current symbol is a superscript. **Notes:** If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.

123.5.13  Text(Level as Integer) as string

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the text string for the current object at the given level.

123.5.14  WordFontAttributes(byref bold as boolean, byref italic as boolean, byref underlined as boolean, byref monospace as boolean, byref serif as boolean, byref smallcaps as boolean, byref fontsize as Integer, byref fontid as Integer) as string

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the font attributes of the current word. **Notes:**
If iterating at a higher level object than words, e.g. textlines, then this will return the attributes of the first word in that textline.
The actual return value is a string representing a font name.
Pointsize is returned in printers points (1/72 inch.)
123.5.15 WordIsFromDictionary as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if the current word was found in a dictionary.

123.5.16 WordIsNumeric as boolean

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if the current word is numeric.

123.5.17 Properties

123.5.18 Handle as Integer

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Internal Object reference. **Notes:** (Read only property)

123.5.19 Parent as TesseractMBS

MBS Images Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent tesseract object. **Notes:** (Read only property)

123.5.20 Constants

123.5.21 kLevelBlock = 0

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the level constants. **Notes:** Block of text/image/seperator line.

123.5.22 kLevelParagraph = 1

MBS Images Plugin, Plugin Version: 12.3. **Function:** One of the level constants. **Notes:** Paragraph within a block.
123.5.23 kLevelSymbol = 4

MBS Images Plugin, Plugin Version: 12.3. **Function**: One of the level constants.
**Notes**: Symbol/character within a word.

123.5.24 kLevelTextline = 2

MBS Images Plugin, Plugin Version: 12.3. **Function**: One of the level constants.
**Notes**: Line within a paragraph.

123.5.25 kLevelWord = 3

MBS Images Plugin, Plugin Version: 12.3. **Function**: One of the level constants.
**Notes**: Word within a textline.
Chapter 124

OpenCL

124.1 class CLCommandQueueMBS

124.1.1 class CLCommandQueueMBS

Function: The class for an OpenCL command queue.

Example:

```vbnet
dim devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
dim device as CLDeviceMBS = devices(0) // we use first one

// Create a context
dim context as new CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)

// Create a command queue
dim queue as new CLCommandQueueMBS(context, device, 0)
```

124.1.2 Methods

124.1.3 Constructor(context as CLContextMBS, device as CLDeviceMBS, flags as Integer = 0)

Function: Create a command-queue on a specific device.

Example:
dim devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
dim device as CLDeviceMBS = devices(0) // we use first one

// Create a context
dim context as new CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)

// Create a command queue
dim queue as new CLCommandQueueMBS(context, device, 0)

Notes:

context: Must be a valid OpenCL context.
device: Must be a device associated with context. It can either be in the list of devices specified when context
is created using CLContextMBS Constructor or have the same device type as the device type specified when
the context is created.
flags: Specifies a list of properties for the command-queue. This is a bit-field. Only command-queue prop-
erties specified in the table below can be set in properties; otherwise the value specified in properties is
considered to be not valid.

<table>
<thead>
<tr>
<th>Command-Queue Properties</th>
<th>Description</th>
</tr>
</thead>
</table>
| kQueueOutOfOrderExecModeEnable         | Determines whether the commands queued in the command-queue are exe-
                                            cuted in-order or out-of-order. If set, the commands in the command-queue
                                            are executed out-of-order. Otherwise, commands are executed in-order. |
| kQueueProfilingEnable                  | Enable or disable profiling of commands in the command-queue. If set, the   |
                                            profiling of commands is enabled. Otherwise profiling of commands is disabled. |

See clGetEventProfilingInfo for more information.

The OpenCL functions that are submitted to a command-queue are enqueued in the order the calls are
made but can be configured to execute in-order or out-of-order. The properties argument in clCreateCom-
mandQueue can be used to specify the execution order.

If the kQueueOutOfOrderExecModeEnable property of a command-queue is not set, the commands en-
queued to a command-queue execute in order. For example, if an application calls EnqueueNDRangeKernel
to execute kernel A followed by a EnqueueNDRangeKernel to execute kernel B, the application can assume
that kernel A finishes first and then kernel B is executed. If the memory objects output by kernel A are
inputs to kernel B then kernel B will see the correct data in memory objects produced by execution of
kernel A. If the kQueueOutOfOrderExecModeEnable property of a commandqueue is set, then there is no
guarantee that kernel A will finish before kernel B starts execution.

Applications can configure the commands enqueued to a command-queue to execute out-of-order by setting
the kQueueOutOfOrderExecModeEnable property of the command-queue. This can be specified when the
command-queue is created or can be changed dynamically using this Constructor. In out-of-order execution
mode there is no guarantee that the enqueued commands will finish execution in the order they were queued.
As there is no guarantee that kernels will be executed in order, i.e. based on when the EnqueueNDRangeKer-
nel calls are made within a command-queue, it is therefore possible that an earlier EnqueueNDRangeKernel
call to execute kernel A identified by event A may execute and/or finish later than a EnqueueNDRangeKernel call to execute kernel B which was called by the application at a later point in time. To guarantee a specific order of execution of kernels, a wait on a particular event (in this case event A) can be used. The wait for event A can be specified in the event_wait_list argument to EnqueueNDRangeKernel for kernel B.

In addition, a wait for events or a barrier command can be enqueued to the command-queue. The wait for events command ensures that previously enqueued commands identified by the list of events to wait for have finished before the next batch of commands is executed. The barrier command ensures that all previously enqueued commands in a command-queue have finished execution before the next batch of commands is executed.

Similarly, commands to read, write, copy or map memory objects that are enqueued after EnqueueNDRangeKernel, EnqueueTask or EnqueueNativeKernel commands are not guaranteed to wait for kernels scheduled for execution to have completed (if the kQueueOutOfOrderExecModeEnable property is set). To ensure correct ordering of commands, the event object returned by EnqueueNDRangeKernel, EnqueueTask or EnqueueNativeKernel can be used to enqueue a wait for event or a barrier command can be enqueued that must complete before reads or writes to the memory object(s) occur.

Lasterror is set.

124.1.4 Context as CLContextMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Return the context specified when the command-queue is created. Notes: Lasterror is set.

124.1.5 Device as CLDeviceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Return the device specified when the command-queue is created. Notes: Lasterror is set.

124.1.6 EnqueueBarrier

MBS MacFrameworks Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A synchronization point that enqueues a barrier operation. Notes: EnqueueBarrier is a synchronization point that ensures that all queued commands in command_queue have finished execution before the next batch of commands can begin execution.
Lasterror is set.

### 124.1.7 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer)

**Function:** Enqueues a command to copy a buffer object to another buffer object.

**Notes:**

- sourceBuffer: the source memory object.
- destBuffer: the destination memory object.
- sourceOffset: The offset where to begin copying data from sourceBuffer.
- destOffset: The offset where to begin copying data into destBuffer.
- size: Refers to the size in bytes to copy.
- EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
- outEvent: Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.
- Lasterror is set.

See also:

- 124.1.8 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

### 124.1.8 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

**Function:** Enqueues a command to copy a buffer object to another buffer object.

**Notes:**

- sourceBuffer: the source memory object.
- destBuffer: the destination memory object.
- sourceOffset: The offset where to begin copying data from sourceBuffer.
- destOffset: The offset where to begin copying data into destBuffer.
- size: Refers to the size in bytes to copy.
- EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete. Lasterror is set.

See also:

- **124.1.7 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer)**

**124.1.9 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer)**

**Function:** Enqueues a command to copy a buffer object to an image object.

**Notes:**

SourceBuffer: A valid buffer object.

destImage: A valid image object.

sourceOffset: The offset where to begin copying data from SourceBuffer.

destOrigin: The (x, y, z) offset in pixels where to begin copying data to destImage. If destImage is a 2D image object, the z value given by destOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If destImage is a 2D image object, the depth value given by RegionDepth must be 1.

The size in bytes of the region to be copied from SourceBuffer referred to as src_cb is computed as width * height * depth * bytes/image element if destImage is a 3D image object and is computed as width * height * bytes/image element if destImage is a 2D image object.

EventWaitList: Optionally, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional. Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Lasterror is set.

See also:
124.1.10 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

**Function:**
Enqueues a command to copy a buffer object to an image object.

**Notes:**
- SourceBuffer: A valid buffer object.
- destImage: A valid image object.
- sourceOffset: The offset where to begin copying data from SourceBuffer.
- destOrigin: The (x, y, z) offset in pixels where to begin copying data to destImage. If destImage is a 2D image object, the z value given by destOriginZ must be 0.
- region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If destImage is a 2D image object, the depth value given by RegionDepth must be 1.

The size in bytes of the region to be copied from SourceBuffer referred to as src_cb is computed as width * height * depth * bytes/image element if destImage is a 3D image object and is computed as width * height * bytes/image element if destImage is a 2D image object.

- EventWaitList: Optionally, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.
- outEvent: Optional. Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Lasterror is set.

See also:
- 124.1.9 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth
124.1.11 EnqueueCopyImage(sourceImage as CLMemMBS, destImage as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer)

**Function:** Enqueues a command to copy image objects.

**Notes:**
- sourceImage: Source image.
- destImage: Dest image.

  sourceOrigin: Defines the starting (x, y, z) location in pixels in src_image from where to start the data copy. If src_image is a 2D image object, the z value given by sourceOriginZ must be 0.

  sourceOrigin: Defines the starting (x, y, z) location in pixels in dst_image from where to start the data copy. If dst_image is a 2D image object, the z value given by sourceOriginZ must be 0.

  region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If src_image or dst_image is a 2D image object, the depth value given by RegionDepth must be 1.

  EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CommandQueue must be the same.

  outEvent: Optional, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

  It is currently a requirement that the sourceImage and destImage image memory objects for EnqueueCopyImage must have the exact same image format (i.e. the cl_image_format descriptor specified when sourceImage and destImage are created must match).

  sourceImage and destImage can be 2D or 3D image objects allowing us to perform the following actions:

  - Copy a 2D image object to a 2D image object.
  - Copy a 2D image object to a 2D slice of a 3D image object.
  - Copy a 2D slice of a 3D image object to a 2D image object.
• Copy a 3D image object to a 3D image object.

• 124.1.12 EnqueueCopyImage(sourceImage as CLMemMBS, destImage as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

124.1.12 EnqueueCopyImage(sourceImage as CLMemMBS, destImage as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

Function: Enqueues a command to copy image objects.

Notes:

sourceImage: Source image.
destImage: Dest image.

sourceOrigin: Defines the starting (x, y, z) location in pixels in src_image from where to start the data copy. If src_image is a 2D image object, the z value given by sourceOriginZ must be 0.

sourceOrigin: Defines the starting (x, y, z) location in pixels in dst_image from where to start the data copy. If dst_image is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If src_image or dst_image is a 2D image object, the depth value given by RegionDepth must be 1.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CommandQueue must be the same.

outEvent: Optional, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

It is currently a requirement that the sourceImage and destImage image memory objects for EnqueueCopyImage must have the exact same image format (i.e. the cl_image_format descriptor specified when sourceImage
sourceImage and destImage can be 2D or 3D image objects allowing us to perform the following actions:

- Copy a 2D image object to a 2D image object.
- Copy a 2D image object to a 2D slice of a 3D image object.
- Copy a 2D slice of a 3D image object to a 2D image object.
- Copy a 3D image object to a 3D image object.

LastError is set.

124.1.13 EnqueueCopyImageToBuffer(sourceImage as CLMemMBS, destBuffer as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, destOffset as Integer)

**Function:** Enqueues a command to copy an image object to a buffer object.

**Notes:**

- sourceImage: A valid image object.
- destBuffer: A valid buffer object.

sourceOrigin: Defines the (x, y, z) offset in pixels in the image from where to copy. If sourceImage is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If sourceImage is a 2D image object, the depth value given by RegionDepth must be 1.

destOffset: The offset where to begin copying data into destBuffer. The size in bytes of the region to be copied referred to as dst.cb is computed as width * height * depth * bytes/image element if sourceImage is a 3D image object and is computed as width * height * bytes/image element if sourceImage is a 2D image object.
EventWaitList: Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Lasterror is set.

- 124.1.13 EnqueueCopyImageToBuffer(sourceImage as CLMemMBS, destBuffer as CLMemMBS, source-OriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, destOffset as Integer)

124.1.15 EnqueueMapBuffer(buffer as CLMemMBS, BlockingMap as boolean, MapFlags as Integer, offset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) as memoryblock

Function: Enqueues a command to map a region of the buffer object given by buffer into the host address space and returns a pointer to this mapped region.

Notes:

BlockingMap: Optional. Indicates if the map operation is blocking or non-blocking. If BlockingMap is true, EnqueueMapBuffer does not return until the specified region in buffer can be mapped. If BlockingMap is false i.e. map operation is non-blocking, the pointer to the mapped region returned by clEnqueueMapBuffer cannot be used until the map command has completed. The event argument returns an event object which can be used to query the execution status of the map command. When the map command is completed, the application can access the contents of the mapped region using the pointer returned by EnqueueMapBuffer.

MapFlags: Is a bit-field and can be set to kMapRead to indicate that the region specified by (offset, size) in the buffer object is being mapped for reading, and/or kMapWrite to indicate that the region specified by (offset, size) in the buffer object is being mapped for writing.

buffer: A valid buffer object. The OpenCL context associated with CLCommandQueueMBS and buffer must be the same.

offset, size: The offset in bytes and the size of the region in the buffer object that is being mapped.

EventWaitList: Optional. Specify events that need to complete before this particular command can be executed. The events specified in EventWaitList act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Lasterror is set.

The contents of the regions of a memory object mapped for writing (i.e. kMapWrite is set in map_flags argument to EnqueueMapBuffer or EnqueueMapImage) are considered to be undefined until this region is unmapped. Reads and writes by a kernel executing on a device to a memory region(s) mapped for writing are undefined.

Multiple command-queues can map a region or overlapping regions of a memory object for reading (i.e.
MapFlags = kMapRead). The contents of the regions of a memory object mapped for reading can also be read by kernels executing on a device(s). The behavior of writes by a kernel executing on a device to a mapped region of a memory object is undefined. Mapping (and unmapping) overlapped regions of a buffer or image memory object for writing is undefined.

The behavior of OpenCL function calls that enqueue commands that write or copy to regions of a memory object that are mapped is undefined.

124.1.17 EnqueueMapImage(image as CLMemMBS, BlockingMap as boolean, MapFlags as Integer, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, byref RowPitch as Integer, byref SlicePitch as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) as memoryblock

Function: Enqueues a command to map a region of an image object into the host address space and returns a pointer to this mapped region.

Notes:

- image: A valid image object. The OpenCL context associated with CLCommandQueueMBS and image must be the same.

- BlockingMap: Optional, Indicates if the map operation is blocking or non-blocking. If BlockingMap is true, EnqueueMapImage does not return until the specified region in image can be mapped. If BlockingMap is false i.e. map operation is non-blocking, the pointer to the mapped region returned by EnqueueMapImage cannot be used until the map command has completed. The event argument returns an event object which can be used to query the execution status of the map command. When the map command is completed, the application can access the contents of the mapped region using the pointer returned by EnqueueMapImage.

- MapFlags: Is a bit-field and can be set to kMapRead to indicate that the region specified by (origin, region) in the image object is being mapped for reading, and/or kMapWrite to indicate that the region specified by (origin, region) in the image object is being mapped for writing.
origin, region: Define the \((x, y, z)\) offset in pixels and \((\text{width}, \text{height}, \text{depth})\) in pixels of the 2D or 3D rectangle region that is to be mapped. If image is a 2D image object, the \(z\) value given by origin\(Z\) must be 0 and the depth value given by regionDepth must be 1.

RowPitch: Returns the scan-line pitch in bytes for the mapped region. This must be a non-nil value.
SlicePitch: Returns the size in bytes of each 2D slice for the mapped region. For a 2D image, zero is returned if this argument is not nil. For a 3D image, \(\text{image}\_\text{slice}\_\text{pitch}\) must be a non-nil value.

EventWaitList: Optional. Specify events that need to complete before EnqueueMapImage can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and CLCommandQueueMBS must be the same.

outEvent: Optional. Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete. event can be nil in which case it will not be possible for the application to query the status of this command or queue a wait for this command to complete.

LastError is set.

If the buffer or image object is created with kMemoryUseHostPtr set in mem_flags, the following will be true:

The HostPtr specified in Constructor is guaranteed to contain the latest bits in the region being mapped when the EnqueueMapBuffer or EnqueueMapImage command has completed.
The pointer value returned by EnqueueMapBuffer or EnqueueMapImage will be derived from the HostPtr specified when the buffer or image object is created.
The contents of the regions of a memory object mapped for writing (i.e. kMapWrite is set in MapFlags argument to EnqueueMapBuffer or EnqueueMapImage) are considered to be undefined until this region is unmapped. Reads and writes by a kernel executing on a device to a memory region(s) mapped for writing are undefined.

Enqueues a marker command to the command queue. The marker command returns an event which can be used to queue a wait on this marker event i.e. wait for all commands queued before the marker command to complete.

Lasterror is set.
124.1.20 EnqueueNativeKernel(FunctionPtr as ptr, args as memoryblock, argsSize as Integer, NumberOfMemoryObjects as Integer, MemList as memoryblock, ArgsMemoryLocations as memoryblock)

**Function:** Enqueues a command to execute a native C/C++ function not compiled using the OpenCL compiler.

**Notes:**

First a warning: Don’t use this with Real Studio methods. You can point to a function written in C which you made thread safe.

`self`: A valid command-queue. A native user function can only be executed on a command-queue created on a device that has kExceNativeKernel capability set in ExecutionCapabilities property.

`FunctionPtr`: A pointer to a host-callable user function.

`args`: A pointer to the args list that FunctionPtr should be called with.

`argsSize`: The size in bytes of the args list that args points to.

The data pointed to by args and argsSize bytes in size will be copied and a pointer to this copied region will be passed to FunctionPtr. The copy needs to be done because the memory objects (CLMemMBS.handle values) that args may contain need to be modified and replaced by appropriate pointers to global memory. When EnqueueNativeKernel returns, the memory region pointed to by args can be reused by the application.

`NumberOfMemoryObjects`: The number of buffer objects that are passed in args.

`MemList`: A list of valid buffer objects, if NumberOfMemoryObjects is greater than 0. The buffer object values specified in MemList are memory object handles (CLMemMBS.handle values) or nil.

`ArgsMemoryLocations`: A pointer to appropriate locations that args points to where memory object handles (CLMemMBS.handle values) are stored. Before the user function is executed, the memory object handles are replaced by pointers to global memory.

`EventWaitList`: Optionally, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

`outEvent`: Optionally, Returns an event object that identifies this particular kernel execution instance.

The data pointed to by args and argsSize bytes in size will be copied and a pointer to this copied region will be passed to FunctionPtr. The copy needs to be done because the memory objects (CLMemMBS.handle
values) that args may contain need to be modified and replaced by appropriate pointers to global memory. When EnqueueNativeKernel returns, the memory region pointed to by args can be reused by the application.

Lasterror is set.

- 124.1.20 EnqueueNativeKernel(FunctionPtr as ptr, args as memoryblock, argsSize as Integer, NumberOfMemoryObjects as Integer, MemList as memoryblock, ArgsMemoryLocations as memoryblock)

124.1.22 EnqueueNDRangeKernel(kernel as CLKernelMBS, GlobalWorkSize as Integer, LocalWorkSize as Integer)

Function: Enqueues a command to execute a kernel on a device.

Notes:

kernel: A valid kernel object. The OpenCL context associated with kernel and command_queue must be the same.

GlobalWorkSize: The number of global work-items.

LocalWorkSize: The number of work-items that make up a work-group (also referred to as the size of the work-group) that will execute the kernel specified by kernel.

The work-group size to be used for kernel can also be specified in the program source using the _attribute_((reqd_work_group_size(X, Y, Z))) qualifier. In this case the size of work group specified by local_work_size must match the value specified by the reqd_work_group_size _attribute_ qualifier.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Optional, Returns an event object that identifies this particular kernel execution instance. Event
objects are unique and can be used to identify a particular kernel execution instance later on.

Work-group instances are executed in parallel across multiple compute units or concurrently on the same compute unit.

Each work-item is uniquely identified by a global identifier. The global ID, which can be read inside the kernel, is computed using the value given by GlobalWorkSize and global_work_offset. In OpenCL 1.0, the starting global ID is always (0, 0, ... 0). In addition, a work-item is also identified within a work-group by a unique local ID. The local ID, which can also be read by the kernel, is computed using the value given by LocalWorkSize. The starting local ID is always (0, 0, ... 0).

LastError is set.

**124.1.24 EnqueueReadBuffer**

*buffer as CLMemMBS, BlockingRead as boolean, offset as Integer, size as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS*

**Function:** Enqueue commands to read from a buffer object to host memory.

**Notes:**

- buffer: Refers to a valid buffer object.
- BlockingRead: Optional, Indicates if the read operations are blocking or non-blocking. If BlockingRead is true i.e. the read command is blocking, clEnqueueReadBuffer does not return until the buffer data has been read and copied into memory pointed to by ptr.

If BlockingRead is false i.e. the read command is non-blocking, EnqueueReadBuffer queues a non-blocking read command and returns. The contents of the buffer that ptr points to cannot be used until the read command has completed. The event argument returns an event object which can be used to query the execution status of the read command. When the read command has completed, the contents of the buffer that ptr points to can be used by the application.

- offset: The offset in bytes in the buffer object to read from.
- size: The size in bytes of data being read.
- mem: The pointer to buffer in host memory where data is to be read into.

EventWaitList: Optional, specifies events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and command_queue must be the same.

outEvent: Optional, Returns an event object that identifies this particular read command and can be used
to query or queue a wait for this particular command to complete.

Calling EnqueueReadBuffer to read a region of the buffer object with the ptr argument value set to mem + offset, where mem is a pointer to the memory region specified when the buffer object being read is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

All commands that use this buffer object have finished execution before the read command begins execution
The buffer object is not mapped
The buffer object is not used by any command-queue until the read command has finished execution

Lasterror is set.

### 124.1.25 EnqueueReadBuffer(buffer as CLMemMBS, offset as Integer, size as Integer, mem as Memoryblock)

**Function:** Enqueue commands to read from a buffer object to host memory.

**Notes:**

buffer: Refers to a valid buffer object.

BlockingRead: Optional, Indicates if the read operations are blocking or non-blocking. If BlockingRead is true i.e. the read command is blocking, clEnqueueReadBuffer does not return until the buffer data has been read and copied into memory pointed to by ptr.

If BlockingRead is false i.e. the read command is non-blocking, EnqueueReadBuffer queues a non-blocking read command and returns. The contents of the buffer that ptr points to cannot be used until the read command has completed. The event argument returns an event object which can be used to query the execution status of the read command. When the read command has completed, the contents of the buffer that ptr points to can be used by the application.

offset: The offset in bytes in the buffer object to read from.

size: The size in bytes of data being read.

mem: The pointer to buffer in host memory where data is to be read into.

EventWaitList: Optional, specifies events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and command_queue must be the same.
124.1. CLASS CLCOMMANDQUEUEMBS

outEvent: Optional. Returns an event object that identifies this particular read command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueReadBuffer to read a region of the buffer object with the ptr argument value set to mem + offset, where mem is a pointer to the memory region specified when the buffer object being read is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

All commands that use this buffer object have finished execution before the read command begins execution
The buffer object is not mapped
The buffer object is not used by any command-queue until the read command has finished execution

LastError is set.

See also:

- 124.1.24 EnqueueReadBuffer(buffer as CLMemMBS, BlockingRead as boolean, offset as Integer, size as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

124.1.26 EnqueueReadImage(image as CLMemMBS, BlockingRead as boolean, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, RowPitch as Integer, SlicePitch as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

Function: Enqueues a command to read from a 2D or 3D image object to host memory.

Notes:

image: Refers to a valid 2D or 3D image object.

BlockingRead: Optional. Indicates if the read operations are blocking or non-blocking.

If BlockingRead is true i.e. the read command is blocking, clEnqueueReadImage does not return until the buffer data has been read and copied into memory pointed to by mem.

If BlockingRead is false i.e. map operation is non-blocking, clEnqueueReadImage queues a non-blocking read command and returns. The contents of the buffer that mem points to cannot be used until the read command has completed. The event argument returns an event object which can be used to query the execution status of the read command. When the read command has completed, the contents of the buffer that mem points to can be used by the application.
origin: Defines the (x, y, z) offset in pixels in the image from where to read. If image is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle being read. If image is a 2D image object, the depth value given by RegionDepth must be 1.

RowPitch: The length of each row in bytes. This value must be greater than or equal to the element size in bytes * width. If RowPitch is set to 0, the appropriate row pitch is calculated based on the size of each element in bytes multiplied by width.

SlicePitch: Size in bytes of the 2D slice of the 3D region of a 3D image being read. This must be 0 if image is a 2D image. This value must be greater than or equal to RowPitch * height. If SlicePitch is set to 0, the appropriate slice pitch is calculated based on the RowPitch * height.

mem: The pointer to a buffer in host memory where image data is to be read from.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional, Returns an event object that identifies this particular read command and can be used to query or queue a wait for this particular command to complete. event can be nil in which case it will not be possible for the application to query the status of this command or queue a wait for this command to complete.

Calling EnqueueReadImage to read a region of the image object with the mem argument value set to HostPtr + (sourceOriginZ * image slice pitch + sourceOriginY * image row pitch + sourceOriginX * bytes per pixel), where host_ptr is a pointer to the memory region specified when the image object being read is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

- All commands that use this image object have finished execution before the read command begins execution.
- The RowPitch and SlicePitch argument values in EnqueueReadImage must be set to the image row pitch and slice pitch.
- The image object is not mapped.
- The image object is not used by any command-queue until the read command has finished execution.

Lasterror is set.
See also:
124.1.27 EnqueueReadImage(image as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, RowPitch as Integer, SlicePitch as Integer, mem as Memoryblock)

**Function:** Enqueues a command to read from a 2D or 3D image object to host memory.  
**Notes:**

- `image`: Refers to a valid 2D or 3D image object.
- `BlockingRead`: Optional. Indicates if the read operations are blocking or non-blocking.

If `BlockingRead` is true i.e. the read command is blocking, `clEnqueueReadImage` does not return until the buffer data has been read and copied into memory pointed to by `mem`.

If `BlockingRead` is false i.e. map operation is non-blocking, `clEnqueueReadImage` queues a non-blocking read command and returns. The contents of the buffer that `mem` points to cannot be used until the read command has completed. The event argument returns an event object which can be used to query the execution status of the read command. When the read command has completed, the contents of the buffer that `mem` points to can be used by the application.

- `origin`: Defines the (x, y, z) offset in pixels in the image from where to read. If image is a 2D image object, the z value given by `sourceOriginZ` must be 0.
- `region`: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle being read. If image is a 2D image object, the depth value given by `RegionDepth` must be 1.

- `RowPitch`: The length of each row in bytes. This value must be greater than or equal to the element size in bytes * `width`. If `RowPitch` is set to 0, the appropriate row pitch is calculated based on the size of each element in bytes multiplied by width.

- `SlicePitch`: Size in bytes of the 2D slice of the 3D region of a 3D image being read. This must be 0 if image is a 2D image. This value must be greater than or equal to `RowPitch` * `height`. If `SlicePitch` is set to 0, the appropriate slice pitch is calculated based on the `RowPitch` * `height`.

- `mem`: The pointer to a buffer in host memory where image data is to be read from.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional, Returns an event object that identifies this particular read command and can be used to query or queue a wait for this particular command to complete. event can be nil in which case it will not be possible for the application to query the status of this command or queue a wait for this command to complete.

Calling EnqueueReadImage to read a region of the image object with the mem argument value set to HostPtr + (sourceOriginZ * image slice pitch + sourceOriginY * image row pitch + sourceOriginX * bytes per pixel), where host_ptr is a pointer to the memory region specified when the image object being read is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

- All commands that use this image object have finished execution before the read command begins execution.
- The RowPitch and SlicePitch argument values in EnqueueReadImage must be set to the image row pitch and slice pitch.
- The image object is not mapped.
- The image object is not used by any command-queue until the read command has finished execution.

LastError is set.

124.1.28 EnqueueReadPicture(image as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, RegionWidth as Integer, RegionHeight as Integer, pic as picture)

**Function:** Enqueues a command to read from a 2D or 3D image object to a Real Studio picture object.

**Example:**

```plaintext
const size = 500

// create test picture
dim pic1 as Picture = LogoMBS(size)

// create destination picture
```
dim pic2 as new Picture(size, size, 32)

// get device list
dim devices() as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)
dim device as CLDeviceMBS = devices(0)

// Create context for that device
dim c as new CLContextMBS(device)

// query what format Real Studio uses for pictures
dim RowPitch as Integer
dim format as CLImageFormatMBS = OpenCLMBS.GetPictureImageFormat(pic1, RowPitch)

// create a matching memory object
dim m as new CLMemMBS(c, CLMemMBS.kMemoryReadWrite, format, size, size, RowPitch)

// create command queue
dim cq as new CLCommandQueueMBS(c, device, 0)

// copy picture content into CLMem object
cq.EnqueueWritePicture(m, 0, 0, size, size, pic1)

// and copy back to second picture
cq.EnqueueReadPicture(m, 0, 0, size, size, pic2)

// finally display it
Backdrop = pic2

Notes:
image: Refers to a valid 2D or 3D image object.

origin: Defines the (x, y) offset in pixels in the image from where to read.
region: Defines the (width, height) in pixels of the 2D or 3D rectangle being read.

pic: The Real Studio picture object to write pixel data to.

This command is always blocking.
Lasterror is set.
124.1.29 EnqueueTask(kernel as CLKernelMBS)

Function: Enqueues a command to execute a kernel on a device.

Notes:

kernel: A valid kernel object. The OpenCL context associated with kernel and command_queue must be the same.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is not passed or empty, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Optional, Returns an event object that identifies this particular kernel execution instance. Event objects are unique and can be used to identify a particular kernel execution instance later on.

The kernel is executed using a single work-item.

EnqueueTask is equivalent to calling EnqueueNDRangeKernel with work_dim = 1, global_work_size set to 1, and local_work_size set to 1.

LastError is set.

See also:

• 124.1.30 EnqueueTask(kernel as CLKernelMBS, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

124.1.30 EnqueueTask(kernel as CLKernelMBS, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

Function: Enqueues a command to execute a kernel on a device.

Notes:

kernel: A valid kernel object. The OpenCL context associated with kernel and command_queue must be the same.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is not passed or empty, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Optional, Returns an event object that identifies this particular kernel execution instance. Event objects are unique and can be used to identify a particular kernel execution instance later on.

The kernel is executed using a single work-item.

EnqueueTask is equivalent to calling EnqueueNDRangeKernel with work_dim = 1, global_work_size set to 1, and local_work_size set to 1.
124.1. CLASS CLCOMMANDQUEuemBS

Lasterror is set.
See also:

- 124.1.29 EnqueueTask(kernel as CLKernelMBS)

124.1.31 EnqueueUnmapMemObject(buffer as CLMemMBS, mem as Memoryblock)

Function: Enqueues a command to unmap a previously mapped region of a memory object.

Notes:

memobj: A valid memory object. The OpenCL context associated with CLCommandQueueMBS and memobj must be the same.

mem: The host address returned by a previous call to EnqueueMapBuffer or EnqueueMapImage for memobj. Do not use this memoryblock after it has been unmapped.

EventWaitList: Optionally, Specify events that need to complete before EnqueueUnmapMemObject can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Optionally, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Reads or writes from the host using the pointer returned by EnqueueMapBuffer or EnqueueMapImage are considered to be complete.

EnqueueMapBuffer and EnqueueMapImage increments the mapped count of the memory object. The initial mapped count value of a memory object is zero. Multiple calls to EnqueueMapBuffer or EnqueueMapImage on the same memory object will increment this mapped count by appropriate number of calls. EnqueueUnmapMemObject decrements the mapped count of the memory object.

EnqueueMapBuffer and clEnqueueMapImage act as synchronization points for a region of the memory object being mapped.

- 124.1.32 EnqueueUnmapMemObject(buffer as CLMemMBS, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)
124.1.32  **EnqueueUnmapMemObject(buffer as CLMemMBS, mem as MemoryBlock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)**

**Function:** Enqueues a command to unmap a previously mapped region of a memory object.

**Notes:**
- **memobj:** A valid memory object. The OpenCL context associated with CLCommandQueueMBS and memobj must be the same.
- **mem:** The host address returned by a previous call to EnqueueMapBuffer or EnqueueMapImage for memobj. Do not use this memoryblock after it has been unmapped.
- **EventWaitList:** Optionally, Specify events that need to complete before EnqueueUnmapMemObject can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
- **outEvent:** Optionally, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.
- Reads or writes from the host using the pointer returned by EnqueueMapBuffer or EnqueueMapImage are considered to be complete.
- EnqueueMapBuffer and EnqueueMapImage increments the mapped count of the memory object. The initial mapped count value of a memory object is zero. Multiple calls to EnqueueMapBuffer or EnqueueMapImage on the same memory object will increment this mapped count by appropriate number of calls. EnqueueUnmapMemObject decrements the mapped count of the memory object.
- EnqueueMapBuffer and clEnqueueMapImage act as synchronization points for a region of the memory object being mapped.

See also:
- 124.1.31 EnqueueUnmapMemObject(buffer as CLMemMBS, mem as MemoryBlock)

124.1.33  **EnqueueWaitForEvents(EventWaitList() as CLEventMBS)**

**Function:** Enqueues a wait for a specific event or a list of events to complete before any future commands queued in the command-queue are executed.

**Notes:**
- **EventWaitList:** Events specified in EventWaitList act as synchronization points.
The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

Lasterror is set.

124.1.34 EnqueueWriteBuffer(buffer as CLMemMBS, BlockingWrite as boolean, offset as Integer, size as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

Function: Enqueue commands to write to a buffer object from host memory.
Notes:
buffer: Refers to a valid buffer object.
BlockingWrite: Optional, Indicates if the write operations are blocking or nonblocking.

If blocking_write is true, the OpenCL implementation copies the data referred to by mem and enqueues the write operation in the command-queue. The memory pointed to by mem can be reused by the application after the EnqueueWriteBuffer call returns.

If blocking_write is false, the OpenCL implementation will use mem to perform a nonblocking write. As the write is non-blocking the implementation can return immediately. The memory pointed to by mem cannot be reused by the application after the call returns. The event argument returns an event object which can be used to query the execution status of the write command. When the write command has completed, the memory pointed to by mem can then be reused by the application.

offset: The offset in bytes in the buffer object to write to.
size: The size in bytes of data being written.
mem: The pointer to buffer in host memory where data is to be written from.

EventWaitList: Optional. Specifies events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Optional. Returns an event object that identifies this particular write command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueWriteBuffer to update the latest bits in a region of the buffer object with the mem argument value set to host_ptr + offset, where host_ptr is a pointer to the memory region specified when the buffer object being written is created with CL_MEM_USE_HOST_PTR, must meet the following requirements in order to avoid undefined behavior:
The host memory region given by (mem + offset, size) contains the latest bits when the enqueued write command begins execution.
The buffer object is not mapped.
The buffer object is not used by any command-queue until the write command has finished execution.

Lasterror is set.

124.1.35 EnqueueWriteBuffer(buffer as CLMemMBS, offset as Integer, size as Integer, mem as Memoryblock)

**Function:** Enqueue commands to write to a buffer object from host memory.

**Notes:**
buffer: Refers to a valid buffer object.
BlockingWrite: Optional, Indicates if the write operations are blocking or nonblocking.

If blocking_write is true, the OpenCL implementation copies the data referred to by mem and enqueues the write operation in the command-queue. The memory pointed to by mem can be reused by the application after the EnqueueWriteBuffer call returns.

If blocking_write is false, the OpenCL implementation will use mem to perform a nonblocking write. As the write is non-blocking the implementation can return immediately. The memory pointed to by mem cannot be reused by the application after the call returns. The event argument returns an event object which can be used to query the execution status of the write command. When the write command has completed, the memory pointed to by mem can then be reused by the application.

offset: The offset in bytes in the buffer object to write to.
size: The size in bytes of data being written.
mem: The pointer to buffer in host memory where data is to be written from.

EventWaitList: Optional. Specifies events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Optional. Returns an event object that identifies this particular write command and can be used to query or queue a wait for this particular command to complete.
124.1. **CLASS CLCOMMANDQUEUEMBS**

Calling `EnqueueWriteBuffer` to update the latest bits in a region of the buffer object with the `mem` argument value set to `host_ptr + offset`, where `host_ptr` is a pointer to the memory region specified when the buffer object being written is created with `CL_MEM_USE_HOST_PTR`, must meet the following requirements in order to avoid undefined behavior:

- The host memory region given by `(mem + offset, size)` contains the latest bits when the enqueued write command begins execution.
- The buffer object is not mapped.
- The buffer object is not used by any command-queue until the write command has finished execution.

`Lasterror` is set.

See also:

- `EnqueueWriteBuffer(buffer as CLMemMBS, BlockingWrite as boolean, offset as Integer, size as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)`

124.1.36 **EnqueueWriteImage**

**Function:** Enqueues a command to write from a 2D or 3D image object to host memory.

**Notes:**

- `image`: Refers to a valid 2D or 3D image object.
- `BlockingWrite`: Optional. Indicates if the write operation is blocking or non-blocking.

If `BlockingWrite` is true the OpenCL implementation copies the data referred to by `mem` and enqueues the write command in the command-queue. The memory pointed to by `mem` can be reused by the application after the `clEnqueueWriteImage` call returns. If `BlockingWrite` is false the OpenCL implementation will use `mem` to perform a nonblocking write. As the write is non-blocking the implementation can return immediately. The memory pointed to by `mem` cannot be reused by the application after the call returns. The event argument returns an event object which can be used to query the execution status of the write command. When the write command has completed, the memory pointed to by `mem` can then be reused by the application.

- `origin`: Defines the `(x, y, z)` offset in pixels in the image from where to write or write. If image is a 2D image object, the `z` value given by `sourceOriginZ` must be 0.
region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle being write or written. If image is a 2D image object, the depth value given by RegionDepth must be 1.

RowPitch
The length of each row in bytes. This value must be greater than or equal to the element size in bytes * width. If RowPitch is set to 0, the appropriate row pitch is calculated based on the size of each element in bytes multiplied by width.

RowPitch: Size in bytes of the 2D slice of the 3D region of a 3D image being written. This must be 0 if image is a 2D image. This value must be greater than or equal to RowPitch * height. If SlicePitch is set to 0, the appropriate slice pitch is calculated based on the RowPitch * height.

mem: The pointer to a buffer in host memory where image data is to be written to.

EventWaitList: Optional. Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional. Returns an event object that identifies this particular write command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueWriteImage to update the latest bits in a region of the image object with the mem argument value set to mem + (sourceOriginZ * image slice pitch + sourceOriginY * image row pitch + sourceOriginX * bytes per pixel), where mem is a pointer to the memory region specified when the image object being written is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

- The host memory region being written contains the latest bits when the enqueued write command begins execution.
- The RowPitch and SlicePitch argument values in EnqueueWriteImage must be set to the image row pitch and slice pitch.
- The image object is not mapped.
- The image object is not used by any command-queue until the write command has finished execution.

124.1.37 **EnqueueWriteImage**

(image as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, RowPitch as Integer, SlicePitch as Integer, mem as Memoryblock)

**Function:**
Enqueues a command to write from a 2D or 3D image object to host memory.

**Notes:**
- **image:** Refers to a valid 2D or 3D image object.
- **BlockingWrite:** Optional. Indicates if the write operation is blocking or non-blocking.

If BlockingWrite is true the OpenCL implementation copies the data referred to by mem and enqueues the write command in the command-queue. The memory pointed to by mem can be reused by the application after the clEnqueueWriteImage call returns. If BlockingWrite is false the OpenCL implementation will use mem to perform a nonblocking write. As the write is non-blocking the implementation can return immediately. The memory pointed to by mem cannot be reused by the application after the call returns. The event argument returns an event object which can be used to query the execution status of the write command. When the write command has completed, the memory pointed to by mem can then be reused by the application.

- **origin:** Defines the (x, y, z) offset in pixels in the image from where to write or write. If image is a 2D image object, the z value given by sourceOriginZ must be 0.

- **region:** Defines the (width, height, depth) in pixels of the 2D or 3D rectangle being write or written. If image is a 2D image object, the depth value given by RegionDepth must be 1.

- **RowPitch**
The length of each row in bytes. This value must be greater than or equal to the element size in bytes * width. If RowPitch is set to 0, the appropriate row pitch is calculated based on the size of each element in bytes multiplied by width.

- **RowPitch:** Size in bytes of the 2D slice of the 3D region of a 3D image being written. This must be 0 if image is a 2D image. This value must be greater than or equal to RowPitch * height. If SlicePitch is set to 0, the appropriate slice pitch is calculated based on the RowPitch * height.

- **mem:** The pointer to a buffer in host memory where image data is to be written to.

- **EventWaitList:** Optional. Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.
outEvent: Optional. Returns an event object that identifies this particular write command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueWriteImage to update the latest bits in a region of the image object with the mem argument value set to mem + (sourceOriginZ * image slice pitch + sourceOriginY * image row pitch + sourceOriginX * bytes per pixel), where mem is a pointer to the memory region specified when the image object being written is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

- The host memory region being written contains the latest bits when the enqueued write command begins execution.
- The RowPitch and SlicePitch argument values in EnqueueWriteImage must be set to the image row pitch and slice pitch.
- The image object is not mapped.
- The image object is not used by any command-queue until the write command has finished execution.

124.1.38 EnqueueWritePicture(image as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, RegionWidth as Integer, RegionHeight as Integer, pic as picture)

**Function:** Enqueues a command to write from a 2D or 3D image object to a Real Studio Picture.

**Example:**

```plaintext
const size = 500

// create test picture
dim pic1 as Picture = LogoMBS(size)

// create destination picture
dim pic2 as new Picture(size, size, 32)

// get device list
dim devices() as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)
dim device as CLDeviceMBS = devices(0)

// Create context for that device
```
dim c as new CLContextMBS(device)

// query what format Real Studio uses for pictures
dim RowPitch as Integer
dim format as CLImageFormatMBS = OpenCLMBS.GetPictureImageFormat(pic1, RowPitch)

// create a matching memory object
dim m as new CLMemMBS(c, CLMemMBS.kMemoryReadWrite, format, size, size, RowPitch)

// create command queue
dim cq as new CLCommandQueueMBS(c, device, 0)

// copy picture content into CLMem object
cq.EnqueueWritePicture(m, 0, 0, size, size, pic1)

// and copy back to second picture
cq.EnqueueReadPicture(m, 0, 0, size, size, pic2)

// finally display it
Backdrop = pic2

Notes:

image: Refers to a valid 2D or 3D image object.

BlockingWrite: Optional. Indicates if the write operation is blocking or non-blocking.

origin: Defines the (x, y) offset in pixels in the image from where to write or write.

region: Defines the (width, height) in pixels of the 2D or 3D rectangle being write or written.

pic: The target Real Studio picture object. This must match in the image format for the image object and the size you specified in region.

This operation is always performed blocked.
Lasterror is set.

124.1.39 Finish

Function: Blocks until all previously queued OpenCL commands in a command-queue are issued to the associated device and have completed.
Notes:
Blocks until all previously queued OpenCL commands in command_queue are issued to the associated device and have completed.

Finish does not return until all queued commands in command_queue have been processed and completed. clFinish is also a synchronization point.

Lasterror is set.

124.1.40 Flush

Function: Issues all previously queued OpenCL commands in a command-queue to the device associated with the command-queue.
Notes:
Issues all previously queued OpenCL commands in command_queue to the device associated with command_queue.

Flush only guarantees that all queued commands to command_queue get issued to the appropriate device. There is no guarantee that they will be complete after Flush returns.

Lasterror is set.

Any blocking commands queued in a command-queue such as EnqueueReadImage or EnqueueReadBuffer with BlockingRead set to true, EnqueueWriteImage or EnqueueWriteBuffer with BlockingWrite set to true, EnqueueMapImage or EnqueueMapBuffer with BlockingMap set to true or WaitForEvents perform an implicit flush of the command-queue.

To use event objects that refer to commands enqueued in a command-queue as event objects to wait on by commands enqueued in a different command-queue, the application must call a Flush or any blocking commands that perform an implicit flush of the command-queue where the commands that refer to these event objects are enqueued.
Lasterror is set.

124.1.41 Properties as UInt32

Function: Return the currently specified properties for the command-queue.
Notes: Lasterror is set.
124.1.42 ReferenceCount as UInt32

Function: Return the command-queue reference count.
Notes: Lasterror is set.

124.1.43 Properties

124.1.44 Handle as Integer

Function: The internal object reference.
Notes:
Not zero if this object is valid.
(Read and Write property)

124.1.45 LastError as Integer

Function: The last error code.
Notes:
See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)
124.2 class CLContextMBS

124.2.1 class CLContextMBS

Function: The OpenCL class for a context.

Example:

```vba
Dim devices(-1) As CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
Dim device As CLDeviceMBS = devices(0) // we use first one

// Create a context
Dim context As New CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)
```

Notes: Contexts are used by the OpenCL runtime for managing objects such as command-queues, memory, program and kernel objects and for executing kernels on one or more devices specified in the context.

124.2.2 Methods

124.2.3 Constructor(Device as CLDeviceMBS, ErrorHandlerMode as Integer = 0)

Function: Creates an OpenCL context.

Example:

```vba
Dim devices(-1) As CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
Dim device As CLDeviceMBS = devices(0) // we use first one

// Create a context
Dim context As New CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)
```

Notes:
Platform: Optional, Specifies the platform to use.
Devices: The devices you want to use. Can be one or several devices. If you specify none, the default one is picked.
ErrorHandlerMode: The error handler mode. Check kErrorMode* constants.

LastError is set.

- 124.2.8 Constructor(Platform as CLPlatformMBS, DeviceType as Integer, ErrorHandlerMode as Integer = 0) 17296

124.2.5 **Constructor(DeviceType as Integer, ErrorHandlerMode as Integer = 0)**

**Function:** Create an OpenCL context from a device type that identifies the specific device(s) to use.

**Example:**
dim co as new CLContextMBS(CLDeviceMBS.kDeviceTypeAll)

Notes:
Platform: Optional, Specifies the platform to use.
DeviceType: A bit-field that identifies the type of device and is described in the table below.
ErrorHandlerMode: The error handler mode. Check kErrorMode* constants.

<table>
<thead>
<tr>
<th>Constants</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kDeviceTypeCPU</td>
<td>An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.</td>
</tr>
<tr>
<td>kDeviceTypeGPU</td>
<td>An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.</td>

</table>

LastError is set.

See also:

- 124.2.3 Constructor(Device as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 17292
- 124.2.4 Constructor(Devices() as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 17293
- 124.2.5 Constructor(DeviceType as Integer, ErrorHandlerMode as Integer = 0) 17293
- 124.2.6 Constructor(Platform as CLPlatformMBS, Device as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 17294
- 124.2.7 Constructor(Platform as CLPlatformMBS, Devices() as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 17295

124.2.9 Devices as CLDeviceMBS()

**Function:** Return the list of devices in context.

**Example:**

```c
// create context for all devices
dim co as new CLContextMBS(CLDeviceMBS.kDeviceTypeAll)

// and query it for it’s devices
```
for each d as CLDeviceMBS in co.Devices
MsgBox d.Name
next

124.2.10 GetSupportedImageFormats(flags as UInt64, type as UInt32) as CLImageFormatMBS()

**Function:** Get the list of image formats supported by an OpenCL implementation.

**Example:**

dim co as new CLContextMBS(CLDeviceMBS.kDeviceTypeAll)
dim formats(-1) as CLImageFormatMBS = co.GetSupportedImageFormats(CLMemMBS.kMemoryReadWrite, CLMemMBS.kMemoryTypeImage2D)
dim lines(-1) as string

for each f as CLImageFormatMBS in formats
   // see constants for what this values mean
   lines.Append hex(f.ImageChannelOrder)+" - " +hex(f.ImageChannelDataType)
next
MsgBox Join(lines,EndOfLine)

**Notes:**

self: A valid OpenCL context on which the image object(s) will be created.
flags: A bit-field that is used to specify allocation and usage information about the image memory object being created and is described in the List of supported cl_mem_flags values for clCreateBuffer
type: Describes the image type and must be either kMemoryTypeImage2D or kMemoryTypeImage3D.

Returns an array of imageformat objects.

124.2.11 ReferenceCount as UInt32

**Function:** Return the context reference count.

**Example:**

dim devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
dim device as CLDeviceMBS = devices(0) // we use first one
// Create a context
Dim context as New CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)
MsgBox str(context.ReferenceCount) // 1

// Create a command queue
Dim queue as New CLCommandQueueMBS(context, device, 0)
MsgBox str(context.ReferenceCount) // 2 as the command queue points to the context, too.

### 124.2.12 Properties

#### 124.2.13 Handle as Integer

**Function:** The internal object reference.
**Notes:**
Not zero if this object is valid.
(Read and Write property)

#### 124.2.14 LastError as Integer

**Function:** The last error code.
**Notes:**
See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

### 124.2.15 Constants

#### 124.2.16 kErrorModeIgnore = 0

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the error mode constants.
124.2. CLASS CLCONTEXTMBS

124.2.17 kErrorModeLogMessagesToStderr = 3

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function**: One of the error mode constants. **Notes**: Sends all log messages to the file descriptor stderr.

124.2.18 kErrorModeLogMessagesToStdout = 2

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function**: One of the error mode constants. **Notes**: Sends all log messages to the file descriptor stdout.

124.2.19 kErrorModeLogMessagesToSystemLog = 1

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function**: One of the error mode constants. **Notes**: Fowards on all log messages to the Apple System Logger.
124.3  class CLDeviceMBS

124.3.1  class CLDeviceMBS

Function: The class for an OpenCL Device.

124.3.2  Methods

124.3.3  AddressBits as UInt32

Function: The default compute device address space size specified as an unsigned integer value in bits.
Example:

dim Devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)

for each p as CLDeviceMBS in Devices
    MsgBox p.Name + " : " + str(p.AddressBits)
next

Notes:
Currently supported values are 32 or 64 bits.
LastError is set.

124.3.4  Available as Boolean

Function: Returns true if the device is available and false if the device is not available.
Notes: Lasterror is set.

124.3.5  CompilerAvailable as Boolean

Function: Returns false if the implementation does not have a compiler available to compile the program
source.
Notes:
Is true if the compiler is available. This can be false for the embedded platform profile only.
124.3. CLASS CLDEVICEMBS

Lasterror is set.

124.3.6 DeviceType as UInt64

Function: The OpenCL device type.
Notes:
Currently supported values are one of or a combination of: kDeviceTypeCPU, kDeviceTypeGPU, kDeviceTypeAccelerator, or kDeviceTypeDefault.
Lasterror is set.

124.3.7 DeviceVersion as String

Function: OpenCL version string.
Notes:
Returns the OpenCL version supported by the device. This version string has the following format:

OpenCL<space><major_version.minor_version><space><vendor-specific information>

The major_version.minor_version value returned will be 1.0.
Lasterror is set.

124.3.8 DriverVersion as String

Function: OpenCL software driver version string in the form major_number.minor_number.
Notes: Lasterror is set.

124.3.9 EndianLittle as Boolean

Function: Returns true if the OpenCL device is a little endian device and false otherwise.
Notes: Lasterror is set.
124.3.10 ErrorCorrectionSupport as Boolean

Function: Returns true if the device implements error correction for the memories, caches, registers etc. in
the device.
Notes:
Returns false if the device does not implement error correction. This can be a requirement for certain clients
of OpenCL.
Lasterror is set.

124.3.11 ExecutionCapabilities as UInt64

Function: Describes the execution capabilities of the device.
Notes:
This is a bit-field that describes one or more of the following values:

kExecKernel - The OpenCL device can execute OpenCL kernels.
kExecNativeKernel - The OpenCL device can execute native kernels.

The mandated minimum capability is kExecKernel.
Lasterror is set.

124.3.12 Extensions as String

Function: Returns a space separated list of extension names.
Example:

// show msgbox with all extensions for first device

dim devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)
dim device as CLDeviceMBS = devices(0)

dim extensions(-1) as string = split(device.Extensions, “ “)

dim lines(-1) as string

for each extension as string in extensions
    lines.append extension
next
**124.3. CLASS CLDEVICEMBS**

MsgBox Join(lines,EndOfLine)

**Notes:**

(the extension names themselves do not contain any spaces).
The list of extension names returned currently can include one or more of the following approved extension names:

- cl_khr_fp64
- cl_khr_select_fprounding_mode
- cl_khr_global_int32_base_atomics
- cl_khr_global_int32_extended_atomics
- cl_khr_local_int32_base_atomics
- cl_khr_local_int32_extended_atomics
- cl_khr_int64_base_atomics
- cl_khr_int64_extended_atomics
- cl_khr_3d_image_writes
- cl_khr_byte_addressable_store
- cl_khr_fp16

Lasterror is set.

**124.3.13 GlobalMemoryCacheLineSize as UInt32**

**Function:** Size of global memory cache line in bytes. 
**Notes:** Lasterror is set.

**124.3.14 GlobalMemoryCacheSize as UInt64**

**Function:** Size of global memory cache in bytes. 
**Notes:** Lasterror is set.

**124.3.15 GlobalMemoryCacheType as UInt32**

**Function:** Type of global memory cache supported. 
**Notes:**
See kCacheMemType* constants.
Lasterror is set.

124.3.16 GlobalMemorySize as UInt64

Function: Size of global device memory in bytes.
Notes: Lasterror is set.

124.3.17 Image2DMaxHeight as UInt32

Function: Max height of 2D image in pixels.
Notes:
The minimum value is 8192 if ImageSupport is true.
Lasterror is set.

124.3.18 Image2DMaxWidth as UInt32

Function: Max width of 2D image in pixels.
Notes:
The minimum value is 8192 if ImageSupport is true.
Lasterror is set.

124.3.19 Image3DMaxDepth as UInt32

Function: Max depth of 3D image in pixels.
Notes:
The minimum value is 2048 if ImageSupport is true.
Lasterror is set.
124.3. **CLASS CLDEVICEMBS**

124.3.20 **Image3DMaxHeight as UInt32**

**Function:** Max height of 3D image in pixels.

**Notes:**

The minimum value is 2048 if ImageSupport is true. Lasterror is set.

124.3.21 **Image3DMaxWidth as UInt32**

**Function:** Max width of 3D image in pixels.

**Notes:**

The minimum value is 2048 if ImageSupport is true. Lasterror is set.

124.3.22 **ImageSupport as Boolean**

**Function:** Returns true if images are supported by the OpenCL device and false otherwise.

**Notes:** Lasterror is set.

124.3.23 **LocalMemorySize as UInt64**

**Function:** Size of local memory arena in bytes.

**Notes:**

The minimum value is 16 KB. Lasterror is set.

124.3.24 **LocalMemType as UInt32**

**Function:** Type of local memory supported.

**Notes:**

This can be set to kMemTypeLocal implying dedicated local memory storage such as SRAM, or kMemType-Global.
124.3.25 MaxClockFrequency as UInt32

Function: Maximum configured clock frequency of the device in MHz.
Notes: Lasterror is set.

124.3.26 MaxComputeUnits as UInt32

Function: The number of parallel compute cores on the OpenCL device.
Notes:
The minimum value is 1.
Lasterror is set.

124.3.27 MaxConstantArgs as UInt32

Function: Max number of arguments declared with the __constant qualifier in a kernel.
Notes:
The minimum value is 8.
Lasterror is set.

124.3.28 MaxConstantBufferSize as UInt64

Function: Max size in bytes of a constant buffer allocation.
Notes:
The minimum value is 64 KB.
Lasterror is set.

124.3.29 MaxMemoryAllocSize as UInt64

Function: Max size of memory object allocation in bytes.
124.3. CLASS CLDEVICEMBS

Notes:
The minimum value is max (1/4th of GlobalMemorySize, 128*1024*1024)
Lasterror is set.

124.3.30 MaxParameterSize as UInt32

Function: Max size in bytes of the arguments that can be passed to a kernel.
Notes:
The minimum value is 256.
Lasterror is set.

124.3.31 MaxReadImageArgs as UInt32

Function: Max number of simultaneous image objects that can be read by a kernel.
Notes:
Lasterror is set.
The minimum value is 128 if ImageSupport is true.

124.3.32 MaxSamplers as UInt32

Function: Maximum number of samplers that can be used in a kernel.
Notes:
The minimum value is 16 if ImageSupport is true.
Lasterror is set.

124.3.33 MaxWorkGroupSize as UInt32

Function: Maximum number of work-items in a work-group executing a kernel using the data parallel execution model.
Notes:
(Refer to EnqueueNDRangeKernel). The minimum value is 1.
Lasterror is set.
124.3.34  MaxWorkItemDimensions as UInt32

Function: Maximum dimensions that specify the global and local work-item IDs used by the data parallel execution model.
Notes:
(Refer to EnqueueNDRangeKernel). The minimum value is 3.
LastError is set.

124.3.35  MaxWriteImageArgs as UInt32

Function: Max number of simultaneous image objects that can be written to by a kernel.
Notes:
The minimum value is 8 if ImageSupport is true.
LastError is set.

124.3.36  MemoryBaseAddressAlign as UInt32

Function: Describes the alignment in bits of the base address of any allocated memory object.
Notes: Lasterror is set.

124.3.37  MinDataTypeAlignSize as UInt32

Function: The smallest alignment in bytes which can be used for any data type.
Notes: Lasterror is set.

124.3.38  Name as String

Function: Device name string.
Example:

dim Devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)
for each p as CLDeviceMBS in Devices
MsgBox p.Name
Notes: Lasterror is set.

124.3.39 Platform as CLPlatformMBS

Function: The platform associated with this device.
Notes: Lasterror is set.

124.3.40 PreferredVectorWidthChar as UInt32

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes: The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.

124.3.41 PreferredVectorWidthDouble as UInt32

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes: The vector width is defined as the number of scalar elements that can be stored in the vector.

If the cl_khr_fp64 extension is not supported, this function must return 0.
Lasterror is set.

124.3.42 PreferredVectorWidthFloat as UInt32

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes: The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.
124.3.43 PreferredVectorWidthInt as UInt32

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes:
The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.

124.3.44 PreferredVectorWidthLong as UInt32

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes:
The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.

124.3.45 PreferredVectorWidthShort as UInt32

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes:
The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.

124.3.46 Profile as String

Function: OpenCL profile string.
Notes:
Returns the profile name supported by the device (see note). The profile name returned can be one of the following strings:

FULL_PROFILE - if the device supports the OpenCL specification (functionality defined as part of the core specification and does not require any extensions to be supported).

EMBEDDED_PROFILE - if the device supports the OpenCL embedded profile.
Lasterror is set.
124.3. CLASS CLDEVICEMBS

124.3.47 ProfilingTimerResolution as UInt32

Function: Describes the resolution of device timer. This is measured in nanoseconds.
Notes: Lasterror is set.

124.3.48 QueueProperties as UInt64

Function: Describes the command-queue properties supported by the device.
Notes:
See kQueueOutOfOrderExecModeEnable and kQueueProfilingEnable.
Lasterror is set.

124.3.49 SingleFPConfig as UInt64

Function: Describes single precision floating-point capability of the device.
Notes:
The mandated minimum floating-point capability is kFPRoundToNearest+kFPInfNAN.
Lasterror is set.

124.3.50 Vendor as String

Function: Vendor name string.
Notes: Lasterror is set.

124.3.51 VendorID as UInt32

Function: A unique device vendor identifier.
Notes:
An example of a unique device identifier could be the PCIe ID.
Lasterror is set.
124.3.52 Properties

124.3.53 Handle as Integer

Function: The internal object reference.
Notes:
Not zero if this object is valid.
(Read and Write property)

124.3.54 LastError as Integer

Function: The last error code.
Notes:
See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

124.3.55 Constants

124.3.56 kCacheMemTypeNone = 0

124.3.57 kCacheMemTypeReadOnlyCache = 1

Notes: Read Only Cache.

124.3.58 kCacheMemTypeReadWriteCache = 2

Notes: Read/Write Cache.
124.3. \texttt{CLASS CLDEVICEMBS}

124.3.59 \texttt{kDeviceTypeAccelerator} = 8

MBS MacFrameworks Plugin, Plugin Version: 11.1. \textbf{Function:} One of the device type constants.  
\textbf{Notes:} Accelerator = some special acceleration device

124.3.60 \texttt{kDeviceTypeAll} = \& \texttt{xffffffff}

MBS MacFrameworks Plugin, Plugin Version: 11.1. \textbf{Function:} One of the device type constants.  
\textbf{Notes:} This is the bitmask to catch all possible types.

124.3.61 \texttt{kDeviceTypeCPU} = 2

MBS MacFrameworks Plugin, Plugin Version: 11.1. \textbf{Function:} One of the device type constants.  
\textbf{Notes:} CPU = your processor

124.3.62 \texttt{kDeviceTypeDefault} = 1

MBS MacFrameworks Plugin, Plugin Version: 11.1. \textbf{Function:} One of the device type constants.  
\textbf{Notes:} Default device.

124.3.63 \texttt{kDeviceTypeGPU} = 4

MBS MacFrameworks Plugin, Plugin Version: 11.1. \textbf{Function:} One of the device type constants.  
\textbf{Notes:} GPU = your graphics card

124.3.64 \texttt{kExceNativeKernel} = 2

MBS MacFrameworks Plugin, Plugin Version: 11.1. \textbf{Function:} One of the execution capabilities constants.  
\textbf{Notes:} The OpenCL device can execute native kernels.

124.3.65 \texttt{kExecKernel} = 1

MBS MacFrameworks Plugin, Plugin Version: 11.1. \textbf{Function:} One of the execution capabilities constants.  
\textbf{Notes:} The OpenCL device can execute OpenCL kernels.
124.3.66  **kFPDenorm = 1**

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the floating point capabilities constants.
**Notes:** denorms are supported

124.3.67  **kFPFMA = 32**

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the floating point capabilities constants.
**Notes:** IEEE754-2008 fused multiply-add is supported

124.3.68  **kFPInfNAN = 2**

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the floating point capabilities constants.
**Notes:** INF and quiet NaNs are supported

124.3.69  **kFPRoundToInf = 16**

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the floating point capabilities constants.
**Notes:** Round to +ve and -ve infinity rounding modes supported

124.3.70  **kFPRoundToNearest = 4**

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the floating point capabilities constants.
**Notes:** Round to nearest even rounding mode supported

124.3.71  **kFPRoundToZero = 8**

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the floating point capabilities constants.
**Notes:** Round to zero rounding mode supported
124.3.72  kMemTypeGlobal = 2

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the memory type constants. **Notes:** Dedicated local memory storage such as SRAM.

124.3.73  kMemTypeLocal = 1

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the memory type constants.

124.3.74  kQueueOutOfOrderExecModeEnable = 1

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the queue properties constants. **Notes:** Out of order execution mode enabled.

124.3.75  kQueueProfilingEnable = 2

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the queue properties constants. **Notes:** Profiling enabled.
124.4 class CLEventMBS

124.4.1 class CLEventMBS

Function: The class for an OpenCL event.
Notes: You can chain several operations together inside a command queue. With events you can have an item execute after another item.

124.4.2 Methods

124.4.3 CommandExecutionStatus as Integer

Function: Return the execution status of the command identified by event.
Notes:
See kCommandExecutionStatus* constants.
Lasterror is set.

124.4.4 CommandQueue as CLCommandQueueMBS

Function: Return the command-queue associated with event.
Notes: Lasterror is set.

124.4.5 CommandType as(UInt32

Function: Return the command associated with event.
Notes:
See kCommand* constants.
Lasterror is set.

124.4.6 ProfilingCommandEnd as UInt64

Function: A 64-bit value that describes the current device time counter in nanoseconds when the command
identified by event has finished execution on the device.

Notes: Lasterror is set.

### 124.4.7 ProfilingCommandQueued as.UInt64

**Function:** A 64-bit value that describes the current device time counter in nanoseconds when the command identified by event is enqueued in a command-queue by the host.

**Notes:** Lasterror is set.

### 124.4.8 ProfilingCommandStart as UInt64

**Function:** A 64-bit value that describes the current device time counter in nanoseconds when the command identified by event starts execution on the device.

**Notes:** Lasterror is set.

### 124.4.9 ProfilingCommandSubmit as UInt64

**Function:** A 64-bit value that describes the current device time counter in nanoseconds when the command identified by event that has been enqueued is submitted by the host to the device associated with the commandqueue.

**Notes:** Lasterror is set.

### 124.4.10 ReferenceCount as UInt32

**Function:** Return the event reference count.

**Notes:**
The reference count returned should be considered immediately stale. It is unsuitable for general use in applications. This feature is provided for identifying memory leaks. Lasterror is set.
124.4.11 Properties

124.4.12 Handle as Integer

Function: The internal object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

124.4.13 LastError as Integer

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

124.4.14 Constants

124.4.15 kCommandAcquireGLObjects = & h11FF

Notes: Acquire GL objects

124.4.16 kCommandCopyBuffer = & h11F5

Notes: Copy Buffer

124.4.17 kCommandCopyBufferToImage = & h11FA

Notes: Copy Buffer to Image
124.4. CLASS CLEVENTMBS

124.4.18  \( k\text{CommandCopyImage} = \& h11F8 \)

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants.
**Notes:** Copy Image

124.4.19  \( k\text{CommandCopyImageToBuffer} = \& h11F9 \)

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants.
**Notes:** Copy Image to Buffer

124.4.20  \( k\text{CommandExecutionStatusComplete} = 0 \)

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command execution status constants.
**Notes:** The command has completed.

124.4.21  \( k\text{CommandExecutionStatusQueued} = 3 \)

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command execution status constants.
**Notes:** command has been enqueued in the command-queue.

124.4.22  \( k\text{CommandExecutionStatusRunning} = 1 \)

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command execution status constants.
**Notes:** Device is currently executing this command.

124.4.23  \( k\text{CommandExecutionStatusSubmitted} = 2 \)

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command execution status constants.
**Notes:** enqueued command has been submitted by the host to the device associated with the command-queue.
124.4.24  kCommandMapBuffer = & h11FB

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. 
**Notes:** Map Buffer

124.4.25  kCommandMapImage = & h11FC

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. 
**Notes:** Map Image

124.4.26  kCommandMarker = & h11FE

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. 
**Notes:** Marker

124.4.27  kCommandNativeKernel = & h11F2

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. 
**Notes:** Execute Native Kernel

124.4.28  kCommandNDRangeKernel = & h11F0

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. 
**Notes:** Execute a ND Range Kernel

124.4.29  kCommandReadBuffer = & h11F3

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. 
**Notes:** Read Buffer

124.4.30  kCommandReadImage = & h11F6

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. 
**Notes:** Read Image
124.4.31 kCommandReleaseGLObjects = & h1200

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. **Notes:** Release GL objects

124.4.32 kCommandTask = & h11F1

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. **Notes:** Execute task

124.4.33 kCommandUnmapMemObject = & h11FD

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. **Notes:** Unmap memory object

124.4.34 kCommandWriteBuffer = & h11F4

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. **Notes:** Write Buffer

124.4.35 kCommandWriteImage = & h11F7

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the command type constants. **Notes:** Write Image
124.5  class CLImageFormatMBS

124.5.1  class CLImageFormatMBS

Function: the OpenCL class for an image format.

124.5.2  Properties

124.5.3  ImageChannelDataType as Integer

Function: Describes the size of the channel data type. 
Notes: 
The number of bits per element determined by the ImageChannelDataType and ImageChannelOrder must 
be a power of two. The list of supported values is described in the table below.

<table>
<thead>
<tr>
<th>Image Channel Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kChannelTypeSNormInt8</td>
<td>Each channel component is a normalized signed 8-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeSNormInt16</td>
<td>Each channel component is a normalized signed 16-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeUNormInt8</td>
<td>Each channel component is a normalized unsigned 8-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeUNormInt16</td>
<td>Each channel component is a normalized unsigned 16-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeUNormShort565</td>
<td>Represents a normalized 5-6-5 3-channel RGB image. The channel order must</td>
</tr>
<tr>
<td></td>
<td>be kChannelOrderRGB.</td>
</tr>
<tr>
<td>kChannelTypeUNormShort555</td>
<td>Represents a normalized x-5-5-5 4-channel xRGB image. The channel order</td>
</tr>
<tr>
<td></td>
<td>must be kChannelOrderRGB.</td>
</tr>
<tr>
<td>kChannelTypeUNormInt101010</td>
<td>Represents a normalized x-10-10-10 4-channel xRGB image. The channel order</td>
</tr>
<tr>
<td></td>
<td>must be kChannelOrderRGB.</td>
</tr>
<tr>
<td>kChannelTypeSignedInt8</td>
<td>Each channel component is an unnormalized signed 8-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeSignedInt16</td>
<td>Each channel component is an unnormalized signed 16-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeSignedInt32</td>
<td>Each channel component is an unnormalized signed 32-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeUnsignedInt8</td>
<td>Each channel component is an unnormalized unsigned 8-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeUnsignedInt16</td>
<td>Each channel component is an unnormalized unsigned 16-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeUnsignedInt32</td>
<td>Each channel component is an unnormalized unsigned 32-bit integer value.</td>
</tr>
<tr>
<td>kChannelTypeHalfFloat</td>
<td>Each channel component is a 16-bit half-float value.</td>
</tr>
<tr>
<td>kChannelTypeFloat</td>
<td>Each channel component is a single precision floating-point value.</td>
</tr>
</tbody>
</table>

(Read and Write property)
124.5.4  ImageChannelOrder as Integer

Function: Specifies the number of channels and the channel layout i.e. the memory layout in which channels are stored in the image.

Notes:
Valid values are described in the table below.

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kChannelOrderR, or kChannelOrderA</td>
<td>This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeUNormInt16, kChannelTypeSNormInt8, kChannelTypeSNormInt16, kChannelTypeHalfFloat, or kChannelTypeFloat.</td>
</tr>
<tr>
<td>kChannelOrderIntensity</td>
<td>This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeUNormInt16, kChannelTypeSNormInt8, kChannelTypeSNormInt16, kChannelTypeHalfFloat, or kChannelTypeFloat.</td>
</tr>
<tr>
<td>kChannelOrderLuminance</td>
<td>This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeUNormInt16, kChannelTypeSNormInt8, kChannelTypeSNormInt16, kChannelTypeHalfFloat, or kChannelTypeFloat.</td>
</tr>
<tr>
<td>kChannelOrderRGB, or kChannelOrderRA</td>
<td>This format can only be used if channel data type = kChannelTypeUNormShort1565, kChannelTypeUNormShort1555 or kChannelTypeUNorm101010.</td>
</tr>
<tr>
<td>kChannelOrderRGBA</td>
<td>This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeSNormInt8, kChannelTypeSignedInt8 or kChannelTypeUnsignedInt8.</td>
</tr>
</tbody>
</table>

(Read and Write property)

124.5.5  Constants

124.5.6  kChannelOrderA = & h10B1

MBS MacFrameworks Plugin, Plugin Version: 11.1. Function: One of the channel order constants

124.5.7  kChannelOrderRGB = & h10B7

MBS MacFrameworks Plugin, Plugin Version: 11.1. Function: One of the channel order constants

124.5.8  kChannelOrderBGRA = & h10B6

MBS MacFrameworks Plugin, Plugin Version: 11.1. Function: One of the channel order constants
124.5.9  kChannelOrderIntensity = & h10B8

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel order constants  
**Notes:** This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeUNormInt16, kChannelTypeSNormInt8, kChannelTypeSNormInt16, kChannelTypeHalfFloat, or kChannelTypeFloat.

124.5.10  kChannelOrderLuminance = & h10B9

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel order constants  
**Notes:** This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeUNormInt16, kChannelTypeSNormInt8, kChannelTypeSNormInt16, kChannelTypeHalfFloat, or kChannelTypeFloat.

124.5.11  kChannelOrderR = & h10B0

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel order constants

124.5.12  kChannelOrderRA = & h10B3

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel order constants

124.5.13  kChannelOrderRG = & h10B2

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel order constants

124.5.14  kChannelOrderRGB = & h10B4

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel order constants  
**Notes:** This format can only be used if channel data type = kChannelTypeUNormShort565, kChannelTypeUNormShort555 or kChannelTypeUNormInt101010.

124.5.15  kChannelOrderRGBA = & h10B5

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel order constants
124.5.16  kChannelTypeFloat = & h10DE

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is a single precision floating-point value.

124.5.17  kChannelTypeHalfFloat = & h10DD

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is a 16-bit half-float value.

124.5.18  kChannelTypeSignedInt16 = & h10D8

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is an unnormalized signed 16-bit integer value.

124.5.19  kChannelTypeSignedInt32 = & h10D9

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is an unnormalized signed 32-bit integer value.

124.5.20  kChannelTypeSignedInt8 = & h10D7

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is an unnormalized signed 8-bit integer value.

124.5.21  kChannelTypeSNormInt16 = & h10D1

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is a normalized signed 16-bit integer value.

124.5.22  kChannelTypeSNormInt8 = & h10D0

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is a normalized signed 8-bit integer value.
124.5.23  kChannelTypeUNormInt101010 = & h10D6

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Represents a normalized x-10-10-10 4-channel xRGB image. The channel order must be kChannelOrderRGB.

124.5.24  kChannelTypeUNormInt16 = & h10D3

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is a normalized unsigned 16-bit integer value.

124.5.25  kChannelTypeUNormInt8 = & h10D2

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is a normalized unsigned 8-bit integer value.

124.5.26  kChannelTypeUNormShort555 = & h10D5

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Represents a normalized x-5-5-5 4-channel xRGB image. The channel order must be kChannelOrderRGB.

124.5.27  kChannelTypeUNormShort565 = & h10D4

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Represents a normalized 5-6-5 3-channel RGB image. The channel order must be kChannelOrderRGB.

124.5.28  kChannelTypeUnsignedInt16 = & h10DB

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is an unnormalized unsigned 16-bit integer value.
124.5.29  kChannelTypeUnsignedInt32 = & h10DC

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is an unnormalized unsigned 32-bit integer value.

124.5.30  kChannelTypeUnsignedInt8 = & h10DA

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function:** One of the channel data type constants. **Notes:** Each channel component is an unnormalized unsigned 8-bit integer value.
124.6 class CLKernelMBS

124.6.1 class CLKernelMBS

Function: The class for an OpenCL Kernel.

124.6.2 Methods

124.6.3 Constructor( Program as CLProgramMBS, KernelName as string)

Function: Creates a kernel object.
Notes: Program: A program object with a successfully built executable.
KernelName: A function name in the program declared with the _kernel qualifier

A kernel is a function declared in a program. A kernel is identified by the _kernel qualifier applied to any
function in a program. A kernel object encapsulates the specific _kernel function declared in a program and
the argument values to be used when executing this _kernel function. Lasterror is set.

124.6.4 FunctionName as string

Function: Return the kernel function name.
Notes: Lasterror is set.

124.6.5 GetKernelCompileWorkGroupSize( device as CLDeviceMBS, byref X as Int64, byref Y as Int64, byref Z as Int64)

Function: Returns the work-group size specified by the _attribute((reqd_work_group_size(X, Y, Z)))
qualifier.
Notes: device: Identifies a specific device in the list of devices associated with kernel. The list of devices is the list
of devices in the OpenCL context that is associated with kernel. If the list of devices associated with kernel
is a single device, device can be a nil value.
If the work-group size is not specified using the above attribute qualifier (0, 0, 0) is returned. Lasterror is set.

### 124.6.6 GetKernelLocalMemorySize(device as CLDeviceMBS = nil) as UInt64

**Function:** Returns the amount of local memory in bytes being used by a kernel.

**Notes:**

device: Identifies a specific device in the list of devices associated with kernel. The list of devices is the list of devices in the OpenCL context that is associated with kernel. If the list of devices associated with kernel is a single device, device can be a nil value.

This includes local memory that may be needed by an implementation to execute the kernel, variables declared inside the kernel with the __local address qualifier and local memory to be allocated for arguments to the kernel declared as pointers with the __local address qualifier and whose size is specified with clSetKernelArg.

If the local memory size, for any pointer argument to the kernel declared with the __local address qualifier, is not specified, its size is assumed to be 0. Lasterror is set.

### 124.6.7 GetKernelWorkGroupSize(device as CLDeviceMBS = nil) as Int64

**Function:** This provides a mechanism for the application to query the work-group size that can be used to execute a kernel on a specific device given by device.

**Notes:**

device: Identifies a specific device in the list of devices associated with kernel. The list of devices is the list of devices in the OpenCL context that is associated with kernel. If the list of devices associated with kernel is a single device, device can be a nil value.

The OpenCL implementation uses the resource requirements of the kernel (register usage etc.) to determine what this work-group size should be. Lasterror is set.

### 124.6.8 NumberOfArguments as UInt32

**Function:** Return the number of arguments to kernel.
124.6.9 ReferenceCount as UInt32

Function: Return the kernel reference count.
Notes:
The reference count returned should be considered immediately stale. It is unsuitable for general use in applications. This feature is provided for identifying memory leaks.
Lasterror is set.

124.6.10 SetKernelArgDouble(index as Integer, value as Double)

Function: Sets the kernel argument with the given index.
Notes:
index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.
value: the value.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types. Lasterror is set.

124.6.11 SetKernelArgFloat(index as Integer, value as Single)

Function: Sets the kernel argument with the given index.
Notes:
index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.
value: the value.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types. Lasterror is set.
124.6. **CLASS CLKERNELMBS**

124.6.12 **SetKernelArgInt32(index as Integer, value as Int32)**

**Function:** Sets the kernel argument with the given index.

**Notes:**

index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.

value: the value.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types. Lasterror is set.

124.6.13 **SetKernelArgInt64(index as Integer, value as Int64)**

**Function:** Sets the kernel argument with the given index.

**Notes:**

index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.

value: the value.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types. Lasterror is set.

124.6.14 **SetKernelArgMem(index as Integer, mem as CLMemMBS)**

**Function:** Sets the kernel argument with the given index.

**Notes:**

index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.

value: the memory object to set for argument.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types. Lasterror is set.
124.6.15 Properties

124.6.16 Context as CLContextMBS

Function: Return the context associated with kernel.
Notes:
Lasterror is set.
(Read and Write property)

124.6.17 Handle as Integer

Function: The internel object reference.
Notes:
Not zero if this object is valid.
(Read and Write property)

124.6.18 LastError as Integer

Function: The last error code.
Notes:
See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

124.6.19 Program as CLProgramMBS

Function: Return the program object associated with kernel.
Notes:
Lasterror is set.
(Read and Write property)
124.7  class CLMemMBS

**Function:** The class for a OpenCL memory block.

**Example:**

```
const Size = 4096
dim context as CLContextMBS // your context
dim input as new CLMemMBS(context, CLMEMMBS.kMemoryReadOnly, 4096)
```

124.7.2  Methods

124.7.3  Constructor(Context as CLContextMBS, Flags as UInt64, ImageFormat as CLImageFormatMBS, Width as Integer, Height as Integer, Depth as Integer, RowPitch as Integer, SlicePitch as Integer, HostPtr as Memoryblock = nil)

**Function:** Creates a 3D image object.

**Notes:**

- context: A valid OpenCL context on which the image object is to be created.
- flags: A bit-field that is used to specify allocation and usage information about the image memory object being created. See kMemory* constants.
- ImageFormat: the image format properties of the image to be allocated.
- Width, Height: The width and height of the image in pixels. These must be values greater than or equal to 1.
- Depth: The depth of the image in pixels. This must be a value greater than 1.
- RowPitch: The scan-line pitch in bytes. This must be 0 if HostPtr is nil and can be either 0 or greater than or equal to Width * size of element in bytes if HostPtr is not nil. If HostPtr is not nil and RowPitch is equal to 0, RowPitch is calculated as Width * size of element in bytes. If RowPitch is not 0, it must be a multiple of the image element size in bytes.
- SlicePitch: The size in bytes of each 2D slice in the 3D image. This must be 0 if HostPtr is nil and can be either 0 or greater than or equal to RowPitch * Height if HostPtr is not nil. If HostPtr is not nil and SlicePitch is equal to 0, SlicePitch is calculated as RowPitch * Height. If SlicePitch is not 0, it must be a multiple of the RowPitch.
- HostPtr: A pointer to the image data that may already be allocated by the application. The size of the buffer that HostPtr points to must be greater than or equal to SlicePitch * image_depth. The size of each element in bytes must be a power of 2. The image data specified by HostPtr is stored as a linear sequence of adjacent 2D slices. Each 2D slice is a linear sequence of adjacent scanlines. Each scanline is a linear sequence of image elements.
Lasterror is set.

124.7.4 Constructor(Context as CLContextMBS, Flags as UInt64, ImageFormat as CLImageFormatMBS, Width as Integer, Height as Integer, RowPitch as Integer, HostPtr as Memoryblock = nil)

**Function:** Creates a 2D image object.

**Notes:**

class: A valid OpenCL context on which the image object is to be created.
flags: A bit-field that is used to specify allocation and usage information about the image memory object being created. See kMemory* constants.
ImageFormat: The format properties of the image to be allocated.
Width and Height: The width and height of the image in pixels. These must be values greater than or equal to 1.
RowPitch: The scan-line pitch in bytes. This must be 0 if HostPtr is nil and can be either 0 or greater than or equal to Width * size of element in bytes if HostPtr is not nil. If HostPtr is not nil and RowPitch is equal to 0, RowPitch is calculated as Width * size of element in bytes. If RowPitch is not 0, it must be a multiple of the image element size in bytes.
HostPtr: A pointer to the image data that may already be allocated by the application. The size of the buffer that HostPtr points to must be greater than or equal to RowPitch * Height. The size of each element in bytes must be a power of 2. The image data specified by HostPtr is stored as a linear sequence of adjacent scanlines. Each scanline is stored as a linear sequence of image elements.

Lasterror is set.

- 124.7.3 Constructor(Context as CLContextMBS, Flags as UInt64, ImageFormat as CLImageFormatMBS, Width as Integer, Height as Integer, Depth as Integer, RowPitch as Integer, SlicePitch as Integer, HostPtr as Memoryblock = nil)

- 124.7.5 Constructor(Context as CLContextMBS, Flags as UInt64, Size as Integer, HostPtr as Memoryblock = nil)
124.7. Constructor(Context as CLContextMBS, Flags as UInt64, Size as Integer, HostPtr as Memoryblock = nil)

Function: Creates a new buffer object.

Notes:

context: A valid OpenCL context used to create the buffer object.
flags: A bit-field that is used to specify allocation and usage information such as the memory arena that should be used to allocate the buffer object and how it will be used. The following table describes the possible values for flags:
size: The size in bytes of the buffer memory object to be allocated.
HostPtr: A memoryblock that may already be allocated by the application. The size of the buffer that HostPtr points to must be greater than or equal to the size bytes.

<table>
<thead>
<tr>
<th>Flags</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kMemoryReadWrite</td>
<td>This flag specifies that the memory object will be read and written by a kernel. This is the default.</td>
</tr>
<tr>
<td>kMemoryWriteOnly</td>
<td>This flag specifies that the memory object will be written but not read by a kernel. Reading from a buffer or image object created with kMemoryWriteOnly inside a kernel is undefined.</td>
</tr>
<tr>
<td>kMemoryReadOnly</td>
<td>This flag specifies that the memory object is a read-only memory object when used inside a kernel. Writing to a buffer or image object created with kMemoryReadOnly inside a kernel is undefined.</td>
</tr>
<tr>
<td>kMemoryUseHostPtr</td>
<td>This flag is valid only if HostPtr is not nil. If specified, it indicates that the application wants the OpenCL implementation to use memory referenced by HostPtr as the storage bits for the memory object. OpenCL implementations are allowed to cache the buffer contents pointed to by HostPtr in device memory. This cached copy can be used when kernels are executed on a device. The result of OpenCL commands that operate on multiple buffer objects created with the same HostPtr or overlapping host regions is considered to be undefined.</td>
</tr>
<tr>
<td>kMemoryAllocHostPtr</td>
<td>This flag specifies that the application wants the OpenCL implementation to allocate memory from host accessible memory. kMemoryAllocHostPtr and kMemoryUseHostPtr are mutually exclusive.</td>
</tr>
<tr>
<td>kMemoryCopyHostPtr</td>
<td>This flag is valid only if HostPtr is not nil. If specified, it indicates that the application wants the OpenCL implementation to allocate memory for the memory object and copy the data from memory referenced by HostPtr. kMemoryCopyHostPtr and kMemoryUseHostPtr are mutually exclusive. kMemoryCopyHostPtr can be used with kMemoryAllocHostPtr to initialize the contents of the cl_mem object allocated using host-accessible (e.g. PCIe) memory.</td>

**Notes:** Lasterror is set.

### 124.7.12 ImageRowPitch as UInt64

**Function:** Return size in bytes of a row of elements of the image object given by image.  
**Notes:** Lasterror is set.

### 124.7.13 ImageSlicePitch as UInt64

**Function:** Return size in bytes of a 2D slice for the 3D image object given by image.  
**Notes:**  
For a 2D image object this value will be 0.  
Lasterror is set.

### 124.7.14 ImageWidth as UInt64

**Function:** Return width of image in pixels.  
**Notes:** Lasterror is set.

### 124.7.15 ReferenceCount as UInt32

**Function:** Return memory object reference count.  
**Notes:**  
The reference count returned should be considered immediately stale. It is unsuitable for general use in applications. This feature is provided for identifying memory leaks.  
Lasterror is set.
124.7.16  Size as UInt64

Function: Return actual size of memory object in bytes.
Notes: Lasterror is set.

124.7.17  Type as UInt32

Function: Returns the memory type.
Notes:
Either normal buffer, image 2D or image 3D.
Lasterror is set.

124.7.18  Properties

124.7.19  Handle as Integer

Function: The internal object reference.
Notes:
Not zero if this object is valid.
(Read and Write property)

124.7.20  LastError as Integer

Function: The last error code.
Notes:
See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

124.7.21  Target as Memoryblock

Function: The reference to the memoryblock if you used kMemoryUseHostPtr to create this memory object.
124.7.22 Constants

124.7.23 kMapRead = 1

MBS MacFrameworks Plugin, Plugin Version: 11.1. Function: One of the mapping mode constants.

124.7.24 kMapWrite = 2

MBS MacFrameworks Plugin, Plugin Version: 11.1. Function: One of the mapping mode constants.

124.7.25 kMemoryAllocHostPtr = 16

MBS MacFrameworks Plugin, Plugin Version: 11.1. Function: One of the flag constants for creating a memory block.

124.7.26 kMemoryCopyHostPtr = 32

MBS MacFrameworks Plugin, Plugin Version: 11.1. Function: One of the flag constants for creating a memory block.

124.7.27 kMemoryReadOnly = 4

MBS MacFrameworks Plugin, Plugin Version: 11.1. Function: One of the flag constants for creating a memory block.

124.7.28 kMemoryReadWrite = 1

MBS MacFrameworks Plugin, Plugin Version: 11.1. Function: One of the flag constants for creating a memory block.
124.7.29  kMemoryTypeBuffer = & h10F0

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function**: One of the memory object types.  
**Notes**: A normal memory buffer.

124.7.30  kMemoryTypeImage2D = & h10F1

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function**: One of the memory object types.  
**Notes**: 2D Image

124.7.31  kMemoryTypeImage3D = & h10F2

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function**: One of the memory object types.  
**Notes**: 3D Image

124.7.32  kMemoryUseHostPtr = 8

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function**: One of the flag constants for creating a memory block.

124.7.33  kMemoryWriteOnly = 2

MBS MacFrameworks Plugin, Plugin Version: 11.1. **Function**: One of the flag constants for creating a memory block.  
**Notes**:  
This flags specifies that the memory object will be written but not read by a kernel.

Reading from a buffer or image object created with kMemoryWriteOnly inside a kernel is undefined.
124.8 class CLPlatformMBS

124.8.1 class CLPlatformMBS

**Function:** The OpenCL class for a platform.

124.8.2 Methods

124.8.3 DeviceCount(types as Int64) as Integer

**Function:** Queries number of devices with given types. 
**Example:**

```vbnet
dim Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
    MsgBox p.Name+": " +str(p.DeviceCount(CLDeviceMBS.kDeviceTypeAll))+" devices"
next
```

**Notes:**

types: A bitfield that identifies the type of OpenCL device. The device_type can be used to query specific OpenCL devices or all OpenCL devices available. The valid values for device_type are specified in the following table.

<table>
<thead>
<tr>
<th>cl_device_type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kDeviceTypeCPU</td>
<td>An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.</td>
</tr>
<tr>
<td>kDeviceTypeGPU</td>
<td>An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.</td>
</tr>
<tr>
<td>kDeviceTypeAccelerator</td>
<td>Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.</td>
</tr>
<tr>
<td>kDeviceTypeDefault</td>
<td>The default OpenCL device in the system.</td>
</tr>
<tr>
<td>kDeviceTypeAll</td>
<td>All OpenCL devices available in the system.</td>
</tr>
</tbody>
</table>

LastError is set.
124.8.4 Devices(types as Int64) as CLDeviceMBS()

**Function:** Queries devices with given types.  
**Example:**

```plaintext
// check all platforms
dim Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
    dim lines(-1) as string
    lines.Append p.Name
    lines.Append ""

    // and show device names
    for each d as CLDeviceMBS in p.Devices(CLDeviceMBS.kDeviceTypeAll)
        lines.Append d.name
    next

next

MsgBox Join(lines,EndOfLine)
```

**Notes:**

*types:* A bitfield that identifies the type of OpenCL device. The device.type can be used to query specific OpenCL devices or all OpenCL devices available. The valid values for device.type are specified in the following table.

<table>
<thead>
<tr>
<th>cl_device_type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kDeviceTypeCPU</td>
<td>An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.</td>
</tr>
<tr>
<td>kDeviceTypeGPU</td>
<td>An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.</td>
</tr>
<tr>
<td>kDeviceTypeAccelerator</td>
<td>Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.</td>
</tr>
<tr>
<td>kDeviceTypeDefault</td>
<td>The default OpenCL device in the system.</td>
</tr>
<tr>
<td>kDeviceTypeAll</td>
<td>All OpenCL devices available in the system.</td>
</tr>
</tbody>
</table>

LastError is set.
124.8. CLASS CLPLATFORMMBS

124.8.5 Extensions as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a space-separated list of extension names (the extension names themselves do not contain any spaces) supported by the platform.

**Example:**

```vbnet
dim Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
    MsgBox p.Name+"": "+p.Extensions
next
```

**Notes:**
Extensions defined here must be supported by all devices associated with this platform. Lasterror is set.

124.8.6 Name as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Platform name string.

**Example:**

```vbnet
dim Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
    MsgBox p.Name
next
```

**Notes:** Lasterror is set.

124.8.7 Profile as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** OpenCL profile string.

**Example:**

```vbnet
dim Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
    MsgBox p.Name+"": "+p.Profile
next
```
124.8.8 Vendor as string

**Function:** Platform vendor string.

**Example:**

```vba
dim Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms
for each p as CLPlatformMBS in Platforms
    MsgBox p.Name+"": "+p.Vendor
next
```

**Notes:** Lasterror is set.

124.8.9 Version as string

**Function:** OpenCL version string.

**Example:**

```vba
dim Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms
for each p as CLPlatformMBS in Platforms
    MsgBox p.Name+"": "+p.Version
next
```
Notes:
Returns the OpenCL version supported by the implementation. This version string has the following format:

OpenCL\(<space>\)<major_version\_.minor_version>\(<space>\)<platform-specific information>

The major\_.version\_.minor\_.version value returned will be 1.0.
LastError is set.

124.8.10 Properties

124.8.11 Handle as Integer

Function: The internal object reference.
Notes:
Not zero if this object is valid.
(Read and Write property)

124.8.12 LastError as Integer

Function: The last error code.
Notes:
See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)
124.9  class CLProgramMBS

124.9.1  class CLProgramMBS

Function: The OpenCL class for a program.

124.9.2  Methods

124.9.3  Binaries as String()

Function: Return the program binaries for all devices associated with program.
Notes:
For each device in program, the binary returned can be the binary specified for the device when program
is created with Constructor or it can be the executable binary generated by BuildProgram. If program is
created with Constructor (with Source code), the binary returned is the binary generated by BuildProgram.
The bits returned can be an implementation-specific intermediate representation (a.k.a. IR) or device specific
executable bits or both. The decision on which information is returned in the binary is up to the OpenCL
implementation.

Each entry in this array is used by the implementation as the location in memory where to copy the program
binary for a specific device, if there is a binary available.

Lasterror is set.

124.9.4  BinarySizes as UInt64()

Function: Returns an array that contains the size in bytes of the program binary for each device associated
with program.
Notes:
The size of the array is the number of devices associated with program. If a binary is not available for a
device(s), a size of zero is returned.

Lasterror is set.
124.9.5  BuildLog(device as CLDeviceMBS) as string

**Function:** Return the build log when BuildProgram was called for device.
**Notes:**
If build status of program for device is kBuildNone, an empty string is returned.
LastError is set.

124.9.6  BuildOptions(device as CLDeviceMBS) as string

**Function:** Return the build options specified by the options argument in BuildProgram for device.
**Notes:**
If build status of program for device is kBuildNone, an empty string is returned.
LastError is set.

124.9.7  BuildProgram(device as CLDeviceMBS, options as string = "")

**Function:** Builds (compiles and links) a program executable from the program source or binary.
**Notes:** See other BuildProgram method for details
See also:

- 124.9.8 BuildProgram(devices() as CLDeviceMBS, options as string = "")
- 124.9.9 BuildProgram(options as string = "")

124.9.8  BuildProgram(devices() as CLDeviceMBS, options as string = "")

**Function:** Builds (compiles and links) a program executable from the program source or binary.
**Notes:**
- **devices** Optional, a list of devices you want to build for. If you specify no device, you build for all devices.
- **device** Optional, the device you want to build for. If you specify no device, you build for all devices.
- **options** A string that describes the build options to be used for building the program executable. The list of supported options is described in "Build Options" below.
OpenCL allows program executables to be built using the source or the binary.

The build options are categorized as pre-processor options, options for math intrinsics, options that control optimization and miscellaneous options. This specification defines a standard set of options that must be supported by an OpenCL compiler when building program executables online or offline. These may be extended by a set of vendor- or platform-specific options.

Preprocessor Options

These options control the OpenCL preprocessor which is run on each program source before actual compilation. -D options are processed in the order they are given in the options argument to clBuildProgram.

-D name
Predefine name as a macro, with definition 1.

-D name=definition
The contents of definition are tokenized and processed as if they appeared during translation phase three in a ‘# define’ directive. In particular, the definition will be truncated by embedded newline characters.

-I dir
Add the directory dir to the list of directories to be searched for header files.

Math Intrinsics Options

These options control compiler behavior regarding floating-point arithmetic. These options trade off between speed and correctness.

-cl-single-precision-constant
Treat double precision floating-point constant as single precision constant.

-cl-denorms-are-zero
This option controls how single precision and double precision denormalized numbers are handled. If specified as a build option, the single precision denormalized numbers may be flushed to zero and if the optional extension for double precision is supported, double precision denormalized numbers may also be flushed to zero. This is intended to be a performance hint and the OpenCL compiler can choose not to flush denorms to zero if the device supports single precision (or double precision) denormalized numbers.

This option is ignored for single precision numbers if the device does not support single precision denormalized numbers i.e. kFPDenorm bit is not set in SingleFPConfig.

This option is ignored for double precision numbers if the device does not support double precision or if it does support double precision but CL_FP_DENORM bit is not set in CL_DEVICE_DOUBLE_FP_CONFIG.
This flag only applies for scalar and vector single precision floating-point variables and computations on these floating-point variables inside a program. It does not apply to reading from or writing to image objects.

Optimization Options

These options control various sorts of optimizations. Turning on optimization flags makes the compiler attempt to improve the performance and/or code size at the expense of compilation time and possibly the ability to debug the program.

- **-cl-opt-disable**
  This option disables all optimizations. The default is optimizations are enabled.

- **-cl-strict-aliasing**
  This option allows the compiler to assume the strictest aliasing rules.

The following options control compiler behavior regarding floating-point arithmetic. These options trade off between performance and correctness and must be specifically enabled. These options are not turned on by default since it can result in incorrect output for programs which depend on an exact implementation of IEEE 754 rules/specifications for math functions.

- **-cl-mad-enable**
  Allow a * b + c to be replaced by a mad. The mad computes a * b + c with reduced accuracy. For example, some OpenCL devices implement mad as truncate the result of a * b before adding it to c.

- **-cl-no-signed-zeros**
  Allow optimizations for floating-point arithmetic that ignore the signedness of zero. IEEE 754 arithmetic specifies the behavior of distinct +0.0 and -0.0 values, which then prohibits simplification of expressions such as x+0.0 or 0.0*x (even with -clfinite-math only). This option implies that the sign of a zero result isn’t significant.

- **-cl-unsafe-math-optimizations**
  Allow optimizations for floating-point arithmetic that (a) assume that arguments and results are valid, (b) may violate IEEE 754 standard and (c) may violate the OpenCL numerical compliance requirements as defined in section 7.4 for single-precision floating-point, section 9.3.9 for double-precision floating-point, and edge case behavior in section 7.5. This option includes the -cl-no-signed-zeros and -cl-mad-enable options.

- **-cl-finite-math-only**
  Allow optimizations for floating-point arithmetic that assume that arguments and results are not NaNs or . This option may violate the OpenCL numerical compliance requirements defined in in section 7.4 for single-precision floating-point, section 9.3.9 for double-precision floating-point, and edge case behavior in section 7.5.

- **-cl-fast-relaxed-math**
Sets the optimization options `-cl-finite-math-only` and `-cl-unsafe-math-optimizations`. This allows optimizations for floating-point arithmetic that may violate the IEEE 754 standard and the OpenCL numerical compliance requirements defined in the specification in section 7.4 for single-precision floating-point, section 9.3.9 for double-precision floating-point, and edge case behavior in section 7.5. This option causes the preprocessor macro `__FAST_RELAXED_MATH__` to be defined in the OpenCL program.

Options to Request or Suppress Warnings

Warnings are diagnostic messages that report constructions which are not inherently erroneous but which are risky or suggest there may have been an error. The following language-independent options do not enable specific warnings but control the kinds of diagnostics produced by the OpenCL compiler.

- `w`
  Inhibit all warning messages.

- `Werror`
  Make all warnings into errors.

LastError is set.

See also:

- 124.9.7 BuildProgram(device as CLDeviceMBS, options as string = "") 17347
- 124.9.9 BuildProgram(options as string = ")") 17350

124.9.9 BuildProgram(options as string = ")")

**Function:** Builds (compiles and links) a program executable from the program source or binary.

**Notes:**

See other BuildProgram method for details

LastError is set.

See also:

- 124.9.7 BuildProgram(device as CLDeviceMBS, options as string = "") 17347
- 124.9.8 BuildProgram(devices() as CLDeviceMBS, options as string = ")") 17347

124.9.10 BuildStatus(device as CLDeviceMBS) as Int64

**Function:** Returns the build status of program for a specific device as given by device.

**Notes:**
124.9. CLASS CLPROGRAMMBS

See kBuild* constants.
Lasterror is set.

124.9.11 Constructor(context as CLContextMBS, devices() as CLDeviceMBS, binaries() as string, status() as Integer)

Function: Creates a program object for a context, and loads specified binary data into the program object.
Notes:
context: Must be a valid OpenCL context.
devices: a list of devices that are in context. The binaries are loaded for devices specified in this list.

The devices associated with the program object will be the list of devices specified by devices. The list of
devices specified by devices must be devices associated with context.

binaries: An array of strings containing the program binaries to be loaded for devices specified by devices.
For each device given by devices(i), the string with the program binary for that device is given by binaries(i).

The program binaries specified by binaries contain the bits that describe the program executable that will
be run on the device(s) associated with context. The program binary can consist of either or both of
device-specific executable(s), and/or implementation-specific intermediate representation (IR) which will be
converted to the device-specific executable.

status: Returns whether the program binary for each device specified in devices was loaded successfully or
not. It is an array of ubound -1 and is filled by the plugin.

Lasterror is set.

OpenCL allows applications to create a program object using the program source or binary and build
appropriate program executables. This allows applications to determine whether they want to use the pre-
built offline binary or load and compile the program source and use the executable compiled/linked online
as the program executable. This can be very useful as it allows applications to load and build program
executables online on its first instance for appropriate OpenCL devices in the system. These executables can
now be queried and cached by the application. Future instances of the application launching will no longer
need to compile and build the program executables. The cached executables can be read and loaded by the
application, which can help significantly reduce the application initialization time.
See also:

- 124.9.12 Constructor(context as CLContextMBS, line as string) 17352

- 124.9.13 Constructor(context as CLContextMBS, lines() as string) 17352
124.9.12 Constructor(context as CLContextMBS, line as string)

**Function:** Creates a program object for a context, and loads the source code specified by the line string into the program object.

**Notes:**

context: Must be a valid OpenCL context.

line: A string with all the lines of the program.

The devices associated with the program object are the devices associated with context.

OpenCL allows applications to create a program object using the program source or binary and build appropriate program executables. This allows applications to determine whether they want to use the pre-built offline binary or load and compile the program source and use the executable compiled/linked online as the program executable. This can be very useful as it allows applications to load and build program executables online on its first instance for appropriate OpenCL devices in the system. These executables can now be queried and cached by the application. Future instances of the application launching will no longer need to compile and build the program executables. The cached executables can be read and loaded by the application, which can help significantly reduce the application initialization time.

An OpenCL program consists of a set of kernels that are identified as functions declared with the __kernel qualifier in the program source. OpenCL programs may also contain auxiliary functions and constant data that can be used by __kernel functions. The program executable can be generated online or offline by the OpenCL compiler for the appropriate target device(s).

Lasterror is set.

- 124.9.13 Constructor(context as CLContextMBS, lines() as string) 17352

124.9.13 Constructor(context as CLContextMBS, lines() as string)

**Function:** Creates a program object for a context, and loads the source code specified by the text strings in the lines array into the program object.

**Notes:**

context: Must be a valid OpenCL context.

lines: An array of strings that make up the source code.

The devices associated with the program object are the devices associated with context.
OpenCL allows applications to create a program object using the program source or binary and build appropriate program executables. This allows applications to determine whether they want to use the pre-built offline binary or load and compile the program source and use the executable compiled/linked online as the program executable. This can be very useful as it allows applications to load and build program executables online on its first instance for appropriate OpenCL devices in the system. These executables can now be queried and cached by the application. Future instances of the application launching will no longer need to compile and build the program executables. The cached executables can be read and loaded by the application, which can help significantly reduce the application initialization time.

An OpenCL program consists of a set of kernels that are identified as functions declared with the `_kernel` qualifier in the program source. OpenCL programs may also contain auxiliary functions and constant data that can be used by `_kernel` functions. The program executable can be generated online or offline by the OpenCL compiler for the appropriate target device(s).

Lasterror is set.

- 124.9.11 Constructor(context as CLContextMBS, devices() as CLDeviceMBS, binaries() as string, status() as Integer) 17351
- 124.9.12 Constructor(context as CLContextMBS, line as string) 17352

124.9.14 Context as CLContextMBS

**Function:** The context for this program.  
**Notes:** Lasterror is set.

124.9.15 CreateKernelsInProgram(maxKernels as Integer = 100) as CKernelMBS()

**Function:** Creates kernel objects for all kernel functions in program.  
**Notes:**  
maxKernels: maximum number of kernels to return.

Kernel objects are not created for any `_kernel` functions in program that do not have the same function definition across all devices for which a program executable has been successfully built.

Kernel objects can only be created once you have a program object with a valid program source or binary loaded into the program object and the program executable has been successfully built for one or more
devices associated with program. No changes to the program executable are allowed while there are kernel objects associated with a program object. This means that calls to BuildProgram return kInvalidOperation (in lasterror) if there are kernel objects attached to a program object. The OpenCL context associated with program will be the context associated with kernel. The list of devices associated with program are the devices associated with kernel. Devices associated with a program object for which a valid program executable has been built can be used to execute kernels declared in the program object.

Lasterror is set.

124.9.16 Devices as CLDeviceMBS()

**Function:** Return the list of devices associated with the program object.  
**Notes:** This can be the devices associated with context on which the program object has been created or can be a subset of devices that are specified when a program object is created.

124.9.17 NumDevices as UInt32

**Function:** Return the number of devices associated with program.  
**Notes:** Lasterror is set.

124.9.18 ReferenceCount as UInt32

**Function:** Return the program reference count.  
**Notes:** Lasterror is set.

124.9.19 Source as string

**Function:** Return the program source code specified in the Constructor.  
**Notes:** The source string returned is a concatenation of all source strings specified to Constructor.
124.9. **CLASS CLPROGRAMMBS**

124.9.20 **Properties**

124.9.21 **Handle as Integer**

*Function:* The internal object reference.
*Notes:* Not zero if this object is valid.
(Read and Write property)

124.9.22 **LastError as Integer**

*Function:* The last error code.
*Notes:* See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

124.9.23 **Constants**

124.9.24 **kBuildError = -2**

MBS MacFrameworks Plugin, Plugin Version: 11.1. *Function:* One of the build status constants
*Notes:* The build status returned if the last call to BuildProgram on the specified program object for device
generated an error.

124.9.25 **kBuildInProgress = -3**

MBS MacFrameworks Plugin, Plugin Version: 11.1. *Function:* One of the build status constants
*Notes:* The build status returned if the last call to BuildProgram on the specified program object for device
has not finished.

124.9.26 **kBuildNone = -1**

MBS MacFrameworks Plugin, Plugin Version: 11.1. *Function:* One of the build status constants
*Notes:* The build status returned if no build has been performed on the specified program object for device.
124.9.27  \textbf{kBuildSuccess} = 0

MBS MacFrameworks Plugin, Plugin Version: 11.1. \textbf{Function}: One of the build status constants  
\textbf{Notes}: The build status returned if the last call to BuildProgram on the specified program object for device was successful.
124.10. **CLASS CLSAMPLERMBS**

124.10 class CLSamplerMBS

124.10.1 class CLSamplerMBS

**Function:** The class for a Sampler.

124.10.2 Methods

124.10.3 AddressingMode as UInt32

**Function:** Return the value specified by addressingmode argument to Constructor.

124.10.4 Constructor(Context as CLContextMBS, NormalizedCoords as Boolean, AddressingMode as UInt32, FilterMode as UInt32)

**Function:** Creates a sampler object.
**Notes:**
context: Must be a valid OpenCL context.
NormalizedCoords: Determines if the image coordinates specified are normalized (if normalized_coords is true) or not (if normalized_coords is false).
AddressingMode: Specifies how out-of-range image coordinates are handled when reading from an image. This can be set to kAddressRepeat, kAddressClampToEdge, kAddressClamp, and kAddressNone.
FilterMode: Specifies the type of filter that must be applied when reading an image. This can be kFilterNearest or kFilterLinear.
Lasterror is set.

A sampler object describes how to sample an image when the image is read in the kernel. The built-in functions to read from an image in a kernel take a sampler as an argument. The sampler arguments to the image read function can be sampler objects created using OpenCL functions and passed as argument values to the kernel or can be samplers declared inside a kernel. In this section we discuss how sampler objects are created using OpenCL functions.
124.10.5 Context as CLContextMBS

Function: Return the context specified when the sampler is created.

124.10.6 FilterMode as UInt32

Function: Return the value specified by filterMode argument to Constructor.

124.10.7 NormalizedCoords as Boolean

Function: Return the value specified by normalizedCoords argument to Constructor.

124.10.8 ReferenceCount as UInt32

Function: Return the sampler reference count.
Notes: The reference count returned should be considered immediately stale. It is unsuitable for general use in applications. This feature is provided for identifying memory leaks.

124.10.9 Properties

124.10.10 Handle as Integer

Function: The internal object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

124.10.11 LastError as Integer

Function: The last error code.
Notes:
See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

124.11 module OpenCLMBS

124.11.1 module OpenCLMBS

Function: The module for OpenCL.
Notes:

from wikipedia:

OpenCL (Open Computing Language) is a framework for writing programs that execute across heterogeneous platforms consisting of CPUs, GPUs, and other processors. OpenCL includes a language (based on C99) for writing kernels (functions that execute on OpenCL devices), plus APIs that are used to define and then control the platforms. OpenCL provides parallel computing using task-based and data-based parallelism.

124.11.2 Methods

124.11.3 AllDeviceCount(types as Int64) as Integer

Function: Queries number of devices with given types.
Example:

```
dim c as Integer = OpenCLMBS.AllDeviceCount(CLDeviceMBS.kDeviceTypeCPU)
dim g as Integer = OpenCLMBS.AllDeviceCount(CLDeviceMBS.kDeviceTypeGPU)
MsgBox str(c)+" CPU and "+str(g)+" GPU"
```

Notes:

types: A bitfield that identifies the type of OpenCL device. The device_type can be used to query specific OpenCL devices or all OpenCL devices available. The valid values for device_type are specified in the following table.

Lasterror is set.

124.11.4 AllDevices(types as Int64) as CLDeviceMBS()

Function: Queries devices with given types.
Example:
124.11. MODULE OPENCLMBS

cl_device_type

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kDeviceTypeCPU An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.</td>
</tr>
<tr>
<td>kDeviceTypeGPU An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.</td>
</tr>
<tr>
<td>kDeviceTypeAccelerator Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.</td>
</tr>
<tr>
<td>kDeviceTypeDefault The default OpenCL device in the system.</td>
</tr>
<tr>
<td>kDeviceTypeAll All OpenCL devices available in the system.</td>
</tr>
</tbody>
</table>

Dim Devices(-1) As CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)

For Each p As CLDeviceMBS In Devices
    MsgBox p.Name
Next

Notes:

types: A bitfield that identifies the type of OpenCL device. The device_type can be used to query specific OpenCL devices or all OpenCL devices available. The valid values for device_type are specified in the following table.

cl_device_type

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kDeviceTypeCPU An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.</td>
</tr>
<tr>
<td>kDeviceTypeGPU An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.</td>
</tr>
<tr>
<td>kDeviceTypeAccelerator Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.</td>
</tr>
<tr>
<td>kDeviceTypeDefault The default OpenCL device in the system.</td>
</tr>
<tr>
<td>kDeviceTypeAll All OpenCL devices available in the system.</td>
</tr>
</tbody>
</table>

Lasterror is set.

124.11.5 GetExtensionFunctionAddress(name as string) as ptr

Function: Returns the address of the extension function named by funcname.

Notes:
The function GetExtensionFunctionAddress returns the address of the extension function named by func-
name. The pointer returned should be cast to a function pointer type matching the extension function’s
definition defined in the appropriate extension specification and header file. A return value of nil indicates
that the specified function does not exist for the implementation. A non-nil return value for GetExtensi-
ionFunctionAddress does not guarantee that an extension function is actually supported. The application
must also make a corresponding query using CLPlatformMBS.Extensions or CLDeviceMBS.Extensions to
determine if an extension is supported by the OpenCL implementation.

GetExtensionFunctionAddress may not be queried for core (non-extension) functions in OpenCL. For func-
tions that are queryable with clGetExtensionFunctionAddress, implementations may choose to also export
those functions statically from the object libraries implementing those functions. However, portable appli-
cations cannot rely on this behavior.

Since there is no way to qualify the query with a device, the function pointer returned must work for all
implementations of that extension on different devices. The behavior of calling a device extension function
on a device not supporting that extension is undefined.

124.11.6  GetPictureImageFormat(pic as picture, byref RowPitch as Integer) as
CLImageFormatMBS

Function: Queries the image format this picture would need when creating a storage object with
CLMemMBS.
Example:

  dim p as new Picture(100,100,32)
  dim rowbytes as Integer
  dim format as CLImageFormatMBS = OpenCLMBS.GetPictureImageFormat(p, rowbytes)

  MsgBox hex(format.ImageChannelOrder)+" " +hex(format.ImageChannelDataType)+" " +str(rowbytes)
  // shows 10B7 and 10D2 and 416 on Mac OS X Carbon

Notes: As Real Studio uses 4 bytes per pixel on Mac and Windows, the plugin returns ARGB (or other
byte order). The alpha channel is not used as Real Studio stores

124.11.7  isAvailable as boolean

Function: Whether OpenCL is available.
Example:
if not OpenCLMBS.isAvailable then
if TargetMachO and TargetX86 then
    MsgBox "OpenCL not available. Please install Mac OS X 10.6 to use it."
else
    MsgBox "OpenCL not available. You need a Mac with Intel processor running Mac OS X 10.6."
end if
end if

Notes: Should return true on Mac OS X 10.6 and false everywhere else.

124.11.8 PlatformCount as Int64

Function: Queries number of platforms available.
Example:
    MsgBox str(OpenCLMBS.PlatformCount)

Notes:
Typically you have two with modern Macs as you get both CPU and GPU listed.
Lasterror is set.

124.11.9 Platforms as CLPlatformMBS()

Function: Obtain the list of platforms available.
Example:
    dim Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms
    for each p as CLPlatformMBS in Platforms
        MsgBox p.Name
    next

Notes: Lasterror is set.
124.11.10 UnloadCompiler

**Function:** Allows the implementation to release the resources allocated by the OpenCL compiler.

**Example:**

OpenCLMBS.UnloadCompiler
MsgBox OpenCLMBS.LastErrorMessage

**Notes:**

This is a hint from the application and does not guarantee that the compiler will not be used in the future or that the compiler will actually be unloaded by the implementation. Calls to BuildProgram after UnloadCompiler will reload the compiler, if necessary, to build the appropriate program executable. Lasterror is set.

124.11.11 WaitForEvents(events() as CLEventMBS)

**Function:** Waits on the host thread for commands identified by event objects to complete.

**Notes:**

events: The events specified in event_list act as synchronization points.

Waits on the host thread for commands identified by event objects in event_list to complete. A command is considered complete if its execution status is kCommandExecutionStatusComplete or a negative value.

Lasterror is set.

124.11.12 Properties

124.11.13 LastError as Integer

**Function:** The last error code.

**Example:**

MsgBox str(OpenCLMBS.LastError)

**Notes:**
All the functions in all the OpenCL classes set this property, too.
(Read only property)

124.11.14 LastErrorMessage as string

**Function:** The text message for the last error code.
**Example:**
MsgBox OpenCLMBS.LastErrorMessage

**Notes:** (Read only property)

124.11.15 Constants

124.11.16 kBuildProgramFailure = -11

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.17 kCompilerNotAvailable = -3

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.18 kDeviceNotAvailable = -2

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.19 kDeviceNotFound = -1

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.
124.11.20 kImageFormatMismatch = -9

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.21 kImageFormatNotSupported = -10

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.22 kInvalidArgIndex = -49

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.23 kInvalidArgSize = -51

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.24 kInvalidArgValue = -50

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.25 kInvalidBinary = -42

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.26 kInvalidBufferSize = -61

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.27 kInvalidBuildOptions = -43

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.
124.11. MODULE OPENCLMBS

124.11.28  kInvalidCommandQueue = -36

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.29  kInvalidContext = -34

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.30  kInvalidDevice = -33

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.31  kInvalidDeviceType = -31

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.32  kInvalidEvent = -58

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.33  kInvalidEventWaitList = -57

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.34  kInvalidGlobalOffset = -56

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.35  kInvalidGloObject = -60

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.
124.11.36  kInvalidHostPtr = -37

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.37  kInvalidImageFormatDescriptor = -39

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.38  kInvalidImageSize = -40

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.39  kInvalidKernel = -48

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.40  kInvalidKernelArgs = -52

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.41  kInvalidKernelDefinition = -47

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.42  kInvalidKernelName = -46

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.43  kInvalidMemObject = -38

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.
124.11.44 kInvalidMipLevel = -62

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.45 kInvalidOperation = -59

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.46 kInvalidPlatform = -32

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.47 kInvalidProgram = -44

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.48 kInvalidProgramExecutable = -45

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.49 kInvalidQueueProperties = -35

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.50 kInvalidSampler = -41

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.51 kInvalidValue = -30

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.
124.11.52  kInvalidWorkDimension = -53

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.53  kInvalidWorkGroupSize = -54

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.54  kInvalidWorkItemSize = -55

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.55  kMapFailure = -12

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.56  kMemCopyOverlap = -8

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.57  kMemObjectAllocationFailure = -4

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.58  kOutOfHostMemory = -6

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.59  kOutOfResources = -5

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.
124.11.60  kProfilingInfoNotAvailable = -7

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.

124.11.61  kSuccess = 0

MBS MacFrameworks Plugin, Plugin Version: 9.6. **Function:** One of the constants for OpenCL errors.
Chapter 125

PDFKit

125.1 class CustomPDFViewMBS

125.1.1 class CustomPDFViewMBS

Function: The class for a custom PDFView.
Notes: Subclass of the PDFViewMBS class.

125.1.2 Methods

125.1.3 ClearOverlay(page as PDFPageMBS, post as boolean = true)

Function: Clear overlay item for this page.
Notes: Is post = false, than we clear the item for pre page drawing, else for post page drawing.
The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.

125.1.4 ClearOverlays

Function: Clear all overlays.
Notes: The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.
125.1.5 Constructor

Function: The constructor for a new custom PDFView object.
See also:
- 125.1.6 Constructor(Handle as Integer) 17374
- 125.1.7 Constructor(left as Double, top as Double, width as Double, height as Double) 17374

125.1.6 Constructor(Handle as Integer)

Function: The constructor.
See also:
- 125.1.5 Constructor 17374
- 125.1.7 Constructor(left as Double, top as Double, width as Double, height as Double) 17374

125.1.7 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: The constructor for a new custom PDFView object.
See also:
- 125.1.5 Constructor 17374
- 125.1.6 Constructor(Handle as Integer) 17374

125.1.8 Destructor

Function: The destructor.

125.1.9 Properties

125.1.10 Overlay(page as PDFPageMBS, post as boolean = true) as variant

Function: Get/Set overlay item.
Notes:
MBS Plugin can draw a picture, NSImageMBS or PDFPageMBS below/over the PDF page. The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn. (Read and Write computed property)

125.1.11 Events

125.1.12 acceptsFirstMouse(e as NSEventMBS) as boolean

**Function:** Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
**Notes:**
The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

125.1.13 acceptsFirstResponder as boolean

**Function:** Whether to accept first responder.
**Notes:** Return true if your control can have the focus and false if not.

125.1.14 AfterDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS)

**Function:** The draw event called after a page was drawn.
**Notes:**
This event may not be called on OS X 10.11 or newer. On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.
125.1.15  AfterDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS)

Function: The draw event called after a page annotations were drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

125.1.16  AfterDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double)

Function: The draw event called after something was drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

125.1.17  becomeFirstResponder as boolean

Function: Called when the object gets focus.
Notes: Return true to accept.

125.1.18  BeforeDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

Function: The draw event called before a page was drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.
125.1.19 BeforeDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

Function: The draw event called before a page annotations were drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

125.1.20 BeforeDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double) as boolean

Function: The draw event called before a something was drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

125.1.21 beginGestureWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a touch gesture.
Notes:
e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

125.1.22 canBecomeKeyView as boolean

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.
125.1.23 Close

Function: The event called when the custom NSView is destroyed.

125.1.24 concludeDragOperation(sender as NSDraggingInfoMBS)

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object’s animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

125.1.25 draggingEnded(sender as NSDraggingInfoMBS)

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

125.1.26 draggingEntered(sender as NSDraggingInfoMBS) as Integer

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging
operation to perform.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

### 125.1.27 draggingExited(sender as NSDraggingInfoMBS)

**Function:** Invoked when the dragged image exits the destination’s bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).

**Notes:** sender: The object sending the message; use it to get details about the dragging operation.

### 125.1.28 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

**Function:** Invoked when the dragging session has completed.

**Notes:**

session: The dragging session.

screenPoint: The point where the drag ended, in screen coordinates.

operation: The drag operation. See constants for drag operation types.
125.1.29 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

Function: Invoked when the drag moves on the screen.
Notes:
session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

125.1.30 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

Function: Declares the types of operations the source allows to be performed. (required)
Notes:
session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

125.1.31 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

Function: Invoked when the drag will begin.
Notes:
session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.
125.1.32 draggingSourceOperationMaskForLocal(flag as boolean) as Integer

Function: Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image’s data.

Notes:

(Deprecated in OS X v10.7. This method is informally deprecated. It is only called if the source does not implement the NSDraggingSource protocol methods. This method will be formally deprecated in a future OS release.)

isLocal: True indicates that the candidate destination object (the window or view over which the dragged image is currently poised) is in the same application as the source, while a false value indicates that the destination object is in a different application.

A mask, created by combining the dragging operations listed in the NSDragOperation section of NSDraggingInfo protocol reference using the C bitwise OR operator. If the source does not permit any dragging operations, it should return NSDragOperationNone.

If not implemented, the default value is NSDragOperationCopy | NSDragOperationLink | NSDragOperationGeneric | NSDragOperationPrivate.

Available in OS X v10.0 and later. Deprecated in OS X v10.7.

125.1.33 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.

Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.
This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

### 125.1.34 endGestureWithEvent(e as NSEventMBS) as boolean

**Function:** Informs the receiver that the user has ended a touch gesture.

**Notes:**

- `e`: An event object representing the gesture end.
- Available in Mac OS X v10.6 and later.
- Return true if you handled this event.

### 125.1.35 ignoreModifierKeysForDraggingSession(session as NSDraggingSessionMBS) as boolean

**Function:** Returns whether the modifier keys will be ignored for this dragging session.

**Notes:**

- `session`: The dragging session.
- Return true if the modifier keys will be ignored, false otherwise.
- Available in OS X v10.7 and later.

### 125.1.36 isOpaque as boolean

**Function:** Whether this view is opaque.
125.1. **CLASS CUSTOMPDFVIEWMBS**

125.1.37  **keyDown(e as NSEventMBS) as boolean**

**Function:** One of the key events.
**Notes:** Return true if you handled this event.

125.1.38  **keyUp(e as NSEventMBS) as boolean**

**Function:** One of the key events.
**Notes:** Return true if you handled this event.

125.1.39  **magnifyWithEvent(e as NSEventMBS) as boolean**

**Function:** Informs the receiver that the user has begun a pinch gesture.
**Notes:**
- `e`: An event object representing the magnify gesture.
- The event will be sent to the view under the touch in the key window.
- Available in Mac OS X v10.6 and later.
- Return true if you handled this event.

125.1.40  **menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS**

**Function:** Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
**Notes:**
- `theEvent`: An object representing a mouse-down event.
- `defaultMenu`: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.
125.1.41 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

125.1.42 mouseDownCanMoveWindow as boolean

Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

125.1.43 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

125.1.44 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

125.1.45 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.
125.1.46  mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

125.1.47  mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

125.1.48  Open

Function: The event called when the custom NSView is created.

125.1.49  otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes:
Return true if you handled this event.
Third mouse button.

125.1.50  otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes:
Return true if you handled this event.
Third mouse button.
125.1.51  `otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean`

**Function:** One of the mouse events.
**Notes:**
Return true if you handled this event.
Third mouse button.

125.1.52  `performDragOperation(sender as NSDraggingInfoMBS) as boolean`

**Function:** Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
**Notes:**
sender: The object sending the message; use it to get details about the dragging operation.
Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.
For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.
If the sender object’s animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

125.1.53  `prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean`

**Function:** Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
**Notes:**
sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object’s animatesToDestination property to true in your implementation of this method.
125.1.54  pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.
Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

125.1.55  resignFirstResponder as boolean

Function: Focus is going away.
Notes: Return true to accept.

125.1.56  rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

125.1.57  rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.

125.1.58  rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

Function: One of the mouse events.
Notes: Return true if you handled this event.
125.1.59 rotateWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:
e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

125.1.60 scrollWheel(e as NSEventMBS) as boolean

Function: Informs the subclass that the mouse’s scroll wheel has moved.
Notes:
e: An object encapsulating information about the wheel-scrolling event.
The default implementation simply passes this message to the next responder.
Return true to not pass the event.

125.1.61 swipeWithEvent(e as NSEventMBS) as boolean

Function: Informs the receiver that the user has begun a swipe gesture.
Notes:
e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

125.1.62 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

Function: Invoked when the dragging images should be changed.
Notes:
sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this
method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

125.1.63 viewDidMoveToWindow

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

125.1.64 wantsPeriodicDraggingUpdates as boolean

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.
125.2 class PDFActionGoToMBS

125.2.1 class PDFActionGoToMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** PDFActionGoTo, a subclass of PDFAction, defines methods for getting and setting the destination of a go-to action.

**Notes:**
A PDFActionGoTo object represents the action of going to a specific location within the PDF document. Subclass of the PDFActionMBS class.

125.2.2 Methods

125.2.3 Constructor(destination as PDFDestinationMBS)

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the go-to action.

**Notes:**

destination: The destination with which to initialize the go-to action.
Available in Mac OS X v10.5 and later.

125.2.4 Properties

125.2.5 destination as PDFDestinationMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destination associated with the action.

**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)
125.3. CLASS PDFACTIONMBS

125.3 class PDFActionMBS

125.3.1 class PDFActionMBS

Function: PDFAction represents an action that is performed when, for example, a PDF annotation is activated or an outline item is clicked.
Notes:
A PDFAction object represents an action associated with a PDF element, such as an annotation or a link, that the viewer application can perform. See the Adobe PDF Specification for more about actions and action types.

PDFAction is an abstract superclass of the following concrete classes:

- PDFActionGoToMBS
- PDFActionNamedMBS
- PDFActionRemoteGoToMBS
- PDFActionResetFormMBS
- PDFActionURLMBS

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

125.3.2 Methods

125.3.3 Constructor

Function: The private constructor.
Notes:
This class is the base class for a number of annotations. So this constructor is private to make sure you don’t create instances of PDFActionMBS. But you can still create instances of the subclasses. This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

125.3.4 copy as PDFActionMBS

Function: Creates a copy of the action object.
### 125.3.5  type as string

**Function:** Returns the type of the action.

**Notes:**

The PDF action type returned by this method may not correspond precisely to the name of a PDFAction subclass. For example, a PDFActionURL object might return "URI" or "Launch," depending on the original action as defined by the Adobe PDF Specification. In the PDF Kit, these two actions are handled in the single PDFActionURL subclass, and the more familiar term "URL" is used instead.

Available in Mac OS X v10.5 and later.

### 125.3.6 Properties

#### 125.3.7  Handle as Integer

**Function:** The internal reference to the PDF action object.

**Notes:** (Read and Write property)
125.4  class PDFActionNamedMBS

125.4.1  class PDFActionNamedMBS

Function: PDFActionNamed defines methods used to work with actions in PDF documents, some of which are named in the Adobe PDF Specification.
Notes:
A PDFActionNamed object represents an action with a defined name, such as "Go back" or "Zoom in." Subclass of the PDFActionMBS class.

125.4.2  Methods

125.4.3  Constructor(name as Integer)

Function: Initializes the PDFActionName object with the specified named action.
Notes: Available in Mac OS X v10.5 and later.

125.4.4  Properties

125.4.5  name as Integer

Function: The name of the named action.
Notes:
Available in Mac OS X v10.5 and later. (Read and Write property)

125.4.6  Constants

125.4.7  kPDFActionNamedFind = 8

MBS MacControls Plugin, Plugin Version: 9.6. Function: One of the name constants for the action.
Notes:
The Find action. Available in Mac OS X v10.5 and later.
125.4.8  kPDFActionNamedFirstPage = 3

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action.
**Notes:**
The First Page action.
Available in Mac OS X v10.5 and later.

125.4.9  kPDFActionNamedGoBack = 5

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action.
**Notes:**
The Go Back action.
Available in Mac OS X v10.5 and later.

125.4.10  kPDFActionNamedGoForward = 6

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action.
**Notes:**
The Go Forward action.
Available in Mac OS X v10.5 and later.

125.4.11  kPDFActionNamedGoToPage = 7

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action.
**Notes:**
The Go to Page action.
Available in Mac OS X v10.5 and later.

125.4.12  kPDFActionNamedLastPage = 4

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action.
**Notes:**
The Last Page action.
Available in Mac OS X v10.5 and later.
125.4.13  kPDFActionNamedNextPage = 1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action. **Notes:** The Next Page action. Available in Mac OS X v10.5 and later.

125.4.14  kPDFActionNamedNone = 0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action. **Notes:** The action has no name. Available in Mac OS X v10.5 and later.

125.4.15  kPDFActionNamedPreviousPage = 2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action. **Notes:** The Previous Page action. Available in Mac OS X v10.5 and later.

125.4.16  kPDFActionNamedPrint = 9

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action. **Notes:** The Print action. Available in Mac OS X v10.5 and later.

125.4.17  kPDFActionNamedZoomIn = 10

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action. **Notes:** The Zoom In action. Available in Mac OS X v10.5 and later.
125.4.18  kPDFActionNamedZoomOut = 11

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the name constants for the action.

**Notes:**
The Zoom Out action.
Available in Mac OS X v10.5 and later.
125.5  class PDFActionRemoteGoToMBS

125.5.1  class PDFActionRemoteGoToMBS

**Function:**  PDFActionRemoteGoTo, a subclass of PDFAction, defines methods for getting and setting the
destination of a go-to action that targets another document.

**Notes:**
Available in Mac OS X v10.5 and later.
Subclass of the PDFActionMBS class.

125.5.2  Methods

125.5.3  Constructor(PageIndex as Integer, atPoint as NSPointMBS, file as folderitem)

**Function:**  Initializes the remote go-to action with the specified page index, point, and document URL.

**Notes:**
pageIndex: The page index of the remote document.
point: The point on the page in the remote document.
file: The file of the remote PDF document.

The PDFActionRemoteGoTo object uses a zero-based page index, not a PDFPage object. This simplifies
the handling of remote destinations for documents that may not be instantiated yet.

Available in Mac OS X v10.5 and later.
See also:
• 125.5.4 Constructor(PageIndex as Integer, atPoint as NSPointMBS, url as string)

125.5.4  Constructor(PageIndex as Integer, atPoint as NSPointMBS, url as string)

**Function:**  Initializes the remote go-to action with the specified page index, point, and document URL.

**Notes:**
pageIndex: The page index of the remote document.
point: The point on the page in the remote document.
url: The URL of the remote PDF document.
The PDFActionRemoteGoTo object uses a zero-based page index, not a PDFPage object. This simplifies the handling of remote destinations for documents that may not be instantiated yet.

Available in Mac OS X v10.5 and later.

See also:

• 125.5.3 Constructor(PageIndex as Integer, atPoint as NSPointMBS, file as folderitem)

### 125.5.5 Properties

#### 125.5.6 pageIndex as Integer

**Function:** The zero-based page index referenced by the remote go-to action.

**Notes:**

Available in Mac OS X v10.5 and later.
(Read and Write property)

#### 125.5.7 point as NSPointMBS

**Function:** The point, in page space, on the page referenced by the remote go-to action.

**Notes:**

The point on the page of the remote document referenced by the action. If either the x value or the y value of the point is kPDFDestinationUnspecifiedValue, no position on the page is specified.

Page space is a 72-dpi coordinate system with the origin at the lower-left corner of the current page.

Available in Mac OS X v10.5 and later.
(Read and Write property)

#### 125.5.8 URL as string

**Function:** The URL of the document referenced by the remote go-to action.

**Notes:**

Available in Mac OS X v10.5 and later.
(Read and Write property)
125.6. class PDFActionResetFormMBS

125.6.1 class PDFActionResetFormMBS

Function: PDFActionResetForm, a subclass of PDFAction, defines methods for getting and clearing fields in a PDF form.
Notes:
A PDFActionResetForm object represents an action associated with a PDF form.
Subclass of the PDFActionMBS class.

125.6.2 Methods

125.6.3 Constructor

Function: Initializes a reset form action.
Notes:
Initially, there are no fields and fieldsIncludedAreCleared returns true.
Available in Mac OS X v10.5 and later.

125.6.4 fields as string()

Function: Returns an array of fields associated with the reset action.
Notes:
An array of strings that corresponds to the fieldNames property of widget annotations (such as PDFAnnotationButtonWidget) on the PDF page. This method can return an empty array.
Available in Mac OS X v10.5 and later.

125.6.5 setFields(fields() as string)

Function: Sets the array of fields associated with the reset action.
Notes: Available in Mac OS X v10.5 and later.
125.6.6 Properties

125.6.7 fieldsIncludedAreCleared as boolean

Function: Whether the fields associated with the reset action are cleared when the action is performed.

Notes:

If true, the reset action’s fields are cleared when the action is performed. If false, the fields are excluded from the reset action; that is, they are not cleared, but all other fields in the document are cleared.

Available in Mac OS X v10.5 and later.

(Read and Write property)
125.7. class PDFActionURLMBS

125.7.1 class PDFActionURLMBS

Function: PDFActionURL, a subclass of PDFAction, defines methods for getting and setting the URL associated with a URL action.  
Notes: Subclass of the PDFActionMBS class.

125.7.2 Methods

125.7.3 Constructor(url as string)

Function: Initializes a URL action with the specified URL.  
Notes: Available in Mac OS X v10.5 and later.

125.7.4 Properties

125.7.5 URL as string

Function: The URL associated with the URL action.  
Notes: Available in Mac OS X v10.5 and later.  
(Read and Write property)
125.8 class PDFAnnotationButtonWidgetMBS

125.8.1 class PDFAnnotationButtonWidgetMBS

**Function:** The class for an annotation button widget.
**Notes:** Subclass of the PDFAnnotationMBS class.

125.8.2 Methods

125.8.3 Constructor(left as single, top as single, width as single, height as single)

**Function:** The constructor which creates a new annotation widget.

125.8.4 Properties

125.8.5 allowsToggleToOff as boolean

**Function:** Returns a Boolean value indicating whether a radio button behaves in a toggling manner.
**Notes:**
True if clicking a radio button control that is already in the on state toggles it to the off state; otherwise false.
Available in Mac OS X v10.5 and later.
(Read only property)

125.8.6 backgroundColor as NSColorMBS

**Function:** The background color.
**Notes:** (Read and Write property)
125.8. **CLASS PDFANNOTATIONBUTTONWIDGETMBS**

125.8.7 **caption as string**

**Function:** The text of the label on a push button control.

**Notes:**

This method applies only to the label drawn on a control of type kPDFWidgetPushButtonControl.
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.8.8 **controlType as Integer**

**Function:** The control type of this widget.

**Notes:**

Value is one of the following constants:

- kPDFWidgetUnknownControl
- kPDFWidgetPushButtonControl
- kPDFWidgetRadioButtonControl
- kPDFWidgetCheckBoxControl
- kPDFWidgetCheckBoxControl

(Read and Write property)

125.8.9 **fieldName as string**

**Function:** The internal name of a field (used for reset-form actions).

**Notes:**

Available in Mac OS X v10.5 and later.
(Read and Write property)

125.8.10 **font as NSFontMBS**

**Function:** The font used in the control’s label.

**Notes:**

Available in Mac OS X v10.5 and later.
(Read and Write property)
125.8.11 **fontColor as NSColorMBS**

**Function:** The font color used in the control’s label.
**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.8.12 **Highlighted as boolean**

**Function:** A Boolean value that indicates whether the control is highlighted when it is drawn.
**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.8.13 **onStateValue as string**

**Function:** The string associated with the on state of a radio button or checkbox control.
**Notes:**
This is a required string for controls of types kPDFWidgetRadioButtonControl and kPDFWidgetCheckBoxControl. The off state is always labeled "Off".
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.8.14 **state as Integer**

**Function:** The state value.
**Notes:** (Read and Write property)
125.8. CLASS PDFANNOTATIONBUTTONWIDGETMBS

125.8.15 Events

125.8.16 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

**Function:** The event called for a custom drawing.  
**Notes:**  
You can draw here what the annotation should show.  
Return true to disable the default drawing from PDFKit.

125.8.17 Constants

125.8.18 kPDFWidgetCheckBoxControl = 2

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the control types for this widget.

125.8.19 kPDFWidgetPushButtonControl = 0

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the control types for this widget.

125.8.20 kPDFWidgetRadioButtonControl = 1

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the control types for this widget.

125.8.21 kPDFWidgetUnknownControl = -1

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the control types for this widget.

125.8.22 NSOffState = 0

MBS MacControls Plugin, Plugin Version: 12.5. **Function:** One of the state constants.  
**Notes:** The corresponding feature is in effect nowhere.
125.8.23 NSOnState = 1

MBS MacControls Plugin, Plugin Version: 12.5. **Function:** One of the state constants.  
**Notes:** The corresponding feature is in effect everywhere.
125.9 class PDFAnnotationChoiceWidgetMBS

125.9.1 class PDFAnnotationChoiceWidgetMBS

Function: A PDFAnnotationChoiceWidget object provides user interactivity on a page of a PDF document, in the form of pop-up menus and lists.
Notes:
PDFAnnotationChoiceWidget inherits general annotation behavior from the PDFAnnotation class. If you use a PDFAnnotationChoiceWidget object, your application must handle hit testing, unless you are simply using PDFView to display content. This is because PDFView automatically handles hit testing for you. Subclass of the PDFAnnotationMBS class.

125.9.2 Methods

125.9.3 choices as string()

Function: Returns an array of strings that represent the items available in the list or pop-up menu of the choice widget annotation.
Notes: Available in Mac OS X v10.5 and later.

125.9.4 Constructor(left as single, top as single, width as single, height as single)

Function: Initializes a PDF annotation object.
Notes:
Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. Available in Mac OS X v10.4 and later.

125.9.5 setChoices(choices() as string)

Function: Sets the items available in the list or pop-up menu of the choice widget annotation.
Notes:
choices: Send an array of strings, each of which represents an item in the list or pop-up menu of the choice annotation widget.
125.9.6 Properties

125.9.7 backgroundColor as NSColorMBS

Function: The color of the widget annotation background.
Notes:
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.9.8 fieldName as string

Function: The internal field name associated with the widget annotation’s value.
Notes:
If the widget annotation is backed by PDF form data, it can associate an optional field name with a value or other data.
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.9.9 font as NSFontMBS

Function: The font used to display the text in the widget annotation.
Notes:
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.9.10 fontColor as NSColorMBS

Function: The font color used to display the text in the widget annotation.
Notes:
125.9. **CLASS PDFANNOTATIONCHOICEWIDGETMBS**

Available in Mac OS X v10.5 and later.
(Read and Write property)

125.9.11 **isListChoice as boolean**

**Function:** Whether the widget annotation is a list.
**Notes:**
A choice widget annotation can be either a list or a pop-up menu.

Available in Mac OS X v10.5 and later.
(Read and Write property)

125.9.12 **stringValue as string**

**Function:** The selection in the widget annotation.
**Notes:**
If the widget annotation object is backed by PDF form data, this method returns the value associated with the appropriate field in the form object, if possible.

Available in Mac OS X v10.5 and later.
(Read and Write property)

125.9.13 **Events**

125.9.14 **drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean**

**Function:** The event called for a custom drawing.
**Notes:**
You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.
125.10 class PDFAnnotationCircleMBS

125.10.1 class PDFAnnotationCircleMBS

Function: The PDFKit class for an annotation circle.

Example:

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationCircleMBS(100,100,100,100)

a.border.style = PDFBorderMBS.kPDFBorderStyleBeveled

page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: Subclass of the PDFAnnotationMBS class.

125.10.2 Methods

125.10.3 Constructor(left as single, top as single, width as single, height as single)

Function: The constructor to create a new annotation circle.

Example:

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationCircleMBS(100,100,100,100)

page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```
125.10.4 Properties

125.10.5 interiorColor as NSColorMBS

Function: Fill color used for drawing annotation.
Example:

```vbs
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Dim doc As New PDFDocumentMBS(f)
Dim page As PDFPageMBS = doc.pageAtIndex(0)
Dim a As New PDFAnnotationCircleMBS(100, 100, 100, 100)
a.interiorColor = NSColorMBS.magentaColor
page.addAnnotation(a)

Dim o As FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: (Read and Write property)

125.10.6 Events

125.10.7 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

Function: The event called for a custom drawing.
Notes:

You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.
125.11 class PDFAnnotationFreeTextMBS

125.11.1 class PDFAnnotationFreeTextMBS

Function: The class for a free text annotation.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim annotations(-1) as PDFAnnotationMBS = page.annotations

for each a as PDFAnnotationMBS in annotations
if a isa PDFAnnotationFreeTextMBS then
    dim ft as PDFAnnotationFreeTextMBS = PDFAnnotationFreeTextMBS(a)
    MsgBox ft.contents
end if
next

Notes: Subclass of the PDFAnnotationMBS class.

125.11.2 Methods

125.11.3 Constructor(left as single, top as single, width as single, height as single)

Function: The constructor to create a new free text annotation.

125.11.4 Properties

125.11.5 alignment as Integer

Function: Alignment of text within annotation bounds.
Example:

dim a as PDFAnnotationFreeTextMBS // an annotation

if a.alignment=a.NSLeftTextAlignment then
// left aligned
end if

Notes:
Supported: NSLeftTextAlignment, NSRightTextAlignment and NSCenterTextAlignment.
(Read and Write property)

125.11.6  font as NSFontMBS

Function: Font associated with the text field.
Notes: (Read and Write property)

125.11.7  fontColor as NSColorMBS

Function: The font color used in the text field of the annotation.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

125.11.8  Events

125.11.9  drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.
125.11.10  Constants

125.11.11  NSCenterTextAlignment=2

MBS MacControls Plugin, Plugin Version: 8.0. **Function**: The Cocoa text alignment constant for center.

125.11.12  NSJustifiedTextAlignment=3

MBS MacControls Plugin, Plugin Version: 8.0. **Function**: The Cocoa text alignment constant for justified.

125.11.13  NSLeftTextAlignment=0

MBS MacControls Plugin, Plugin Version: 8.0. **Function**: The Cocoa text alignment constant for left.

125.11.14  NSNaturalTextAlignment=4

MBS MacControls Plugin, Plugin Version: 8.0. **Function**: The Cocoa text alignment constant for natural.

125.11.15  NSRightTextAlignment=1

MBS MacControls Plugin, Plugin Version: 8.0. **Function**: The Cocoa text alignment constant for right.
125.12. **class PDFAnnotInkMBS**

125.12.1 **class PDFAnnotInkMBS**

**Function:** The PDFKit class for an ink annotation.
**Notes:** Subclass of the PDFAnnotMBS class.

125.12.2 **Methods**

125.12.3 **addBezierPath(path as NSBezierPathMBS)**

**Function:** Adds a Bezier path to an annotation.

125.12.4 **Constructor(left as single, top as single, width as single, height as single)**

**Function:** The constructor to create a new ink annotation.

125.12.5 **paths as NSBezierPathMBS()**

**Function:** Returns an array containing the Bezier paths that make up an annotation.
**Example:**

```vbnet
dim a as new PDFAnnotInkMBS(0, 0, 100, 100)
dim b1 as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(NSMakeRectMBS(10, 10, 10, 10))
a.addBezierPath b1

dim b2 as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(NSMakeRectMBS(50, 50, 20, 30))
a.addBezierPath b2

dim paths() as NSBezierPathMBS = a.paths
break
```
125.12.6  removeBezierPath(path as NSBezierPathMBS)

Function: Removes a Bezier path from an annotation.

125.12.7  Events

125.12.8  drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.
125.13.  CLASS PDFANNOTATIONLINEMBS

125.13  class PDFAnnotationLineMBS

125.13.1  class PDFAnnotationLineMBS

Function: The PDFKit class for a line annotation.
Example:

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim annotations(-1) as PDFAnnotationMBS = page.annotations

// show lines on first page
for each a as PDFAnnotationMBS in annotations
    if a isa PDFAnnotationLineMBS then
        dim l as PDFAnnotationLineMBS = PDFAnnotationLineMBS(a)
        MsgBox "Line from " + l.startPoint.String + " to " + l.endPoint.String
    end if
next
```

Notes: Subclass of the PDFAnnotationMBS class.

125.13.2  Methods

125.13.3  Constructor(left as single, top as single, width as single, height as single)

Function: The constructor for a new annotation line.
Example:

```vba
dim a as new PDFAnnotationLineMBS(100,100,100,100)
```

125.13.4  Properties

125.13.5  endLineStyle as Integer

Function: Style used for ornaments at the line end.
Example:
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationLineMBS(100,100,100,100)
a.colorValue = NSColorMBS.redColor
a.endLineStyle = a.kPDFLineStyleOpenArrow

page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)

Notes: (Read and Write property)

125.13.6  endPoint as NSPointMBS

Function: A point specifying the end point for line annotation.
Example:
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim annotations(-1) as PDFAnnotationMBS = page.annotations

// show lines on first page
for each a as PDFAnnotationMBS in annotations
if a isa PDFAnnotationLineMBS then
dim l as PDFAnnotationLineMBS = PDFAnnotationLineMBS(a)
MsgBox "Line from " +l.startPoint.String+" to "+l.endPoint.String
end if
next

Notes: (Read and Write property)

125.13.7  interiorColor as NSColorMBS

Function: The color used to fill the ornament at the ends of the line.
125.13. CLASS PDFANNOTATIONLINEMBS

Notes:
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.13.8 startLineStyle as Integer

Function: Style used for ornaments at the line start.
Example:

```vbscript
dim a as new PDFAnnotationLineMBS(100,100,100,100)
a.startLineStyle = a.kPDFLineStyleSquare
```

Notes: (Read and Write property)

125.13.9 startPoint as NSPointMBS

Function: A point specifying the start point for line annotation.
Example:

```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim annotations(-1) as PDFAnnotationMBS = page.annotations
// show lines on first page
for each a as PDFAnnotationMBS in annotations
if a isa PDFAnnotationLineMBS then
    dim l as PDFAnnotationLineMBS = PDFAnnotationLineMBS(a)
    MsgBox "Line from " + l.startPoint.String + " to " + l.endPoint.String
end if
next
```

Notes: (Read and Write property)
125.13.10 Events

125.13.11 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

Function: The event called for a custom drawing.
Notes:
You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

125.13.12 Constants

125.13.13 kPDFLineStyleCircle=2

MBS MacControls Plugin, Plugin Version: 8.0. Function: One of the constants for the styles used for line end caps.
Example:
```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationLineMBS(100,100,100,100)
a.endLineStyle = a.kPDFLineStyleCircle
page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

125.13.14 kPDFLineStyleClosedArrow=5

MBS MacControls Plugin, Plugin Version: 8.0. Function: One of the constants for the styles used for line end caps.
Example:
```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
```
125.13. **CLASS PDFANNOTATIONLINEMBS**

```vbnet
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationLineMBS(100,100,100,100)

a.endLineStyle = a.kPDFLineStyleClosedArrow

page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)

 o.Launch
```

125.13.15 **kPDFLineStyleDiamond=3**

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for the styles used for line end caps.

**Example:**

```vbnet
dim a as new PDFAnnotationLineMBS(100,100,100,100)
a.startLineStyle = a.kPDFLineStyleDiamond
```

125.13.16 **kPDFLineStyleNone=0**

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for the styles used for line end caps.

125.13.17 **kPDFLineStyleOpenArrow=4**

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for the styles used for line end caps.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationLineMBS(100,100,100,100)

a.endLineStyle = a.kPDFLineStyleOpenArrow

page.addAnnotation(a)
```
dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch

125.13.18  kPDFLineStyleSquare=1

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** On of the constants for the styles used for line end caps.

**Example:**

dim a as new PDFAnnotationLineMBS(100,100,100,100)
a.endLineStyle = a.kPDFLineStyleSquare
125.14. class PDFAnnotationLinkMBS

Function: The PDFKit class for a link annotation.

Example:

```vbscript
// load a PDF
dim sourceFile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim p as new PDFDocumentMBS(sourceFile)

// get 4th page
dim page as PDFPageMBS = p.pageAtIndex(3)

// create a destination
dim dest as new PDFDestinationMBS(page, NSMakePointMBS(0,0))

// create the link annotation
dim LinkAnnotation as new PDFAnnotationLinkMBS(100,100,100,100)
LinkAnnotation.destination = dest

// add a color rect so we see the link
dim SquareAnnotation as new PDFAnnotationSquareMBS(100,100,100,100)
SquareAnnotation.colorValue = NSColorMBS.redColor

// add to the first page
p.pageAtIndex(0).addAnnotation(SquareAnnotation)
p.pageAtIndex(0).addAnnotation(LinkAnnotation)

// and write new PDF.
dim destfile as FolderItem = SpecialFolder.Desktop.Child("output.pdf")
call p.write(destfile)
```

Notes: Subclass of the PDFAnnotationMBS class.

125.14.2 Methods

125.14.3 Constructor(left as single, top as single, width as single, height as single)

Function: The constructor for a new annotation link.
125.14.4  setHighlighted(value as boolean)

**Function:** The highlight state dictates how the annotation is drawn.
**Notes:** If a user has clicked on a "Link" annotation, you should set highlighted to true and redraw it. When the user lets up, set highlighted to false and redraw again.

125.14.5  Properties

125.14.6  destination as PDFDestinationMBS

**Function:** Destination for the link.
**Notes:** (Read and Write property)

125.14.7  URL as string

**Function:** URL for the link.
**Notes:** (Read and Write property)

125.14.8  Events

125.14.9  drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

**Function:** The event called for a custom drawing.
**Notes:**
You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.
125.15  class PDFAnnotationMarkupMBS

125.15.1 class PDFAnnotationMarkupMBS

Function: The class for a markup annotation.  
Example: 

dim f as FolderItem = SpecialFolder.Desktop.\Child("test.pdf")  
dim doc as new PDFDocumentMBS(f)  

    dim page as PDFPageMBS = doc.pageAtIndex(0)  
dim a as new PDFAnnotationMarkupMBS(100,100,100,100)  
    page.addAnnotation(a)  

    dim o as FolderItem = SpecialFolder.Desktop.\Child("testout.pdf")  
call doc.write(o)  
o.Launch

Notes: Subclass of the PDFAnnotationMBS class.

125.15.2 Methods

125.15.3 Constructor(left as single, top as single, width as single, height as single)

Function: The constructor to create a new markup annotation.  
Example: 

dim a as new PDFAnnotationMarkupMBS(100,100,100,100)

125.15.4 quadrilateralPoints as NSPointMBS()

Function: Get the quadrilateral points.  
Example: 

    dim m as new PDFAnnotationMarkupMBS(10, 20, 30, 40)  
dim points() as NSPointMBS = m.quadrilateralPoints
break // see points in debugger

Notes:
Array of (n * 4) NSPoints defining n quadrilaterals in page space where n is the number of quad points.
The points for each quad are ordered in a 'Z' pattern. That is, the first point should represent the upper left
point representing the start of the marked-up text, the next point will be the upper right, the third point
will represent the lower left of the text and the last point the lower right. Points are specified relative to the
annotation’s bound’s origin.

125.15.5 setQuadrilateralPoints(points() as NSPointMBS)

Function: Set the quadrilateral points.
Notes:
Array of (n * 4) NSPoints defining n quadrilaterals in page space where n is the number of quad points.
The points for each quad are ordered in a 'Z' pattern. That is, the first point should represent the upper left
point representing the start of the marked-up text, the next point will be the upper right, the third point
will represent the lower left of the text and the last point the lower right. Points are specified relative to the
annotation’s bound’s origin.

125.15.6 Properties

125.15.7 markupType as Integer

Function: Type of mark-up (highlight, strike-out or underline).
Example:

```vbs
    dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
    dim doc as new PDFDocumentMBS(f)

    dim page as PDFPageMBS = doc.pageAtIndex(0)
    dim a as new PDFAnnotationMarkupMBS(100,100,100,100)
    a.markupType = PDFAnnotationMarkupMBS.kPDFMarkupTypeUnderline
    page.addAnnotation(a)

    dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
    call doc.write(o)
    o.Launch
```
Notes:
Changing the markup type also changes the annotations type to one of: "Highlight", "Strikeout", or "Underline" (these are three separate annotation types treated here as three separate flavors of the one PDFAnnotationMarkup class).
(Read and Write property)

125.15.8 Events

125.15.9 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

Function: The event called for a custom drawing.
Notes:
You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

125.15.10 Constants

125.15.11 kPDFMarkupTypeHighlight=0

MBS MacControls Plugin, Plugin Version: 8.0. Function: A constant for the markup type.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationMarkupMBS(100,100,100,100)
a.markupType = PDFAnnotationMarkupMBS.kPDFMarkupTypeHighlight
page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch

125.15.12 kPDFMarkupTypeStrikeOut=1

MBS MacControls Plugin, Plugin Version: 8.0. Function: A constant for the markup type.
Example:
```dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationMarkupMBS(100,100,100,100)
a.markupType = PDFAnnotationMarkupMBS.kPDFMarkupTypeStrikeOut
page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

**125.15.13**  
**kPDFMarkupTypeUnderline=2**

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** A constant for the markup type.  
**Example:**

```dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationMarkupMBS(100,100,100,100)
a.markupType = PDFAnnotationMarkupMBS.kPDFMarkupTypeStrikeOut
page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```
125.16.  CLASS PDFANNOTATIONMBS

125.16  class PDFAnnotationMBS

125.16.1  class PDFAnnotationMBS

Function: This is the base class for all annotations.
Notes:
A PDFAnnotation object by itself is not useful, only the subclasses (like PDFAnnotationCircle, PDFAnnotationText) are interesting. In parsing a PDF however, any unknown or unsupported annotations will be represented as this base class. Its drawRect method merely frames the bounds of the annotation and prints the annotation type (like "TrapNet") within the box.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

125.16.2  Methods

125.16.3  Constructor

Function: The private constructor.
Notes:
This class is the base class for a number of annotations. So this constructor is private to make sure you don't create instances of PDFAnnotationMBS. But you can still create instances of the subclasses.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

125.16.4  copy as PDFAnnotationMBS

Function: Creates a copy of the annotation object.
Notes:
For Mac OS X 10.7 and newer this function uses the framework function.
For Mac OS X 10.6 and older this function uses our own copy function to duplicate the annotation.

125.16.5  Destructor

Function: The destructor.
125.16.6 drawWithBox(box as Integer)

Function: Draws the annotation on its associated page.
Notes:
The annotation is drawn relative to the origin of box in page space.

Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.

For additional information see the "Constants" section in the PDFPage class.

Available in Mac OS X v10.4 and later.

125.16.7 removeAllAppearanceStreams

Function: All appearance streams for the target annotation are removed.
Notes:
Without an appearance stream, annotations are drawn strictly according to their parameters (color, border, font, etc.). When a PDF is saved, PDF Kit will always write out an appearance stream(s) for each annotation. If the PDF is reloaded, you will need to remove the appearance streams in order to continue to edit the annotations parameters.

Requires Mac OS X 10.5.

125.16.8 Properties

125.16.9 border as PDFBorderMBS

Function: Optional border or border style that describes how to draw the annotation border (if any).
Example:

```javascript
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Dim doc As New PDFDocumentMBS(f)
Dim page As PDFPageMBS = doc.pageAtIndex(0)
Dim a As New PDFAnnotationSquareMBS(100,100,100,100)
a.interiorColor = NSColorMBS.greenColor
```
125.16. **CLASS PDFANNOTATIONMBS**

```plaintext
a.colorValue = NSColorMBS.redColor
a.border.lineWidth=5
page.addAnnotation(a)
```

```plaintext
dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

**Notes:** (Read and Write property)

---

### 125.16.10  bounds as NSRectMBS

**Function:** The bounding box for the annotation in page space.

**Notes:**

Page space is a 72-dpi coordinate system with the origin at the lower-left corner of the current page.

Available in Mac OS X v10.4 and later.

(Read and Write property)

---

### 125.16.11  colorValue as NSColorMBS

**Function:** For many annotations ("Circle", "Square") the stroke color.

**Example:**

```plaintext
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationLineMBS(100,100,100,100)

a.colorValue = NSColorMBS.redColor
a.endLineStyle = a.kPDFLineStyleOpenArrow

page.addAnnotation(a)
```

```plaintext
dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
```
Notes:

Used for other annotations as well.  
(Read and Write property)

125.16.12  contents as string

Function: A string of text associated with an annotation.  
Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationTextMBS(100,100,100,100)

a.contents="Hello"
a.colorValue = NSColorMBS.redColor

page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes:

Often to be displayed in a pop-up when the annotation is clicked on ("FreeText" and "Text" especially).  
(Read and Write property)

125.16.13  Handle as Integer

Function: The handle used internally for the object reference.  
Notes: (Read and Write property)
125.16. **CLASS PDFANNOTATIONMBS**

125.16.14 **hasAppearanceStream as boolean**

**Function:** Returns true if the annotation has an appearance stream.

**Notes:**
Annotations with appearance streams are drawn using their stream. As a result, setting many parameters (like 'setColor' above), will have no visible effect.
(Read only property)

125.16.15 **modificationDate as date**

**Function:** The modification date of the annotation.

**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.16.16 **mouseUpAction as PDFActionMBS**

**Function:** The action performed when a user releases the mouse button within an annotation.

**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.16.17 **page as PDFPageMBS**

**Function:** Returns the page the annotation is associated with.

**Notes:** (Read only property)

125.16.18 **popup as Variant**

**Function:** The pop-up annotation associated with an annotation.

**Notes:**
The variant is a PDFAnnotationPopupMBS.

Pop-up annotations are not used with links or widgets. The bounds and open state of the pop-up annotation indicate the placement and open state of the pop-up window.

Available in Mac OS X v10.5 and later.
(Read and Write property)

125.16.19 shouldDisplay as boolean

Function: Specifies whether it should be drawn to the display or not.
Notes: (Read and Write property)

125.16.20 shouldPrint as boolean

Function: Specifies whether it should be printed or not.
Notes: (Read and Write property)

125.16.21 toolTip as string

Function: String used for tooltips.
Notes: The base class returns contents, sub-classes may override as appropriate.
(Read only property)

125.16.22 type as string

Function: Returns the annotation type (called "Subtype" in the PDF specification since "Annot" is the type).
Example:

```vbnet
dim a as new PDFAnnotationTextMBS(100,100,100,100)
MsgBox a.type // Text
```
Notes:
Examples include: "Text", "Link", "Line", etc.
(Read only property)

125.16.23  userName as string

Function: The name of the user who created the annotation.
Notes:
Available in Mac OS X v10.5 and later.
(Read and Write property)
125.17 class PDFAnnotationPopupMBS

125.17.1 class PDFAnnotationPopupMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A PDFAnnotationPopup object provides user interactivity on a PDF page in the form of a pop-up menu. **Notes:** Subclass of the PDFAnnotationMBS class.

125.17.2 Methods

125.17.3 Constructor(left as single, top as single, width as single, height as single)

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new annotation popup annotation with the given size.

125.17.4 Properties

125.17.5 isOpen as boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the pop-up is open. **Notes:** Available in Mac OS X v10.5 and later.

125.17.6 Events

125.17.7 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called for a custom drawing. **Notes:** You can draw here what the annotation should show. Return true to disable the default drawing from PDFKit.
125.18. **CLASS PDFANNOTATIONSQUAREMBS**

### 125.18 class PDFAnnotationSquareMBS

**Function:** The class for a square annotation.

**Example:**

```plaintext
// load a PDF
dim sourceFile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim p as new PDFDocumentMBS(sourceFile)

// get 4th page
dim page as PDFPageMBS = p.pageAtIndex(3)

// create a destination
dim dest as new PDFDestinationMBS(page, NSMakePointMBS(0,0))

// create the link annotation
dim LinkAnnotation as new PDFAnnotationLinkMBS(100,100,100,100)
LinkAnnotation.destination = dest

// add a color rect so we see the link
dim SquareAnnotation as new PDFAnnotationSquareMBS(100,100,100,100)
SquareAnnotation.colorValue = NSColorMBS.redColor

// add to the first page
p.pageAtIndex(0).addAnnotation(SquareAnnotation)
p.pageAtIndex(0).addAnnotation(LinkAnnotation)

// and write new PDF.
dim destfile as FolderItem = SpecialFolder.Desktop.Child("output.pdf")
call p.write(destfile)
```

**Notes:** Subclass of the PDFAnnotationMBS class.

### 125.18.2 Methods

### 125.18.3 Constructor(left as single, top as single, width as single, height as single)

**Function:** The constructor to create a square annotation.

**Example:**

```plaintext
17438

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationSquareMBS(100,100,100,100)

a.interiorColor = NSColorMBS.greenColor
a.colorValue = NSColorMBS.redColor
a.border.lineWidth=5

page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

125.18.4 Properties

125.18.5 interiorColor as NSColorMBS

Function: Fill color used for drawing annotation.
Example:

```
dim a as new PDFAnnotationSquareMBS(100,100,100,100)
a.interiorColor = NSColorMBS.greenColor
```

Notes: (Read and Write property)

125.18.6 Events

125.18.7 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

Function: The event called for a custom drawing.
Notes:

You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

**Function:** A PDFAnnotationStamp object allows you to display a word or phrase, such as "Confidential," in a PDF page.

**Example:**

// create new document with blank page
dim doc as new PDFDocumentMBS
dim page as new PDFPageMBS
doc.appendPage page

// make new stamp annotation
dim stamp as new PDFAnnotationStampMBS(100, 100, 100, 100)

// Name of stamp annotation. Standard stamps include names like, "Approved", "Draft", "TopSecret", etc.
// The name must be representable as ASCII.
// Very little is rendered if the annotation has no appearance stream.
stamp.name = "Approved"

page.addAnnotation stamp

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

if doc.write(f) then
    f.Launch
else
    MsgBox "write failed"
end if

**Notes:**

A PDFAnnotationStamp object should have an appearance stream associated with it; otherwise, nothing useful is rendered.

Subclass of the PDFAnnotationMBS class.
125.19.2 Methods

125.19.3 Constructor(left as single, top as single, width as single, height as single)

Function: Creates a new annotation stamp with the given size.

125.19.4 Properties

125.19.5 name as string

Function: The name associated with the stamp annotation.
Notes:
The name must be representable in ASCII. You can set a stamp annotation’s name to help you identify it,
but that name is not displayed on the PDF page. You must provide the string you want displayed on the
page, such as "Draft" or "Top Secret", in the appearance stream for the annotation.

Note that the name value of the stamp annotation is not necessarily identical to the user-visible appearance
of the stamp annotation. For example, a stamp annotation that displays "Confidential" on a PDF page may
not have a name value of "Confidential".

Available in Mac OS X v10.5 and later.
(Read and Write property)

125.19.6 Events

125.19.7 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

Function: The event called for a custom drawing.
Notes:
You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.
125.20. class PDFAnnotationTextMBS

125.20.1. class PDFAnnotationTextMBS

_**Function**_: The PDFKit class for an annotation text.
_**Notes**_: Subclass of the PDFAnnotationMBS class.

125.20.2. Methods

125.20.3. Constructor(left as single, top as single, width as single, height as single)

_**Function**_: The constructor to create a new annotation text.

125.20.4. Properties

125.20.5. iconType as Integer

_**Function**_: The type of icon displayed in the PDF.
_**Notes**_: Supported icons: "Comment", "Key", "Note", "Help", "NewParagraph", "Paragraph" and "Insert".
(Read and Write property)

125.20.6. Events

125.20.7. drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

_**Function**_: The event called for a custom drawing.
_**Notes**_: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.
125.20.8 Constants

125.20.9 kPDFTextAnnotationIconComment=0

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for use with the icontype property.

125.20.10 kPDFTextAnnotationIconHelp=3

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for use with the icontype property.

125.20.11 kPDFTextAnnotationIconInsert=6

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for use with the icontype property.

125.20.12 kPDFTextAnnotationIconKey=1

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for use with the icontype property.

125.20.13 kPDFTextAnnotationIconNewParagraph=4

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for use with the icontype property.

125.20.14 kPDFTextAnnotationIconNote=2

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for use with the icontype property.
MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for use with the icontype property.
125.21 class PDFAnnotationTextWidgetMBS

125.21.1 class PDFAnnotationTextWidgetMBS

Function: The PDFKit class for a text widget annotation.
Notes: Subclass of the PDFAnnotationMBS class.

125.21.2 Methods

125.21.3 Constructor(left as single, top as single, width as single, height as single)

Function: The constructor to create a new annotation.

125.21.4 Properties

125.21.5 alignment as Integer

Function: Alignment of text.
Notes:
Supported: NSLeftTextAlignment, NSRightTextAlignment and NSCenterTextAlignment. (Read and Write property)

125.21.6 attributedStringValue as NSAttributedStringMBS

Function: Attributed string associated with text field (font / fontColor).
Notes:
Available on Mac OS X 10.8 or newer. (Read and Write property)
125.21.7 backgroundColor as NSColorMBS

**Function:** The background color of the annotation text field.
**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.21.8 fieldName as string

**Function:** The internal name for the annotation text field.
**Notes:**
Field names are optional, internal names that identify text fields in a PDF form. You use field names with the PDFActionResetForm action. Note that multiple PDFAnnotationTextWidget objects with the same field name always have the same text associated with that field name. When text is entered into one of the objects, the text associated with that field name is changed in all objects. If you need to ensure unique text for a PDFAnnotationTextWidget object, you must give it a unique field name.
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.21.9 font as NSFontMBS

**Function:** Font associated with the text field.
**Notes:** (Read and Write property)

125.21.10 fontColor as NSColorMBS

**Function:** The font color used for the annotation’s text field.
**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)
CHAPTER 125. PDFKIT

125.21.11 maximumLength as Integer

Function: The maximum number of characters allowed in the annotations string.
Notes:
A value of 0 means that there is no specified maximum.
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.21.12 rotation as Integer

Function: The rotation angle of the annotation text field in degrees.
Notes:
The rotation angle to be applied to the annotation text field, in degrees. The rotation angle must be a positive or negative multiple of 90 (negative angles are converted to their positive equivalents; for example -90 is changed to 270).
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.21.13 stringValue as string

Function: String value associated with text field.
Notes: (Read and Write property)

125.21.14 Events

125.21.15 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

Function: The event called for a custom drawing.
Notes:
You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.
125.21.16 Constants

125.21.17 NSCenterTextAlignment=2
MBS MacControls Plugin, Plugin Version: 8.0. **Function:** The Cocoa text alignment constant for center.

125.21.18 NSJustifiedTextAlignment=3
MBS MacControls Plugin, Plugin Version: 8.0. **Function:** The Cocoa text alignment constant for justified.

125.21.19 NSLeftTextAlignment=0
MBS MacControls Plugin, Plugin Version: 8.0. **Function:** The Cocoa text alignment constant for left.

125.21.20 NSNaturalTextAlignment=4
MBS MacControls Plugin, Plugin Version: 8.0. **Function:** The Cocoa text alignment constant for natural.

125.21.21 NSRightTextAlignment=1
MBS MacControls Plugin, Plugin Version: 8.0. **Function:** The Cocoa text alignment constant for right.
125.22 class PDFBorderMBS

125.22.1 class PDFBorderMBS

**Function:** The class for PDFKit borders.
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

125.22.2 Methods

125.22.3 Constructor

**Function:** The private constructor.

125.22.4 copy as PDFBorderMBS

**Function:** Creates a copy of the border object.
**Notes:** Not available in Mac OS X 10.6.

125.22.5 dashPattern as Double()

**Function:** Gets the dash pattern for the border.
**Notes:** Refer to the description for NSBezierPath for more information.

125.22.6 setDashPattern(values() as Double)

**Function:** Sets the dash pattern for the border.
**Notes:** Refer to the description for NSBezierPath for more information.
125.22.7 Properties

125.22.8 horizontalCornerRadius as single

Function: For rounded-rect borders, the corner radius.
Notes:
Deprecated in Mac OS X 10.7.
(Read and Write computed property)

125.22.9 lineWidth as single

Function: Width of line used to strok border.
Example:
```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationSquareMBS(100,100,100,100)
a.interiorColor = NSColorMBS.greenColor
a.colorValue = NSColorMBS.redColor
a.border.lineWidth=5

page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: (Read and Write computed property)

125.22.10 style as Integer

Function: Whether border is drawn solid, dashed etc.
Example:
```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
```
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationSquareMBS(100,100,100,100)
a.border.style = PDFBorderMBS.kPDFBorderStyleDashed
page.addAnnotation(a)
dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch

Notes:
Use this constants:

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>kPDFBorderStyleSolid</td>
<td>0</td>
</tr>
<tr>
<td>kPDFBorderStyleDashed</td>
<td>1</td>
</tr>
<tr>
<td>kPDFBorderStyleBeveled</td>
<td>2</td>
</tr>
<tr>
<td>kPDFBorderStyleInset</td>
<td>3</td>
</tr>
<tr>
<td>kPDFBorderStyleUnderline</td>
<td>4</td>
</tr>
</tbody>
</table>

(Read and Write computed property)

### 125.22.11 verticalCornerRadius as single

**Function:** For rounded-rect borders, the corner radius.
**Notes:**
Deprecated in Mac OS X 10.7.
(Read and Write computed property)

### 125.22.12 Constants

#### 125.22.13 kPDFBorderStyleBeveled = 2

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for the border style. 
**Example:**
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
```vbnet
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationSquareMBS(100,100,100,100)

a.border.style = PDFBorderMBS.kPDFBorderStyleBeveled

page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

**125.22.14 kPDFBorderStyleDashed = 1**

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for the border style. **Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim page as PDFPageMBS = doc.pageAtIndex(0)
dim a as new PDFAnnotationSquareMBS(100,100,100,100)

a.border.style = PDFBorderMBS.kPDFBorderStyleDashed

page.addAnnotation(a)

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

**125.22.15 kPDFBorderStyleInset = 3**

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for the border style.

**125.22.16 kPDFBorderStyleSolid = 0**

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants for the border style.
125.22.17 \texttt{kPDFBorderStyleUnderline} = 4

MBS MacControls Plugin, Plugin Version: 8.0. \textbf{Function:} One of the constants for the border style.
125.23.  CLASS PDFDESTINATIONMBS

125.23  class PDFDestinationMBS

125.23.1  class PDFDestinationMBS

Function: The class for a pdf destination.

125.23.2  Methods

125.23.3  compare(dest as PDFDestinationMBS) as Integer

Function: Returns a comparison result that indicates the location of the destination in the document, relative to the current position.
Notes:
A comparison result, indicating the position of the passed-in destination relative to the current position.

If destination is between the receiver’s position and the end of the document, compare returns NSOrderedAscending; if it is between the receiver’s position and the beginning of the document, compare returns NSOrderedDescending. Otherwise, if destination matches the receiver’s position, compare returns NSOrderedSame.

This method ignores the horizontal component of the destination point (the x value). If the destination’s vertical component (or y value) is kPDFDestinationUnspecifiedValue, compare treats the destination as if its y value is the top point on the destination page.

An exception is raised if destination does not have a page associated with it or if its page is associated with a document other than the receiver’s document.

Available in Mac OS X v10.5 and later.

125.23.4  Constructor(page as PDFPageMBS, point as NSPointMBS)

Function: Initializes the destination.
Notes:
page: The page of the destination.
point: The point of the destination, in page space.
Specify point in page space. Typically, there’s no need to initialize destinations. Instead, you get them from PDFAnnotationLink, PDFOutline, or PDFView objects.

Page space is a 72-dpi coordinate system with the origin at the lower-left corner of the current page.

Available in Mac OS X v10.4 and later.

**125.23.5 copy as PDFDestinationMBS**

**Function:** Creates a copy of the destination object.

**125.23.6 kPDFDestinationUnspecifiedValue as single**

**Function:** Value used for unspecified destination.  
**Example:**  
MsgBox str(PDFDestinationMBS.kPDFDestinationUnspecifiedValue)

**Notes:**  
Unspecified value used when a destination’s actual x or y value is unimportant.  
Available in Mac OS X v10.5 and later.

**125.23.7 page as PDFPageMBS**

**Function:** Page the destination refers to (destination page).

**125.23.8 point as NSPointMBS**

**Function:** Returns the point, in page space, that the destination refers to.  
**Notes:**  
Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.
125.23. CLASS PDFDESTINATIONMBS

Available in Mac OS X v10.4 and later.

125.23.9 Properties

125.23.10 Zoom as Double

Function: Specify the scale factor the PDF viewer should assume for this destination.

Notes:

kPDFDestinationUnspecifiedValue indicates the scale factor is unaffected.
Available in Mac OS X 10.7 and later.
(Read and Write computed property)
125.24 class PDFDocumentDelegateMBS

125.24.1 class PDFDocumentDelegateMBS

Notes: Subclass this class to handle document events.

125.24.2 Events

125.24.3 Close

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called when the delegate is destroyed.

125.24.4 didMatchString(selection as PDFSelectionMBS)

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event for an item found.
Notes: If implemented by the delegate, called for every search instance found during a find. PDFDocument’s implementation accumulates each PDFSelection in an array.

125.24.5 documentDidBeginDocumentFind

125.24.6 documentDidBeginPageFind(PageIndex as Integer)

Notes: PageIndex is zero based.

125.24.7 documentDidEndDocumentFind

125.24.8  documentDidEndPageFind(PageIndex as Integer)

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The page search finished on this page. **Notes:** PageIndex is zero based.

125.24.9  documentDidFindMatch(selection as PDFSelectionMBS)

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The search found an item.

125.24.10  documentDidUnlock

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The document has been unlocked.

125.24.11  Open

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when the delegate is installed.
125.25 class PDFDocumentMBS

125.25.1 class PDFDocumentMBS

Function: The PDFKit class for a PDF document.
Notes:
Basicly this is the code used by Preview.app by Apple.

Destructor is dispatched to main thread to avoid bugs in OS X 10.12.

125.25.2 Methods

125.25.3 appendPage(page as PDFPageMBS)

Function: Appends a page to the document.

125.25.4 beginFindString(text as string, options as Integer)

Function: Begins a find, searching the document for string.
Notes: Search results are handled via a DidFindMatch event in the delegate. Supported options are: NSCaseInsensitiveSearch, NSLiteralSearch, and NSBackwardsSearch.

125.25.5 cancelFindString

Function: Method to cancel a search.
Notes: Can be called from a user method being serviced by a find notification.

125.25.6 Constructor

Function: The constructor to create a new pdf document in memory.
Example:
125.25.  CLASS PDFDOCUMENTMBS

dim doc as new PDFDocumentMBS // new empty document
dim page as new PDFPageMBS // new empty page

doc.Creator="Realbasic"
doc.Title="Test file"

doc.insertPage page,0

dim f as FolderItem=SpecialFolder.Desktop.Child("test.pdf")

if doc.write(f) then
f.launch
end if

See also:

• 125.25.7 Constructor(data as memoryblock)
• 125.25.8 Constructor(file as folderitem)

125.25.7  Constructor(data as memoryblock)

Function: The constructor to create a new pdf document based on a string.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim b as BinaryStream = f.OpenAsBinaryFile(false)
dim s as string = b.Read(b.Length)

dim doc as new PDFDocumentMBS(s)

MsgBox doc.Title

See also:

• 125.25.6 Constructor
• 125.25.8 Constructor(file as folderitem)

125.25.8  Constructor(file as folderitem)

Function: The constructor to create a new pdf document based on a file.
Example:

```vba
dim p as PDFDocumentMBS
dim f as FolderItem

f=SpecialFolder.Desktop.Child("test.pdf")
p=new PDFDocumentMBS(f)

MsgBox "Text from first page:" +EndOfLine+EndOfLine+p.pageAtIndex(0).stringValue
```

See also:

- 125.25.6 Constructor
- 125.25.7 Constructor(data as memoryblock)

### 125.25.9 copy as PDFDocumentMBS

**Function:** Creates a copy of the document object.

**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim p as new PDFDocumentMBS(f)

// make a copy
dim c as PDFDocumentMBS = p.copy

// remove second page
c.removePageAtIndex 1

// c has one page less
MsgBox str(p.pageCount)+" "+str(c.pageCount)
```

**Notes:**

For Mac OS X 10.7 and newer this function uses the framework function.
For Mac OS X 10.6 and older this function uses our own copy function to duplicate the document.

### 125.25.10 dataRepresentation(QuartzFilter as Variant = nil) as memoryblock

**Function:** Methods to record the current state of the PDFDocument as data string.
Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

dim o as FolderItem = SpecialFolder.Desktop.Child("out.pdf")
dim b as BinaryStream = o.CreateBinaryFile"

b.Write doc.dataRepresentation
```

**Notes:** Optional for Mac OS X 10.6, you can pass a QuartzFilterMBS object to use that filter here.

### 125.25.11 documentRef as Integer

**Function:** Returns a CGPDFDocumentRef value for this document.  
**Notes:**  
This is the CGPDFDocument associated with the PDFDocument object. With this object you can call many CoreGraphics API. May return 0 if the document was not created from an existing PDF file or data.  
Use CGPDFDocumentMBS with Constructor taking a handle to call functions on this CGPDFDocument object.

### 125.25.12 exchangePageAtIndexWithPageAtIndex(indexA as Integer, indexB as Integer)

**Function:** Exchanges the two pages with the given index.  
**Notes:** Index is zero based.

### 125.25.13 findString(text as string, options as Integer) as PDFSelectionMBS()

**Function:** Searches entire document for string and returns an array of PDFSelections representing all instances found.  
**Example:**

```vbnet
dim p as PDFDocumentMBS
dim f as FolderItem
dim sa() as PDFSelectionMBS
```
dim i,c as Integer
dim s as PDFSelectionMBS

const NSCaseInsensitiveSearch=1

f=SpecialFolder.Desktop.Child("test.pdf")
p=new PDFDocumentMBS(f)

if p.pageCount=0 then
    MsgBox "Failed to load the PDF."
    Return
end if

sa=p.findString("Plugin",NSCaseInsensitiveSearch)

if ubound(sa)<0 then
    MsgBox "no item found."
else
    MsgBox str(ubound(sa)+1)+" items found."
end if

s=sa(0)
s.extendSelectionAtEnd(50)
s.extendSelectionAtStart(50)

MsgBox s.stringValue // shows a bit more text before and after the location found

Notes:
May return an empty array if nothing is found.
Returns nil on any error.

Supported options are:
NSCaseInsensitiveSearch, NSLiteralSearch, and NSBackwardsSearch.

125.25.14 findStringFromSelection(text as string, selection as PDFSelectionMBS, options as Integer) as PDFSelectionMBS

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Searches for only the next instance of string beginning after the last character of selection with options (or preceding the first character of the selection if NSBackwardsSearch is specified as a search option). Notes: Returns next instance as a PDFSelection or nil if the end of the document is reached. Supported options are: NSCaseInsensitiveSearch, NSLiteralSearch, and NSBackwardsSearch. Passing in nil for selection will start the search from the beginning of the document (or end if NSBackwardsSearch is specified).
125.25.15 indexForPage(page as PDFPageMBS) as Integer

Function: Given a PDFPage, returns the pages index within the document.
Notes: Indices are zero-based.

125.25.16 insertPage(page as PDFPageMBS, index as Integer)

Function: Inserts a page in the pdf on the given index.
Example:

```plaintext
dim file1, file2, file3, destfile as FolderItem
dim page1, page2, page3 as PDFPageMBS
dim doc1, doc2 as PDFDocumentMBS
dim img as NSImageMBS
dim doc as PDFDocumentMBS

file1=SpecialFolder.Desktop.Child("test1.pdf")
file2=SpecialFolder.Desktop.Child("test2.pdf")
file3=SpecialFolder.Desktop.Child("logo.jpg")

doc1=new PDFDocumentMBS(file1)
doc2=new PDFDocumentMBS(file2)
MsgBox str(doc1.pageCount)

img=new NSImageMBS(file3)
Backdrop=img.CopyPicture

page1=new PDFPageMBS(img)
page2=doc1.pageAtIndex(0)
page3=doc2.pageAtIndex(0)

doc=new PDFDocumentMBS
doc.insertPage page1, 0
doc.insertPage page2, 1
doc.insertPage page3, 2

destfile=SpecialFolder.Desktop.Child("test.pdf")
call doc.write(destfile)
```
Notes: Index is zero based.

125.25.17 Keywords as string()

Function: Array of Strings containing document keywords.
Example:
```
dim f as FolderItem = SpecialFolder.Desktop.Child(“test.pdf”)  
dim doc as new PDFDocumentMBS(f)  
MsgBox join(doc.Keywords)
```

125.25.18 outlineItemForSelection(selection as PDFSelectionMBS) as PDFOutlineMBS

Function: Given a PDFSelection, this method returns the child outline item the selection most closely falls beneath.
Notes:
Since a selection may span multiple outline items, only the point representing the first character of the PDFSelection is considered. Typically, outline’s indicate things like chapters for the PDF. Therefore, this method would help you identify the chapter the selection falls within.

For some PDFs this method returns nil.

125.25.19 pageAtIndex(index as Integer) as PDFPageMBS

Function: Returns a PDFPage object representing the page at index.
Example:
```
dim p as PDFDocumentMBS  
dim f as FolderItem  

p=new PDFDocumentMBS(f)  
MsgBox ”Text from first page:” + EndOfLine + p.pageAtIndex(0).stringValue
```
Notes: Will raise an exception if index is out of bounds. Indices are zero-based.

125.25.20  PrintOperation(PrintInfo as Variant, AutoRotate as boolean = true, scalingMode as Integer = 0) as Variant

Function: Creates print operation for PDF document.
Example:

```vba
// select a PDF
dim f as FolderItem = GetOpenFolderItem(""")
if f = nil then Return

// open PDF
dim doc as new PDFDocumentMBS(f)

// define some print setting via PrintInfo
dim PrintInfo as new NSPrintInfoMBS

// start print operation
dim printOperation as NSPrintOperationMBS = doc.PrintOperation(printinfo)

printOperation.showsPrintPanel = true
printOperation.showsProgressPanel = true

call printOperation.runOperation
```

Notes: Returns NSPrintOperationMBS object.

125.25.21  removePageAtIndex(index as Integer)

Function: Removes a page in the pdf on the given index.
Notes: Index is zero based.
125.25.22 selectionForEntireDocument as PDFSelectionMBS

Function: Returns a selection representing text for the entire document.

125.25.23 selectionFromPage(StartPage as PDFPageMBS, StartCharacterIndex as Integer, EndPage as PDFPageMBS, EndCharacterIndex as Integer) as PDFSelectionMBS

Function: Returns a selection representing text from page startPage and point StartCharacterIndex to page endPage and to point EndCharacterIndex on that page.
Notes: Start and end page can be the same.
See also:
  • 125.25.24 selectionFromPage(StartPage as PDFPageMBS, StartPointX as single, StartPointY as single, EndPage as PDFPageMBS, EndPointX as single, EndPointY as single) as PDFSelectionMBS

125.25.24 selectionFromPage(StartPage as PDFPageMBS, StartPointX as single, StartPointY as single, EndPage as PDFPageMBS, EndPointX as single, EndPointY as single) as PDFSelectionMBS

Function: Returns a selection representing text from page startPage and point startPt to page endPage and to point endPt on that page.
Notes: Points are in page-space and relative to their respective pages. Start and end page can be the same (and are then equivalent to calling selectionFromPointToPoint).
See also:
  • 125.25.23 selectionFromPage(StartPage as PDFPageMBS, StartCharacterIndex as Integer, EndPage as PDFPageMBS, EndCharacterIndex as Integer) as PDFSelectionMBS

125.25.25 SetDelegate(d as PDFDocumentDelegateMBS)

Function: If a PDFDocument has a delegate, delegate methods may be called for this document.

125.25.26 SetKeywords(keywords() as string)

Function: Sets the array of strings containing document keywords.
### 125.25.27 unlockWithPassword(password as string) as boolean

**MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Unlocks an encrypted PDF with the given password.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
if doc.unlockWithPassword("mypassword") then
    MsgBox "OK"
end if
```

**Notes:** Means of passing in a password to unlock encrypted PDF’s. Calling unlockWithPassword will attempt to unlock the PDF. If successful, a DidUnlockDocument event is sent to the delegate. You cannot "re-lock" a PDF by passing in a bogus password. Returns true if the document is now unlocked, false otherwise (isLocked = false).

### 125.25.28 write(file as folderitem, QuartzFilter as Variant = nil) as boolean

**MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Methods to record the current state of the PDFDocument as a file.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
// modify here

dim o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
```

**Notes:**

Returns true on success and false on failure.

There is a bug known in Mac OS X 10.4 that this function may return true even if the saving failed. So you may prefer to check the file whether it exists after write.

Optional for Mac OS X 10.6, you can pass a QuartzFilterMBS object to use that filter here.
125.25.29  Properties

125.25.30  allowsCopying as boolean

Function: Whether copying is allowed.
Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox str(doc.allowsCopying)
```

Notes:
Even unlocked, encrypted PDF’s may have certain restrictions regarding copying or printing placed upon them.
(Read only property)

125.25.31  allowsPrinting as boolean

Function: Whether printing is allowed.
Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox str(doc.allowsPrinting)
```

Notes:
Even unlocked, encrypted PDF’s may have certain restrictions regarding copying or printing placed upon them.
(Read only property)

125.25.32  Author as string

Function: String containing document author.
Example:
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox doc.Author

**Notes:** (Read and Write property)

### 125.25.33 CreationDate as Date

**Function:** Date representing document creation date.
**Example:**

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox doc.CreationDate.LongDate

**Notes:** (Read and Write property)

### 125.25.34 Creator as string

**Function:** String containing name of app that created document content.
**Example:**

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox doc.Creator

**Notes:** (Read and Write property)

### 125.25.35 documentURL as string

**Function:** The document location.
**Example:**

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox doc.documentURL

Notes:
May return nil if the document was created from data.
(Read only property)

125.25.36   Handle as Integer

Function: The internal reference to the PDF Document.
Notes: (Read and Write property)

125.25.37   isEncrypted as boolean

Function: Whether the PDF is encrypted.
Example:

    dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
    dim doc as new PDFDocumentMBS(f)
    MsgBox str(doc.isEncrypted)

Notes:
With the right password, a PDF can be unlocked - nonetheless, the PDF still indicates that it is encrypted - just no longer locked. Some PDF’s may be encrypted but can be unlocked with the empty string.
These are unlocked automatically.
(Read only property)

125.25.38   isFinding as boolean

Function: Returns true if document is currently searching for a string.
Notes: (Read only property)
125.25. CLASS PDFDOCUMENTMBS

125.25.39  isLocked as boolean

Function: Whether the PDF is locked.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox str(doc.isLocked)

Notes:
With the right password, a PDF can be unlocked - nonetheless, the PDF still indicates that it is encrypted - just no longer locked. Some PDF’s may be encrypted but can be unlocked with the empty string. These are unlocked automatically.
(Read only property)

125.25.40  majorVersion as Integer

Function: PDF version of the PDF file (example: major version = 1, minor = 4; PDF v1.4).
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox str(doc.majorVersion)+"."+str(Doc.minorVersion)

Notes:  (Read only property)

125.25.41  minorVersion as Integer

Function: PDF version of the PDF file (example: major version = 1, minor = 4; PDF v1.4).
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox str(doc.majorVersion)+"."+str(Doc.minorVersion)

Notes:  (Read only property)
125.25.42 ModificationDate as Date

**Function:** Date representing last document modification date.
**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox doc.ModificationDate.LongDate
```

**Notes:** (Read and Write property)

125.25.43 outlineRoot as PDFOutlineMBS

**Function:** Returns the root outline object for the PDF (or nil if none).
**Notes:** (Read and Write property)

125.25.44 pageCount as Integer

**Function:** The number of pages in the document.
**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox str(Doc.pageCount)
```

**Notes:** (Read only property)

125.25.45 permissionsStatus as Integer

**Function:** Returns the permissions status of the PDF document.
**Example:**
125.25. CLASS PDFDOCUMENTMBS

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

Select case doc.permissionsStatus
case doc.kPDFDocumentPermissionsNone
MsgBox "None"
case doc.kPDFDocumentPermissionsOwner
MsgBox "Owner or no password"
case doc.kPDFDocumentPermissionsUser
MsgBox "User"
end Select
```

Notes:
You have kPDFDocumentPermissionsNone status for an encrypted document that you have not supplied either a valid user or owner password. For a document with no encryption, you automatically have kPDFDocumentPermissionsOwner status.

Requires Mac OS X 10.6.
(Read only property)

125.25.46 Producer as string

**Function:** String containing name of app that produced PDF data.
**Example:**
```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
MsgBox doc.Producer
```

Notes: (Read and Write property)

125.25.47 stringValue as string

**Function:** The text of the document.
**Example:**
```vba
dim p as PDFDocumentMBS
dim f as FolderItem
```
f=SpecialFolder.Desktop.Child("test.pdf")
p=new PDFDocumentMBS(f)

MsgBox "Text from PDF Document:" + EndOfLine + EndOfLine + p.stringValue

Notes:
Convenience method. Returns a string representing the entire document (each page’s string concatenated with line feeds between pages).

If you need to extract the text of a PDF document cross platform or with more options, you may want to look on the DynaPDF plugin.

It seems like this string value is not always available. It works for PDF Documents created from a disc file, but not for files our test app created on runtime in memory by using PDFDocument constructor and insertpage.
(Read only property)

125.25.48 Subject as string

Function: String containing document subject.
Example:

    dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
    dim doc as new PDFDocumentMBS(f)
    MsgBox doc.Subject

Notes: (Read and Write property)

125.25.49 Title as string

Function: String containing document title.
Example:

    dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
    dim doc as new PDFDocumentMBS(f)
    MsgBox doc.Title
**Notes:** (Read and Write property)

### 125.25.50 documentAttributes as Dictionary

**Function:** The PDF meta data as a Real Studio Dictionary object.  
**Notes:**  
Returns a dictionary with PDF metadata. Metadata is optional for PDF’s and so some of the keys may be missing or the entire dictionary may be empty.  
(Read and Write computed property)

### 125.25.51 Constants

#### 125.25.52 kPDFDocumentPermissionsNone=0

**Function:** One of the permission status constants.  
**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

Select case doc.permissionsStatus
    case doc.kPDFDocumentPermissionsNone
        MsgBox "None"
    case doc.kPDFDocumentPermissionsOwner
        MsgBox "Owner or no password"
    case doc.kPDFDocumentPermissionsUser
        MsgBox "User"
end Select
```

**Notes:** Document permissions status. For encrypted PDF’s, supplying the owner password will enable owner permission status.

#### 125.25.53 kPDFDocumentPermissionsOwner=2

**Function:** One of the permission status constants.  
**Example:**

```vbnet
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

Select case doc.permissionsStatus
    case doc.kPDFDocumentPermissionsNone
        MsgBox "None"
    case doc.kPDFDocumentPermissionsOwner
        MsgBox "Owner or no password"
    case doc.kPDFDocumentPermissionsUser
        MsgBox "User"
end Select
```

### 125.25.54 kPDFDocumentPermissionsUser=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the permission status constants. **Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)

Select case doc.permissionsStatus
    case doc.kPDFDocumentPermissionsNone
        MsgBox "None"
    case doc.kPDFDocumentPermissionsOwner
        MsgBox "Owner or no password"
    case doc.kPDFDocumentPermissionsUser
        MsgBox "User"
end Select
```

### 125.25.55 kPDFPrintPageScaleDownToFit=2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants for printing page-scaling modes.

### 125.25.56 kPDFPrintPageScaleNone=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants for printing page-scaling modes.
125.25.57 kPDFPrintPageScaleToFit=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants for printing page-scaling modes.

125.25.58 NSBackwardsSearch=4

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the Cocoa search modes. **Notes:** Performs searching from the end of the range toward the beginning.

125.25.59 NSCaseInsensitiveSearch=1

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the Cocoa search modes. **Notes:** Ignores case distinctions among characters.

125.25.60 NSLiteralSearch=2

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the Cocoa search modes. **Notes:** Performs a byte-for-byte comparison. Differing literal sequences (such as composed character sequences) that would otherwise be considered equivalent are considered not to match. Using this option can speed some operations dramatically.
125.26 class PDFOutlineMBS

125.26.1 class PDFOutlineMBS

Function: The class for a pdf outline object.

125.26.2 Methods

125.26.3 childAtIndex(index as Integer) as PDFOutlineMBS

Function: PDFOutline child at index.
Notes: Will throw exception if index is out of range.

125.26.4 Constructor

Function: Initializes a PDFOutline object.
Notes:
If you want the PDFOutline object returned by this method to be the outline root, you must add additional
PDFOutline objects to create the outline hierarchy you desire. Then, you must add the root outline object
to your PDF document by assigning it to the PDFDocument OutlineRoot.

If you want the PDFOutline object returned by this method to be a child of an existing outline, you must
use setLabel: to give it a label and give it either a destination or action using setDestination: or setAction:,
respectively. In addition, you must add this outline object to the existing PDFOutline object as a new child,
using insertChild.

Available in Mac OS X v10.4 and later.

125.26.5 document as PDFDocumentMBS

Function: The PDFDocument the outline is assoicated with.
125.26.6  index as Integer

Function: Returns the index of the outline.
Notes:
The index of the outline object is relative to its siblings and from the perspective of the parent of the outline object. The root outline object, and any outline object without a parent, has an index value of 0.

Available in Mac OS X v10.5 and later.

125.26.7  insertChild(child as PDFOutlineMBS, index as Integer)

Function: Inserts the specified outline object at the specified index.
Notes:
To build a PDF outline hierarchy, use this method to add child outline objects. Before you call this method on a PDFOutline object that already has a parent, you should retain the object and call removeFromParent on it first.

Available in Mac OS X v10.5 and later.

125.26.8  numberOfChildren as Integer

Function: Number of PDFOutline children this PDFOutline has.

125.26.9  parent as PDFOutlineMBS

Function: The parent outline object of the outline.
Notes:
Can be nil for the root object.
Available in Mac OS X v10.5 and later.
125.26.10  **removeFromParent**

**Function:** Removes the outline object from its parent (does nothing if outline object is the root outline object).

**Notes:** Available in Mac OS X v10.5 and later.

125.26.11  **Properties**

125.26.12  **action as PDFActionMBS**

**Function:** The action performed when users click the outline.

**Notes:**

The root outline serves only as a container for the outlines it owns; it does not have an action. Note that a PDFOutline object can have either an action or a destination, not both.

If the PDFOutline object has a destination, instead of an action, action returns a PDFActionGoTo object (this is equivalent to calling destination on the PDFOutline object). For other action types, action returns the appropriate PDF Kit action type object, such as PDFActionURL.

Available in Mac OS X v10.5 and later.

(Read and Write computed property)

125.26.13  **destination as PDFDestinationMBS**

**Function:** The destination associated with the outline item.

**Notes:**

The root PDFOutline has no destination.

(Read and Write computed property)

125.26.14  **isOpen as boolean**

**Function:** Whether the outline object is initially disclosed.

**Notes:**

Calling isOpen on an outline object that has no children always returns false. Calling isOpen on the root
outline object always returns true.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)

125.26.15 label as string

Function: The label for the outline.
Notes:
The root PDFOutline has no label and is only a container for children PDFOutlines.
(Read and Write computed property)
125.27 class PDFPageMBS

125.27.1 class PDFPageMBS

**Function:** The PDFKit class for a page in a pdf document.

**Example:**

```vbnet
dim file1, file2, file3, destfile as FolderItem
dim page1, page2, page3 as PDFPageMBS
dim doc1, doc2 as PDFDocumentMBS
dim img as NSImageMBS
dim doc as PDFDocumentMBS

file1 = SpecialFolder.Desktop.Child("test1.pdf")
file2 = SpecialFolder.Desktop.Child("test2.pdf")
file3 = SpecialFolder.Desktop.Child("logo.jpg")

doc1 = new PDFDocumentMBS(file1)
doc2 = new PDFDocumentMBS(file2)

MsgBox str(doc1.pageCount)

img = new NSImageMBS(file3)

Backdrop = img.CopyPicture

page1 = new PDFPageMBS(img)
page2 = doc1.pageAtIndex(0)
page3 = doc2.pageAtIndex(0)

doc = new PDFDocumentMBS

doc.insertPage page1, 0
doc.insertPage page2, 1
doc.insertPage page3, 2

destfile = SpecialFolder.Desktop.Child("test.pdf")
call doc.write(destfile)
```
125.27.2 Methods

125.27.3 `addAnnotation(annotation as PDFAnnotationMBS)`

Function: Methods allowing annotations to be added.

125.27.4 `annotationAtPoint(x as single, y as single) as PDFAnnotationMBS`

Function: Hit-testing method returns the annotation at point (or nil if none).
Notes: The point is in page-space.

125.27.5 `annotations as PDFAnnotationMBS()`

Function: Returns an array containing the page’s annotations.
Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim doc as new PDFDocumentMBS(f)
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim annotations(-1) as PDFAnnotationMBS = page.annotations

// show a msgbox with the types of all annotations
dim types(-1) as string
for each a as PDFAnnotationMBS in annotations
    types.Append a.type
next
MsgBox Join(types)
```

Notes:
The elements of the array will most likely be typed to subclasses of the PDFAnnotation class.

Available in Mac OS X v10.4 and later.
125.27.6 CalcTransformForBox(box as Integer) as Variant

Function: An utility function to calculate the transform needed to draw into a page.
Notes: Returns NSAffineTransformMBS object.

125.27.7 CGPDFPageHandle as Integer

Function: The CoreGraphics PDFPage handle.

125.27.8 characterBoundsAtIndex(index as Integer) as NSRectMBS

Function: Returns the bounds in page-space of the character at index.
Notes: In the unlikely event that more than one character are at the specified point, only the first character encountered is returned.

125.27.9 characterIndexAtPoint(x as single, y as single) as Integer

Function: Returns the index of the character at point (in page space).
Notes: Returns -1 if no character at point.

125.27.10 Constructor

Function: The constructor to create a custom PDF page.
Example:

```vba
Dim doc As New PDFDocumentMBS
Dim page As PDFPageMBS
Dim f As FolderItem

page = New MyPDFPageMBS

doc.Creator = "Realbasic"
doc.Title = "Test file"

doc.insertPage page, 0
```
125.27. CLASS PDFPAGEMBS

f=SpecialFolder.Desktop.Child("test.pdf")

if doc.write(f) then
f.launch
end if

Notes: You draw the content using drawRect event.
See also:

- 125.27.11 Constructor(image as NSImageMBS)

125.27.11 Constructor(image as NSImageMBS)

Function: Creates a PDFPage for the NSImage passed in.
Notes:
An easy way to create a PDFPage from an image to add to a PDFDocument.

Mac OS X 10.5 only.
See also:

- 125.27.10 Constructor

125.27.12 copy as PDFPageMBS

Function: Creates a copy of the page object.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim p as new PDFDocumentMBS(f)

// make a new PDF
dim c as new PDFDocumentMBS

// get first page
dim page as PDFPageMBS = p.pageAtIndex(0)

// add copy of page to new pdf
c.insertPage page.copy, 0

// c now has one page
125.27.13 Destructor

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

125.27.14 Draw(g as NSGraphicsMBS, box as Integer = 0)

Function: Draws PDF page into graphics environment.
Notes: Use kPDFDisplay*Box constants for box parameter.

125.27.15 drawWithBox(box as Integer)

Function: Draws the page within the specified box.
Notes: This method takes into account the page rotation and draws clipped to the specified box. If the page
is set to display annotations, this method also draws them. This method does not clear the background. To
clear the background before drawing, use NSRectFill with NSColor set (typically) to white.

125.27.16 removeAnnotation(annotation as PDFAnnotationMBS)

Function: Methods allowing annotations to be removed.

125.27.17 Render(dpi as Double = 72.0, box as Integer = 0, background as NSColorMBS = nil) as NSImageMBS

Function: Renders a PDF Page into an image.
Example:

dim f as FolderItem = GetFolderItem("Castles.pdf")
dim doc as new PDFDocumentMBS(f)
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim image as NSImageMBS = page.Render
Backdrop = image.CopyPicture

**Notes:**

dpi: The resolution you want to have on the image. Default 72.0. To get a scaled image with factor x, pass 72.0\*x.
box: The display box. Use one of the kPDFDisplayBox* constants.
background: optional NSColorMBS object to fill the background before drawing the PDF. This will affect only PDFs with transparent background.

Returns nil on any error.

Version 11.1pr8 adds code here to handle rotation better.
Due to bugs in Apples PDFKit you may see memory leaks with JPEG data from PDF pages (seen in macOS 10.12).

### 125.27.18 selectionForLineAtPoint(left as single, top as single) as PDFSelectionMBS

**Function:** Given a point in page-space, returns a selection representing a whole line at that point.

**Notes:** May return nil if no character (and by extension no line) under point.

### 125.27.19 selectionForRange(position as Integer, length as Integer) as PDFSelectionMBS

**Function:** Given a range, returns a selection representing text within that range.

**Example:**

```pascal
dim MyPDFView as PDFViewMBS // your view

dim doc as PDFDocumentMBS = MyPDFView.document
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim sel as PDFSelectionMBS = page.selectionForRange(0,5)
MyPDFView.currentSelection = sel
```

**Notes:** Will raise an exception if the range length is zero or if the range is outside the range of the characters on the page.
125.27.20 \textbf{selectionForRect(left as single, top as single, width as single, height as single) as PDFSelectionMBS}

\textbf{Function:} Given a rect in page-space, returns a selection representing enclosed text on page.

125.27.21 \textbf{selectionForWordAtPoint(left as single, top as single) as PDFSelectionMBS}

\textbf{Function:} Given a point in page-space, returns a selection representing a whole word at that point.
\textbf{Notes:} May return nil if no character (and by extension no word) under point.

125.27.22 \textbf{selectionFromPointToPoint(startleft as single, starttop as single, endleft as single, endtop as single) as PDFSelectionMBS}

\textbf{Function:} Returns a selection representing text between startPt and endPt.
\textbf{Notes:} Point are sorted first top to bottom, left to right.

125.27.23 \textbf{transformContextForBox(box as Integer)}

\textbf{Function:} Given a display box, will transform the current context to take into account the rotation of the page as well as the origin of the box with repect to the page’s base coordinates system.
\textbf{Notes:} This is a convenient method to call from within drawPage or from within the draw method a PDFAnnotation subclass.

Mac OS X 10.5 only.
125.27.24 Properties

125.27.25 attributedString as NSAttributedStringMBS

**Function:** String (with linefeeds and in some cases spaces inserted) representing the text on the page.
**Notes:** (Read only property)

125.27.26 dataRepresentation as memoryblock

**Function:** Returns PDF data (a proper PDF document) consisting of a single page (this page).
**Notes:**
Note, external page links are not preserved.
(Read only property)

125.27.27 displaysAnnotations as boolean

**Function:** Method to turn on or off the display of annotations when the page is drawn.
**Notes:** (Read and Write property)

125.27.28 document as PDFDocumentMBS

**Function:** The PDFDocument the page is associated with.
**Notes:** (Read only property)

125.27.29 label as string

**Function:** The page label. Usually "1" for the first page, "2" for the second, etc.
**Notes:** (Read only property)
125.27.30  numberOfCharacters as Integer

Function: Number of characters on the page (including linefeeds and spaces inserted).
Notes: (Read only property)

125.27.31  rotation as Integer

Function: Rotation on a page.
Notes:
Must be 0, 90, 180 or 270 (negative rotations will be "normalized" to one of 0, 90, 180 or 270).
Some PDF's have an inherent rotation and so rotation may be non-zero when a PDF is first opened.
(Read and Write property)

125.27.32  stringValue as string

Function: String (with linefeeds and in some cases spaces inserted) representing the text on the page.
Example:

```vba
Dim p As PDFDocumentMBS
Dim f As FolderItem

f = SpecialFolder.Desktop.Child("test.pdf")
p = new PDFDocumentMBS(f)

MsgBox "Text from first page:" + EndOfLine + EndOfLine + p.pageAtIndex(0).stringValue
```

Notes:
If you need to extract the text of a PDF document page cross platform or with more options, you may want to look on the DynaPDF plugin.

It seems like this string value is not always available. It works for PDF Documents created from a disc file, but not for files our test app created on runtime in memory by using PDFDocument constructor and insertpage.
(Read only property)
125.27. **CLASS PDFPAGEMBS**

125.27.33 **boundsForBox**(box as Integer) as NSRectMBS

**Function:** Returns the bounds for the specified PDF display box.

**Notes:**

The PDFDisplayBox enumeration defines the various box types.

Note that only the media box is required for a PDF. If you request the bounds for the crop box, but the PDF does not include a crop box, the bounds for the media box are returned instead. If you request the bounds for other box types, and the PDF does not includes these types, the bounds for the crop box are returned instead.

The coordinates for the box are in page space, so you might need to transform the points if the page has a rotation on it. Also, note that the bounds boundsForBox returns are intersected with the page's media box.

boundsForBox throws a range exception if box is not in range.

(Read and Write computed property)

125.27.34 **Events**

125.27.35 **drawRect**(box as Integer, g as NSGraphicsMBS)

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** The event called when the PDFPage needs to be drawn.

**Example:**

```vcl
Sub drawRect(box as Integer, g as NSGraphicsMBS)
    if g.Valid then
        System.DebugLog "is valid"
    else
        System.DebugLog "not valid"
    end if

g.SetColorRGB 0,1,0

g.drawRect 200,200,200,200

g.SetColorRGB 1,0,0

g.fillRect 100,100,100,100
End Sub
```
Notes:
Do not store the graphics reference as it is only valid in this event.
Use the kPDFDisplayBox* constants for the box value.
You can draw another PDF page here with Draw command.

125.27.36  Constants

125.27.37  kPDFDisplayBoxArtBox=4

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants to use for page boxes.

125.27.38  kPDFDisplayBoxBleedBox=2

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants to use for page boxes.

125.27.39  kPDFDisplayBoxCropBox=1

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants to use for page boxes.

125.27.40  kPDFDisplayBoxMediaBox=0

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants to use for page boxes.

125.27.41  kPDFDisplayBoxTrimBox=3

MBS MacControls Plugin, Plugin Version: 8.0. **Function:** One of the constants to use for page boxes.
125.28.  CLASS PDFSELECTIONMBS

125.28  class PDFSelectionMBS

125.28.1  class PDFSelectionMBS

Function: The PDFKit class for selections.
Example:

dim MyPDFView as PDFViewMBS // your view

dim doc as PDFDocumentMBS = MyPDFView.document
dim page as PDFPageMBS = doc.pageAtIndex(0)
dim sel as PDFSelectionMBS = page.selectionForRange(0,5)
MyPDFView.currentSelection = sel

125.28.2  Methods

125.28.3  addSelection(selection as PDFSelectionMBS)

Function: Add a selection to this selection.
Notes: Selections do not have to be contiguous. If the selection added overlaps with this selection, overlaps
are removed.

125.28.4  addSelections(selection() as PDFSelectionMBS)

Function: Adds the specified array of selections to the receiving selection.
Notes:
This method provides better performance than multiple calls to addSelection if you need to add several
selections to an existing selection. This is because the normalization of the selection (the removal of any
overlaps between selections) occurs only once, after all selections have been added.
Available in Mac OS X v10.5 and later.

125.28.5  attributedString as NSAttributedStringMBS

Function: String representing the text covered by the selection.
Notes: May contain line-feeds.
125.28.6 boundsForPage(page as PDFPageMBS) as NSRectMBS

Function: Returns the bounds of the selection on the specified page.
Notes:
The selection rectangle is given in page space.
Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.

125.28.7 Constructor(doc as PDFDocumentMBS)

Function: Creates an empty PDFSelection object.
Notes:
Typically, you don’t need to create a PDFSelection object, but you can use an empty PDFSelection object
as a container into which you can place selections, using addSelection: and addSelections.
Available in Mac OS X v10.5 and later.

125.28.8 copy as PDFSelectionMBS

Function: Creates a copy of the selection object.

125.28.9 drawForPage(page as PDFPageMBS, active as boolean)

Function: Calls drawForPage with a default value for box parameter.
Notes: The default value is kPDFDisplayBoxCropBox. If active is true, drawing uses selectedTextBack-
groundColor. If false, it uses secondarySelectedControlColor.
See also:
- 125.28.10 drawForPage(page as PDFPageMBS, box as Integer, active as boolean)

125.28.10 drawForPage(page as PDFPageMBS, box as Integer, active as boolean)

Function: Draws the selection relative to the origin of the specified box in page space.
Notes:
The selection is drawn using the current highlight color. If active is true, drawing uses selectedTextBack-
groundColor. If false, it uses secondarySelectedControlColor. Refer to the PDFPage class for the list of
available box types.

Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. See also:

- 125.28.9 `drawForPage(page as PDFPageMBS, active as boolean)`

125.28.11 `extendSelectionAtEnd(chars as Integer)`

**Function:** Extends the selection at either end.

**Example:**

```javascript
dim s as PDFSelectionMBS // your selection

s.extendSelectionAtEnd(50)
```

**Notes:** Selections can be extended right off onto neighboring pages even to include the entire PDF document.

125.28.12 `extendSelectionAtStart(chars as Integer)`

**Function:** Extends the selection at either end.

**Example:**

```javascript
dim s as PDFSelectionMBS // your selection

s.extendSelectionAtStart(50)
```

**Notes:** Selections can be extended right off onto neighboring pages even to include the entire PDF document.

125.28.13 `numberOfTextRangesOnPage(page as PDFPageMBS) as UInt32`  

**Function:** Returns the number of contiguous ranges of text on the specified page.

**Notes:**

Returns zero if page is not in selection.
A typical, simple selection will contain a single range of text.
125.28.14  pages as PDFPageMBS()

Function: Array of pages covered by the selection.  
Notes: 
These are sorted by page index.  
Returns nil on any error.

125.28.15  rangeAtIndex(page as PDFPageMBS, index as Integer) as NSRangeMBS

Function: Returns a range of contiguous text at index on the specified page.  
Notes: 
A simple selection. A typical, simple selection will contain a single range of text.  
Available in Mac OS X 10.7 and later.

125.28.16  selectionsByLine as PDFSelectionMBS()

Function: Returns an array of selections, one for each line of text covered by the receiver.  
Notes: 
If you call this method on a PDFSelection object that represents a paragraph, for example, selectionsByLine returns an array that contains one PDFSelection object for each line of text in the paragraph.  
Available in Mac OS X v10.5 and later.

125.28.17  stringValue as string

Function: String representing the text covered by the selection.  
Notes: May contain line-feeds.
125.28. CLASS PDFSELECTIONMBS

125.28.18 Properties

125.28.19 Handle as Integer

Function: The handle used internally for the object reference.
Notes: (Read and Write property)

125.28.20 colorValue as NSColorMBS

Function: The color used to draw the selection.
Notes:
Note that when no color has been specified for the PDFSelection objects in a document, the selections are
drawn using NSColorMBS.selectedTextBackgroundColor for the active state and NSColorMBS.secondarySelectedControlColor for the inactive state.
(Read and Write computed property)
125.29 control PDFThumbnailViewControlMBS

125.29.1 control PDFThumbnailViewControlMBS

**Function:** The Xojo control for a PDFThumbnailView.
**Notes:**
This control embeds a special PDFThumbnailView subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

Does no longer work well with MacOS 10.12 or 10.13 as focus can’t be set.

125.29.2 Properties

125.29.3 View as PDFThumbnailViewMBS

**Function:** The view used in the control.
**Notes:**
Use this object to set more options on the control.
(Read only property)

125.29.4 Events

125.29.5 BoundsChanged

**Function:** The event called when the bounds, but not the frame, changed.

125.29.6 EnableMenuItems

**Function:** The event where you can enable menu items.
125.29.7 **FrameChanged**

**Function:** The event called when the frame changed.

125.29.8 **GotFocus**

**Function:** The control itself got focus.  
**Notes:** This only fires if the control itself got focus and not a sub control.

125.29.9 **LostFocus**

**Function:** The control lost focus.  
**Notes:** This only fires if the control itself lost focus and not a sub control.

125.29.10 **MenuAction(HitItem as MenuItem) As Boolean**

**Function:** Called when a menuitem is choosen.  
**Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

125.29.11 **MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean**

**Function:** The mouse button was pressed inside the controls region at the location passed in to x, y.  
**Notes:**  
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.  
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.  
- You will receive the MouseDrag and MouseUp events.
If you return False, the system handles the MouseDown so the above event handlers do not get called.

**125.29.12 MouseDrag(x as Integer, y as Integer)**

**Function:** This event fires continuously after the mouse button was pressed inside the Control.

**Notes:**
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

**125.29.13 MouseUp(x as Integer, y as Integer)**

**Function:** The mouse button was released.

**Notes:** Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

**125.29.14 ScaleFactorChanged(NewFactor as Double)**

**Function:** The backing store scale factor has changed.

**Notes:** Please invalidate any cached bitmaps or other relevant state.
125.30. class PDFThumbnailViewMBS

**Function:** A PDFThumbnailView object contains a set of thumbnails, each of which represents a page in a PDF document.

**Notes:**
You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

125.30.2 Methods

125.30.3 Constructor

**Function:** Creates a new PDF thumbnail view with size 100/100 and position 0/0

**Example:**
```
dim t as new PDFThumbnailViewMBS
```

**Notes:** On success the handle property is not zero.
See also:

- 125.30.4 Constructor(Handle as Integer)
- 125.30.5 Constructor(left as Double, top as Double, width as Double, height as Double)

125.30.4 Constructor(Handle as Integer)

**Function:** Creates an object based on the given PDFThumbnailView handle.

**Example:**
```
dim t as new PDFThumbnailViewMBS(0, 0, 100, 100)
dim v as new PDFThumbnailViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

**Notes:** The handle is casted to a PDFThumbnailView and the plugin retains this handle.
See also:
125.30.5 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new PDF thumbnail view with the given size and position.

**Example:**
```vba
dim x as new PDFThumbnailViewMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.

See also:

- 125.30.3 Constructor
- 125.30.4 Constructor(Handle as Integer)

125.30.6 selectedPages as PDFPageMBS()

**Function:** Returns an array of PDF pages that correspond to the selected thumbnails in the thumbnail view.

**Notes:**

If the thumbnail view allows multiple selections (if allowsMultipleSelection returns true), you can use this method to get the PDF pages that correspond to the selected thumbnails.

Available in Mac OS X v10.5 and later.

125.30.7 Properties

125.30.8 allowsDragging as boolean

**Function:** Whether users can drag thumbnails within the thumbnail view; that is, re-order pages in the document.

**Notes:**

Available in Mac OS X v10.5 and later.

(Read and Write property)
125.30.9  allowsMultipleSelection as boolean

**Function:** Whether the thumbnail view allows users to select more than one thumbnail at a time.  
**Notes:**  
By default, PDFThumbnailView allows only a single thumbnail to be selected at one time. When this is the case, you can get the PDF page that corresponds to the selected thumbnail using the PDFView method currentPage.

If you use setAllowsMultipleSelection to enable multiple selections, however, you must use selectedPages to get the pages that correspond to the set of selected thumbnails.  
Available in Mac OS X v10.5 and later.  
(Read and Write property)

125.30.10  backgroundColor as NSColorMBS

**Function:** The color used in the background of the thumbnail view.  
**Notes:**  
Available in Mac OS X v10.5 and later.  
(Read and Write property)

125.30.11  Bezeled as Boolean

**Function:** Whether to use bezel for control.  
**Notes:** (Read and Write property)

125.30.12  labelFont as NSFontMBS

**Function:** The font used to label the thumbnails.  
**Notes:**  
Typically, the label of a thumbnail is the page number of the page it represents.  
Available in Mac OS X v10.5 and later.  
(Read and Write property)
125.30.13 maximumNumberOfColumns as Integer

**Function:** Returns the maximum number of columns of thumbnails the thumbnail view can display.
**Notes:**
The thumbnail displays as many columns of thumbnails as fit in its size.
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.30.14 PDFView as PDFViewMBS

**Function:** The PDFView object associated with the thumbnail view.
**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)

125.30.15 thumbnailSize as NSSizeMBS

**Function:** The maximum width and height of the thumbnails in the thumbnail view.
**Notes:**
Available in Mac OS X v10.5 and later.
(Read and Write property)
125.31. CONTROL PDFVIEWCONTROLMBS

125.31  control PDFViewControlMBS

125.31.1  control PDFViewControlMBS

Function: The Xojo control for a PDFView.
Notes:
This control embeds a special PDFView subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

125.31.2  Methods

125.31.3  ClearOverlay(page as PDFPageMBS, post as boolean = true)

Function: Clear overlay item for this page.
Notes:
Is post = false, than we clear the item for pre page drawing, else for post page drawing.
The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.

125.31.4  ClearOverlays

Function: Clear all overlays.
Notes: The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.

125.31.5  Properties

125.31.6  View as PDFViewMBS

Function: The view used in the control.
Notes:
Use this object to set more options on the control.
(Read only property)
125.31.7 Overlay(page as PDFPageMBS, post as boolean = true) as variant

Function: Get/Set overlay item.
Notes:
MBS Plugin can draw a picture, NSImageMBS or PDFPageMBS below/over the PDF page.
The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.
(Read and Write computed property)

125.31.8 Events

125.31.9 AfterDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS)

Function: The draw event called after something was drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

125.31.10 AfterDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS)

Function: The draw event called after a page annotations were drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

125.31.11 AfterDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double)

Function: The draw event called after a page was drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

125.31.12 BeforeDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

Function: The draw event called before a page was drawn.
BeforeDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

Function: The draw event called before a page annotations were drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

BeforeDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double) as boolean

Function: The draw event called before a something was drawn.

BoundsChanged

Function: The event called when the bounds, but not the frame, changed.

EnableMenuItems

Function: The event where you can enable menu items.

FrameChanged

Function: The event called when the frame changed.
125.31.18  GotFocus

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

125.31.19  LostFocus

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

125.31.20  MenuAction(HitItem as MenuItem) As Boolean

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

125.31.21  MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes:
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

125.31.22  MouseDrag(x as Integer, y as Integer)

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

### 125.31.23 MouseUp(x as Integer, y as Integer)

**Function:** The mouse button was released.  
**Notes:** Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

### 125.31.24 ScaleFactorChanged(NewFactor as Double)

**Function:** The backing store scale factor has changed.  
**Notes:** Please invalidate any cached bitmaps or other relevant state.
125.32 class PDFViewMBS

125.32.1 class PDFViewMBS

**Function:** A PDFView object encapsulates the functionality of PDF Kit into a single widget that you can add to your application.

**Notes:**

PDFView may be the only class you need to deal with for adding PDF functionality to your application. It lets you display PDF data and allows users to select content, navigate through a document, set zoom level, and copy textual content to the Pasteboard. PDFView also keeps track of page history.

You can subclass PDFView to create a custom PDF viewer or better use our CustomPDFViewMBS class.

You can also create a custom PDF viewer by using the PDF Kit utility classes directly and not using PDFView at all.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

125.32.2 Methods

125.32.3 annotationsChangedOnPage(page as PDFPageMBS)

**Function:** Tells the PDF view that an annotation on the specified page has changed.

**Notes:**

When the PDFView object receives this message, it rescans for tool tips and pop-ups and informs the PDFThumbnailView objects so the thumbnail images can be redrawn. Available in Mac OS X v10.5 and later.

125.32.4 areaOfInterestForMouse(e as NSEventMBS) as Integer

**Function:** Returns the type of area the mouse cursor is over.

**Notes:** The PDFAreaOfInterest enumeration defines the various area types. This method is for custom subclasses of the PDFView class. Use it if you override the NSResponder class’s mouseMoved: method or related methods.
125.32.5 canGoBack as Boolean

**Function:** Returns a Boolean value indicating whether the user can navigate to the previous page in the page history.
**Notes:** The page history gets built as your application calls navigation methods such as goToDestination and goToLastPage.

125.32.6 canGoForward as Boolean

**Function:** Returns a Boolean value indicating whether the user can navigate to the next page in the page history.
**Notes:** The page history gets built as your application calls navigation methods such as goToDestination and goToLastPage.

125.32.7 canGoToFirstPage as Boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the user can navigate to the first page of the document.
**Notes:** The return value will be true unless the view is already displaying the first page.

125.32.8 canGoToLastPage as Boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the user can navigate to the last page of the document.
**Notes:** The return value will be true unless the view is already displaying the last page.

125.32.9 canGoToNextPage as Boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the user can navigate to the next page of the document.
**Notes:** The return value will be true unless the view is displaying the last page.

125.32.10 canGoToPreviousPage as Boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the user can navigate to the previous page of the
**125.32.11 canZoomIn as Boolean**

**Function:** Returns a Boolean value indicating whether the user can magnify the view that is, zoom in.

**125.32.12 canZoomOut as Boolean**

**Function:** Returns a Boolean value indicating whether the user can view an expanded area that is, zoom out.

**125.32.13 clearSelection**

**Function:** Clears the selection.
**Notes:** The view redraws as necessary but does not scroll. This call is equivalent to setting CurrentSelection=nil.

**125.32.14 Constructor**

**Function:** Creates a new PDF view with size 100/100 and position 0/0
**Example:**

```dim t as new PDFViewMBS```

**Notes:** On success the handle property is not zero.
See also:

- **125.32.15 Constructor(Handle as Integer)**
- **125.32.16 Constructor(left as Double, top as Double, width as Double, height as Double)**
**125.32. CLASS PDFVIEWMBS**

**125.32.15 Constructor(Handle as Integer)**

**Function:** Creates an object based on the given PDFView handle.

**Example:**

```vba
dim t as new PDFViewMBS(0, 0, 100, 100)
dim v as new PDFViewMBS(t.handle)
```

**Notes:** The handle is casted to a NSButton and the plugin retains this handle.

See also:

- 125.32.14 Constructor
- 125.32.16 Constructor(left as Double, top as Double, width as Double, height as Double)

**125.32.16 Constructor(left as Double, top as Double, width as Double, height as Double)**

**Function:** Creates a new PDF view with the given size and position.

**Example:**

```vba
dim x as new PDFViewMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.

See also:

- 125.32.14 Constructor
- 125.32.15 Constructor(Handle as Integer)

**125.32.17 convertPointFromPage(point as NSPointMBS, page as PDFPageMBS) as NSPointMBS**

**Function:** Converts a point from page space to view space.

**Notes:** Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. View space is a coordinate system with the origin at the lower-left corner of the current PDF view.
125.32.18  `convertPointToPage(point as NSPointMBS, page as PDFPageMBS) as NSPointMBS`

**Function:** Converts a point from view space to page space.
**Notes:** Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. View space is a coordinate system with the origin at the lower-left corner of the current PDF view.

125.32.19  `convertRectFromPage(rect as NSRectMBS, page as PDFPageMBS) as NSRectMBS`

**Function:** Converts a rectangle from page space to view space.
**Notes:** Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. View space is a coordinate system with the origin at the lower-left corner of the current PDF view.

125.32.20  `convertRectToPage(rect as NSRectMBS, page as PDFPageMBS) as NSRectMBS`

**Function:** Converts a rectangle from view space to page space.
**Notes:** Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. View space is a coordinate system with the origin at the lower-left corner of the current PDF view.

125.32.21  `copy`

**Function:** Copies the text in the selection, if any, to the Pasteboard.

125.32.22  `currentDestination as PDFDestinationMBS`

**Function:** Returns a PDFDestination object representing the current page and the current point in the view specified in page space.
**Notes:** Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.
125.32.23 currentPage as PDFPageMBS

**Function:** Returns the current page.
**Notes:** When there are two pages in the view in a two-up mode, “current page” is the left page. For continuous modes, returns the page crossing a horizontal line halfway between the view’s top and bottom bounds.

125.32.24 documentView as NSViewMBS

**Function:** Returns the innermost view used by PDFView or by your PDFView subclass.
**Notes:** The innermost view is the one displaying the visible document pages. This method is useful when converting coordinates from one view to another.

125.32.25 drawPage(page as PDFPageMBS)

**Function:** For use by subclasses of PDFView for custom rendering of pages.
**Notes:**
Do not invoke this method, except by invoking it on super from a subclass.

The PDFView class calls drawPage: as necessary for each visible page that requires rendering. In the PDFView class, this method erases page to white, calls page.drawInRect(pageRect,self.displayBox), and then draws the selection, if any.

You can override this method to draw on top of a PDF page or to control how pages are drawn. In these cases, invoke this method on super and then perform custom drawing on top of the PDF page.

125.32.26 drawPagePost(page as PDFPageMBS)

**Function:** For use by subclasses of PDFView for post-page rendering.
**Notes:**
The default implementation of this method draws the text highlighting (if any) for the page. This method does not apply scaling or rotating to the current context to map to page space; instead, the context is in view-space coordinates (in which the origin is at the lower-left corner of the current PDF view). Available in Mac OS X v10.5 and later.
125.32.27  goBack

**Function:** Navigates back one step in the page history.
**Notes:** The page history gets built as your application calls navigation methods such as goToDestination and goToLastPage.

125.32.28  goForward

**Function:** Navigates forward one step in the page history.
**Notes:** The page history gets built as your application calls navigation methods such as goToDestination and goToLastPage.

125.32.29  goToDestination(page as PDFDestinationMBS)

**Function:** Navigates to the specified destination.
**Notes:**
Destinations include a page and a point on the page specified in page space.
Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.

125.32.30  goToFirstPage

**Function:** Navigates to the first page of the document.
**Notes:** PDF Kit records the move in its page history.

125.32.31  goToLastPage

**Function:** Navigates to the last page of the document.
**Notes:** PDF Kit records the move in its page history.
125.32.32  goToNextPage

Function: Navigates to the next page of the document.
Notes: PDF Kit records the move in its page history.

125.32.33  goToPage(page as PDFPageMBS)

Function: Scrolls to the specified page.
Notes: PDF Kit records the move in its page history.

125.32.34  goToPreviousPage

Function: Navigates to the previous page of the document.
Notes: PDF Kit records the move in its page history.

125.32.35  goToRect(rect as NSRectMBS, page as PDFPageMBS)

Function: Navigates to the specified rectangle on the specified page.
Notes:
If the specified rectangle is already visible, this method does nothing. This allows you to scroll the PDFView object to a specific PDFAnnotation or PDFSelection object, because both of these objects have bounds methods that return an annotation or selection position in page space.

Note that rect is specified in page-space coordinates. Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.
Available in Mac OS X v10.5 and later.

125.32.36  goToSelection(page as PDFSelectionMBS)

Function: Scrolls to the first character of the specified selection.
Notes: PDF Kit records the move in its page history.
125.32.37  layoutDocumentView

**Function:** Performs layout of the inner views.
**Notes:**
The PDFView actually contains several subviews, such as the document view (where the PDF is actually
drawn) and a "matte view" (which may appear as a gray area around the PDF content, depending on the
scaling). Changes to the PDF content may require changes to these inner views, so you must call this
method explicitly if you use PDF Kit utility classes to add or remove a page, rotate a page, or perform other
operations affecting visible layout.

This method is called automatically from PDFView methods that affect the visible layout (such as setDoc-
ument, setDisplayBox or zoomIn).

125.32.38  pageForPoint(point as NSPointMBS, nearest as boolean) as PDF-
PageMBS

**Function:** Returns the page containing a point specified in view coordinates.
**Notes:** Returns nil if there’s no page at the specified point and nearest is set to false.

125.32.39  PDFViewAnnotationHitNotification as string

**Function:** One of the notification names used with the PDF view.
**Notes:**
Posted when the user clicks on an annotation.

Use the "PDFAnnotationHit" key to obtain userinfo of type PDFAnnotation.

125.32.40  PDFViewAnnotationWillHitNotification as string

**Function:** One of the notification names used with the PDF view.
**Notes:**
Posted before the user clicks an annotation.
Available in Mac OS X v10.5 and later.
125.32.41 PDFViewChangedHistoryNotification as string

Function: One of the notification names used with the PDF view.
Notes: Posted when the page history changes.

125.32.42 PDFViewCopyPermissionNotification as string

Function: One of the notification names used with the PDF view.
Notes: Posted when the user attempts to copy to the pasteboard without the appropriate permissions.

125.32.43 PDFViewDisplayBoxChangedNotification as string

Function: One of the notification names used with the PDF view.
Notes:
Posted when the display box has changed.
Available in Mac OS X v10.5 and later.

125.32.44 PDFViewDisplayModeChangedNotification as string

Function: One of the notification names used with the PDF view.
Notes:
Posted when the display mode has changed.
Available in Mac OS X v10.5 and later.

125.32.45 PDFViewDocumentChangedNotification as string

Function: One of the notification names used with the PDF view.
Notes: Posted when a new document is associated with the view.
125.32.46 PDFViewPageChangedNotification as string

Function: One of the notification names used with the PDF view.
Notes: Posted when a new page becomes the current page.

125.32.47 PDFViewPrintPermissionNotification as string

Function: One of the notification names used with the PDF view.
Notes: Posted when the user attempts to print without the appropriate permissions.

125.32.48 PDFViewScaleChangedNotification as string

Function: One of the notification names used with the PDF view.
Notes: Posted when the scale factor changes.

125.32.49 PDFViewSelectionChangedNotification as string

Function: One of the notification names used with the PDF view.
Notes: Posted when the current selection has changed.
Available in Mac OS X v10.5 and later.

125.32.50 performAction(action as PDFActionMBS)

Function: Performs the specified action.
Notes: Available in Mac OS X v10.5 and later.

125.32.51 rowSizeForPage(page as PDFPageMBS) as NSSizeMBS

Function: Returns the size needed to display a row of the current document page.
Notes: The size is dependent on the current scale factor and display attributes.

125.32.52 scrollSelectionToVisible

Function: Scrolls the view until the selection is visible.

125.32.53 selectAll

Function: Selects all text in the document.

125.32.54 setCurrentSelection(selection as PDFSelectionMBS, animate as boolean)

Function: Sets the selection, in an animated way, if desired.
Notes:
This method behaves as setCurrentSelection, but with the addition of animation, if animate is true. The animation serves to draw the user’s attention to the new selection, which can be useful when implementing search.
Available in Mac OS X v10.5 and later.

125.32.55 setCursorForAreaOfInterest(area as Integer)

Function: Sets the type of mouse cursor according to the type of area the mouse cursor is over.
Notes: This method is especially useful for custom subclasses of the PDFView class.

125.32.56 visiblePages as PDFPageMBS()

Function: Returns an array of PDFPageMBS objects that represent the currently visible pages.
Notes: Available in Mac OS X v10.5 and later.
125.32.57  **zoomIn**

**Function:** Zooms in by increasing the scaling factor.
**Notes:**
Each invocation of zoomIn multiplies the scaling factor by the square root of 2.
Available in Mac OS X v10.4 and later.

125.32.58  **zoomOut**

**Function:** Zooms out by decreasing the scaling factor.
**Notes:**
Each invocation of zoomOut divides the scaling factor by the square root of 2.
Available in Mac OS X v10.4 and later.

125.32.59  **Properties**

125.32.60  **allowsDragging** as Boolean

**Function:** Determines whether the view can accept new PDF documents dragged into it by the user.
**Notes:** (Read and Write computed property)

125.32.61  **autoScales** as Boolean

**Function:** A Boolean value indicating whether autoscaling is set.
**Notes:** (Read and Write computed property)

125.32.62  **backgroundColor** as NSColorMBS

**Function:** Returns the view’s background color.
**Notes:**
A view’s background is the area displayed to either side of a PDF document’s pages. The background also appears between pages when page breaks are enabled. The default color is a 50% gray.
125.32.63 currentSelection as PDFSelectionMBS

Function: Returns the current selection.
Example:

```vbs
dim MyPDFView as PDFViewMBS // your view

dim doc as PDFDocumentMBS = MyPDFView.document

dim page as PDFPageMBS = doc.pageAtIndex(0)

dim sel as PDFSelectionMBS = page.selectionForRange(0,5)

MyPDFView.currentSelection = sel
```

Notes:

Returns NULL if no selection exists.

Note that this method returns the actual instance of the current PDFSelectionMBS object. Therefore, if you want to modify it, you should make a copy of the returned selection and modify that, instead.

(Read and Write computed property)

125.32.64 displayBox as Integer

Function: The current style of display box.
Notes:

The available values for display boxes are defined in the Constants section in the PDFPageMBS class.
(Read and Write computed property)

125.32.65 displayMode as Integer

Function: The current display mode.
Notes:

Value can be kPDFDisplaySinglePage, kPDFDisplaySinglePageContinuous, kPDFDisplayTwoUp and kPDFDisplayTwoUpContinuous.
(Read and Write computed property)
125.32.66  displaysAsBook as Boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: A Boolean value indicating whether the view will display the first page as a book cover (meaningful only when the document is in two-up or two-up continuous display mode). **Notes**: (Read and Write computed property)

125.32.67  displaysPageBreaks as Boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: A Boolean value indicating whether the view is displaying page breaks. **Notes**: (Read and Write computed property)

125.32.68  document as PDFDocumentMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Returns the document associated with a PDFView object. **Notes**: (Read and Write computed property)

125.32.69  enableDataDetectors as Boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Whether data detection is enabled. **Notes**: If enabled, page text will be scanned for URL’s as the page becomes visible. Where // URL’s are found, Link annotations are created in place. These are temporary annotations and are not saved.

Requires Mac OS X 10.6. (Read and Write computed property)

125.32.70  greekingThreshold as Double

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: The greeking threshold to use for displaying text. **Notes**: 
The default threshold is 3.0.
(Read and Write computed property)

125.32.71 interpolationQuality as Integer

Function: The interpolation quality for images drawn into the PDFView context.
Notes: Available in Mac OS X 10.7 or later.
(Read and Write computed property)

125.32.72 scaleFactor as Double

Function: The scale factor for the view.
Notes: The default value is 1.0, corresponding to actual size.
(Read and Write computed property)

125.32.73 shouldAntiAlias as Boolean

Function: Whether to use anti-aliasing in the view.
Notes: (Read and Write computed property)

125.32.74 Constants

125.32.75 kPDFAnnotationArea=4

MBS MacControls Plugin, Plugin Version: 9.6. Function: One of the constants to apply mouse position over PDF view areas.
Notes: The mouse is over an annotation.
125.32.76 kPDFControlArea=16

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to apply mouse position over PDF view areas.  
**Notes:** The mouse is over a control.

125.32.77 kPDFDisplaySinglePage=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the PDF view display mode constants.  
**Notes:** The document displays one page at a time horizontally and vertically. Vertical and horizontal scrolling apply only to the current page.

125.32.78 kPDFDisplaySinglePageContinuous=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the PDF view display mode constants.  
**Notes:** The document displays in continuous mode vertically, with single-page width horizontally. Vertical scrolling applies to the entire document.

125.32.79 kPDFDisplayTwoUp=2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the PDF view display mode constants.  
**Notes:** The document displays two pages side-by-side. Vertical and horizontal scrolling apply only to the pair of displayed pages.

125.32.80 kPDFDisplayTwoUpContinuous=3

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the PDF view display mode constants.  
**Notes:** The document displays in continuous mode vertically and displays two pages side-by-side horizontally. Vertical scrolling applies to the entire document.

125.32.81 kPDFIconArea=64

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to apply mouse position over PDF view areas.  
**Notes:** The mouse is over an icon.  
Available in Mac OS X v10.5 and later.
125.32.82 kPDFInterpolationQualityHigh = 2

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the interpolation quality constants.  
**Notes:** high

125.32.83 kPDFInterpolationQualityLow = 1

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the interpolation quality constants.  
**Notes:** low

125.32.84 kPDFInterpolationQualityNone = 0

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the interpolation quality constants.

125.32.85 kPDFLinkArea=8

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to apply mouse position over PDF view areas.  
**Notes:** The mouse is over a link.

125.32.86 kPDFNoArea=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to apply mouse position over PDF view areas.  
**Notes:** The mouse is over an undefined area.

125.32.87 kPDFPageArea=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to apply mouse position over PDF view areas.  
**Notes:** The mouse is over a page.
125.32.88  kPDFPopupArea=128

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to apply mouse position over PDF view areas.  
**Notes:** The mouse is over a popup menu.

125.32.89  kPDFTextArea=2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to apply mouse position over PDF view areas.  
**Notes:** The mouse is over text.

125.32.90  kPDFTextFieldArea=32

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to apply mouse position over PDF view areas.  
**Notes:** The mouse is over a text field.
Chapter 126

Phidgets

126.1 class PhidgetAccelerometerMBS

126.1.1 class PhidgetAccelerometerMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The class for the phidget accelerometer. Notes: The PhidgetAccelerometer is a component that provides a high-level programmer interface to control a PhidgetAccelerometer device connected through a USB port. The product is available as a dual axis or a 3-axis module. With this component, the programmer can:

- Measure up to 5 Gravity (9.8 m/s²) change per axis, depending on unit purchased.
- Measures both dynamic acceleration (e.g., vibration) and static acceleration (e.g., gravity or tilt) on 2 or 3 axis.

Subclass of the PhidgetMBS class.

126.1.2 Methods

126.1.3 Constructor

126.1.4  getAcceleration(index as Integer) as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the last acceleration value received from the PhidgetAccelerometer for a particular axis.
**Notes:** Lasterror is set.

126.1.5  getAccelerationChangeTrigger(index as Integer) as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the amount of change that should exist between the last reported value and the current value before an OnAccelerationChange event is fired.
**Notes:** Lasterror is set.

126.1.6  getAccelerationMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum acceleration supported by an axis.
**Notes:** The Lasterror property is set.

126.1.7  getAccelerationMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum acceleration supported by an axis.
**Notes:** The Lasterror property is set.

126.1.8  getAxisCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of acceleration axes supported by this accelerometer.
**Notes:** The Lasterror property is set.

126.1.9  setAccelerationChangeTrigger(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Specifies the amount of change that should exist between the last reported value and the current value before an AccelerationChange event is fired.
**Notes:**
If the AccelerationChangeTrigger is set to 0, an event will be triggered for every measurement of acceleration taken.

LastError is set.

126.1.10 Events

126.1.11 AccelerationChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The event called for each change on the Acceleration.
**Notes:**
- **Index:** Index of the Accelerometer posting event
- **Value:** Value of the Accelerometer

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.2 class PhidgetAdvancedServoMBS

126.2.1 class PhidgetAdvancedServoMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class for a phidget advanced servo device.
**Notes:**
On the time the plugin was written the phidget documentation did not include this class so the documentation here is limited.
Subclass of the PhidgetMBS class.

126.2.2 Methods

126.2.3 Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.
**Notes:** On success the handle value is not zero.

126.2.4 getAcceleration(index as Integer) as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the acceleration for the given index.
**Notes:** The Lasterror property is set.

126.2.5 getAccelerationMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the maximum acceleration supported by a motor.
**Notes:** The Lasterror property is set.

126.2.6 getAccelerationMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the minimum acceleration supported by a motor.
**Notes:** The Lasterror property is set.
126.2.7  getCurrent(index as Integer) as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the current value.
**Notes:** The Lasterror property is set.

126.2.8  getEngaged(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the engaged state of a motor.
**Notes:**
This is whether the motor is powered or not.
The Lasterror property is set.

126.2.9  getMotorCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of motors supported by this controller.
**Notes:** The Lasterror property is set.

126.2.10 getPosition(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the current position of an encoder.
**Notes:** The Lasterror property is set.

126.2.11 getPositionMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the maximum position that a motor can go to.
**Notes:** The Lasterror property is set.

126.2.12 getPositionMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the minimum position that a motor can go to.
CHAPTER 126. PHIDGETS

Notes: The Lasterror property is set.

126.2.13 getServoType(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Gets the servo type of a motor.
Notes:
The Lasterror property is set.
For the value, check the PHIDGET_SERVO_* constants.

126.2.14 getSpeedRampingOn(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Gets the speed ramping state for a motor.
Notes:
This is whether or not velocity and acceleration are used.
The Lasterror property is set.

126.2.15 getStopped(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Gets the stopped state of a motor.
Notes:
This is true when the motor is not moving and there are no outstanding commands.
The Lasterror property is set.

126.2.16 getVelocity(index as Integer) as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns the current velocity.
Notes: The Lasterror property is set.

126.2.17 getVelocityLimit(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Gets the last set velocity limit for a motor.
126.2. CLASS PHIDGETADVANCEDSERVOMBS

Notes: The Lasterror property is set.

126.2.18 getVelocityMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Gets the maximum velocity that can be set for a motor. Notes: The Lasterror property is set.

126.2.19 getVelocityMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Gets the minimum velocity that can be set for a motor. Notes: The Lasterror property is set.

126.2.20 setAcceleration(index as Integer, value as Double)

126.2.21 setEngaged(index as Integer, value as boolean)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets the engaged state of a motor. This is whether the motor is powered or not. Notes: The Lasterror property is set.

126.2.22 setPosition(index as Integer, value as Double)

126.2.23 setPositionMax(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets the maximum position that a motor can go to.
CHAPTER 126. PHIDGETS

Notes: The Lasterror property is set.

126.2.24 setPositionMin(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets the minimum position that a motor can go to. Notes: The Lasterror property is set.

126.2.25 setServoParameters(index as Integer, min_us as Double, max_us as Double, degrees as Double, velocity_max as Double)

- `index`: The motor index.
- `min_us`: The minimum supported PCM in microseconds.
- `max_us`: The maximum supported PCM in microseconds.
- `degrees`: The degrees of rotation defined by the given PCM range.
- `velocity_max`: The maximum velocity in degrees/second.

126.2.26 setServoType(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets the servo type of a motor. Notes: The Lasterror property is set. For the value, check the PHIDGET_SERVO_* constants.

126.2.27 setSpeedRampingOn(index as Integer, value as boolean)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets the speed ramping state for a motor. Notes:
This is whether or not velocity and acceleration are used. The Lasterror property is set.

126.2.28 setVelocityLimit(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the velocity limit for a motor. 
**Notes:** The Lasterror property is set.

126.2.29 Events

126.2.30 CurrentChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The current value changed. 
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. 
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.2.31 PositionChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The position changed. 
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. 
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.2.32 VelocityChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The velocity changed. 
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.2.33 Constants

126.2.34 PHIDGET_SERVO_DEFAULT = 1

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.

126.2.35 PHIDGET_SERVO_FIRGELLI_L12_100_100_06_R = 17

MBS USB Plugin, Plugin Version: 12.1. **Function:** One of the servo type constants.

126.2.36 PHIDGET_SERVO_FIRGELLI_L12_100_50_06_R = 16

MBS USB Plugin, Plugin Version: 12.1. **Function:** One of the servo type constants.

126.2.37 PHIDGET_SERVO_FIRGELLI_L12_30_50_06_R = 13

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.

126.2.38 PHIDGET_SERVO_FIRGELLI_L12_50_100_06_R = 14

MBS USB Plugin, Plugin Version: 12.1. **Function:** One of the servo type constants.

126.2.39 PHIDGET_SERVO_FIRGELLI_L12_50_210_06_R = 15

MBS USB Plugin, Plugin Version: 12.1. **Function:** One of the servo type constants.

126.2.40 PHIDGET_SERVO_HITEC_805BB = 5

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.
126.2.41 PHIDGET_SERVO_HITEC_815BB = 12

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.

126.2.42 PHIDGET_SERVO_HITEC_HS322HD = 3

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.

126.2.43 PHIDGET_SERVO_HITEC_HS422 = 6

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.

126.2.44 PHIDGET_SERVO_HITEC_HS485HB = 10

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.

126.2.45 PHIDGET_SERVO_HITEC_HS5245MG = 4

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.

126.2.46 PHIDGET_SERVO_HITEC_HS645MG = 11

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.

126.2.47 PHIDGET_SERVO_HITEC_HS785HB = 9

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.

126.2.48 PHIDGET_SERVO_HITEC_HSR1425CR = 8

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the servo type constants.
126.2.49  PHIDGET_SERVO_RAW_us_MODE = 2

MBS USB Plugin, Plugin Version: 11.0.  **Function:** One of the servo type constants.

126.2.50  PHIDGET_SERVO_SPRINGRC_SM_S2313M = 18

MBS USB Plugin, Plugin Version: 12.1.  **Function:** One of the servo type constants.

126.2.51  PHIDGET_SERVO_SPRINGRC_SM_S3317M = 19

MBS USB Plugin, Plugin Version: 13.4.  **Function:** One of the servo type constants.

126.2.52  PHIDGET_SERVO_SPRINGRC_SM_S3317SR = 20

MBS USB Plugin, Plugin Version: 13.4.  **Function:** One of the servo type constants.

126.2.53  PHIDGET_SERVO_TOWERPRO_MG90 = 7

MBS USB Plugin, Plugin Version: 11.0.  **Function:** One of the servo type constants.
126.3. CLASS PHIDGETANALOGMBS

126.3  class PhidgetAnalogMBS

126.3.1  class PhidgetAnalogMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Class specific to the Phidget Analog.
**Notes:**
See the product manual for more specific API details, supported functionality, units, etc.
Subclass of the PhidgetMBS class.

126.3.2  Methods

126.3.3  Constructor

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new analog device instance.
**Notes:** Lasterror is set.

126.3.4  getEnabled(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the enabled state for an output.
**Notes:** Lasterror is set.

126.3.5  getOutputCount as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of outputs supported by this phidget analog.
**Notes:** Lasterror is set.

126.3.6  getVoltage(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the currently set voltage for an output, in V.
**Notes:** Lasterror is set.
126.3.7 getVoltageMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum settable output voltage, in V.
**Notes:** Lasterror is set.

126.3.8 getVoltageMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum settable output voltage, in V.
**Notes:** Lasterror is set.

126.3.9 setEnabled(index as Integer, value as boolean)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the enabled state for an output.
**Notes:** Lasterror is set.

126.3.10 setVoltage(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the voltage of an output, in V.
**Notes:** Lasterror is set.
126.4  class PhidgetBridgeMBS

126.4.1  class PhidgetBridgeMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class specific to the Phidget Bridge.
**Notes:**
See the product manual for more specific API details, supported functionality, units, etc.
Subclass of the PhidgetMBS class.

126.4.2  Methods

126.4.3  Constructor

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new instance.
**Notes:** Lasterror is set.

126.4.4  getBridgeMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the maximum value supported by a bridge input, in mV/V. This is affected by Gain.
**Notes:** Lasterror is set.

126.4.5  getBridgeMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the minimum value supported by a bridge input, in mV/V. This is affected by Gain.
**Notes:** Lasterror is set.

126.4.6  getBridgeValue(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the current value of a bridge input, in mV/V.
**Notes:** Lasterror is set.
126.4.7 getDatosRate as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the the data rate for the Phidget Bridge, in milliseconds.
**Notes:** Lasterror is set.

126.4.8 getDataRateMax as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the the maximum data rate for the Phidget Bridge, in milliseconds.
**Notes:** Lasterror is set.

126.4.9 getDataRateMin as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the the minimum data rate for the Phidget Bridge, in milliseconds.
**Notes:** Lasterror is set.

126.4.10 getEnabled(index as Integer) as Boolean

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the enabled state for an input.
**Notes:** Lasterror is set.

126.4.11 getGain(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the the Gain for an input.
**Notes:** Lasterror is set.

126.4.12 getInputCount as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of inputs supported by this phidget bridge.
**Notes:** Lasterror is set.
126.4. CLASS PHIDGETBRIDGEMBS

126.4.13  **setDataRate(milliseconds as Integer)**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  **Function:**
Sets the the data rate for the Phidget Bridge, in milliseconds.
**Notes:** Lasterror is set.

126.4.14  **setEnabled(index as Integer, value as Boolean)**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  **Function:**
Sets the enabled state for an input.
**Notes:** Lasterror is set.

126.4.15  **setGain(index as Integer, value as Integer)**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  **Function:**
Sets the the Gain for an input.
**Notes:** Lasterror is set.

126.4.16  **Events**

126.4.17  **BridgeDataReceived(index as Integer, value as Double)**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.  **Function:**
The bridge data event handler.
**Notes:** This is called at a set rate as defined by data rate.

126.4.18  **Constants**

126.4.19  **PHIDGET_BRIDGE_GAIN_1 = 1**

MBS USB Plugin, Plugin Version: 11.1.  **Function:** One of the gain constants.
**Notes:** Gain of 1.

126.4.20  **PHIDGET_BRIDGE_GAIN_128 = 6**

MBS USB Plugin, Plugin Version: 11.1.  **Function:** One of the gain constants.
**Notes:** Gain of 128.
126.4.21 PHIDGET_BRIDGE_GAIN_16 = 3

MBS USB Plugin, Plugin Version: 11.1. Function: One of the gain constants.
Notes: Gain of 16.

126.4.22 PHIDGET_BRIDGE_GAIN_32 = 4

MBS USB Plugin, Plugin Version: 11.1. Function: One of the gain constants.
Notes: Gain of 32.

126.4.23 PHIDGET_BRIDGE_GAIN_64 = 5

MBS USB Plugin, Plugin Version: 11.1. Function: One of the gain constants.
Notes: Gain of 64.

126.4.24 PHIDGET_BRIDGE_GAIN_8 = 2

MBS USB Plugin, Plugin Version: 11.1. Function: One of the gain constants.
Notes: Gain of 8.

126.4.25 PHIDGET_BRIDGE_GAINUNKNOWN = 7

MBS USB Plugin, Plugin Version: 11.1. Function: One of the gain constants.
Notes: Unknown Gain.
126.5. **CLASS PHIDGETDICTIONARYMBS**

### 126.5.1 class PhidgetDictionaryMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The Phidget Dictionary is a service provided by the Phidget Web service.  
**Notes:**
The Webservice maintains a centralized dictionary of key-value pairs that can be accessed and changed from 
any number of clients through the CPhidgetDictionary interface available in phidget21.

Note that the Webservice uses this dictionary to control access to Phidgets through the openRemote and 
openRemoteIP interfaces, and as such, you should never add or modify a key that starts with /PSK/ or 
/PCK/, unless you want to explicitly modify Phidget specific data and this is highly discouraged, as it’s 
very easy to break things. Listening to these keys is fine if so desired.

The intended use for the dictionary is as a central repository for communication and persistent storage of 
data between several client applications. As an example - a higher level interface exposed by one application 
which controls the Phidgets, for others to access rather then every client talking directly to the Phidgets 
themselves.

The dictionary makes use of extended regular expressions for key matching. See the end of this document 
for the rules of regular expressions.

See the Phidget manuals for help on regular expressions.

### 126.5.2 Methods

#### 126.5.3 addKey(key as string, value as string, persistent as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Adds a new key to the Dictionary, or modifies the value of an existing key.  
**Notes:**
The key can only contain numbers, letters, /', .', -., and must begin with a letter, _' or '/'. 
The value can contain any value.
The persistent value controls whether a key will stay in the dictionary after the client that created it dis- 
connects. If persistent == 0, the key is removed when the connection closes. Otherwise the key remains in 
the dictionary until it is explicitly removed.

Lasterror is set.
126.5.4 Close

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Closes the file handles for this device.
**Notes:**
You should always call this when finished with a Dictionary. Lasterror is set.

126.5.5 Constructor

**See also:**
- 126.5.6 Constructor(pattern as string)

126.5.6 Constructor(pattern as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.
**Notes:**
The Lasterror property is set.
Pattern is a regular expression that matches the keys you want to listen for in the keychange event.
**See also:**
- 126.5.5 Constructor

126.5.7 GetDeviceStatus as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns an integer indicating the status of the device.
**Notes:**
Returns:
PHIDGET_ATTACHED 0x1
PHIDGET_NOTATTACHED 0x0
Lasterror is set.
126.5.8  
**getServerAddress(byref port as Integer) as string**

**Function:** Gets the address and port.  
**Notes:** The Lasterror property is set.

126.5.9  
**getServerID as string**

**Function:** Gets the server ID.  
**Notes:** The Lasterror property is set.

126.5.10  
**GetServerStatus as Integer**

**Function:** Returns an integer indicating the connection status of a Webservice.  
**Notes:**  
Returns one of the following values:  
1 CONNECTED  
0 NOTCONNECTED

Lasterror is set.

126.5.11  
**openRemote(serverID as string, password as string)**

**Function:** This method is not yet implemented and will return EPHIDGET_UNSUPPORTED.  
**Notes:** The Lasterror property is set.

126.5.12  
**openRemoteIP(addr as string, port as Integer, password as string)**

**Function:** Opens a connection to a remote Phidget Dictionary.  
**Notes:**  
OpenRemoteIP will block until it connects to the server, which means that when it returns with EPHIDGET_OK, this means that the connection is active. If the server is unavailable, this will return an error code.
If the connection to a webservice is disrupted while in use, an error event will be thrown, and it is recommended that an error event listener be registered for this reason.

LastError is set.

### 126.5.13 removeKey(pattern as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a key, or set of keys, from the Dictionary.

**Notes:**
The key name is a regular expressions pattern, and so care must be taken to only have it match the specific keys you want to remove.
LastError is set.

### 126.5.14 Properties

#### 126.5.15 Handle as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal used CPhidgetDictionaryHandle.

**Notes:** (Read and Write property)

#### 126.5.16 Lasterror as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last error code.

**Notes:** (Read and Write property)

### 126.5.17 Events

#### 126.5.18 Error(errorCode as Integer, errorDescription as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This error event is used for reporting asynchronous errors mostly related to opening remote Phidgets.

**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

### 126.5.19 KeyChanged(key as string, value as string, reason as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** These event will be called on key add, remove, and change.

**Notes:**
- The Lasterror property is set.
- It will also fire once to give an initial key value as soon as it is registered, if the key already exists.

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.

Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

**Reason values:**

- PHIDGET_DICTIONARY_VALUE_CHANGED 1
- PHIDGET_DICTIONARY_ENTRY_ADDED 2
- PHIDGET_DICTIONARY_ENTRY_REMOVING 3
- PHIDGET_DICTIONARY_CURRENT_VALUE 4

### 126.5.20 ServerConnect

MBS USB Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called when a connection to the sever has been made.

**Notes:**
- With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
- Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

### 126.5.21 ServerDisconnect

MBS USB Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called when a connection to the server has been lost.

**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.6. class PhidgetEncoderMBS

126.6.1. class PhidgetEncoderMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for the phidget encoder device.
**Notes:**
The PhidgetEncoder is a component that provides a high-level programmer interface to control a PhidgetEncoder device connected through a USB port.
With this component, the programmer can:

- Detect changes in position of incremental and absolute encoders.
- Easily track the changes with respect to time.

Subclass of the PhidgetMBS class.

126.6.2. Methods

126.6.3. Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.
**Notes:**
On success the handle value is not zero.
The Lasterror property is set.

126.6.4. getEnabled(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the enabled state of an encoder. This is whether the encoder is powered or not.
**Notes:** The Lasterror property is set.

126.6.5. getEncoderCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of encoder inputs supported by this board.
**Notes:** The Lasterror property is set.
126.6.6 `getIndexPosition(index as Integer) as Integer`

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries index position.  
**Notes:**  
Gets the position of the last index pulse, as referenced to `getPosition`.  
This will return EPHIDGET_UNKNOWN if there hasn’t been an index event, or if the encoder doesn’t support index.

The Lasterror property is set.

126.6.7 `getInputCount as Integer`

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of digital inputs supported by this board.  
**Notes:** The Lasterror property is set.

126.6.8 `getInputState(index as Integer) as boolean`

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the state of a digital input.  
**Notes:** The Lasterror property is set.

126.6.9 `getPosition(index as Integer) as Integer`

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the current position of an encoder.  
**Notes:** The Lasterror property is set.

126.6.10 `setEnabled(index as Integer, value as boolean)`

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the enabled state of an encoder. This is whether the encoder is powered or not.  
**Notes:** The Lasterror property is set.
126.6. CLASS PHIDGETENCODERMBS

126.6.11 setPosition(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the current position of an encoder.  
**Notes:** The Lasterror property is set.

126.6.12 Events

126.6.13 InputChanged(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event for a change in the input.  
**Notes:**  
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.  
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.6.14 PositionChanged(index as Integer, position as Integer, time as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called for every position change.  
**Notes:**  
Index: Index of the Encoder firing the Event  
Position: Position of the Encoder  
Time: Time of change  
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.  
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.7 class PhidgetFrequencyCounterMBS

126.7.1 class PhidgetFrequencyCounterMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Class specific to the Phidget Frequency Counter.

**Notes:**
See the product manual for more specific API details, supported functionality, units, etc.
Subclass of the PhidgetMBS class.

126.7.2 Methods

126.7.3 Constructor

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new instance.

**Notes:** Lasterror is set.

126.7.4 getEnabled(index as Integer) as Boolean

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the enabled state for an input.

**Notes:** Lasterror is set.

126.7.5 getFilter(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the filter type for an input.

**Notes:** Lasterror is set.

126.7.6 getFrequency(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the measured frequency of an input, in Hz.

**Notes:** Lasterror is set.
126.7.7  **getFrequencyInputCount as Integer**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of inputs supported by this phidget frequency counter.
**Notes:** Lasterror is set.

126.7.8  **getTimeout(index as Integer) as Integer**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the timeout value for an input, in microseconds. This controls the lowest measurable frequency.
**Notes:** Lasterror is set.

126.7.9  **getTotalCount(index as Integer) as Int64**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the total number of ticks that have happened since the last reset on this input.
**Notes:** Lasterror is set.

126.7.10  **getTotalTime(index as Integer) as Int64**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the total time that has passed since the last reset on this input, in microseconds.
**Notes:** Lasterror is set.

126.7.11  **reset(index as Integer)**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Resets total count and total time for an input.
**Notes:** Lasterror is set.

126.7.12  **setEnabled(index as Integer, value as Boolean)**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the enabled state for an input.
**Notes:** Lasterror is set.
126.7.13  \texttt{setFilter(index as Integer, filter as Integer)}

\textbf{Notes:} Lasterror is set.

126.7.14  \texttt{setTimeout(index as Integer, filter as Integer)}

\textbf{Notes:} Lasterror is set.

126.7.15  Events

126.7.16  \texttt{Counted(index as Integer, time as Integer, counts as Integer)}

MBS USB Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. \textbf{Function:} This event is called when ticks have been counted on an input, or when the timeout has passed.

126.7.17  Constants

126.7.18  \texttt{PHIDGET\_FREQUENCYCOUNTER\_FILTERTYPE\_LOGIC\_LEVEL}  
\hspace{1cm} = 2

MBS USB Plugin, Plugin Version: 11.1. \textbf{Function:} One of the Filter Type Constants. 
\textbf{Notes:} Logic level signal filter.

126.7.19  \texttt{PHIDGET\_FREQUENCYCOUNTER\_FILTERTYPE\_UNKNOWN}  
\hspace{1cm} = 3

MBS USB Plugin, Plugin Version: 11.1. \textbf{Function:} One of the Filter Type Constants. 
\textbf{Notes:} Filter type unknown.
126.7.20 PHIDGET_FREQUENCYCOUNTER_FILTERTYPE_ZERO_CROSSING = 1

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the Filter Type Constants.  
**Notes:** Zero crossing signal filter.
126.8  class PhidgetGPGGAMBS

126.8.1  class PhidgetGPGGAMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a NMEA GGA Sentence.

126.8.2  Properties

126.8.3  altitude as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The altitude value.  
**Notes:** (Read only property)

126.8.4  fixQuality as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The fix Quality.  
**Notes:** (Read and Write property)

126.8.5  heightOfGeoid as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height of GEO ID.  
**Notes:** (Read only property)

126.8.6  horizontalDilution as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The horizontal dilution.  
**Notes:** (Read only property)

126.8.7  latitude as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The latitude value.
126.8. CLASS PHIDGETGPPIAMBS

Notes: (Read only property)

126.8.8  longitude as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The longitude value. Notes: (Read only property)

126.8.9  numSatellites as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The number of satellites. Notes: (Read and Write property)

126.8.10  time as PhidgetGPSTimeMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The time value. Notes: (Read and Write property)
126.9 class PhidgetGPGSAMBS

126.9.1 class PhidgetGPGSAMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The NMEA GSA Sentence class.

126.9.2 Methods

126.9.3 satUsed(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** IDs of used sats in no real order, 0 means nothing.

126.9.4 Properties

126.9.5 fixType as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The fix type.
**Notes:** (Read and Write property)

126.9.6 horizDilution as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Horizontal dilution.
**Notes:** (Read only property)

126.9.7 mode as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The mode.
**Notes:** (Read and Write property)
126.9. **CLASS PHIDGETGPGSAMBS**

### 126.9.8 posnDilution as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Position dilution.  
**Notes:** (Read only property)

### 126.9.9 vertDilution as Double

**Notes:** (Read only property)

### 126.9.10 Constants

#### 126.9.11 kFixType2D = 2

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the Fix Type values.  
**Notes:** 2D

#### 126.9.12 kFixType3D = 3

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the Fix Type values.  
**Notes:** 3D

#### 126.9.13 kFixTypeNo = 1

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the Fix Type values.  
**Notes:** no fix.

#### 126.9.14 kModeAuto = 65

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the mode constants.  
**Notes:** Auto
MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the mode constants.

**Notes:** Forced
126.10  class PhidgetGPGSVMBS

126.10.1  class PhidgetGPGSVMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The NMEA GSV Sentence class.

126.10.2  Methods

126.10.3  satInfo(index as Integer) as PhidgetGPSSatInfoMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Query the satellite information with the given index. **Notes:** Index from 0 to 11.

126.10.4  Properties

126.10.5  satsInView as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of satellites in view. **Notes:** (Read and Write property)
CHAPTER 126. PHIDGETS

126.11 class PhidgetGPRMCMBS

126.11.1 class PhidgetGPRMCMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for NMEA RMC Sentence

126.11.2 Properties

126.11.3 date as PhidgetGPSDateMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The date value.
**Notes:** (Read and Write property)

126.11.4 heading as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The heading value.
**Notes:** (Read only property)

126.11.5 latitude as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The latitude value.
**Notes:** (Read only property)

126.11.6 longitude as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The longitude value.
**Notes:** (Read only property)

126.11.7 magneticVariation as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The magnetic variation.
126.11. CLASS PHIDGETGPRMCMBST

Notes: (Read only property)

126.11.8 mode as Integer

Notes: (Read and Write property)

126.11.9 speedKnots as Double

Notes: (Read only property)

126.11.10 status as Integer

Notes: (Read and Write property)

126.11.11 time as PhidgetGPSTimeMBS

Notes: (Read and Write property)
126.12 class PhidgetGPSDateMBS

126.12.1 class PhidgetGPSDateMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GPS Date in UTC.

126.12.2 Properties

126.12.3 Day as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Day of the month (1-31).
**Notes:** (Read and Write property)

126.12.4 Month as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Month (1-12).
**Notes:** (Read and Write property)

126.12.5 Year as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Year.
**Notes:** (Read and Write property)
126.13 class PhidgetGPSMBS

126.13.1 class PhidgetGPSMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Class specific to the Phidget GPS.
**Notes:**
See the product manual for more specific API details, supported functionality, units, etc.
Subclass of the PhidgetMBS class.

126.13.2 Methods

126.13.3 Constructor

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates an GPS instance.
**Notes:** Lasterror is set.

126.13.4 getAltitude as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current altitude, in meters.
**Notes:** Lasterror is set.

126.13.5 getDate as PhidgetGPSDateMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current GPS date, in UTC
**Notes:** Lasterror is set.

126.13.6 getHeading as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current heading, in degrees.
**Notes:** Lasterror is set.
126.13.7 getLatitude as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current latitude.
**Notes:** Lasterror is set.

126.13.8 getLongitude as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current longitude.
**Notes:** Lasterror is set.

126.13.9 getNMEAData as PhidgetNMEADataMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets Raw NMEA Data.
**Notes:** Lasterror is set.

126.13.10 getPositionFixStatus as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the position fix status.
**Notes:** Lasterror is set.

126.13.11 getTime as PhidgetGPSTimeMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current GPS time, in UTC.
**Notes:** Lasterror is set.

126.13.12 getVelocity as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current velocity, in km/h.
**Notes:** Lasterror is set.
126.13.13 Events

126.13.14 PositionChanged(latitude as Double, longitude as Double, altitude as Double)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The position change event. **Notes:** Called when any of latitude, longitude, or altitude change.

126.13.15 PositionFixStatusChanged(status as Integer)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The position fix status change event. **Notes:** Called when a position fix is acquired or lost.
126.14 class PhidgetGPSSatInfoMBS

126.14.1 class PhidgetGPSSatInfoMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A class for Satellite info - used in GSV sentence.

126.14.2 Properties

126.14.3 Azimuth as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The azimuth value.
**Notes:** (Read and Write property)

126.14.4 Elevation as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The elevation value.
**Notes:** (Read and Write property)

126.14.5 ID as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The ID.
**Notes:** (Read and Write property)

126.14.6 SNR as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The serial number.
**Notes:** (Read and Write property)
126.15 class PhidgetGPSTimeMBS

126.15.1 class PhidgetGPSTimeMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GPS Time in UTC.

126.15.2 Properties

126.15.3 Hour as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The hour value.
**Notes:** (Read and Write property)

126.15.4 Millisecond as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Milliseconds value.
**Notes:** (Read and Write property)

126.15.5 Minute as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The minutes value.
**Notes:** (Read and Write property)

126.15.6 Second as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The seconds value.
**Notes:** (Read and Write property)
126.16 class PhidgetGPVTGMBS

126.16.1 class PhidgetGPVTGMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class for a NMEA VTG Sentence.

126.16.2 Properties

126.16.3 magneticHeading as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The magnetic heading.  
**Notes:** (Read only property)

126.16.4 mode as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The mode.  
**Notes:** (Read and Write property)

126.16.5 speed as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The speed in km/hour.  
**Notes:** (Read only property)

126.16.6 speedKnots as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The speed in knots.  
**Notes:** (Read only property)

126.16.7 trueHeading as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The true heading.
126.16. CLASS PHIDGETGPVTGMBS

Notes: (Read only property)
126.17 class PhidgetInterfaceKitMBS

126.17.1 class PhidgetInterfaceKitMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a phidget interface kit.
**Notes:**
The PhidgetInterfaceKit is a component that provides a high-level programmer interface to control a PhidgetInterfaceKit device connected through a USB port.
With this component, the programmer can:

- Turn particular outputs on and off.
- Get notified of changes of state of the inputs as events.
- Configure events to fire when the analog inputs change.

The PhidgetInterfaceKit devices provide a combination of:

- Digital outputs.
- Digital inputs.
- Analog inputs.

Subclass of the PhidgetMBS class.

126.17.2 Methods

126.17.3 Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.
**Notes:**
On success the handle value is not zero.
The Lasterror property is set.

126.17.4 getDataRate(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the Data Rate for an analog input in milliseconds.
**Notes:**
The Lasterror property is set.

This is the event rate. Since we’re not going to run an extra thread, the accuracy of the data rate is limited by the interrupt endpoint data rate (>=8ms).

126.17.5 getDataRateMax(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum supported data rate for an analog input in milliseconds.
**Notes:** The Lasterror property is set.

126.17.6 getDataRateMin(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum supported data rate for an analog input in milliseconds.
**Notes:** The Lasterror property is set.

126.17.7 getInputCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of digital inputs supported by this board.
**Notes:** The Lasterror property is set.

126.17.8 getInputState(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the state of a digital input.
**Notes:** The Lasterror property is set.

126.17.9 getOutputCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of digital outputs supported by this board.
**Notes:** The Lasterror property is set.
126.17.10  **getOutputState(index as Integer) as boolean**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the state of a digital output.
**Notes:** The Lasterror property is set.

126.17.11  **getRatiometric as boolean**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the ratiometric state for this board.
**Notes:** The Lasterror property is set.

126.17.12  **getSensorChangeTrigger(index as Integer) as Integer**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the amount of change that should exist between the last reported value and the current value before
an OnSensorChange event is fired.
**Notes:**
To receive all events, set the SensorChangeTrigger to zero.
The Lasterror property is set.

126.17.13  **getSensorCount as Integer**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of sensor (analog) inputs supported by this board.
**Notes:** The Lasterror property is set.

126.17.14  **getSensorRawValue(index as Integer) as Integer**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the reported actual value of the sensor between 0 - 4095.
**Notes:**
This is directly proportional to the analog input, ranging from 0-5V (or 0-Vcc if Ratiometric is set to True).
Note that this value defaults to 65535 for an unitialised state. Applications that do not wish to encounter
this value should use ChangeTrigger event handlers as opposed to polling the device for new data.
The Lasterror property is set.
126.17.15  getSensorValue(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the last reported sensor value for the given index as a value from 0-1000
**Notes:**
Note that this value defaults to 65535 for an unitialised state. Applications that do not wish to encounter
this value should use ChangeTrigger event handlers as opposed to polling the device for new data.
The Lasterror property is set.

126.17.16  setDataRate(index as Integer, milliseconds as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the Data Rate for an analog input in milliseconds.
**Notes:** The Lasterror property is set.

126.17.17  setOutputState(index as Integer, value as boolean)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the state of a digital output.
**Notes:** The Lasterror property is set.

126.17.18  setRatiometric(value as boolean)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the ratiometric state for this board.
**Notes:** The Lasterror property is set.

126.17.19  setSensorChangeTrigger(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Specifies the amount of change that should exist between the last reported value and the current value before
an OnSensorChange event is fired.
**Notes:** Lasterror is set.
126.17.20  Events

126.17.21  InputChanged(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Called on any input change.

**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.17.22  OutputChanged(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the number of digital outputs on this particular Phidget device.

**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.17.23  SensorChanged(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Called on any sensor change.

**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.18. class PhidgetIRCodeInfoMBS

126.18.1. class PhidgetIRCodeInfoMBS

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a code info for the IR receiver/sender.
**Notes:**
The PhidgetIR CodeInfo structure contains all information needed to transmit a code, apart from the actual
code data.
Some values can be set to null to select defaults. See the product manual for more information.

126.18.2. Properties

126.18.3. bitCount as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Number of bits in the code.
**Notes:** (Read and Write property)

126.18.4. carrierFrequency as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Carrier frequency in Hz - defaults to 38kHz.
**Notes:** (Read and Write property)

126.18.5. dutyCycle as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Duty Cycle in percent (10-50).
**Notes:**
Defaults to 33.
(Read and Write property)

126.18.6. encoding as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Encoding used to encode the data.
**Notes:**
126.18.7  gap as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gap time in us.
**Notes:** (Read and Write property)

126.18.8  length as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The length of the code.
**Notes:**
Constant or Variable length encoding.
See PHIDGET_IR_LENGTH_* constants.
(Read and Write property)

126.18.9  minRepeat as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Minium number of times to repeat a code on transmit.
**Notes:** (Read and Write property)

126.18.10  trail as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Trail time in us - can be 0 for none.
**Notes:** (Read and Write property)

126.18.11  header(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The header value.
**Notes:**
Header pulse and space - can be 0 for none
Index from 0 to 1.
126.18.12 one(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The one array.
**Notes:**
Pulse and Space times to represent a '1' bit, in us
Index from 0 to 1.
(Read and Write computed property)

126.18.13 repeat(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A series or pulse and space times to represent the repeat code.
**Notes:**
Start and end with pulses and null terminate. Set to 0 for none.
Index from 0 to 25.
(Read and Write computed property)

126.18.14 toggleMask(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Bit toggles, which are applied to the code after each transmit.
**Notes:** (Read and Write computed property)

126.18.15 zero(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the arrays.
**Notes:**
Index from 0 to 1.
Pulse and Space times to represent a '0' bit, in us.
(Read and Write computed property)
126.18.16 Constants

126.18.17 PHIDGET_IR_ENCODING_BIPHASE = 4

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the encoding constants.  
**Notes:** Bi-Phase, or Manchester encoding.

126.18.18 PHIDGET_IR_ENCODING_PULSE = 3

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the encoding constants.  
**Notes:** Pulse encoding, or Pulse Width Modulation.

126.18.19 PHIDGET_IR_ENCODING_RC5 = 5

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the encoding constants.  
**Notes:** RC5 - a type of Bi-Phase encoding.

126.18.20 PHIDGET_IR_ENCODING_RC6 = 6

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the encoding constants.  
**Notes:** RC6 - a type of Bi-Phase encoding.

126.18.21 PHIDGET_IR_ENCODING_SPACE = 2

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the encoding constants.  
**Notes:** Space encoding, or Pulse Distance Modulation.

126.18.22 PHIDGET_IR_ENCODING_UNKNOWN = 1

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the encoding constants.  
**Notes:** Unknown - the default value.
126.18.23 PHIDGET_IR_LENGTH_CONSTANT = 2

MBS USB Plugin, Plugin Version: 11.0. **Function**: One of the length constants. **Notes**: Constant - the bitstream + gap length is constant.

126.18.24 PHIDGET_IR_LENGTH_UNKNOWN = 1

MBS USB Plugin, Plugin Version: 11.0. **Function**: One of the length constants. **Notes**: Unknown - the default value.

126.18.25 PHIDGET_IR_LENGTH_VARIABLE = 3

MBS USB Plugin, Plugin Version: 11.0. **Function**: One of the length constants. **Notes**: Variable - the bitstream has a variable length with a constant gap.
126.19 class PhidgetIRMBS

126.19.1 class PhidgetIRMBS

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for an IR receiver/sender.
**Notes:**
Calls specific to the Phidget IR. See the product manual for more specific API details, supported functionality, units, etc.
Subclass of the PhidgetMBS class.

126.19.2 Methods

126.19.3 Constructor

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.
**Notes:**
The Lasterror property is set.
On success the handle value is not zero.

126.19.4 getLastCode(byref bitCount as Integer) as MemoryBlock

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the last code that was received.
**Notes:**
The Lasterror property is set.

bitCount: set to the bit count of the code.

126.19.5 getLastLearnedCode(byref codeInfo as PhidgetIRCodeInfoMBS) as MemoryBlock

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the last code that was learned.
**Notes:** The Lasterror property is set.
126.19.6  getRawData as MemoryBlock

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Read any available raw data.  
**Notes:**  
This should be polled continuously (every 20ms) to avoid missing data. Read data always starts with a space and ends with a pulse.  
The Lasterror property is set.

126.19.7  Transmit(data as MemoryBlock, codeInfo as PhidgetIRCodeInfoMBS)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Transmits a code according to the settings in a CodeInto object.  
**Notes:**  
The Lasterror property is set.

data: The code to send. Data is transmitted MSBit first. MSByte is in array index 0. LSBit is right justified, so MSBit may be in bit positions 0-7 in array index 0 depending on the bit count.  
codeInfo: The CodeInfo structure specifying to to send the code. Anything left as null to select default is filled in for the user.

126.19.8  TransmitRaw(data as MemoryBlock, length as Integer, carrierFrequency as Integer, dutyCycle as Integer, gap as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Transmits RAW data as a series of pulses and spaces.  
**Notes:**  
The Lasterror property is set.

data: The data to send. The array (Int32) must start and end with a pulse and each element is a positive time in us.  
length: The length of the data array. Maximum length is 1024, but streams should be kept much shorter, i.e. <100ms between gaps.  
carrierFrequency: The Carrier Frequency in Hz. leave as 0 for default.  
dutyCycle: The Duty Cycle (10-50). Leave as 0 for default.  
gap: The gap time in us. This guarantees a gap time (no transmitting) after the data is sent, but can be set to 0.
126.19.9 TransmiteRepeat

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Transmits a repeat of the last transmitted code.  
**Notes:**  
The Lasterror property is set.  
Depending of the CodeInfo structure, this may be a retransmission of the code itself, or there may be a special repeat code.

126.19.10 Events

126.19.11 Code(data as memoryblock, bitcount as Integer, repeat as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A code was received.  
**Notes:**  
This is called when a code has been received that could be automatically decoded.  
Data is return as an array with MSB in index 0. Bit count and a repeat flag are also returned. (Int32 values)  
Repeats are detected as either the same code repeated in <100ms or as a special repeat code.

126.19.12 Learn(data as memoryblock, code as PhidgetIRCodeInfoMBS)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The learn event.  
**Notes:**  
This is called when a code has been received for long enough to be learned.  
The returned CodeInfo object can be used to retransmit the same code.

126.19.13 RawData(tag as memoryblock)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This is called when raw data has been read from the device.  
**Notes:**  
Raw data always starts with a space and ends with a pulse.  
tag contains 4 byte integer values.
126.20. **CLASS PHIDGETLEDMBS**

### 126.20 class PhidgetLED

#### 126.20.1 class PhidgetLED

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a phidget LED device.

**Notes:**
The PhidgetLED is a component that provides a high-level programmer interface to control a PhidgetLED device connected through a USB port.

With this component, the programmer can:

- Control each led individually, On/Off and Brightness.

Subclass of the PhidgetMBS class.

#### 126.20.2 Methods

#### 126.20.3 Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.

**Notes:**
The Lasterror property is set.
On success the handle value is not zero.

#### 126.20.4 **getCurrentLimit as Integer**

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the current limit.

**Notes:**
This is for all outputs.
Lasterror is set.
See the `PHIDGET_LED_CURRENT_LIMIT_*` constants.
126.20.5  getDiscreteLED(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the brightness of an individual LED.
**Notes:**
The Lasterror property is set.
Range of brightness is 0-100.

126.20.6  getLEDCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the number of LED positions available in this Phidget.
**Notes:**
The Lasterror property is set.
This property does not return the number of LEDs actually attached.

126.20.7  getVoltage as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Queries the voltage.
**Notes:**
Lasterror is set.
See the PHIDGET_LED_VOLTAGE_* constants.

126.20.8  setCurrentLimit(currentLimit as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the current limit.
**Notes:**
Lasterror is set.
See the PHIDGET_LED_CURRENT_LIMIT_* constants.

126.20.9  setDiscreteLED(index as Integer, Brightness as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the brightness of an individual LED.
**Notes:**
The Lasterror property is set.
Range of brightness is 0-100.

126.20.10  setVoltage(Voltage as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the current voltage.
**Notes:**
Lasterror is set.
See the PHIDGET_LED_VOLTAGE_* constants.

126.20.11  Constants

126.20.12  PHIDGET_LED_CURRENT_LIMIT_20mA = 1

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the limit constants.
**Notes:** 20mA

126.20.13  PHIDGET_LED_CURRENT_LIMIT_40mA = 2

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the limit constants.
**Notes:** 40mA

126.20.14  PHIDGET_LED_CURRENT_LIMIT_60mA = 3

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the limit constants.
**Notes:** 60mA

126.20.15  PHIDGET_LED_CURRENT_LIMIT_80mA = 4

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the limit constants.
**Notes:** 80mA
126.20.16  PHIDGET_LED_VOLTAGE_1_7V = 1

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the voltage constants.
**Notes:** 1.7V

126.20.17  PHIDGET_LED_VOLTAGE_2_75V = 2

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the voltage constants.
**Notes:** 2.75V

126.20.18  PHIDGET_LED_VOLTAGE_3_9V = 3

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the voltage constants.
**Notes:** 3.9V

126.20.19  PHIDGET_LED_VOLTAGE_5_0V = 4

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the voltage constants.
**Notes:** 5.0V
126.21. **CLASS PHIDGETMANAGERMBS**

126.21  class PhidgetManagerMBS

126.21.1  class PhidgetManagerMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Phidget manager is an interface that allows for monitoring of all phidgets connected to a system, without opening them.

126.21.2  Methods

126.21.3  Close

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Closes the file handles for this device. You should always call this when finished with a Manager.
**Notes:** Lasterror is set.

126.21.4  Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.
**Notes:**
The Lasterror property is set.
On success the handle value is not zero.

126.21.5  Device(index as Integer) as PhidgetMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The array of the attached devices.
**Notes:**
The Lasterror property is set.
You need to call getAttachedDevices before this property is valid.

126.21.6  getAttachedDevices

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies the list of attached devices into the Device and Count properties.
**Notes:** Lasterror is set.
126.21.7 GetDeviceStatus as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns an integer indicating the status of the device.
Notes:
Returns:
PHIDGET_ATTACHED 0x1
PHIDGET_NOTATTACHED 0x0

Lasterror is set.

126.21.8 getServerAddress(byref port as Integer) as string

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Gets the address and port.
Notes: The Lasterror property is set.

126.21.9 getServerID as string

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Gets the server ID.
Notes: The Lasterror property is set.

126.21.10 GetServerStatus as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns an integer indicating the connection status of a Webservice.
Notes:
Returns one of the following values:
1 CONNECTED
0 NOTCONNECTED

Lasterror is set.
126.21.11 Open

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens a connection to the local Phidget Manager.  
**Notes:** Lasterror is set.

126.21.12 openRemote(serverID as string, password as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This method is not yet implemented and will return EPHIDGET_UNSUPPORTED.  
**Notes:** Lasterror is set.

126.21.13 openRemoteIP(addr as string, port as Integer, password as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens a connection to a remote Phidget Manager.  
**Notes:**  
OpenRemoteIP will block until it connects to the server, which means that when it returns with EPHIDGET_OK, this means that the connection is active.  
If the server is unavailable, this will return an error code. If the connection to a webservice is disrupted while in use, an error event will be thrown.  
Lasterror is set.

Address is the address of the computer running the Phidget Webservice.  
This can be either an IP address or a hostname.  
Port specifies the port of the Webservice on the remote computer.  
Password specifies the password, which is required if authentication is active on the Webservice.  
If authentication is not active, this can be set to "".

126.21.14 Properties

126.21.15 Count as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of devices.  
**Notes:**
The Lasterror property is set. You need to call getAttachedDevices before this property is valid. (Read and Write property)

126.21.16 Handle as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal used CPhidgetManagerHandle.
**Notes:** (Read and Write property)

126.21.17 Lasterror as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last error code reported.
**Notes:** (Read and Write property)

126.21.18 Events

126.21.19 Attach(devicehandle as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when a device is attached.
**Notes:** With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.21.20 Detach(devicehandle as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when a device is detached.
**Notes:** With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.21.21 Error(errorCode as Integer, errorDescription as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is used for reporting asynchronous errors mostly related to opening remote Phidgets.
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.21.22 ServerConnect

MBS USB Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is called when a connection to the sever has been made.
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.21.23 ServerDisconnect

MBS USB Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is called when a connection to the server has been lost.
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.22 class PhidgetMBS

126.22.1 class PhidgetMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The base class of all Phidget device classes.
**Notes:**
Check phidgets.com for information on this devices.
http://www.phidgets.com/

126.22.2 Methods

126.22.3 Close

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Closes the file handles for this device.
**Notes:**
You can call this while reads and writes are still outstanding; they will fail quickly.
LastError is set.
The destructor does a close if you forget it.

126.22.4 disableLogging

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Disables logging on the library.
**Notes:** The Lasterror property is set.

126.22.5 enableLogging(level as Integer, outputFile as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Enables logging on the library.
**Notes:**
The Lasterror property is set.
Data is written to the file specified with the output file path.
Not sure how the path must be specified. This is depending on the library used.

The levels:
126.22. CLASS PHIDGETMBS

| PHIDGET_LOG_CRITICAL  | 1 |
| PHIDGET_LOG_ERROR     | 2 |
| PHIDGET_LOG_WARNING   | 3 |
| PHIDGET_LOG_DEBUG     | 4 |
| PHIDGET_LOG_INFO      | 5 |
| PHIDGET_LOG_VERBOSE   | 6 |

126.22.6 GetDeviceClass as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the class of a Phidget.
**Notes:** See the PHIDCLASS_* constants.

126.22.7 GetDeviceID as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the device ID of a Phidget.
**Notes:** See the PHIDID_* constants.

126.22.8 GetDeviceLabel as string

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the Label for the Phidget.
**Notes:**
The Label is a user programmable serial number stored on the Phidget - it can be used to implement a serial numbering scheme, or describe the functionality of the Phidget in a specific application.

Lasterror is set.

126.22.9 GetDeviceName as string

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns string describing the name of the Phidget.
**Notes:**
For example, "Phidget InterfaceKit 8/8/8", "Phidget InterfaceKit 0/0/4", etc.
The Lasterror property is set.
126.22.10 GetDeviceStatus as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns an integer indicating the status of the device.

**Notes:**
Returns:
PHIDGET_ATTACHED 0x1
PHIDGET_NOTATTACHED 0x0

Lasterror is set.

126.22.11 GetDeviceType as string

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns a string describing the type of the Phidget.

**Notes:**
All PhidgetInterfaceKits will return "PhidgetInterfaceKit", PhidgetRFID returns "PhidgetRFID" and so on.

Lasterror is set.

126.22.12 GetDeviceVersion as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns a string describing the Device Version of the Phidget.

**Notes:**
Lasterror is set.

126.22.13 GetErrorDescription(errorcode as Integer) as string

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns a string describing the ErrorCode passed.

**Notes:**
Lasterror is set.

The list of the error codes:

0 EPHIDGET_OK
1 EPHIDGET_NOTFOUND
126.22.  CLASS PHIDGETMBS

2 EPHIDGET_NOMEMORY
3 EPHIDGET_UNEXPECTED
4 EPHIDGET_INVALIDARG
5 EPHIDGET_NOTATTACHED
6 EPHIDGET_INTERRUPTED
7 EPHIDGET_INVALID
8 EPHIDGET_NETWORK
9 EPHIDGET_UNKNOWNVAL
10 EPHIDGET_BADPASSWORD
11 EPHIDGET_UNSUPPORTED
12 EPHIDGET_DUPLICATE
13 EPHIDGET_TIMEOUT
14 EPHIDGET_OUTOFBOUNDS
15 EPHIDGET_EVENT
16 EPHIDGET_NETWORK_NOTCONNECTED
17 EPHIDGET_WRONGDEVICE

126.22.14  GetLibraryVersion as string

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** returns a string providing the version number of the API library. **Notes:** Lasterror is set.

126.22.15  GetSerialNumber as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the unique serial number of this Phidget. **Notes:**

Lasterror is set.
This number is set during manufacturing, and is unique across all Phidgets.

126.22.16  GetServerAddress(byref port as Integer) as string

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the IP Address and Port of a remote Phidget device. **Notes:**

This should only be called on Phidgets that were opened with openRemote or openRemoteIP. Lasterror is set.
126.22.17 GetServerID as string

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the Server ID for a remote Phidget device.  
**Notes:**  
This method is not yet implemented and will return EPHIDGET_UNSUPPORTED.  
This should only be called on Phidgets that were opened with openRemote or openRemoteIP. The Lasterror property is set.

126.22.18 GetServerStatus as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns an integer indicating the connection status of a Webservice.  
**Notes:**  
Returns one of the following values:  
1 CONNECTED  
0 NOTCONNECTED  
Lasterror is set.

126.22.19 Open(serialNumber as Integer = -1)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a connection between an PhidgetMBS object and a physical Phidget.  
**Example:**

```vbnet
dim p as new PhidgetInterfaceKitMBS

p.open -1
p.waitForAttachment 0
// use the phidget
```

**Notes:**  
Open is pervasive. What this means is that you can call open on a device before it is plugged in, and keep the device opened across device dis- and re-connections.  
Open is Asynchronous. What this means is that open will return immediately - before the device being opened is actually available.  
What this means is that you need to either poll getDeviceStatus for an attached status, or handle the attach
event, in order to wait for the device to become available before trying to use it.

SerialNumber specifies the desired serial number, allowing the call to open a specific Phidget. Specifying -1 for the serial number will cause it to open the first available device. Lasterror is set.

126.22.20  OpenLabel(label as string = "")

MBS USB Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Opens a Phidget by label.

**Notes:**
Available with phidget library from December 2011.
Labels can be up to 10 characters (UTF-8 encoding). Specify "" to open any.
Lasterror is set.

126.22.21  openLabelRemote(label as string, serverID as string, password as string = "")

MBS USB Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Opens a Phidget remotely by ServerID. Note that this requires Bonjour (mDNS) to be running on both the host and the server.

**Notes:**
Available with phidget library from December 2011.
label: The label string. Labels can be up to 10 characters (UTF-8 encoding). Specify "" to open any.
serverID: Server ID. Specify "" to open any.
password: The Password. Can be "" if the server is running unsecured.
Lasterror is set.

126.22.22  openLabelRemoteIP(label as string, addr as string, port as Integer, password as string = "")

MBS USB Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Opens a Phidget remotely by address and port, with optional label.

**Notes:**
Available with phidget library from December 2011.
Lasterror is set.

label: Label string. Labels can be up to 10 characters (UTF-8 encoding). Specify "" to open any.
address: The Address. This can be a hostname or IP address.
port: The Port number. Default is 5001.
password: The Password. Can be NULL if the server is running unsecured.

126.22.23 openRemote(serial as Integer, serverID as string, password as string = "")

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This method is not yet implemented and will return EPHIDGET_UNSUPPORTED.
**Notes:** Lasterror is set.

126.22.24 openRemoteIP(serial as Integer, addr as string, port as Integer, password as string = "")

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Attempts to open a connection to a Phidget Webservice, and waits for a phidget on that connection.
**Notes:**
OpenRemoteIP will block until it connects to the server, which means that when it returns with EPHIDGET_OK, this means that the connection is active. If the server is unavailable, this will return an error code. If the connection to a webservice is disrupted while in use, an error event will be thrown, and it is recommended that an error event listener be registered for this reason.
As with the regular open, openRemoteIP is pervasive and asynchronous so long as the connection to the Webservice remains active.
SerialNumber specifies the desired serial number, allowing the call to open a specific Phidget. Specifying -1 for the serial number will cause it to open the first available device.
Address is the address of the computer running the Phidget Webservice. This can be either an IP address or a hostname.
Port specifies the port of the Webservice on the remote computer.
Password specifies the password, which is required if authentication is active on the Webservice. If authentication is not active, this can be set to "".
Lasterror is set.

126.22.25 PUNK_DBL as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The value used for unknown values (Double).
126.22. CLASS PHIDGETMBS

126.22.26  PUNK_FLT as single

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The value used for unknown values (Float).

126.22.27  SetDeviceLabel(label as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Writes a Label a string up to 10 characters long to the Phidget associated with this handle.
**Notes:**
SetDeviceLabel may not be available on all operating systems.
Currently it is available on MacOS X, Linux, and Windows CE.
Calling this on Windows will return EPHIDGET_UNSUPPORTED
Lasterror is set.

126.22.28  waitForAttachment(milliseconds as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Waits the given time till a device has been attached.
**Example:**
```pascal
dim p as new PhidgetInterfaceKitMBS
p.open -1
p.waitForAttachment 0
// use the phidget
```

**Notes:**
Lasterror is set to EPHIDGET_OK when the device is available, or to EPHIDGET_TIMEOUT if the device
is not attached before the timeout expires.
Timeouts below about 300ms cannot be trusted because of initialization time, and sometimes an even larger timeout is required ie. the first time a device is plugged into a windows machine.
A timeout of 0 is infinite.
This function can be used in conjunction with (or instead of) an attach event handler.
The Lasterror property is set.
126.22.29 Properties

126.22.30 Handle as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The internal used CPhidgetHandle. Notes: (Read and Write property)

126.22.31 Lasterror as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The last error code. Notes:

EPHIDGET_NOTFOUND 1 "A Phidget matching the type and or serial number could not be found." This indicates that a Phidget being searched for (ie. via Open) could not be located.
EPHIDGET_NOMEMORY 2 "Memory could not be allocated." This indicates that there is not enough memory for the Phidgets library to create the object requested.
EPHIDGET_UNEXPECTED 3 "Unexpected Error. Contact Phidgets Inc. for support." Indicates that a serious error has occurred, or a severe bug exists within the library.
EPHIDGET_INVALIDARG 4 "Invalid argument passed to function." An argument is not valid to the requirements of the function. In many cases this refers to an invalid Phidget Handle.
EPHIDGET_NOTATTACHED 5 "Phidget not physically attached." Indicates the function requires an attached Phidget to operate.
EPHIDGET_INTERRUPTED 6 "Read/Write operation was interrupted" An error occurred while attempting to communicate with the Phidget over USB.
EPHIDGET_INVALID 7 "The Error Code is not defined." Indicates that a serious error has occurred, or a severe bug exists within the library.
EPHIDGET_NETWORK 8 "Network Error." Attempting to communicate with the Phidget via the Network has failed.
EPHIDGET_UNKNOWNVAL 9 "Value is Unknown (State not yet received from device)." A query to a value on the Phidget device has failed as the Phidget has not returned data yet.
EPHIDGET_BADPASSWORD 10 "Authorization Failed." The remote access method has failed it’s authorization.
EPHIDGET_UNSUPPORTED 11 "Not Supported" This is a bad or unsupported function call.
EPHIDGET_DUPLICATE 12 "Duplicated request" A previous request to the device has already performed this function, and it is not valid to perform twice.
EPHIDGET_TIMEOUT 13 "Given timeout has been exceeded" A synchronous request has failed it’s time limits. Usually this is returned when attempting WaitForConnect.
EPHIDGET_OUTOFBOUNDS 14 "Index out of Bounds" An index into the function is above or below the recognized bounds of the device. ie. when accessing a single sensor on a multisensor device.
EPHIDGET_EVENT 15 "A non-null error code was returned from an event handler" An error code was passed to a function handler. Note that correct decoding of the actual error would have to be done within the event handler itself.
EPHIDGET_NETWORK_NOTCONNECTED 16 "A connection to the server does not exist." An attempt to connect to a remotely connected device or service failed due to network connectivity problems.
EPHIDGET_WRONGDEVICE 17 "Function is not applicable for this device." The wrong type of device handle was passed as an argument to a function. (ie. calling CPhidgetWeightSensor_getWeight with an Accelerometer handle)

(Read and Write property)
126.22.32  Events

126.22.33  Attach

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The event called when a device is attached.
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.22.34  Detach

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The event called when a device is detached.
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.22.35  Error(errorCode as Integer, errorDescription as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is used for reporting asynchronous errors - mostly related to opening remote Phidgets.
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.22.36  ServerConnect

MBS USB Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is used for opening Phidgets remotely, and is called when a connection to the sever has been made.
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

### 126.22.37 ServerDisconnect

**MBS USB Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.** **Function:** This event is used for opening Phidgets remotely, and is called when a connection to the server has been lost.

**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

### 126.22.38 Wakeup

**MBS USB Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.** **Function:** This event is called when the device wakes up.

### 126.22.39 WillSleep

**MBS USB Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.** **Function:** This event is called when the device will go to sleep.

### 126.22.40 Constants

#### 126.22.41 EPHIDGET_BADPASSWORD=10

**MBS USB Plugin, Plugin Version: 11.0.** **Function:** One of the error constants.
**Notes:** Authorization exception. "No longer used. Replaced by EEPHIDGET_BADPASSWORD"

#### 126.22.42 EPHIDGET_BADVERSION=19

**MBS USB Plugin, Plugin Version: 11.0.** **Function:** One of the error constants.
**Notes:** Version Mismatch. "No longer used. Replaced by EEPHIDGET_BADVERSION"
126.22.43  EPHIDGET_CLOSED=18

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the error constants.
**Notes:** Phidget Closed. "Phidget handle was closed."

126.22.44  EPHIDGET_DUPLICATE=12

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the error constants.
**Notes:** Duplicate request. "Duplicated request."

126.22.45  EPHIDGET_EVENT=15

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the error constants.
**Notes:** Event. "A non-null error code was returned from an event handler." This code is not currently used.

126.22.46  EPHIDGET_INTERRUPTED=6

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the error constants.
**Notes:** Interrupted. "Read/Write operation was interrupted." This code is not currently used.

126.22.47  EPHIDGET_INVALID=7

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the error constants.
**Notes:** Invalid error code. "The Error Code is not defined."

126.22.48  EPHIDGET_INVALIDARG=4

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the error constants.
**Notes:** Invalid argument. "Invalid argument passed to function."

126.23 class PhidgetMissingFunctionExceptionMBS

126.23.1 class PhidgetMissingFunctionExceptionMBS

MBS USB Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class used to report that a given phidget function was not loaded from the library.

**Notes:**
Check the message property.
Subclass of the RuntimeException class.
class PhidgetMotorControlMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for the phidget motor control device.

**Notes:**
The PhidgetMotorControl is a component that provides a high-level programmer interface to control a PhidgetMotorControl device connected through a USB port.

With this component, the programmer can:

- Control direction, and start and stop DC motors.
- Control the velocity and acceleration of each DC motor.
- Read the limit switch.

Subclass of the PhidgetMBS class.

**126.24.2 Methods**

**126.24.3 Constructor**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.

**Notes:**
On success the handle value is not zero.
Lasterror is set.

**126.24.4 getAcceleration(index as Integer) as Double**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the current acceleration.

**Notes:**
Note that this value defaults to 10 upon initialisation.
The Lasterror property is set.
126.24.5  getAccelerationMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum acceleration supported by a motor.
**Notes:** The Lasterror property is set.

126.24.6  getAccelerationMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum acceleration supported by a motor.
**Notes:** The Lasterror property is set.

126.24.7  getBackEMF(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the Back EMF voltage for a motor.
**Notes:** Lasterror is set.

126.24.8  getBackEMFSensingState(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
 Gets the Back EMF sensing state for a motor.
**Notes:** Lasterror is set.

126.24.9  getBraking(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the Braking value for a motor.
**Notes:**
Lasterror is set.
Returns the braking value, in percent.

126.24.10  getCurrent(index as Integer) as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
get the current motor current consumption.
**126.24.11  getEncoderCount as Integer**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the number of encoder inputs supported by this board.

**Notes:** Lasterror is set.

**126.24.12  getEncoderPosition(index as Integer) as Integer**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the position of an encoder. This position starts at 0 every time the phidget is opened.

**Notes:** Lasterror is set.

**126.24.13  getInputCount as Integer**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the number of digital inputs supported by this board.

**Notes:** The Lasterror property is set.

**126.24.14  getInputState(index as Integer) as boolean**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the state of a digital input.

**Notes:** The Lasterror property is set.

**126.24.15  getMotorCount as Integer**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the number of motors supported by this controller.

**Notes:** The Lasterror property is set.

**126.24.16  getRatiometric as Integer**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the ratiometric state.
126.24.17  getSensorCount as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of sensor inputs supported by this board.
**Notes:** Lasterror is set.

126.24.18  getSensorRawValue(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the raw value of a sensor (12-bit).
**Notes:** Lasterror is set.

126.24.19  getSensorValue(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the value of a sensor.
**Notes:** Lasterror is set.

126.24.20  getSupplyVoltage as Double

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the Supply voltage for the motors.
**Notes:**
This could be higher than the actual supply voltage.
Returns the supply voltage, in volts.
Lasterror is set.

126.24.21  getVelocity(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current velocity of a motor.
**Notes:** The Lasterror property is set.
126.24.22 setAcceleration(index as Integer, value as Double)

**Notes:**  
Valid values are 0-100.  
The Lasterror property is set.

126.24.23 setBackEMFSensingState(index as Integer, EMFState as Integer)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the Back EMF sensing state for a motor.  
**Notes:** Lasterror is set.

126.24.24 setBraking(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the Braking value for a motor.  
**Notes:**  
This is applied when velocity is 0. Default is 0%.  
value: The braking value, in percent.  
Lasterror is set.

126.24.25 setEncoderPosition(index as Integer, position as Integer)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the encoder position.  
**Notes:**  
This can be used to set the position to a known value, and should only be called when the encoder is not moving.  
Lasterror is set.

126.24.26 setRatiometric(value as Integer)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the ratiometric state.  
**Notes:**
This control the voltage reference used for sampling the analog sensors. Lasterror is set.

126.24.27  setVelocity(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the velocity of a motor. **Notes:** The Lasterror property is set.

126.24.28  Events

126.24.29  BackEMFUpdated(index as Integer, voltage as Double)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called at a constant rate; every 16ms, when back EMF sensing is enabled for that motor.

126.24.30  CurrentChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The current motor current consumption changed. **Notes:**

Index: Index of the Motor firing the Event
Value: Value of the Motor Current

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.24.31  CurrentUpdated(index as Integer, current as Double)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The current update event. **Notes:** This is called at a constant rate; every 8ms.
126.24.32  EncoderPositionChanged(index as Integer, time as Integer, positionChange as Integer)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: The encoder position change event. Notes: This is called when the encoder position changes.

126.24.33  EncoderPositionUpdated(index as Integer, positionChange as Integer)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: The encoder position update event. Notes: This is called at a constant rate; every 8ms, whether the encoder position has changed or not.

126.24.34  InputChanged(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: The input value changed. Notes:

Index: Index of the Input firing the Event
State: State of the Input

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.24.35  SensorUpdated(index as Integer, sensorValue as Integer)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: The sensor update event. Notes: This is called at a constant rate; every 8ms.

126.24.36  VelocityChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: This event is called when the velocity changes. Notes:
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.25 class PhidgetNMEADatambs

126.25.1 class PhidgetNMEADatambs

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** NMEA Data Structure. Contains a set of supported NMEA sentences.

126.25.2 Properties

126.25.3 GGA as PhidgetGPGGAMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GPS Fix and position data.  
**Notes:** (Read and Write property)

126.25.4 GSA as PhidgetGPGSAMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GPS DOP and active satellites.  
**Notes:** (Read and Write property)

126.25.5 GSV as PhidgetGPGSVMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Detailed satellite information.  
**Notes:** (Read and Write property)

126.25.6 RMC as PhidgetGPRMCBMBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Recommended minimum data.  
**Notes:** (Read and Write property)

126.25.7 VTG as PhidgetGPVTGMBBS

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Heading and Speed over the Ground.
Notes: (Read and Write property)
class PhidgetNotInitializedExceptionMBS

MBS USB Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The class used to report that a given phidget object was not initialized properly.

Notes:
Check the message property.
Subclass of the RuntimeException class.
126.27 class PhidgetPHSensorMBS

126.27.1 class PhidgetPHSensorMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a phidget PH sensor device.

**Notes:**
The PhidgetPHSensor is a component that provides a high-level programmer interface to control a PhidgetPHSensor device connected through a USB port.

With this component, the programmer can:

- Read the pH of a liquid with a pH sensor.

Subclass of the PhidgetMBS class.

126.27.2 Methods

126.27.3 Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.

**Notes:**
On success the handle value is not zero.
The Lasterror property is set.

126.27.4 getPH as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the current pH.

**Notes:**
The Lasterror property is set.
Valid range is -10 to 10.
Note that this value defaults to -20. Applications not wishing to encounter this value should use Change Handlers instead of polling the device for data.
126.27.5  getPHChangeTrigger as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the amount of change that should exist between the last reported value and the current value before an PHChange event is fired.
**Notes:** The Lasterror property is set.

126.27.6  getPHMax as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum PH that the sensor could report.
**Notes:** The Lasterror property is set.

126.27.7  getPHMin as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum PH that the sensor could report.
**Notes:** The Lasterror property is set.

126.27.8  getPotential as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the current potential in volts.
**Notes:**
The Lasterror property is set.
Range is 0-5v.
2.5v corresponds to a pH of 7.0.

126.27.9  getPotentialMax as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum potential that can be sensed.
**Notes:** The Lasterror property is set.
126.27.10  getPotentialMin as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum potential that can be sensed.
**Notes:** The Lasterror property is set.

126.27.11  setPHChangeTrigger(value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Specifies the amount of change that should exist between the last reported value and the current value before an OnPHChange event is fired.
**Notes:** The Lasterror property is set.

126.27.12  setTemperature(value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the ambient temperature of the PH sensor for increased accuracy.
**Notes:**
This value defaults to 20 degrees celsius which is applicable for most applications.
The Lasterror property is set.

126.27.13  Events

126.27.14  PHChanged(value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is called if the pH changes by more than the PH trigger.
**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.28 class PhidgetRFIDMBS

126.28.1 class PhidgetRFIDMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a phidget RFID device.

**Notes:**
The PhidgetRFID is a component that provides a high-level programmer interface to control a PhidgetRFID
device connected through a USB port.
With this component, the programmer can:

- Read Radio Frequency Identification tags.

Radio Frequency Identification or RFID, is a non-contact identification technology which uses a reader to
read data stored on low cost tags.

The particular instance of the technology we use stores a 40-bit number on the tag. Every tag that is pur-
chased from Phidgets Inc. is guaranteed unique.

When a RFID tag is read, the component returns the unique number contained in the RFID tag.
Subclass of the PhidgetMBS class.

126.28.2 Methods

126.28.3 Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.

**Notes:**
On success the handle value is not zero.
The Lasterror property is set.

126.28.4 getAntennaOn as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the state of the antenna.

**Notes:** The Lasterror property is set.
126.28.5  getLastTag(m as memoryblock) as memoryblock

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Stores the last tag in a memoryblock.
**Notes:**
You need to pass in a memoryblock of the correct size for your tags.
For convenience the memoryblock is returned.

The Lasterror property is set.

126.28.6  getLEDOn as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the state of the onboard LED.
**Notes:** The Lasterror property is set.

126.28.7  getOutputCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of outputs supported by this board.
**Notes:** The Lasterror property is set.

126.28.8  getOutputState(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the state of an output.
**Notes:** The Lasterror property is set.

126.28.9  getTagStatus as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the tag present status.
**Notes:**
This is whether or not a tag is being read by the reader.
The Lasterror property is set.
**126.28. CLASS PHIDGETRFIDMBS**

**126.28.10 setAntennaOn(value as boolean)**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the state of the antenna.

**Notes:**
Note that the antenna must be enabled before tags will be read.
The Lasterror property is set.

**126.28.11 setLEDOn(value as boolean)**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the state of the onboard LED.

**Notes:** The Lasterror property is set.

**126.28.12 setOutputState(index as Integer, value as boolean)**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the state of an output.

**Notes:** The Lasterror property is set.

**126.28.13 Events**

**126.28.14 OutputChanged(index as Integer, value as Integer)**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is called if an output changes.

**Notes:**
Index: Index of the Output firing the Event
Value: State of the Output.

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.28.15 Tag (tag as memoryblock)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An RFID Tag is read.

**Notes:**
Current plugins expect a maximum tag size of 20 bytes. Not all 20 bytes may be used for the given tag.

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.28.16 TagLost (tag as memoryblock)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A RFID Tag is removed from the field.

**Notes:**
Current plugins expect a maximum tag size of 20 bytes. Not all 20 bytes may be used for the given tag.

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.29. **GLOBALS**

126.29  **Globals**

126.29.1  **LoadPhidgetFrameworkMBS(framework as folderitem) as boolean**

**Function:** Loads the phidget framework.  
**Notes:** Returns true on success and false on failure.  
Path a folderitem for the phidget.framework in /library/frameworks.  
Deprecated in plugin version 10.4.

126.29.2  **LoadPhidgetLibraryMBS(file as folderitem) as boolean**

**Function:** Loads the Phidgets shared library.  
**Notes:** Returns true on success and false on failure.

Loads a Windows DLL, a Linux shared library, a Mac OS X shared library or a Mac OS X framework from the given path.  
See also:

- 126.29.3 LoadPhidgetLibraryMBS(path as string) as boolean

126.29.3  **LoadPhidgetLibraryMBS(path as string) as boolean**

**Function:** Loads the Phidgets shared library.  
**Notes:** Returns true on success and false on failure.  
Path can be an absolute, a relative or just a file name.

Loads a Windows DLL, a Linux shared library, a Mac OS X shared library or a Mac OS X framework from the given path.  
See also:

- 126.29.2 LoadPhidgetLibraryMBS(file as folderitem) as boolean
126.29.4 LoadPhidgetLinuxLibraryMBS(path as string) as boolean

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the phidget library.

**Notes:**
Returns true on success and false on failure.
Pass in the path to a .so file.
Deprecated in plugin version 10.4.

126.29.5 LoadPhidgetWindowsDLLMBS(dllpath as string) as boolean

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the windows dll.

**Notes:**
Returns true on success and false on failure.
Path can be an absolute, a relative or just a file name.
Deprecated in plugin version 10.4.

126.30 class PhidgetServoMBS

126.30.1 class PhidgetServoMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a phidget servo device.

**Notes:**
The PhidgetServo is a component that provides a high-level programmer interface to control a PhidgetServo device connected through a USB port.

With this component, the programmer can:

- Set the desired position for a servo motor, ranging from 0 to 180 degrees.

Subclass of the PhidgetMBS class.
126.30.2 Methods

126.30.3 Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.
**Notes:**
On success the handle value is not zero.
The Lasterror property is set.

126.30.4 getEngaged(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the engaged state of a motor. This is whether the motor is powered or not.
**Notes:**
The Lasterror property is set.

index: The motor index.

126.30.5 getMotorCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of motors supported by this controller
**Notes:** The Lasterror property is set.

126.30.6 getPosition(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the current position of a motor.
**Notes:**
index: The motor index.
The Lasterror property is set.
126.30.7  getPositionMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the maximum position that a motor can be set to. **Notes:**

index: The motor index.

The Lasterror property is set.

126.30.8  getPositionMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the minimum position that a motor can be set to. **Notes:**

index: The motor index.

The Lasterror property is set.

126.30.9  getServoType(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the servo type of a motor. **Notes:**

The Lasterror property is set. For the value, check the PHIDGET_SERVO_* constants.

126.30.10  setEngaged(index as Integer, value as boolean)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the engaged state of a motor. This is whether the motor is powered or not. **Notes:**

index: The motor index.

The Lasterror property is set.
126.30. **CLASS PHIDGETSERVOMBS**

### 126.30.11 setPosition(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the current position of a motor.  
**Notes:**
The Lasterror property is set.

- **index:** The motor index.  
- **position:** The motor position.

### 126.30.12 setServoParameters(index as Integer, min_us as Double, max_us as Double, degrees as Double)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the servo parameters of a motor.  
**Notes:**
The Lasterror property is set.

- **index**  The motor index.  
- **min_us**  The minimum supported PCM in microseconds.  
- **max_us**  The maximum supported PCM in microseconds.  
- **degrees**  The degrees of rotation defined by the given PCM range.

### 126.30.13 setServoType(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the servo type of a motor.  
**Notes:**
The Lasterror property is set.  
For the value, check the PHIDGET\_SERVO\_* constants.

### 126.30.14 Events

### 126.30.15 MotorPositionChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is called if the motor position is changed.
Notes:

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.31. **CLASS PHIDGETSPATIALEVENTDATAMBS**

126.31  **class PhidgetSpatialEventDataMBS**

126.31.1  **class PhidgetSpatialEventDataMBS**

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for event data on a spatial device.
**Notes:** Timestamped position data returned by the PhidgetSpatialMBS.SpatialData event.

126.31.2  **Properties**

126.31.3  **TimestampMicroseconds as Integer**

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The microseconds part of the Hardware timestamp.
**Notes:** (Read and Write property)

126.31.4  **TimestampSeconds as Integer**

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The seconds part of the Hardware timestamp.
**Notes:** (Read and Write property)

126.31.5  **acceleration(index as Integer) as Double**

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Acceleration data for up to 3 axes.
**Notes:**
Index from 0 to 2.
(Read and Write computed property)

126.31.6  **angularRate(index as Integer) as Double**

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Angular rate data (Gyroscope) for up to 3 axes.
**Notes:**
Index from 0 to 2.
(Read and Write computed property)
126.31.7  magneticField(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Magnetic field data (Compass) for up to 3 axes.
**Notes:**
Index from 0 to 2.
(Read and Write computed property)
126.32  class PhidgetSpatialMBS

126.32.1  class PhidgetSpatialMBS

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class to control the spatial phidget device.
**Notes:**
Calls specific to the Phidget Spatial. See the product manual for more specific API details, supported functionality, units, etc.
Subclass of the PhidgetMBS class.

126.32.2  Methods

126.32.3  Constructor

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.
**Notes:**
On success the handle value is not zero.
Lasterror is set.

126.32.4  getAcceleration(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current acceleration of an axis.
**Notes:**
index: The acceleration index.
Returns the acceleration in gs.
Lasterror is set.

126.32.5  getAccelerationAxisCount as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of acceleration axes supplied by this board.
126.32.6  getAccelerationMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum acceleration supported by an axis.
**Notes:**
index: The acceleration index.
LastError is set.

126.32.7  getAccelerationMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum acceleration supported by an axis.
**Notes:** index: The acceleration index.

126.32.8  getAngularRate(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current angular rate of an axis.
**Notes:**
Returns the angular rate in degrees/second.
index: The angular rate index.
LastError is set.

126.32.9  getAngularRateMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum angular rate supported by an axis.
**Notes:**
index: The angular rate index.
LastError is set.

126.32.10  getAngularRateMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum angular rate supported by an axis.
**Notes:**
index: The angular rate index.
126.32. **CLASS PHIDGETSPATIALMBS**

Lasterror is set.

### 126.32.11 getCompassAxisCount as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the number of compass axes supplied by this board.

**Notes:** Lasterror is set.

### 126.32.12 getDataRate as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Queries the data rate in milliseconds.

**Notes:** Lasterror is set.

### 126.32.13 getDataRateMax as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the maximum supported data rate in milliseconds.

**Notes:** Lasterror is set.

### 126.32.14 getDataRateMin as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the minimum supported data rate in milliseconds.

**Notes:** Lasterror is set.

### 126.32.15 getGyroAxisCount as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the number of gyroscope axes supplied by this board.

**Notes:** Lasterror is set.

### 126.32.16 getMagneticField(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Gets the current magnetic field strenght of an axis.
**Notes:**

index: The magnetic field index.
Returns the magnetic field strength in Gauss.
Lasterror is set.

### 126.32.17  
getMagneticFieldMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum magnetic field strength supported by an axis.

**Notes:**

index: The magnetic field index.
Lasterror is set.

### 126.32.18  
getMagneticFieldMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum magnetic field strength supported by an axis.

**Notes:**

index: The magnetic field index.
Lasterror is set.

### 126.32.19  
resetCompassCorrectionParameters

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Resets the compass correction factors.

**Notes:**

Magnetic field data will be presented directly as reported by the sensor.
Lasterror is set.

### 126.32.20  
setCompassCorrectionParameters(magField as Double, offset0 as Double, offset1 as Double, offset2 as Double, gain0 as Double, gain1 as Double, gain2 as Double, T0 as Double, T1 as Double, T2 as Double, T3 as Double, T4 as Double, T5 as Double)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the compass correction factors. This can be used to correcting any sensor errors, including hard and
126.32. CLASS PHIDGETSPATIALMBS

soft iron offsets and sensor error factors.

Notes:
Lasterror is set.

magField: Local magnetic field strength.
offset0: Axis 0 offset correction.
offset1: Axis 1 offset correction.
offset2: Axis 2 offset correction.
gain0: Axis 0 gain correction.
gain1: Axis 1 gain correction.
gain2: Axis 2 gain correction.
T0: Non-orthogonality correction factor 0.
T1: Non-orthogonality correction factor 1.
T2: Non-orthogonality correction factor 2.
T3: Non-orthogonality correction factor 3.
T4: Non-orthogonality correction factor 4.
T5: Non-orthogonality correction factor 5.

126.32.21 setDataRate(milliseconds as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Sets the data rate in milliseconds.

Notes:
Lasterror is set.
Note that data at rates faster then 8ms will be delivered to events as an array of data.

126.32.22 zeroGyro

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Zeroes the gyroscope.

Notes:
This takes about two seconds and the gyro zxes will report 0 during the process.
This should only be called when the board is not moving.

Lasterror is set.
126.32.23 Events

126.32.24 SpatialData(data() as PhidgetSpatialEventDataMBS, dataCount as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is called when new data has been received.

**Notes:**
This is called at getDataRate, up to 8ms, for faster than 8ms data, multiple sets of data are supplied in a single event.
Lasterror is set.
126.33. **CLASS PHIDGETSTEPPERMBS**

**126.33 class PhidgetStepperMBS**

126.33.1 **class PhidgetStepperMBS**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A class for a phidget stepper device.
**Notes:**
On the time the plugin was written the phidget documentation did not include this class so the documentation here is limited.
Subclass of the PhidgetMBS class.

**126.33.2 Methods**

**126.33.3 Constructor**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.
**Notes:** On success the handle value is not zero.

**126.33.4 getAcceleration(index as Integer) as Double**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the acceleration value.
**Notes:** The Lasterror property is set.

**126.33.5 getAccelerationMax(index as Integer) as Double**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum acceleration supported by a motor.
**Notes:**
index: The motor index.
The Lasterror property is set.
126.33.6 getAccelerationMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the minimum acceleration supported by a motor.
**Notes:**
index: The motor index.
The Lasterror property is set.

126.33.7 getCurrent(index as Integer) as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the current value.
**Notes:** The Lasterror property is set.

126.33.8 getCurrentLimit(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the minimum position that a motor can go to.
**Notes:**
index: The motor index.
The Lasterror property is set.

126.33.9 getCurrentMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the maximum current limit.
**Notes:**
index: The motor index.
The Lasterror property is set.
126.33.10  getCurrentMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum current limit.
**Notes:**
index: The motor index.

The Lasterror property is set.

126.33.11  getCurrentPosition(index as Integer) as int64

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current position of a motor.
**Notes:** The Lasterror property is set.

126.33.12  getEngaged(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the engaged state of a motor. This is whether the motor is powered or not.
**Notes:**
index: The motor index.

The Lasterror property is set.

126.33.13  getInputCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of digital inputs supported by this board.
**Notes:** The Lasterror property is set.

126.33.14  getInputState(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the state of a digital input.
**Notes:** The Lasterror property is set.
126.33.15 getMotorCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of motors supported by this controller. **Notes:** The Lasterror property is set.

126.33.16 getPositionMax(index as Integer) as int64

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the maximum velocity that can be set for a motor. **Notes:** The Lasterror property is set.

126.33.17 getPositionMin(index as Integer) as int64

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the minimum position that a motor can go to. **Notes:** The Lasterror property is set.

126.33.18 getStopped(index as Integer) as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the stopped state of a motor. This is true when the motor is not moving and there are no outstanding commands. **Notes:**

- index: The motor index.

The Lasterror property is set.

126.33.19 getTargetPosition(index as Integer) as int64

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the last set target position of a motor. **Notes:**

- index: The motor index.

The Lasterror property is set.
126.33.20 getVelocity(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the current velocity of a motor.

**Notes:**

index: The motor index.

The Lasterror property is set.

126.33.21 getVelocityLimit(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the last set velocity limit for a motor.

**Notes:**

index: The motor index.

The Lasterror property is set.

126.33.22 getVelocityMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum velocity that can be set for a motor.

**Notes:**

index: The motor index.

The Lasterror property is set.

126.33.23 getVelocityMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum velocity that can be set for a motor.

**Notes:** The Lasterror property is set.
126.33.24  setAcceleration(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the acceleration. **Notes:** The Lasterror property is set.

126.33.25  setCurrentLimit(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the current limit for a motor. **Notes:**

index: The motor index.

The Lasterror property is set.

126.33.26  setCurrentPosition(index as Integer, value as int64)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the current position of a motor. **Notes:**

This will not move the motor, just update the position value.

index: The motor index.

value: The position.

The Lasterror property is set.

126.33.27  setEngaged(index as Integer, value as boolean)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the engaged state of a motor. This is whether the motor is powered or not. **Notes:**

index: The motor index.

value: The engaged state. Possible values are true and false.

The Lasterror property is set.
126.33.28  setTargetPosition(index as Integer, value as int64)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the target position of a motor.
**Notes:**

index: The motor index.

The Lasterror property is set.

126.33.29  setVelocityLimit(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the velocity limit for a motor.
**Notes:**

index: The motor index.

The Lasterror property is set.

126.33.30  Events

126.33.31  CurrentChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The current value changed.
**Notes:**

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

126.33.32  InputChanged(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The input value changed.
**Notes:**

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available.
Older plugins execute the event on the thread where the event was created which may lead into problems
described in the ThreadMBS class documentation.

### 126.33.33 ServoChanged(index as Integer, value as int64)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The servo value changed.

**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. 
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.

### 126.33.34 VelocityChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called when the velocity changes.

**Notes:**
With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. 
Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.34  class PhidgetTemperatureSensorMBS

126.34.1  class PhidgetTemperatureSensorMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a phidget temperature sensor.
**Notes:**
The PhidgetTemperatureSensor is a component that provides a high-level programmer interface to control
a PhidgetTemperatureSensor device connected through a USB port.

With this component, the programmer can:

- Read the temperature of Thermocouple device.
- Read cold junction temperature.
- Get notification of temperature change.

Subclass of the PhidgetMBS class.

126.34.2  Methods

126.34.3  Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.
**Notes:** On success the handle value is not zero.

126.34.4  getAmbientTemperature as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the ambient (board) temperature.
**Notes:** The Lasterror property is set.

126.34.5  getAmbientTemperatureMax as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum temperature that the ambient onboard temperature sensor can measure.
**Notes:** The Lasterror property is set.
**126.34.6 getAmbientTemperatureMin as Double**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum temperature that the ambient onboard temperature sensor can measure.
**Notes:** The Lasterror property is set.

**126.34.7 getPotential(index as Integer) as Double**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the potential value for the temperature sender with the given index.
**Notes:** The Lasterror property is set.

**126.34.8 getPotentialMax(index as Integer) as Double**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum potential that a thermocouple input can measure.
**Notes:** The Lasterror property is set.

**126.34.9 getPotentialMin(index as Integer) as Double**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum potential that a thermocouple input can measure.
**Notes:** The Lasterror property is set.

**126.34.10 getTemperature(index as Integer) as Double**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the current temperature in Celsius or Fahrenheit (depending on UseImperial property).
**Notes:**
Index = 0 returns the temperature of the cold junction.
Index = 1 returns the temperature of the thermocouple.

Note that this value defaults to -500. Applications that do not wish to see this value should use Change Handlers instead of polling the device for data.

The Lasterror property is set.
126.34.11  getTemperatureChangeTrigger(index as Integer) as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the amount of change that should exist between the last reported value and the current value before an TemperatureChange event is fired.
**Notes:** The Lasterror property is set.

126.34.12  getTemperatureInputCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of thermocouple inputs supported by this board.
**Notes:** The Lasterror property is set.

126.34.13  getTemperatureMax(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the maximum temperature that can be measured by a thermocouple input. This depends on the type of thermocouple attached.
**Notes:** The Lasterror property is set.

126.34.14  getTemperatureMin(index as Integer) as Double

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the minimum temperature that can be measured by a thermocouple input.
**Notes:**
This depends on the type of thermocouple attached.
The Lasterror property is set.

126.34.15  getThermocoupleType(index as Integer) as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the type of thermocouple set to be at a thermocouple input. By default this is K-Type.
**Notes:**
The Lasterror property is set.
type: The thermocouple type.
126.34.16  setTemperatureChangeTrigger(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Specifies the amount of change that should exist between the last reported value and the current value before an TemperatureChange event is fired. **Notes:** The Lasterror property is set.

126.34.17  setThermocoupleType(index as Integer, value as Integer)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the type of thermocouple plugged into a thermocouple input. By default this is K-Type. **Example:**

dim t as PhidgetTemperatureSensorMBS

    const PHIDGET_TEMPERATURE_SENSOR_K_TYPE = 1 // K-Type thermocouple
    const PHIDGET_TEMPERATURE_SENSOR_J_TYPE = 2 // J-Type thermocouple
    const PHIDGET_TEMPERATURE_SENSOR_E_TYPE = 3 // E-Type thermocouple
    const PHIDGET_TEMPERATURE_SENSOR_T_TYPE = 4 // T-Type thermocouple

    t.setThermocoupleType 0, PHIDGET_TEMPERATURE_SENSOR_T_TYPE

**Notes:** The Lasterror property is set.

126.34.18  Events

126.34.19  TemperatureChanged(index as Integer, value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The temperatur changed. **Notes:**

Index: Index of the Temperature Sensor firing the Event
Value: Value of the Temperature Sensor

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
126.34.20 Constants

126.34.21 PHIDGET_TEMPERATURE_SENSOR_E_TYPE = 3

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the sensor type constants.  
**Notes:** E-Type thermocouple

126.34.22 PHIDGET_TEMPERATURE_SENSOR_J_TYPE = 2

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the sensor type constants.  
**Notes:** J-Type thermocouple

126.34.23 PHIDGET_TEMPERATURE_SENSOR_K_TYPE = 1

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the sensor type constants.  
**Notes:** K-Type thermocouple

126.34.24 PHIDGET_TEMPERATURE_SENSOR_T_TYPE = 4

MBS USB Plugin, Plugin Version: 11.0. **Function:** One of the sensor type constants.  
**Notes:** T-Type thermocouple
126.35  class PhidgetTextLCDMBS

126.35.1  class PhidgetTextLCDMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for the phidget text LCD.
**Notes:**
The PhidgetTextLCD is a component that provides a high-level programmer interface to control a Phidget-
TextLCD device connected through a USB port.

With this component, the programmer can:

- Display text on a PhidgetTextLCD module.

Subclass of the PhidgetMBS class.

126.35.2  Methods

126.35.3  Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.
**Notes:**
On success the handle value is not zero.
Lasterror is set.

126.35.4  getBacklight as boolean

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the state of the backlight.
**Notes:** The Lasterror property is set.

126.35.5  getBrightness as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the brightness of the backlight. Not supported on all TextLCDs
**Notes:**
The backlight brightness has a range of 0 to 255.
The Lasterror property is set.

126.35.6 getColumnCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of columns per supported by this display.
**Notes:** The Lasterror property is set.

126.35.7 getContrast as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the contrast value from 0-255.
**Notes:**
Note that this defaults to 0.
The Lasterror property is set.

126.35.8 getCursorBlink as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Determines if the cursor’s blinking is on or off.
**Notes:**
Note that this defaults to False.
The Lasterror property is set.

126.35.9 getCursorOn as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Determines if the cursor is on or off.
**Notes:**
Note that this defaults to False.
The Lasterror property is set.
126.35.10  getRowCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of rows supported by this display.
**Notes:** The Lasterror property is set.

126.35.11  getScreen as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the active screen.
**Notes:** Lasterror is set.

126.35.12  getScreenCount as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the number of Display supported by this TextLCD.
**Notes:** Lasterror is set.

126.35.13  getScreenSize as Integer

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the screen size.
**Notes:**
See PHIDGET_TEXTLCD_SCREEN_* constants.
Lasterror is set.

126.35.14  initialize

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Initializes the active screen.
**Notes:**
Only supported on the TextLCD adapter.
This should be called if a screen is attached after power up, or to clear the screen after setting the size.
Lasterror is set.
126.35.15  setBacklight(backlightState as boolean)

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the state of the backlight.
**Notes:** The Lasterror property is set.

126.35.16  setBrightness(Brightness as Integer)

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the brightness of the backlight. Not supported on all TextLCDs
**Notes:**
The backlight brightness has a range of 0 to 255.
The Lasterror property is set.

126.35.17  setContrast(Contrast as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the contrast from 0-255.
**Notes:** The Lasterror property is set.

126.35.18  setCursorBlink(CursorBlink as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the cursor’s blinking on or off.
**Notes:** The Lasterror property is set.

126.35.19  setCursorOn(CursorOn as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the cursor on or off.
**Notes:**
This cursor is displayed at the last location that was changed.

The Lasterror property is set.
**126.35.20 setCustomCharacter(index as Integer, val1 as Integer, val2 as Integer)**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets a custom character.

**Notes:**
With existing hardware, there is space for 8 custom characters: Index can range from 8 to 15.
Each character is described by a set of integers.
For more information, have a look at the TextLCD example in the examples.zip for Phidget21.

The Lasterror property is set.

**126.35.21 setDisplayCharacter(index as Integer, column as Integer, character as Integer)**

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets a single character on the display.

**Notes:**
index: The row index.
column: The column index.
character: The character to display.

The Lasterror property is set.

**126.35.22 setDisplayString(row as Integer, displayString as string)**

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the text to display on a particular row of the display.

**Notes:**
Row: Row to set on display
DisplayString: String to set on display. The text will be clipped at the right edge of the display.
The Lasterror property is set.

**126.35.23 setScreen(screenIndex as Integer)**

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the active screen.

**Notes:**
This is the screen that all subsequent API calls will apply to. Lasterror is set.

126.35.24  setScreenSize(screenSize as Integer)

MBS USB Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the active screen size. Only supported on the TextLCD Adapter. **Notes:** Lasterror is set.

126.35.25  Constants

126.35.26  PHIDGETTEXTLCD_SCREEN_1x16 = 4

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter. **Notes:** 1 row, 16 column screen

126.35.27  PHIDGETTEXTLCD_SCREEN_1x40 = 10

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter. **Notes:** 1 row, 40 column screen

126.35.28  PHIDGETTEXTLCD_SCREEN_1x8 = 2

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter. **Notes:** 1 row, 8 column screen

126.35.29  PHIDGETTEXTLCD_SCREEN_2x16 = 5

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter. **Notes:** 2 row, 16 column screen
CHAPTER 126. PHIDGETS

126.35.30 PHIDGET_TEXTLCD_SCREEN_2x20 = 7

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter.
**Notes:** 2 row, 20 column screen

126.35.31 PHIDGET_TEXTLCD_SCREEN_2x24 = 9

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter.
**Notes:** 2 row, 24 column screen

126.35.32 PHIDGET_TEXTLCD_SCREEN_2x40 = 11

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter.
**Notes:** 2 row, 40 column screen

126.35.33 PHIDGET_TEXTLCD_SCREEN_2x8 = 3

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter.
**Notes:** 2 row, 8 column screen

126.35.34 PHIDGET_TEXTLCD_SCREEN_4x16 = 6

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter.
**Notes:** 4 row, 16 column screen

126.35.35 PHIDGET_TEXTLCD_SCREEN_4x20 = 8

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter.
**Notes:** 4 row, 20 column screen
126.35. PHIDGETTEXTLCDMBS

126.35.36 PHIDGET_TEXTLCD_SCREEN_4x40 = 12

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter.
**Notes:** 4 row, 40 column screen (special case, requires both screen connections)

126.35.37 PHIDGET_TEXTLCD_SCREEN_NONE = 1

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter.
**Notes:** no screen attached

126.35.38 PHIDGET_TEXTLCD_SCREEN_UNKNOWN = 13

MBS USB Plugin, Plugin Version: 11.1. **Function:** One of the screen size constants for the Phidget TextLCD Adapter.
**Notes:** Unknown
126.36 class PhidgetTextLEDMBS

126.36.1 class PhidgetTextLEDMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a phidget text LED.
**Notes:**
On the time the plugin was written the phidget documentation did not include this class so the documentation here is limited.
Subclass of the PhidgetMBS class.

126.36.2 Methods

126.36.3 Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.
**Notes:** On success the handle value is not zero.

126.36.4 getBrightness as Integer

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the current brightness.
**Notes:** The Lasterror property is set.

126.36.5 getColumnCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of columns per supported by this display.
**Notes:** The Lasterror property is set.

126.36.6 getRowCount as Integer

MBS USB Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of rows supported by this display.
**Notes:** The Lasterror property is set.
126.36.7 setBrightness(Brightness as Integer)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the brightness. **Notes:** The Lasterror property is set.

126.36.8 setDisplayString(row as Integer, displayString as string)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the display string for the given row. **Notes:** The Lasterror property is set.
126.37 class PhidgetWeightSensorMBS

126.37.1 class PhidgetWeightSensorMBS

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a phidget weight sensor.
**Notes:**
On the time the plugin was written the phidget documentation did not include this class so the documentation here is limited.
Subclass of the PhidgetMBS class.

126.37.2 Methods

126.37.3 Constructor

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.
**Notes:**
On success the handle value is not zero.
The Lasterror property is set.

126.37.4 getWeight as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the current weight.
**Notes:** The Lasterror property is set.

126.37.5 getWeightChangeTrigger as Double

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the amount of change that should exist between the last reported value and the current value before an WeightChange event is fired.
**Notes:** The Lasterror property is set.

126.37.6 setWeightChangeTrigger(value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the amount of change that should exist between the last reported value and the current value before an
WeightChange event is fired.

**Notes:** The Lasterror property is set.

### 126.37.7 Events

### 126.37.8 WeightChanged(value as Double)

MBS USB Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The weight changed.

**Notes:**

With plugin version 8.5 and newer this event is executed on the main thread of your application to avoid crashes with REALbasic. Events are buffered until you the main thread has time available. Older plugins execute the event on the thread where the event was created which may lead into problems described in the ThreadMBS class documentation.
Chapter 127

PHP

127.1 class PHPMBS

127.1.1 class PHPMBS

Notes: For Linux and Mac OS X the PHP library is included in the plugin.
Plugin version 15.3 is built for PHP 5.6.12.

127.1.2 Methods

127.1.3 CallbackArgumentCount as Integer

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Returns the number of arguments to the callback event.
Notes: Returns 0 on any error.

127.1.4 CallbackArgumentDouble(index as Integer) as Double

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Converts the parameter with the given index to double and returns it.
Notes: Returns 0 on any error.
127.1.5 CallbackArgumentInteger(index as Integer) as Integer

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Converts the parameter with the given index to integer and returns it. **Notes:** Returns 0 on any error.

127.1.6 CallbackArgumentString(index as Integer) as string

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Converts the parameter with the given index to string and returns it. **Notes:** Returns an empty string on any error.

127.1.7 Constructor

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initializes the PHP engine. **Example:**

```vbnet
const path="php.dll"
call PHPMBS.LoadLibrary(path) // load the dll
dim p as new PHPMBS // initialize
if p.inited then // worked?
    messagebox "ok"
end if
```

**Notes:** In older plugins this work was done by the method Init.

127.1.8 Execute(code as string) as string

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Runs php code. **Example:**

```vbnet
dim p as PHPMBS
p=new PHPMBS
MsgBox p.Execute("echo ""Hello"";")
```
127.1. CLASS PHPMBS

**Notes:** Same as run, but does not call the write event, but return the whole output as one big string.

127.1.9  **existsVariable(name as string) as boolean**

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks whether variable exists or not. **Notes:** getVariable returns "" for variables which don’t exist, but your variable may just be an empty string so this function lets you know whether the variable actually exists.

127.1.10  **getVariable(name as string) as string**

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns value of the variable with the given name. **Notes:** Returns an empty string if the variable name is wrong.

127.1.11  **INI as String**

MBS Tools Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The PHP Ini to use. **Notes:** Must be called before initialization.

Default is:
- html_errors=0
- register_argc_argv=1
- implicit_flush=1
- output_buffering=0
- max_execution_time=0
- max_input_time=-1
(Read and Write computed property)

127.1.12  **LoadExtension(Path as string) as boolean**

MBS Tools Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads an extension. **Notes:** Returns true on success. Will write errors to stderr which you see in console apps.
127.1.13 LoadLibrary(file as folderitem) as boolean

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the PHP shared library.
**Notes:**
Loads a Windows DLL, a Linux shared library, a Mac OS X shared library from the given path.
Returns true on success and false on any error.
It may be possible that your PHP library is not compatible with this way of loading which results in crashes.
See also:
- 127.1.14 LoadLibrary(path as string) as boolean

127.1.14 LoadLibrary(path as string) as boolean

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the PHP shared library.
**Notes:**
Loads a Windows DLL, a Linux shared library, a Mac OS X shared library from the given path.
Returns true on success and false on any error.
It may be possible that your PHP library is not compatible with this way of loading which results in crashes.
See also:
- 127.1.13 LoadLibrary(file as folderitem) as boolean

127.1.15 Run(code as string) as boolean

**Example:**

```
dim php as PHPMBS // your php object

if php.run("echo 1+2;") then
    // ok
else
    // failed
end if
```

**Notes:**
127.1.  CLASS PHPMBS

Returns true on success.
Returns false on any compilation error or the library is not loaded/available.

You need to wrap your code into exception handlers as the plugin will ignore all exceptions and if you want to find errors, you need to catch them yourself.

127.1.16  setVariable(name as string, value as string)

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the variable with the given name to the given value.

127.1.17  Properties

127.1.18  Inited as Boolean

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the PHP library has been initialized.
**Notes:**
Returns true on success.
(Read only property)

127.1.19  LastErrorFile as String

MBS Tools Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The last error file name.
**Notes:** (Read and Write property)

127.1.20  LastErrorLine as Integer

MBS Tools Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The last error line.
**Notes:** (Read and Write property)
127.1.21 LastErrorMessage as String

MBS Tools Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The last error message.
**Notes:** (Read and Write property)

127.1.22 LastExitStatus as Integer

MBS Tools Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The last exit status.
**Notes:** (Read and Write property)

127.1.23 Loaded as Boolean

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the PHP library has been loaded.
**Notes:**
Returns true on success.
(Read only property)

127.1.24 UseUTF8 as Boolean

MBS Tools Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether to use UTF-8 text encoding.
**Notes:**
By default we use ISO Latin1 encoding.
But you can ask for passing UTF-8 to/from PHP.
If enabled and a text is passed back from PHP which is not valid UTF-8, we still returned it marked as
Latin1.
(Read and Write property)

127.1.25 Events

127.1.26 Callback(ArgumentCount as Integer) as Variant

MBS Tools Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The event called when you call the php function callReaIbasic()
127.1. CLASS PHPMBS

Notes:
Return a variant with double, float, string or integer value.
Parameters are available using CallbackArgument* functions.

127.1.27 LogMessage(message as string)
Notes: Normally written by apache to the log files.

127.1.28 Write(data as string)
Notes:
This text is normally the result, e.g. the content of the website the php code produces.
If php.ini file is used, you need to disable the output_buffering option to have this callback working.
Chapter 128

Pictures Import and Export

128.1  Globals

128.1.1  BMPStringtoPictureMBS(data as string) as picture

Example:
```
dim p as Picture = LogoMBS(500)
dim s as string = p.BMPDataMBS
dim q as Picture = BMPStringtoPictureMBS(s)
window1Backdrop = q
```

Notes:
This function is endian safe and supports 1, 4, 8, 16, 24, 32 bit BMP images.
For 32bit images the alpha value is ignored.
Returns nil on any error.
Only uncompressed BMP files are supported.

128.1.2  Split1BitFileMBS(f as folderitem, fc as folderitem, fm as folderitem, fy as folderitem, fk as folderitem, width as Integer, height as Integer, CallbackTarget as object, CacheSizeRead as Integer, CacheSizeWrite as Integer) as Integer

Notes:

Source file has 1 bit for each channel.
Error code is returned which is 0 for no error.
CacheSize can be set to a value greater than 0. And it may make the process faster or slower depending on what you do.

CallbackTarget can be nil or must be an object with a method with the following declaration: "Progress(RowIndex as Integer, RowCount as Integer)"

Errorcodes:

1   not used
2   Failed to open f
3   Failed to open fc
4   Failed to open fm
5   Failed to open fy
6   Failed to open fk
7   Width<1
8   Height<1
9   Allocating read buffer failed
10  Allocating write buffer failed for c
11  Allocating write buffer failed for m
12  Allocating write buffer failed for y
13  Allocating write buffer failed for k
14  Read failed
15  Write failed for c
16  Write failed for m
17  Write failed for y
18  Write failed for k

See also:

- 128.1.3 Split1BitFileMBS(f as folderitem, fc as folderitem, fm as folderitem, fy as folderitem, fk as folderitem, width as Integer, height as Integer, CallbackTarget as object, CacheSizeRead as Integer, CacheSizeWrite as Integer, ReadLines as Integer, WriteLines as Integer) as Integer
128.1.3  Split1BitFileMBS(f as folderitem, fc as folderitem, fm as folderitem, 
fy as folderitem, fk as folderitem, width as Integer, height as Integer, 
CallbackTarget as object, CacheSizeRead as Integer, CacheSizeWrite 
as Integer, ReadLines as Integer, WriteLines as Integer) as Integer

MBS Images Plugin, Plugin Version: 6.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Splits a one bit CMYK file into different files.

**Notes:**
Source file has 1 bit for each channel.
Error code is returned which is 0 for no error.
CacheSize can be set to a value greater than 0. And it may make the process faster or slower depending on 
what you do.

CallbackTarget can be nil or must be an object with a method with the following declaration: "Progress(RowIndex 
as Integer, RowCount as Integer)"

ReadLines and WriteLines define how many rows to read in one I/O operation.

**Error codes:**

1  not used
2  Failed to open f
3  Failed to open fc
4  Failed to open fm
5  Failed to open fy
6  Failed to open fk
7  Width<1
8  Height<1
9  Allocating read buffer failed
10 Allocating write buffer failed for c
11 Allocating write buffer failed for m
12 Allocating write buffer failed for y
13 Allocating write buffer failed for k
14 Read failed
15 Write failed for c
16 Write failed for m
17 Write failed for y
18 Write failed for k
128.2 class PNGOptimizerMBS

128.2.1 class PNGOptimizerMBS

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This class is a wrapper for the OptiPNG command line tool.

**Example:**

```vba
dim p as Picture = LogoMBS(500)

dim fi as FolderItem = SpecialFolder.Desktop.Child("test unoptimized.png")
if not fi.SaveAsPNGMBS(p,0) then
    MsgBox "Failed to save PNG file."
    Return
end if

dim fo as FolderItem = SpecialFolder.Desktop.Child("test optimized.png")
fo.Delete // delete if existed before

dim o as new PNGOptimizerMBS

o.YieldTicks=10 // give time for other threads
o.InputFile=fi
o.OutputFile=fo

if o.Optimize then
    MsgBox "OK: Saved " + str(o.BytesSaved)
    fo.Launch
else
    MsgBox "failed"
end if
```

**Notes:**

OptiPNG: Advanced PNG optimization program.
http://optipng.sourceforge.net/

Copyright (C) 2001-2008 Cosmin Truta.
OptiPNG is open-source software, and is distributed under the same licensing and warranty terms as libpng.

PNG optimization is described in detail in the PNG-Tech article "A guide to PNG optimization"
http://www.cs.toronto.edu/~cosmin/pngtech/optipng.html

The idea of running multiple compression trials with different PNG filters and zlib parameters is inspired from the pngcrush program by Glenn Randers-Pehrson.
The idea of performing lossless image reductions is inspired from the pngrewrite program by Jason Summers.

128.2.2 Methods

128.2.3 Optimize as boolean

Notes: Returns true on success and false on failure.

128.2.4 Properties

128.2.5 BytesSaved as Integer

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: After the optimization this property shows how many bytes were saved.
Notes: (Read and Write property)

128.2.6 Force as Boolean

Notes: If the input image has a digital signature, the library will not optimize the file unless force=true.
(Read and Write property)
128.2.7  full as Boolean

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to produce a full report on IDAT (might reduce speed).
**Notes:** (Read and Write property)

128.2.8  InputFile as Folderitem

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The file to process.
**Notes:** (Read and Write property)

128.2.9  interlace as Integer

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The interlace type (0-1).
**Notes:** (Read and Write property)

128.2.10 KeepBackup as Boolean

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to keep a backup of the modified files.
**Notes:**
If the file exists and KeepBackup=false an error is reported. If you set KeepBackup=True the old file is renamed.
(Read and Write property)

128.2.11  NoBitDepthReduction as Boolean

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to not do a bit depth reduction.
**Notes:**
Reducing the bit depth of the image data can reduce the file size.
(Read and Write property)
128.2.12 NoColorTypeReduction as Boolean

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to not do a color type reduction.

**Notes:**

If your PNG file has only 256 colors in use, the optimizer can use a color palette to save space.
(Read and Write property)

128.2.13 NoIDATRecompression as Boolean

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to not recompress the image data.

**Notes:** (Read and Write property)

128.2.14 NoPaletteReduction as Boolean

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to not reduce the palette.

**Notes:**

If not all colors are used, the palette can be reduced in its size.
(Read and Write property)

128.2.15 OptimizationLevel as Integer

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The optimization level.

**Notes:**

A value between 0 and 7.
Default is 2.
(Read and Write property)

128.2.16 OutputFile as Folderitem

**Notes:** (Read and Write property)
128.2.17 Preserve as Boolean

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to preserve file attributes if possible. **Notes:** (Read and Write property)

128.2.18 simulate as Boolean

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the optimization runs only in simulation mode. **Notes:** No file is written in simulation mode. (Read and Write property)

128.2.19 YieldTicks as Integer

MBS Images Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** How much time is given back to REALbasic for other ticks.  
**Example:**

```plaintext
dim p as new PNGOptimizerMBS
p.YieldTicks=6 // only use 1/10th of a second
```

**Notes:** If value is greater than zero, the application will yield to another RB thread after the given number of ticks have passed. 60 ticks are one second. Using a small value can slow down processing a lot while a big value keeps your application not responding to mouse clicks. If you use this property with e.g. 6 as the value, you may also want to use this method in a thread so you can handle mouse events or let REALbasic redraw a progressbar. (Read and Write property)

128.2.20 Events

128.2.21 Log(message as string)

MBS Images Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event to output a message to the log file. **Notes:** You may want to show that to your advantaged users.
128.2.22 Panic(message as string)

MBS Images Plugin, Plugin Version: 10.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Called if something really bad happen and the app needs to quit.

128.2.23 Progress(index as Integer, count as Integer)

MBS Images Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called for reporting ongoing process in the trials. **Notes:** The library will try several PNG settings and report progress so you can update a progress bar.

128.2.24 ProgressBegin

MBS Images Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called before the library starts to optimize. **Notes:** You may want to show a progress dialog here.

128.2.25 ProgressEnd

MBS Images Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called after the library finished. **Notes:** You may want to hide your progress dialog here.
Chapter 129

PNG

129.1  Globals

129.1.1  PictureToPNGStringMBS(pic as picture, gamma as single = 0.0) as string

MBS Images Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves a picture to a PNG string.

**Notes:**
If the picture has no mask, no alpha channel is written to the file. Returns "" on any error.

The gamma parameter defines what gamma correction is applied:
- positive value: use the value as the gamma correction
- zero: use default value (or value saved in file itself)
- negative value: do not correct gamma

See also:

- 129.1.2 PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 17708

- 129.1.3 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single = 0.0) as string 17708

- 129.1.4 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 17709
129.1.2 PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string

Notes:
If the picture has no mask, no alpha channel is written to the file. Colors must be an array with 256 values defining the palette.

Returns true on success and false on failure.

The gamma parameter defines what gamma correction is applied:
- positive value: use the value as the gamma correction
- zero: use default value (or value saved in file itself)
- negative value: do not correct gamma

If Interlace is true the Adam7 interlacing is used. FilterType specifies the filter:

```plaintext
const PNG_NO_FILTERS   = 0
const PNG_FILTER_NONE  = 8
const PNG_FILTER_SUB   = 16
const PNG_FILTER_UP    = 32
const PNG_FILTER_AVG   = 64
const PNG_FILTER_PAETH = 128
const PNG_FILTER_ALL   = 248
```

See also:
- 129.1.1 PictureToPNGStringMBS(pic as picture, gamma as single = 0.0) as string
- 129.1.3 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single = 0.0) as string
- 129.1.4 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string

129.1.3 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single = 0.0) as string

Notes:
Returns "" on any error.

It uses the mask passed. If nil, no alpha channel is written to the file.
The mask from the picture is ignored.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

See also:

- 129.1.1 PictureToPNGStringMBS(pic as picture, gamma as single = 0.0) as string 17707
- 129.1.2 PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 17708
- 129.1.4 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 17709

129.1.4 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string

MBS Images Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves a picture to a PNG string.

**Notes:**
Returns "" on any error.

It uses the mask passed. If nil, no alpha channel is written to the file.
The mask from the picture is ignored.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

If Interlace is true the Adam7 interlacing is used.
FilterType specifies the filter:

See also:

- 129.1.1 PictureToPNGStringMBS(pic as picture, gamma as single = 0.0) as string 17707
- 129.1.2 PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 17708
const PNG_NO_FILTERS = 0
const PNG_FILTER_NONE = 8
const PNG_FILTER_SUB = 16
const PNG_FILTER_UP = 32
const PNG_FILTER_AVG = 64
const PNG_FILTER_PAETH = 128
const PNG_FILTER_ALL = 248

• 129.1.3 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single = 0.0) as string

129.1.5 PNGStringToPictureMBS(data as string, gamma as single = 0.0, AllowDamaged as boolean = false) as picture

**Notes:**
If the picture has an alpha channel the returned picture will have a mask.

Returns picture on success and nil on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

AllowDamaged: Whether to allow damaged PNG files to return a part of the image as picture.

129.1.6 PNGStringToPNGPictureMBS(data as string, gamma as single = 0.0, AllowDamaged as boolean = false) as PNGPictureMBS

**Notes:**
Returns PNGPictureMBS object on success and nil on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma
AllowDamaged: Whether to allow damaged PNG files to return a part of the image as picture.

129.2   class PNGpictureMBS

129.2.1   class PNGpictureMBS

MBS Images Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** A class for a PNG picture.

**Notes:** Based on LibPNG.

129.2.2   Methods

129.2.3   CombinePictureWithMask as picture

MBS Images Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a new picture which is created using the picture and it’s mask.

**Example:**

```
    dim t as TiffPictureMBS
    ' ...
    canvas1.backdrop=t.CombinePictureWithMask
```

129.2.4   PNGLibVersion as string

MBS Images Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The version of the PNG library compiled into the plugin.

**Notes:** Please ask if you need a newer version.

129.2.5   Properties

129.2.6   height as Integer

MBS Images Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height of the picture.

**Notes:** (Read and Write property)
129.2.7  mask as picture

MBS Images Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The mask of the picture.  
**Notes:**  
May be nil.  
(Read and Write property)

129.2.8  pict as picture

MBS Images Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The picture data of the picture.  
**Notes:**  
If this image is all black, you may use a different gamma setting.  
(Read and Write property)

129.2.9  width as Integer

MBS Images Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of the picture.  
**Notes:** (Read and Write property)

129.2.10  Constants

129.2.11  kDefaultGamma = 0

MBS Images Plugin, Plugin Version: 11.3. **Function:** The default gamma constant.  
**Notes:** Pass this value to get the default gamma.
129.3. class PNGReaderMBS

129.3.1 class PNGReaderMBS

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for reading PNG files.

**Example:**
```pascal
  dim Current as PictureMBS // global
dim f as FolderItem

  f=GetopenFolderItem(FileTypes.Png)
  if f<>Nil then
    Current=nil

    dim p as new PNGReaderMBS
    if p.OpenFile(f) then
      if p.ApplyOptions(0) then
        Current=new PictureMBS(p.Width,p.Height,PictureMBS.ImageFormatRGB)
        dim i,c as Integer
        c=p.Height-1
        for i=0 to c
          Current.RowInFormat(i, PictureMBS.ImageFormatRGBA)=p.ReadRow
        next
      end if
    end if
  end if
```

**Notes:**
Use this class to read PNG files row by row as memoryblock.

Based on LibPNG.
129.3.2 Methods

129.3.3 ApplyOptions(gamma as Double = 0.0, ScreenGamma as Double = -1.0) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Applies various options.

**Notes:**
The gamma parameter defines what gamma correction is applied:
- positive value: use the value as the gamma correction
- zero: use default value (or value saved in file itself)
- negative value: do not correct gamma

Added ScreenGamma parameter in plugin version 15.2. If you set both gamma and ScreenGamma to a value >0.0, the plugin will use those gamma values. If both are equal, no gamma correction is made.

129.3.4 CombinePictureWithMask as picture

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Combines the pict and the mask property to a picture with mask.

129.3.5 Open(file as folderitem, data as string) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens either the data string or the file.

**Notes:** Returns true on success.

129.3.6 OpenData(data as string) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens a PNG file from the data string.

**Notes:** Returns true on success.

129.3.7 OpenFile(file as folderitem) as boolean

129.3.8  OpenSpecialData(data as string) as boolean

MBS Images Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Same as OpenData but with special handling of the png data.

**Example:**

```rbs
dim f as FolderItem = getfolderitem("mbs.png")
dim b as BinaryStream = f.OpenAsBinaryFile(false) // BinaryStream.Open(f) in newer RB versions
dim s as string = b.Read(B.Length)

dim p as new PNGReaderMBS
if p.OpenSpecialData(s) then
  if p.ApplyOptions(0) then
    if p.ReadPicture then
      Backdrop = p.Pict
      Title = "OK"
    else
      Title = "Failed to read picture."
    end if
  else
    Title = "Failed to apply options."
  end if
else
  Title = "Failed to open picture."
end if
```

**Notes:**
This function can be used to read PNG files made for the Apple iPhone. The PNG is converted from the Apple format to the normal PNG format and passed to OpenData. In the SourceData property you can get the modified PNG data. Still this modified PNG data has the channels swapped, so you should read the image with the pict property.

On Mac OS X 10.8, the NSImage class also reads iOS optimized PNG files.

129.3.9  PNGLibVersion as string

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The version of the PNG library compiled into the plugin.
129.3.10  ReadICCProfile(byref name as string, byref compression as Integer, byref profile as string) as boolean

MBS Images Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads the ICC Profile from the PNG file. **Notes:**
Name is the profile name, compression the method used to compress the profile data and profile a string with the content of the profile as binary data. Returns true on success.

129.3.11  ReadPicture as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads the picture into the pict and mask properties. **Notes:** Returns true on success.

129.3.12  ReadRow as memoryblock

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads the next row as a memoryblock. **Example:**
```vba
dim fSource as FolderItem = SpecialFolder.Desktop.Child("test.png") // some png with alpha
dim oPNGInput as new PNGReaderMBS
If oPNGInput.OpenFile(fSource) Then
    If oPNGInput.ApplyOptions(0) Then
        dim imgSource as New PictureMBS(oPNGInput.Width, oPNGInput.Height, PictureMBS.ImageFormatRGBA)
        ' Read row by row the file and puts it in a PictureMBS instance
        dim nMax as Integer = oPNGInput.Height - 1
        For nInd as Integer = 0 To nMax
            imgSource.RowInFormat(nInd, PictureMBS.ImageFormatRGBA, true) = oPNGInput.ReadRow()
        Next
        ' show only alpha/mask channel
        Backdrop=imgSource.AlphaChannel.CopyPicture
        ' show Picture without mask
        Backdrop=imgSource.CopyPicture
```
129.3. CLASS PNGREADERMBS

' show picture with mask
Backdrop=imgSource.CopyPictureWithMask

End If
End If

Notes:
Returns nil on any error.
Format is RGBA as in the example with 4 bytes per pixel.
See also:

• 129.3.13 ReadRow(mem as memoryblock) as boolean

129.3.13 ReadRow(mem as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Reads the next row into the given memoryblock.
Notes:
Returns false on any error and true on success.
Format is RGBA as in the example with 4 bytes per pixel.
Make sure the memoryblock is big enough. Else you risk a crash.

See also PNGReaderMBS.RowBytes.

ReadRow with reusing memoryblock is faster than allocating a new one for each row.
See also:

• 129.3.12 ReadRow as memoryblock

129.3.14 ReadRowAlphaOnly(mem as memoryblock) as boolean

Reads the next row into the given memoryblock.
Notes:
Returns false on any error and true on success.
Format is alpha channel as in the example with one byte per pixel.
Make sure the memoryblock has size from RowBytes property. Else you risk a crash.
The data in memoryblock is width bytes long, 1/4 of the size of the memoryblock.

See also PNGReaderMBS.RowBytes.
ReadRow with reusing memoryblock is faster than allocating a new one for each row.

129.3.15 **ReadRowMaskOnly(mem as memoryblock) as boolean**

MBS Images Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads the next row into the given memoryblock.  
**Notes:**  
Returns false on any error and true on success.  
Format is mask (inverse alpha) as in the example with one byte per pixel.  
Make sure the memoryblock has size from RowBytes property. Else you risk a crash.  
The data in memoryblock is width bytes long, 1/4 of the size of the memoryblock.  
See also PNGReaderMBS.RowBytes.  
ReadRow with reusing memoryblock is faster than allocating a new one for each row.

129.3.16 **ReadsRGBTag(byref file_srgb_intent as Integer) as boolean**

MBS Images Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads the sRGB tag.  
**Notes:** Returns true if the value was read into the given variable.

129.3.17 **RowBytes as Integer**

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The length of each row in bytes.

129.3.18 **Properties**

129.3.19 **AllowDamaged as Boolean**

MBS Images Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to return picture for files with damaged content.  
**Notes:**  
e.g. a half downloaded PNG file can still be processed and may give you a preview for the file.  
(Read and Write property)
129.3. **CLASS PNGREADERMBS**

### 129.3.20 BitDepth as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The bit depth of the PNG file. **Notes:** (Read and Write property)

### 129.3.21 ColorType as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color type of the PNG file.  
**Notes:**  
The value is a combination of this constants:

```
PNG_COLOR_MASK_PALETTE  = 1
PNG_COLOR_MASK_COLOR    = 2
PNG_COLOR_MASK_ALPHA    = 4
```

The PNG library will convert on reading every row into 32bit RGBA, so don’t worry about this.  
(Read and Write property)

### 129.3.22 Height as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height of the picture in pixels. **Notes:** (Read and Write property)

### 129.3.23 InterlaceType as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The interlace setting. **Notes:** (Read and Write property)

### 129.3.24 Interlacing as Integer

MBS Images Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the png file is interlaced. 
**Notes:**
Value is 1 if not interlaced and 7 if interlaced.
(Read and Write property)

### 129.3.25 Mask as Picture

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The mask of the picture.
**Notes:** (Read and Write property)

### 129.3.26 Pict as Picture

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The picture read.
**Notes:** (Read and Write property)

### 129.3.27 SourceData as String

MBS Images Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The source data used in Open functions.
**Example:**
```
dim p as PNGReaderMBS // your reader

// write data to file
dim fo as FolderItem = SpecialFolder.Desktop.Child("mbsout.png")
dim bo as BinaryStream = fo.CreateBinaryFile("") // BinaryStream.Create(fo,true) in newer RB Versions
bo.Write p.SourceData
```

**Notes:**
If you used OpenSpecialData, the data here is the PNG without the Apple modifications, but still with swapped colors.
This property is set by the OpenSpecialData, Open and OpenData functions.
(Read and Write property)
129.3.28 SourceFile as FolderItem

MBS Images Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The folderitem passed to the Open functions.
**Notes:**
This property is set by the Open and OpenFile functions.
(Read and Write property)

129.3.29 SwapRB as Boolean

MBS Images Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether to swap red and blue channels.
**Example:**
```vbnet
dim p as new PNGReaderMBS
p.SwapRB = true
```

**Notes:**
The PNG files for the iPhone have swapped channels so the iPhone does not need to swap them for display.
One of the tricks Apple uses for making the iPhone faster.
This flag is set to true by OpenSpecialData.
(Read and Write property)

129.3.30 Width as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The width of the picture in pixels.
**Notes:** (Read and Write property)

129.3.31 Events

129.3.32 Error(msg as string)

MBS Images Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The PNG library has an error message for you.
**Notes:** Processing will stop soon.
129.3.33 Warning(msg as string)

MBS Images Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The PNG library has a warning for you.
129.4. class PNGWriterMBS

129.4.1 class PNGWriterMBS

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class to write a PNG file.

**Example:**

```vbp
dim Current as PictureMBS ' your picture
dim f as FolderItem

f=GetsaveFolderItem(FileTypes.Png,"test.png")

if f<>Nil then
const PNG_COLOR_MASK_PALETTE = 1
const PNG_COLOR_MASK_COLOR = 2
const PNG_COLOR_MASK_ALPHA = 4

dim p as new PNGWriterMBS

p.Width=Current.Width
p.Height=Current.Height
p.Type=PNG_COLOR_MASK_COLOR
p.bpc=3
p.Rowbytes=p.Width*p.bpc

if p.OpenWriteDestination(f) then
if p.SetHeader(false, -1) then
if p.SetGamma(0) then
if p.WriteInfo then
    dim i,c as Integer
    
c=p.Height-1
    for i=0 to c
        p.WriteRow current.RowInFormat(i, Current.ImageFormatRGB)
    next
    
    if p.WriteEnd then
        MsgBox "OK"
    end if
end if
end if
end if
end if
end if
```
Notes:
You can use this class to write PNG files by row.

Based on LibPNG.

129.4.2 Methods

129.4.3 CloseDestination

129.4.4 Finish as string

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Finishes the PNG file and returns the PNG file content as string.
**Notes:** Returns "" on any error.

129.4.5 OpenWriteDestination(file as folderitem) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens the file to write.
**Notes:** If you pass nil for the file, the data is collected in memory and you can get it on the end using the Finish method.

129.4.6 PNGLibVersion as string

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The version of the PNG library compiled into the plugin.

129.4.7 SetAlphaData(alphas() as Integer, colors() as color) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the alpha data and the color palette.
**Notes:**
The array can have up to 256 colors. The color and the alpha arrays must have the same size. Returns true on success.

129.4.8 SetAlphas as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes the alpha data to the file.  
**Notes:**  
You must call SetAlphaData before. Returns true on success.

129.4.9 SetGamma(gamma as Double = 0.0) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Defines the gamma value and other options for the PNG file. 
**Notes:**  
Returns on success.

The gamma parameter defines what gamma correction is applied:  
positive value: use the value as the gamma correction  
zero: use default value (or value saved in file itself)  
negative value: do not correct gamma

Default for Mac is 1.8 and for Windows 2.2. If you use SRGB, the Gamma must be 2.2.

129.4.10 SetGrayPicture(pict as picture, mask as picture = nil) as boolean

MBS Images Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies a picture into the internal buffers for writing a Grayscale image file. 
**Notes:**  
This method sets width, height, type and bpc properties. Returns true on success.

Mask can be nil.
129.4.11  SetHeader(Interlace as boolean = false, Filter as Integer = -1, Compression as Integer = -1) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Defines the header options for the PNG file.
**Notes:**
Interlace is true the Adam7 interlacing is used.
FilterType specifies the filter:

```plaintext
const PNG_NO_FILTERS = 0
const PNG_FILTER_NONE = 8
const PNG_FILTER_SUB = 16
const PNG_FILTER_UP = 32
const PNG_FILTER_Avg = 64
const PNG_FILTER_PAETH = 128
const PNG_FILTER_ALL = 248
```

Compression can be between 0 (none) to 9 (max). Default is 6. Value -1 means the plugin will not change from default of PNG library. Normally you have no better compression for setting higher than 6, but only burn more CPU power.

129.4.12  SetICCProfile(name as string, CompressionType as Integer, Profile as string) as boolean

MBS Images Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a ICC Profile to the PNG.
**Notes:**
Name is the profile name as an ASCII string.
CompressionType is always 0 (PNG_COMPRESSION_TYPE_BASE).

129.4.13  SetPalette as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the palette data.
**Notes:** Returns true on success.
129.4.14 SetPaletteData(colors() as color) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the color palette.

**Notes:**
The array can have up to 256 colors.
Returns true on success.

129.4.15 SetPalettePicture(pict as picture) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies a picture into the internal buffers.

**Notes:**
You need to define the color palette before calling this method.

This method sets width, height, type and bpc properties.
Returns true on success.

129.4.16 SetResolution(ResolutionHorizontal as Integer, ResolutionVertical as Integer, Unit as Integer) as boolean

MBS Images Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the resolution of the PNG.

**Notes:**
Unit is ResolutionUnknown, ResolutionMeter or ResolutionDPI.
Internally the PNG saves only in dots per meter, so the plugin converts DPI to DPM for you.

129.4.17 SetRGBPicture(pict as picture, mask as picture = nil) as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies a picture into the internal buffers.

**Example:**

```// Write a RGBA PNG file```
```
dim current as Picture = LogoMBS(500)
```

```// create a mask```
```
dim g as Graphics = current.Mask.Graphics
```
```
g.ForeColor = & c FFFFFF
```
CHAPTER 129. PNG

```vbnet
g.FillRect 0,0,500,500
g.ForeColor = & c000000
g.FillOval 0,0,500,500

// show in window
window1.Backdrop = current

// and write to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")

dim p as new PNGWriterMBS

if p.OpenWriteDestination(f) then // open file
if p.SetRGBPicture(current, current.mask) then // set picture to write
if p.SetHeader(false, -1) then // setup file header
if p.SetGamma(0) then // and default gamma
if p.WriteInfo then // write file header
if p.WriteRows then // write pixels
if p.WriteEnd then // and write file end
p = nil // cleanup
f.Launch
end if
end if
end if
end if
end if

Notes:
This method sets width, height, type and bpc properties.
Returns true on success.

Mask can be nil.

129.4.18 SetRows(rows() as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Uses the given memoryblocks for row data.
Notes:
The memory is not copied, so keep the array alive!
This method sets height. You need to set width, bpc, type and rowbytes.
129.4. CLASS PNGWRITERMBS

Returns true on success.

129.4.19 SetsRGB(intent as Integer) as boolean

MBS Images Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Sets the sRGB intent.
Notes:
Possible values:

- const PNG_sRGB_INTENT_PERCEPTUAL = 0
- const PNG_sRGB_INTENT_RELATIVE = 1
- const PNG_sRGB_INTENT_SATURATION = 2
- const PNG_sRGB_INTENT_ABSOLUTE = 3

129.4.20 WriteEnd as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Finishes the writing.
Notes:
Returns true on success.
Do not call if you use WriteRows.

129.4.21 WriteInfo as boolean

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Writes the PNG file header.
Notes:
Returns true on success.
Do not call if you use WriteRows.

129.4.22 WriteRow(row as memoryblock)

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Writes one row of image data.
Notes:
The data must be in the RGBA format with one byte per value.
(4 bytes per Pixel)

Returns true on success.

Do not call if you use WriteRows.

129.4.23 WriteRows as boolean

Example:

```vbscript
// Write a RGB PNG file
dim current as Picture = LogoMBS(500)
dim f as FolderItem = SpecialFolder.Desktop.Child(“test.png”)
dim p as new PNGWriterMBS

if p.OpenWriteDestination(f) then // open file
if p.SetRGBPicture(current) then // set picture to write
if p.SetHeader(false, -1) then // setup file header
if p.SetGamma(0) then // and default gamma
if p.WriteInfo then // write file header
if p.WriteRows then // write pixels
if p.WriteEnd then // and write file end
  p = nil // cleanup
f.Launch
end if
end if
end if
end if
end if
end if
```

Notes: If you call this method, you need to call SetRGBPicture or SetPalettePicture before and you can’t call WriteInfo, WriteRow and WriteEnd.
129.4.24 Properties

129.4.25 bpc as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The bytes per pixel.

**Notes:**
Should be 3 for RGB, 1 for palette pictures and 4 for RGB with Alpha.
(Read and Write property)

129.4.26 Height as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height of the picture to write.

**Notes:** (Read and Write property)

129.4.27 Rowbytes as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The bytes per row.

**Notes:** (Read and Write property)

129.4.28 Type as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color type.

**Notes:**
The value is a combination of this constants:

- PNG_COLOR_MASK_PALETTE = 1
- PNG_COLOR_MASK_COLOR = 2
- PNG_COLOR_MASK_ALPHA = 4

(Read and Write property)
129.4.29 Width as Integer

MBS Images Plugin, Plugin Version: 9.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of the picture to write. **Notes:** (Read and Write property)

129.4.30 Events

129.4.31 Error(msg as string)

MBS Images Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The PNG library has an error message for you. **Notes:** Processing will stop soon.

129.4.32 Warning(msg as string)

MBS Images Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The PNG library has a warning for you.

129.4.33 Constants

129.4.34 ResolutionDPI = 2

MBS Images Plugin, Plugin Version: 10.1. **Function:** One of the resolution unit type constants. **Notes:** The unit for points per inch.

129.4.35 ResolutionMeter = 1

MBS Images Plugin, Plugin Version: 10.1. **Function:** One of the resolution unit type constants. **Notes:** The unit for points per meter.

129.4.36 ResolutionUnknown = 0

MBS Images Plugin, Plugin Version: 10.1. **Function:** One of the resolution unit type constants.
129.4.37 TypeGray = 0

MBS Images Plugin, Plugin Version: 12.5. **Function:** One of the type constants.  
**Notes:** Gray

129.4.38 TypeGrayA = 4

MBS Images Plugin, Plugin Version: 12.5. **Function:** One of the type constants.  
**Notes:** Gray with Alpha

129.4.39 TypePalette = 1

MBS Images Plugin, Plugin Version: 12.5. **Function:** One of the type constants.  
**Notes:** Palette

129.4.40 TypeRGB = 2

MBS Images Plugin, Plugin Version: 12.5. **Function:** One of the type constants.  
**Notes:** RGB

129.4.41 TypeRGBA = 6

MBS Images Plugin, Plugin Version: 12.5. **Function:** One of the type constants.  
**Notes:** RGB with Alpha.
Chapter 130

Power

130.1 class IOPMAssertionMBS

130.1.1 class IOPMAssertionMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for PowerManagement assertions. **Notes:** You use this class to block a Mac from sleeping display, disk or whole machine.

130.1.2 Methods

130.1.3 AssertionsByProcess as Dictionary

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary listing all assertions, grouped by their owning process. **Notes:**

Notes: One process may have multiple assertions. Several processes may have asserted the same assertion to different levels.

On success, this returns a dictionary of assertions per process. At the top level, keys to the Dictionary are pids stored as Integer. The value associated with each pid is an array of active assertions. Each entry in the array is an assertion represented as a Dictionary. See the keys kIOPMAssertionTypeKey and kIOPMAssertionLevelKey.
130.1.4 AssertionsStatus as Dictionary

Notes:
The system-wide level is the maximum of all individual assertions’ levels.

On success, this returns a Dictionary of all assertions currently available. The keys in the dictionary are the assertion types, and the value of each is a CFNumber that represents the aggregate level for that assertion.

130.1.5 Constructor(type as string, level as Integer, name as string)

130.1.6 CreateWithDescription(AssertionType as string, Name as string, Details as string = "", HumanReadableReason as string = "", LocalizationBundlePath as string = "", Timeout as Double = 0, TimeoutAction as string = "") as IOPMAssertionMBS

Notes:
This is the preferred API to call to create an assertion. It allows the caller to specify the Name, Details, and HumanReadableReason at creation time. There are other keys that can further describe an assertion, but most developers don’t need to use them. Use SetProperty or CreateWithProperties if you need to specify properties that aren’t available here.

AssertionType: An assertion type constant. Caller must specify this argument.
Name: A String value to correspond to key kIOPMAssertionNameKey. Caller must specify this argument.
Details: A String value to correspond to key kIOPMAssertionDetailsKey. Caller my pass "", but it helps power users and administrators identify the reasons for this assertion.
HumanReadableReason: A String value to correspond to key kIOPMAssertionHumanReadableReasonKey. Caller may pass "", but if it’s specified OS X may display it to users to describe the active assertions on their system.
LocalizationBundlePath: A String value to correspond to key kIOPMAssertionLocalizationBundlePathKey. This bundle path should include a localization for the string HumanReadableReason. Caller may pass "", but this argument is required if caller specifies HumanReadableReason.
Timeout: Specifies a timeout for this assertion. Pass 0 for no timeout.
TimeoutAction: Specifies a timeout action. Caller my pass "". If a timeout is specified but a TimeoutAction
130.1. **CLASS IOPMASSERTIONMBS**

is not, the default timeout action is kIOPMAssertionTimeoutActionTurnOff.

On success this function returns a new assertion.

### 130.1.7 **CreateWithHandle(Handle as Integer) as IOPMAssertionMBS**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new object with retaining given handle.

### 130.1.8 **CreateWithName(type as string, level as Integer, name as string) as IOPMAssertionMBS**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Dynamically requests a system behavior from the power management system. **Notes:** Create is deprecated in favor of CreateWithProperties. Please use that version of this API instead.

No special privileges are necessary to make this call - any process may activate a power assertion. Caller must specify an AssertionName - ”” is not a valid input.

- **Type**  The String assertion type to request from the PM system.
- **Level** Pass kIOPMAssertionLevelOn or kIOPMAssertionLevelOff.
- **Name** A string that describes the name of the caller and the activity being handled by this assertion (e.g. ”Mail Compacting Mailboxes”). Name may be no longer than 128 characters.

On success, returns an IOPMAssertionMBS object.

### 130.1.9 **CreateWithProperties(AssertionProperties as Dictionary) as IOPMAssertionMBS**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an IOPMAssertion with more flexibility than CreateWithDescription. **Notes:** AssertionProperties: Dictionary providing the properties of the assertion that need to be created. On successful return, returns the assertion.
Create a new PM assertion - the caller must specify the type of assertion, initial level, and its properties as IOPMAssertionDictionaryKeys keys in the AssertionProperties dictionary. The following keys are recommend and/or required to be specified in the AssertionProperties dictionary argument.

- Required kIOPMAssertionTypeKey define the assertion type.
- Required kIOPMAssertionValueKey define an initial value.
- Required kIOPMAssertionNameKey Caller must describe the name for the activity that requires the change in behavior provided by the assertion.
- Optional kIOPMAssertionDetailsKey Caller may describe context-specific data about the assertion.
- Optional kIOPMAssertionHumanReadableReasonKey Caller may describe the reason for creating the assertion in a localizable String. This should be a human readable phrase that describes the actions the calling process is taking while the assertion is held, like "Downloading TV episodes", or "Compiling Projects"
- Optional kIOPMAssertionLocalizationBundlePathKey Caller may provide its bundle's path, where OS X can localize for GUI display the String specified by kIOPMAssertionHumanReadableReasonKey.
- Optional kIOPMAssertionPlugInIDKey if the caller is a plugin with a different identity than the process it's loaded in.
- Optional kIOPMAssertionFrameworkIDKey if the caller is a framework acting on behalf of a process.
- Optional The caller may specify a timeout.

130.1.10 DeclareUserActivity(AssertionName as string, userType as Integer, byref AssertionID as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Declares that the user is active on the system.

Notes:
This causes the display to power on and postpone display sleep up to the user’s display sleep Energy Saver settings. If you prefer to hold the display awake for a longer period and you know how long you’d like to hold it, consider taking assertion kIOPMAssertionTypePreventUserIdleDisplaySleep using CreateWithDescription instead.

No special privileges are necessary to make this call - any process may call this API. Caller must specify an AssertionName.

AssertionName: A string that describes the name of the caller and the activity being handled by this assertion (e.g. "Mail Compacting Mailboxes"). Name may be no longer than 128 characters.
userType: This parameter specifies if the active user is located locally in front of the system or connected
to the system over the network. Various components of the system are maintained at different power levels depending on user location.

On Success, unique id will be returned in this parameter. Caller may call this function again with the unique id returned previously to report continuous user activity. The unique id returned by this function may change on each call depending on how frequently this function call is repeated and the current display sleep timer value. If you make this call more than once, track the returned value for assertionID, and pass it in as an argument on each call.

Returns kIOReturnSuccess (0) on success, any other return indicates PM could not successfully activate the specified assertion.

130.1.11 Properties as Dictionary

130.1.12 SetProperty(key as string, value as Variant) as boolean

```vba
dim t as string = IOPMAssertionMBS.kIOPMAssertionTypePreventUserIdleDisplaySleep
dim l as Integer = IOPMAssertionMBS.kIOPMAssertionLevelOn
dim a as IOPMAssertionMBS = IOPMAssertionMBS.CreateWithName(t, l, "Working")
if a.SetProperty(IOPMAssertionMBS.kIOPMAssertionNameKey, "test") then
    MsgBox a.name
end if
```

Notes:

Only the process that created an assertion may change its properties.
key: The string key to modify.
Value: The property to set. It must be a number or string, as specified by the property key named in key.
Returns false on any error and true on success.
130.1.13 Properties

130.1.14 Details as String

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The details for this assertion. Notes: You may provide extra, contextual information about an assertion for admins and for debugging in this key. Setting this key in an assertion dictionary is optional.

Please name your assertion something unique with kIOPMAssertionNameKey first. If you have more data to describe this assertion, put it here as a String.

Example: OS X creates an assertion named com.apple.powermanagement.tty to prevent sleep for remote-logged in users. To identify the cause for these assertions, OS X sets kIOPMAssertionDetailsKey to the String device path of the active remote session(s), e.g. "/dev/ttys000" or "/dev/ttys004"

The String you associate with this key does not have to be localizable (OS X will not attempt to localize it.) (Read and Write property)

130.1.15 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal handle to the assertion. Notes: Zero is not a valid ID. (Read only property)

130.1.16 HumanReadableReason as String

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Optional value that provides a localizable string for OS X to display PM Assertions in the GUI. Notes: The caller should specify this string in CreateWithProperties. If present, OS X may display this string, localized to the user’s language, to explain changes in system behavior caused by the assertion.

If set, the caller must also specify a bundle path for the key kIOPMAssertionLocalizationBundlePathKey. The bundle at that path should contain localization info for the specified string.
130.1.17  **Level as Integer**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The assertion level.  
**Notes:** (Read and Write property)

130.1.18  **LocalizationBundlePath as String**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Refers to a string, identifying the path to the caller’s bundle, which contains localization info.  
**Notes:** (Read and Write property)

130.1.19  **Name as String**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the assertion.  
**Example:**

```vba
dim t as string = IOPMAssertionMBS.kIOPMAssertionTypePreventUserIdleDisplaySleep
dim l as Integer = IOPMAssertionMBS.kIOPMAssertionLevelOn
dim a as IOPMAssertionMBS = IOPMAssertionMBS.CreateWithName(t, l, "Working")
MsgBox a.Name
```

**Notes:**

kIOPMAssertionNameKey describes the the activity the assertion is protecting. The creator should specify a String value for this key in the dictionary passed to CreateWithProperties.

The assertion name is separate from the assertion type’s behavior - specify a String like "Checking mail" or "Compiling" that describes the task that this assertion protects.

The String you associate with this key does not have to be localizable (OS X will not attempt to localize it.) (Read and Write property)
130.1.20 **RetainCount as Integer**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The retain count of the object.
**Notes:** (Read only property)

130.1.21 **Timeout as Double**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies an outer bound, in seconds, that this assertion should be asserted.
**Notes:**
If your application hangs, or is unable to complete its assertion task in a reasonable amount of time, specifying a timeout allows PM to disable your assertion so the system can resume normal activity. Once a timeout with the kIOPMAssertionTimeoutActionTurnOff assertion fires, the level will be set to kIOPMAssertionTimeoutActionTurnOff. The assertion may be re-armed by calling IOPMAssertionSetLevel. (Read and Write property)

130.1.22 **TimeoutAction as String**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the action to take upon timeout expiration.
**Notes:**
Specifying the timeout action only has meaning if you also specify an kIOPMAssertionTimeoutKey. If the caller does not specify a timeout action, the default action is kIOPMAssertionTimeoutActionTurnOff. (Read and Write property)

130.1.23 **Type as String**

MBS MacOSX Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The assertion type.
**Notes:**
The value for this key will be a CFStringRef, with the value of the assertion type specified at creation time. Note that OS X may substitute a support assertion type string if the caller specifies a deprecated assertion type; in that case the value for this key could differ from the caller-provided assertion type. (Read and Write property)
130.1.24 Constants

130.1.25 kIOPMAssertionDetailsKey = ”Details”

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the keys for the properties dictionary. **Notes:**

You may provide extra, contextual information about an assertion for admins and for debugging in this key. Setting this key in an assertion dictionary is optional.

Please name your assertion something unique with kIOPMAssertionNameKey first. If you have more data to describe this assertion, put it here as a String.

Example: OS X creates an assertion named com.apple.powermanagement.tty to prevent sleep for remote-logged in users. To identify the cause for these assertions, OS X sets kIOPMAssertionDetailsKey to the String device path of the active remote session(s), e.g. ”/dev/tty000” or ”/dev/tty004”

The String you associate with this key does not have to be localizable (OS X will not attempt to localize it.)

Describe your assertion as thoroughly as possible. See these other keys that can you can set to add explanation to an assertion:

- Optional kIOPMAssertionNameKey
- Optional kIOPMAssertionHumanReadableReasonKey
- Optional kIOPMAssertionLocalizationBundlePathKey

130.1.26 kIOPMAssertionFrameworkIDKey = ”FrameworkBundleID”

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the keys for the properties dictionary.

130.1.27 kIOPMAssertionHumanReadableReasonKey = ”HumanReadableReason”

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the keys for the properties dictionary. **Notes:**

Optional key that provides a localizable string for OS X to display PM Assertions in the GUI.

The caller should specify this string in CreateWithProperties. If present, OS X may display this string, localized to the user’s language, to explain changes in system
behavior caused by the assertion.

If set, the caller must also specify a bundle path for the key `kIOPMAssertionLocalizationBundlePathKey`. The bundle at that path should contain localization info for the specified string.

This key may be specified in the dictionary passed to `CreateWithProperties`. This key may be present in the dictionary returned from `Properties`.

Describe your assertion as thoroughly as possible. See these other keys that can you can set to add explanation to an assertion:

- Required `kIOPMAssertionNameKey`
- Optional `kIOPMAssertionDetailsKey`

### 130.1.28 `kIOPMAssertionLevelKey` = ”AssertLevel”

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the keys for the properties dictionary. **Notes:** The Dictionary key for assertion level in an assertion info dictionary.

The value for this key will be an integer with value `kIOPMAssertionLevelOff` or `kIOPMAssertionLevelOn`. The level reflects the assertion’s level set at creation, or adjusted via `IOPMAssertionSetLevel`.

### 130.1.29 `kIOPMAssertionLevelOff` = 0

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** Level for a disabled assertion, passed as an argument to `Create`.

### 130.1.30 `kIOPMAssertionLevelOn` = 255

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** Level for an enabled assertion, passed as an argument to `Create`. **Example:**

```vbnet
dim t as string = IOPMAssertionMBS.kIOPMAssertionTypePreventUserIdleDisplaySleep
dim l as Integer = IOPMAssertionMBS.kIOPMAssertionLevelOn
dim a as IOPMAssertionMBS = IOPMAssertionMBS.CreateWithName(t, l, ”Working”)
MsgBox a.Name
```
130.1.31 kIOPMAssertionLocalizationBundlePathKey = "BundlePath"

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the keys for the properties dictionary. **Notes:** Refers to a string, identifying the path to the caller’s bundle, which contains localization info.

130.1.32 kIOPMAssertionNameKey = "AssertName"

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the keys for the properties dictionary.  
**Example:**
```vba
    dim t as string = IOPMAssertionMBS.kIOPMAssertionTypePreventUserIdleDisplaySleep
    dim l as Integer = IOPMAssertionMBS.kIOPMAssertionLevelOn
    dim a as IOPMAssertionMBS = IOPMAssertionMBS.CreateWithName(t, l, "Working")
    dim d as Dictionary = a.Properties
    dim v as String = d.Value(IOPMAssertionMBS.kIOPMAssertionNameKey)
    MsgBox v
```

**Notes:**  
The Dictionary key for assertion name. Setting this key is required when you’re creating an assertion.

kIOPMAssertionNameKey describes the the activity the assertion is protecting. The creator should specify a String value for this key in the dictionary passed to CreateWithProperties.

The assertion name is separate from the assertion type’s behavior - specify a String like "Checking mail" or "Compiling" that describes the task that this assertion protects.

The String you associate with this key does not have to be localizable (OS X will not attempt to localize it.)

Describe your assertion as thoroughly as possible. See these other keys that can you can also set to add explanation to an assertion:

- Optional kIOPMAssertionDetailsKey
- Optional kIOPMAssertionHumanReadableReasonKey
- Optional kIOPMAssertionLocalizationBundlePathKey
130.1.33 kIOPMAssertionPlugInIDKey = "PlugInBundleID"

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the keys for the properties dictionary.

130.1.34 kIOPMAssertionRetainCountKey = "RetainCount"

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the keys for the properties dictionary. **Notes:** The retain count of the object.

130.1.35 kIOPMAssertionTimeoutActionKey = "TimeoutAction"

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the keys for the properties dictionary. **Notes:** Specifies the action to take upon timeout expiration. Specifying the timeout action only has meaning if you also specify an kIOPMAssertionTimeoutKey. If the caller does not specify a timeout action, the default action is kIOPMAssertionTimeoutActionTurnOff. This key may be specified in the dictionary passed to CreateWithProperties. This key may be present in the dictionary returned from Properties.

130.1.36 kIOPMAssertionTimeoutActionLog = "TimeoutActionLog"

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the values for kIOPMAssertionTimeoutActionKey. **Notes:** When this timeout action is specified, PM will log the timeout event but will not turn off or affect the setting of the assertion in any way.

130.1.37 kIOPMAssertionTimeoutActionRelease = "TimeoutActionRelease"

MBS MacOSX Plugin, Plugin Version: 13.2. **Function:** One of the values for kIOPMAssertionTimeoutActionKey. **Notes:** When a timeout expires with this action, Power Management will log the timeout event, and will release the assertion.
130.1.38  kIOPMAssertionTimeoutActionTurnOff = ”TimeoutActionTurnOff”

MBS MacOSX Plugin, Plugin Version: 13.2. Function: One of the values for kIOPMAssertionTimeoutActionKey.
Notes: When a timeout expires with this action, Power Management will log the timeout event, and will set the assertion’s level to kIOPMAssertionLevelOff.

130.1.39  kIOPMAssertionTimeoutKey = ”TimeoutSeconds”

MBS MacOSX Plugin, Plugin Version: 13.2. Function: One of the keys for the properties dictionary.
Notes: Specifies an outer bound, in seconds, that this assertion should be asserted.

If your application hangs, or is unable to complete its assertion task in a reasonable amount of time, specifying a timeout allows PM to disable your assertion so the system can resume normal activity. Once a timeout with the kIOPMAssertionTimeoutActionTurnOff assertion fires, the level will be set to kIOPMAssertionTimeoutActionTurnOff. The assertion may be re-armed by calling IOPMAssertionSetLevel.

This key may be specified in the dictionary passed to CreateWithProperties. This key may be present in the dictionary returned from Properties.

130.1.40  kIOPMAssertionTypeKey = ”AssertType”

MBS MacOSX Plugin, Plugin Version: 13.2. Function: One of the keys for the properties dictionary.
Example:

```vbnet
dim t as string = IOPMAssertionMBS.kIOPMAssertionTypePreventUserIdleDisplaySleep
dim l as Integer = IOPMAssertionMBS.kIOPMAssertionLevelOn
dim a as IOPMAssertionMBS = IOPMAssertionMBS.CreateWithName(t, l, ”Working”)  
dim d as Dictionary = a.Properties
dim v as String = d.Value(IOPMAssertionMBS.kIOPMAssertionTypeKey)
MsgBox v
```

Notes: The dictionary key for assertion type in an assertion info dictionary.

The value for this key will be a CFStringRef, with the value of the assertion type specified at creation time. Note that OS X may substitute a support assertion type string if the caller specifies a deprecated assertion type; in that case the value for this key could differ from the caller-provided assertion type.
130.1.41 kIOPMAssertionTypePreventSystemSleep = "PreventSystemSleep"

MBS MacOSX Plugin, Plugin Version: 13.2. Function: One of the assertion types.
Notes:
Prevents the system from sleeping and allows the system to reside in Dark Wake for an arbitrary length of
time.

When asserted and set to level kIOPMAssertionLevelOn, the system will prefer to enter the Dark Wake state, or remain in Dark Wake if already there, rather than go to sleep.

Assertions are just suggestions to the OS, and the OS can only honor them to the best of its ability. In the case of low power or a thermal emergency, the system may sleep anyway despite the assertion.

An assertion must publish the AssertionType in its assertion properties dictionary. The AssertionType should be a key in the properties dictionary, with a value of a CFNumber containing the kCFNumberIntegerType value kIOPMAssertionLevelOff or kIOPMAssertionLevelOn.

130.1.42 kIOPMAssertionTypePreventUserIdleDisplaySleep = "PreventUserIdleDisplaySleep"

MBS MacOSX Plugin, Plugin Version: 13.2. Function: One of the assertion types.
Notes:
Prevents the display from dimming automatically.

When asserted and set to level kIOPMAssertionLevelOn, will prevent the display from turning off due to a period of idle user activity. Note that the display may still sleep from other reasons, like a user closing a portable’s lid or the machine sleeping. If the display is already off, this assertion does not light up the display. If display needs to be turned on, then consider calling function IOPMAssertionDeclareUserActivity. While the display is prevented from dimming, the system cannot go into idle sleep.
This assertion has no effect if the system is in Dark Wake.

130.1.43 kIOPMAssertionTypePreventUserIdleSystemSleep = "PreventUserIdleSystemSleep"

MBS MacOSX Plugin, Plugin Version: 13.2. Function: One of the assertion types.
Notes:
130.1. CLASS IOPMASSERTIONMBS

Prevents the system from sleeping automatically due to a lack of user activity. When asserted and set to level kIOPMAssertionLevelOn, will prevent the system from sleeping due to a period of idle user activity.

The display may dim and idle sleep while kIOPMAssertionTypePreventUserIdleSystemSleep is enabled, but the system may not idle sleep. The system may still sleep for lid close, Apple menu, low battery, or other sleep reasons.

This assertion has no effect if the system is in Dark Wake.

130.1.44 kIOPMAssertPreventDiskIdle = "PreventDiskIdle"

MBS MacOSX Plugin, Plugin Version: 13.2. Function: One of the assertion types. Notes: Prevent attached disks from idling into lower power states.

When asserted and set to level kIOPMAssertionLevelOn, will prevent attached disks and optical media from idling into lower power states. Apps who rely on real-time access to disks should create this assertion to avoid latencies caused by disks changing power states. For example, audio and video performance or recording apps may benefit from this assertion. Most Apps should not take this assertion; preventing disk idle consumes battery life, and most apps don’t require the low latency disk access that this provides. This assertion doesn’t increase a disk’s power state (it just prevents that device from idling). After creating this assertion, the caller should perform disk I/O on the necessary drives to ensure that they’re in a usable power state. The system may still sleep while this assertion is active. Callers should also take kIOPMAssertionTypePreventUserIdleSystemSleep if necessary, to prevent idle system sleep.

130.1.45 kIOPMUserActiveLocal = 0

MBS MacOSX Plugin, Plugin Version: 13.2. Function: One of the user activity constants. Notes: User is local on the system

130.1.46 kIOPMUserActiveRemote = 1

MBS MacOSX Plugin, Plugin Version: 13.2. Function: One of the user activity constants. Notes: Remote User connected to the system.
130.2  class IOPMMBS

130.2.1  class IOPMMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Mac OS X class which can control the energy settings.

**Example:**

```vbnet
dim p as new IOPMMBS
Listbox1.AddRow "EthernetWakeOnLANSettings: " + str(p.EthernetWakeOnLANSettings)
Listbox1.AddRow "GeneralAggressiveness: " + str(p.GeneralAggressiveness)
Listbox1.AddRow "MinutesToDim: " + str(p.MinutesToDim)
Listbox1.AddRow "MinutesToSleep: " + str(p.MinutesToSleep)
Listbox1.AddRow "MinutesToSpinDown: " + str(p.MinutesToSpinDown)
Listbox1.AddRow "MotionSensor: " + str(p.MotionSensor)
Listbox1.AddRow "PowerSource: " + str(p.PowerSource)
Listbox1.AddRow "SetProcessorSpeed: " + str(p.SetProcessorSpeed)
```

**Notes:** The functions and properties are not described from Apple.

130.2.2  Properties

130.2.3  Handle as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference for the power manager.

**Notes:**

If this value is zero, the properties will not work.

(Read and Write property)

130.2.4  EthernetWakeOnLANSettings as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The setting for whether ethernet wake on LAN.

**Notes:**

Value is 1 if you enable this option in the energy system control panel and 0 if you disable it.

(Read and Write computed property)
130.2.5 GeneralAggressiveness as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The general aggressiveness.  
**Notes:** (Read and Write computed property)

130.2.6 MinutesToDim as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minutes until the display is dimmed.  
**Example:**
```
dim p as new IOPMMBS  
p.MinutesToDim=10 // dim display in 10 minutes  
```

**Notes:**  
This value is the same as in the energy system control panel.  
(Read and Write computed property)

130.2.7 MinutesToSleep as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time in minutes until the Mac goes to sleep.  
**Example:**
```
dim p as new IOPMMBS  
p.MinutesToSleep=10 // sleep display in 10 minutes  
```

**Notes:** (Read and Write computed property)

130.2.8 MinutesToSpinDown as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time in minutes until the hard discs spin down.  
**Notes:**  
If you enable the spin down option in the energy system control panel, this value is 10 and if you disable it, it is 180.
(Read and Write computed property)

130.2.9 MotionSensor as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The setting for the motion sensor. **Notes:** (Read and Write computed property)

130.2.10 PowerSource as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The power source settings. **Notes:**

Constants for this property:

```plaintext
const kIOPMInternalPower = 1
const kIOPMExternalPower = 2
```

(Read and Write computed property)

130.2.11 SetProcessorSpeed as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The setting for the processor speed. **Notes:** (Read and Write computed property)
130.3  class IOPowerSourcesMBS

130.3.1  class IOPowerSourcesMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class to look on all the power sources on a Mac OS X based computer.

**Example:**

```vbs
Dim i As IOPowerSourcesMBS
Dim j, n As Integer

i = New IOPowerSourcesMBS
n = i.Count - 1
For j = 0 To n
    CFShowMBS i.Item(j)  // Print battery info to console.
Next
```

**Notes:** Requires Mac OS X.

130.3.2  Methods

130.3.3  ExternalPowerAdapterDetails as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a CFDictionary that describes the attached (AC) external power adapter (if any external power adapter is attached).

**Example:**

```vbs
Dim d As CFDictionaryMBS = IOPowerSourcesMBS.ExternalPowerAdapterDetails
Dim dic As Dictionary = d.Dictionary

Dim lines() As String
lines.Append "AdapterRevision: " + dic.Lookup("AdapterRevision", ")
lines.Append "AdapterID: " + dic.Lookup("AdapterID", ")
lines.Append "FamilyCode: " + dic.Lookup("FamilyCode", ")
lines.Append "SerialNumber: " + dic.Lookup("SerialNumber", ")
lines.Append "Watts: " + dic.Lookup("Watts", ")
```

MsgBox Join(lines, EndOfLine)

**Notes:**
CHAPTER 130. POWER

Returns a CFDictionary on success.
If no adapter is attached, or if there's an error, returns nil.

130.3.4 Item(index as Integer) as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Ask for the power source description with the given index.
Example:
```
dim i as new IOPowerSourcesMBS
i.Update
MsgBox i.Item(0).XML.Str // shows dictionary for first power source
```

Notes: Index is from 0 to count-1.

130.3.5 Update

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Queries for new power sources and updates the item array.
Example:
```
dim i as new IOPowerSourcesMBS
i.Update
MsgBox str(i.Count)
```

130.3.6 Properties

130.3.7 Count as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The number of registered power sources.
Example:
```
dim i as new IOPowerSourcesMBS
i.Update
MsgBox str(i.Count)
```

Notes: (Read only property)
130.3.8 Events

130.3.9 Changed

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The state of one power source changed.

**Notes:** Whenever something changes around the power sources, you are notified with this event.
130.4 class SleepNotificationMBS

130.4.1 class SleepNotificationMBS

MBS MacOSX Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class to listen for sleep notifications on Mac OS X.
**Notes:**
Uses IOKit.

Your application can use the sleep event to deny idle sleep, i.e. sleep after a period of inactivity. Applications should not deny idle sleep unless absolutely necessary.

The kIOMessage* constants in this class are declared in the Mac OS X headers, but they are not all used by the system.

In the plugins is the WakeNotifierMBS class and the SleepNotificationMBS class. WakeNotifierMBS uses the API coming from Mac OS and it can delay sleep. SleepNotificationMBS works on the lower Next APIs.

130.4.2 Properties

130.4.3 running as Boolean

MBS MacOSX Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Whether this notification class is working.
**Notes:**
Value is true on MachO targets.
(Read and Write property)

130.4.4 Events

130.4.5 Sleep(message as int64) as boolean

MBS MacOSX Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A message was received.
**Notes:**
Use the constants to check what message you got.

Return true to deny or false to allow.
On the Can Messages the plugin informs the system about Deny or Allow, but on the Will messages, it will not answer if you return true, so the system will wait for an answer and delay sleep. There seems to be no way to delay more than 30 seconds when the user selects the sleep menu command.

The message parameter is an int64 in Plugin version 9.7 so the integer comparison to the constants works better.

130.4.6 Constants

130.4.7 kIOMessageCanSystemPowerOff = & he0000240

MBS MacOSX Plugin, Plugin Version: 8.0. Function: One of the message constants.

130.4.8 kIOMessageCanSystemSleep = & he0000270

MBS MacOSX Plugin, Plugin Version: 8.0. Function: One of the message constants.
Notes:
Idle sleep is about to kick in.
Applications have a chance to prevent sleep by returning true in the sleep event. Most applications should not prevent idle sleep.

Power Management waits up to 30 seconds for you to either allow or deny idle sleep. If you don’t acknowledge this power change by returning true or false, the system will wait 30 seconds then go to sleep.

130.4.9 kIOMessageSystemHasPoweredOn = & he0000300

MBS MacOSX Plugin, Plugin Version: 8.0. Function: One of the message constants.

130.4.10 kIOMessageSystemWillNotPowerOff = & he0000260

MBS MacOSX Plugin, Plugin Version: 8.0. Function: One of the message constants.
130.4.11  kIOMessageSystemWillNotSleep = \& he0000290

MBS MacOSX Plugin, Plugin Version: 8.0. **Function:** One of the message constants.

130.4.12  kIOMessageSystemWillPowerOff = \& he0000250

MBS MacOSX Plugin, Plugin Version: 8.0. **Function:** One of the message constants.

130.4.13  kIOMessageSystemWillPowerOn = \& he0000320

MBS MacOSX Plugin, Plugin Version: 8.0. **Function:** One of the message constants.

130.4.14  kIOMessageSystemWillRestart = \& he0000310

MBS MacOSX Plugin, Plugin Version: 8.0. **Function:** One of the message constants.

130.4.15  kIOMessageSystemWillSleep = \& he0000280

MBS MacOSX Plugin, Plugin Version: 8.0. **Function:** One of the message constants.
class WakeNotifierMBS

Function: Notification and statistics about sleeping off a Mac.

Notes:
For Mac OS X 10.5.6 you see the SleepDemand and the WakeUp events when your Mac sleeps and wakes up.

In the plugins is the WakeNotifierMBS class and the SleepNotificationMBS class. WakeNotifierMBS uses the API coming from Mac OS and it can delay sleep. SleepNotificationMBS works on the lower Next APIs.

Properties

CallEvents as boolean

Function: whether or not to call the events of this class.

Notes:
Default is false.
(Read and Write property)

DisableSleep as boolean

Function: Disabled sleep if a sleep request comes?

Notes:
Not used if you have code in the SleepRequest event handler.
(Read and Write property)

HadSleeped as boolean

Function: Slept since last reset?

Notes:
You can set this value to false to reset it.
(Read and Write property)
130.5.6 LastSleepTime as Double

Function: Last time in absolute seconds when fell asleep.
Notes:
Changed type from integer to double in version 4.2.
Value is the same as in date.totalseconds.
(Read and Write property)

130.5.7 LastWakeTime as Double

Function: Last time in absolute seconds when waken up.
Notes:
Changed type from integer to double in version 4.2.
Value is the same as in date.totalseconds.
(Read and Write property)

130.5.8 SleepCount as Integer

Function: Count of sleep demands.
Notes: (Read only property)

130.5.9 SleepEventCount as Integer

Function: Counts how often the Power Manager calls the sleep notification function.
Notes:
For debugging so you know that sleep requests are handled.
(Read and Write property)
130.5. CLASS WAKENOTIFIERMBS

130.5.10 Valid as boolean

**Function:** Returns True if the sleep event handler could be installed.
**Notes:**
False, if no Power Manager is installed.
(Read only property)

130.5.11 WakeCount as Integer

**Function:** Count of waking up.
**Notes:** (Read only property)

130.5.12 Events

130.5.13 SleepDemand

MBS MacClassic Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. 
**Function:** Called just before falling asleep.

130.5.14 SleepRequest as boolean

MBS MacClassic Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. 
**Function:** Can be go sleeping?
**Notes:**
Return true to deny sleeping.
Returning nothing or false will put the Mac to sleep.

130.5.15 SleepRevoke

MBS MacClassic Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. 
**Function:** Called when a sleep request was denied by an application or a device driver.
130.5.16 WakeUp

MBS MacClassic Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when the Mac wakes up.
130.6  class WindowsPowerStateMBS

130.6.1  class WindowsPowerStateMBS

MBS Win Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to watch for power changes on a computer using Microsoft Windows as operation system.  
**Notes:**
Not all Windows versions call the same/all events.

This function listens for WM_POWERBROADCAST sent to all applications.

see

130.6.2  Events

130.6.3  BatteryLow

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The BatteryLow event is broadcast to notify applications that battery power is low.

130.6.4  OEMEvent(eventcode as Integer)

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The OEMEvent event is broadcast when an APM BIOS signals an APM OEM event.  
**Notes:**
eventcode: A DWORD value that specifies the OEM-defined event code that was signaled by the system's APM BIOS. OEM event codes are in the range &h0200 - &h02FF.

Because not all APM BIOS implementations provide OEM event notifications, this event may never be broadcast on some computers.

130.6.5  PowerStatusChange

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The PowerStatusChange event is broadcast when a change in the power status of the computer is detected, such as a switch from battery power to A/C.  
**Notes:** The system also broadcasts this event when remaining battery power slips below the threshold
specified by the user or if the battery power changes by a specified percentage.

130.6.6 QueryStandby(PromptUser as boolean) as boolean

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The QueryStandby event is broadcast to request permission to set the computer into standby mode.
**Notes:**
An application that grants permission should carry out preparations for the suspension before returning.

PromptUser: If true, the application can prompt the user for directions on how to prepare for the suspension; otherwise, the application must prepare without user interaction.

Return true to deny the request, false to grant the request.

An application should process this event by first determining whether permission to go to standby mode can be granted. It must not grant permission if doing so would cause a loss of data. The application can prompt the user for directions on how to prepare for suspension only if PromptUser is set.

The system allows approximately 20 seconds for an application to remove the message that is sending the QueryStandby event from the application’s message queue. If an application does not remove the message from its queue in less than 20 seconds, the system will assume that the application is in a non-responsive state, and that the application agrees to the sleep request. Applications that do not process their message queues may have their operations interrupted. After it removes the message from the message queue, an application can take as much time as needed to perform any required operations before entering the sleep state. Any operations that could take longer than 20 seconds should be performed at this time, since the system allows only 20 seconds for operations to complete during standby processing.

130.6.7 QueryStandbyFailed

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The QueryStandbyFailed event is broadcast as a notification that permission to go to standby mode was denied.
**Notes:** This event is broadcast if any application or driver returned false to a previous QueryStandby event.

130.6.8 QuerySuspend(PromptUser as boolean) as boolean

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The QuerySuspend event is broadcast to request permission to suspend the computer.
**Notes:**
An application that grants permission should carry out preparations for the suspension before returning.

PromptUser: If true, the application can prompt the user for directions on how to prepare for the suspension; otherwise, the application must prepare without user interaction.

Return true to deny the request, false to grant the request.

An application should process this event by first determining whether permission to suspend can be granted. It must not grant permission if doing so would cause a loss of data. The application can prompt the user for directions on how to prepare for suspension only if PromptUser is set.

The system allows approximately 20 seconds for an application to remove the message that is sending the QuerySuspend event from the application’s message queue. If an application does not remove the message from its queue in less than 20 seconds, the system will assume that the application is in a non-responsive state, and that the application agrees to the sleep request. Applications that do not process their message queues may have their operations interrupted. After it removes the message from the message queue, an application can take as much time as needed to perform any required operations before entering the sleep state. Any operations that could take longer than 20 seconds should be performed at this time, since the system allows only 20 seconds for operations to complete during Suspend processing.

130.6.9 QuerySuspendFailed

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The QuerySuspendFailed event is broadcast as a notification that permission to suspend the computer was denied.

**Notes:** This event is broadcast if any application or driver returned false to a previous QuerySuspend event.

130.6.10 ResumeAutomatic

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The ResumeAutomatic event is broadcast when the computer wakes up automatically to handle an event.

**Notes:** An application will not generally respond unless it is handling the event, because the user is not present.

130.6.11 ResumeCritical

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The ResumeCritical event is broadcast as a notification that the system has resumed operation.

**Notes:** This event can indicate that some or all applications did not receive a Suspend event. For example,
this event can be broadcast after a critical suspension caused by a failing battery.

130.6.12 ResumeStandby

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The ResumeStandby event is broadcast as a notification that the system has resumed operation after being put to standby.

130.6.13 ResumeSuspend

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The ResumeSuspend event is broadcast as a notification that the system has resumed operation after being suspended.

130.6.14 Standby

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The Standby event is broadcast immediately before the computer enters a standby state.
**Notes:** This event is typically broadcast when all applications and installable drivers have returned okay to a previous QueryStandby event.

130.6.15 Suspend

MBS Win Plugin, Plugin Version: 6.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The Suspend event is broadcast immediately before the computer enters a suspended state.
**Notes:** This event is typically broadcast when all applications and installable drivers have returned okay to a previous QuerySuspend event.
Chapter 131

Printing

131.1  Globals

131.1.1  NewCPMPageFormatMBS as CPMPageFormatMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Creates a new page format object.
Notes: Returns nil on any error.

131.1.2  NewCPMPrintSessionMBS as CPMPrintSessionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Creates a new print session object.
Example:

'get a print session

// print this PDF
    dim pathPrinted as FolderItem=GetFolderItem("test.pdf")

    dim thePrintSession as CPMPrintSessionMBS = NewCPMPrintSessionMBS
    if thePrintSession = nil then Return

    'get default page format and print settings and attach it to the print settings
    dim thePageFormat as CPMPageFormatMBS = NewCPMPageFormatMBS
    dim thePrintSettings as CPMPrintSettingsMBS = NewCPMPrintSettingsMBS
    thePrintSession.DefaultPageFormat thePageFormat
    thePrintSession.DefaultPrintSettings thePrintSettings
show the print dialog if not thePrintSession.PrintDialog(thePrintSettings, thePageFormat) then return

open the file which will be printed dim thePdfDocument as CGPDFDocumentMBS = pathPrinted.OpenAsCGPDFDocumentMBS

limit page counts to the one we have dim LastPage as Integer = thePdfDocument.PageCount if thePrintSettings.LastPage<lastpage then lastpage=thePrintSettings.LastPage end if

you get better progress bar if you tell how many pages will come thePrintSettings.LastPage=lastpage

begin the printing thePrintSession.BeginDocument(thePrintSettings, thePageFormat)

loop over the number of copies for currentCopy as Integer = 1 to thePrintSettings.Copies

loop over the pages for currentPage as Integer = thePrintSettings.FirstPage to LastPage

prepage the page dim PrintRect as CPMRectMBS =thePageFormat.AdjustedPageSize dim CGRect as CGRectMBS =CGMakeRectMBS(PrintRect.left, PrintRect.top, PrintRect.Width, PrintRect.Height) thePrintSession.BeginPage(thePageFormat, nil) dim thePrintContext as CGContextMBS = thePrintSession.PageContext if thePrintContext = Nil then return

print the page thePrintContext.DrawCGPDFDocument thePdfDocument, CGRect, currentPage

end the page thePrintContext = nil thePrintSession.EndPage next

end the printing thePrintSession.EndDocument
131.2. **CLASS CPMLANGUAGEINFOMBS**

**Notes:** Returns nil on any error.

131.1.3 **NewCPMPrintSettingsMBS as CPMPrintSettingsMBS**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new print settings object. **Notes:** Returns nil on any error.

131.2 **class CPMLanguageInfoMBS**

131.2.1 **class CPMLanguageInfoMBS**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a language info. **Notes:** Only a data class.

131.2.2 **Properties**

131.2.3 **Level as String**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The level string of the printer. **Notes:** (Read and Write property)

131.2.4 **Release as String**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The release string of the printer. **Notes:** (Read and Write property)

131.2.5 **Version as String**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The version string of the printer. **Notes:** (Read and Write property)
131.3   class CPMPageFormatMBS

131.3.1   class CPMPageFormatMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a page format.

131.3.2   Methods

131.3.3   AdjustedPageSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The adjusted page size.
**Notes:** Lasterror is set.

131.3.4   AdjustedPaperSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The adjusted page size.
**Notes:** Lasterror is set.

131.3.5   Constructor

MBS MacCG Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new page format object.

131.3.6   CopySettings(Destination as CPMPageFormatMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Copies the settings to another pageformat object.

131.3.7   CreateDataRepresentation(Format as Integer = 0) as String

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a data representation of a PMPageFormat object as a data string.
**Example:**
131.3. CLASS CPMPAGEFORMATMBS

```vbscript
dim p as new CPMPageFormatMBS
p.orientation = p.kPMLandscape
dim d as string = p.CreateDataRepresentation
break // check in debugger
```

Notes:
Use CreateWithDataRepresentation to create a CPMPageFormatMBS from a string created by this call. Format can be kPMDataFormatXMLDefault, kPMDataFormatXMLMinimal or kPMDataFormatXMLCompressed.

131.3.8 CreateWithDataRepresentation(Data as String) as CPMPageFormatMBS

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Creates a PMPageFormat object from a data representation created with CreateDataRepresentation.
Example:
```vbscript
dim p as new CPMPageFormatMBS
p.orientation = p.kPMLandscape
dim d as string = p.CreateDataRepresentation

dim other as CPMPageFormatMBS = CPMPageFormatMBS.CreateWithDataRepresentation(d)
MsgBox str(other.Orientation)
```

Notes: Returns nil in case of error.

131.3.9 PrinterID as String

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Obtains the formatting printer for the pageformat.
Notes: Will either return the formatting printer for the pageformat or will return nil if the pageformat doesn’t have that information.

131.3.10 UnadjustedPageSize as CPMRectMBS

Notes: Lasterror is set.
131.3.11 UnadjustedPaperSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The unadjusted page size. **Notes:** Lasterror is set.

131.3.12 Properties

131.3.13 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle for the page format. **Notes:** It’s a PMPageFormat which you find in CMTypes.h in the Toolbox. (Read and Write property)

131.3.14 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The error code from the last command. **Notes:** 0 if successful, -1 if function is not available or a required parameter was not set. Else a Mac OS error code. (Read and Write property)

131.3.15 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether the destructor will release the handle. **Notes:** (Read and Write property)

131.3.16 Orientation as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The page orientation. **Example:**

```vba
dim p as new CPMPageFormatMBS
p.orientation = p.kPMLandscape
```
Notes:
Lasterror is set.

Possible values:

- kPMPortrait: 1
- kPMLandscape: 2
- kPMReversePortrait: 3 (will revert to kPortrait for current drivers)
- kPMReverseLandscape: 4 (will revert to kLandscape for current drivers)

(Read and Write computed property)

### 131.3.17 Scale as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The page scaling.

**Notes:**
- Lasterror is set.
- Value is 100 for 100%.
  (Read and Write computed property)

### 131.3.18 Constants

#### 131.3.19 kPMDataFormatXMLCompressed = 2

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the data formats constants.

**Notes:** kPMDataFormatXMLCompressed is only compatible and usable with Mac OS X version 10.5 and later. Data in this format can be only be reconstituted into the equivalent printing manager object with the appropriate PMXXXCreateWithDataRepresentation function. The data representation produced when using kPMDataFormatXMLCompressed is approximately 20 times smaller than kPMDataFormatXMLDefault. This format is a good choice when execution on versions of Mac OS X prior to 10.5 is not necessary and the minimum data size is important.
131.3.20  kPMDataFormatXMLDefault = 0

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the data formats constants. **Notes:** Specifies a data format that is compatible with all Mac OS X versions. Data in this format can be used with the PMUnflattenXXX routines present in all versions of Mac OS X prior to 10.5. However, this data representation is much larger than the more modern data representations described below.

131.3.21  kPMDataFormatXMLMinimal = 1

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the data formats constants. **Notes:** XMLMinimal is only compatible and usable with Mac OS X version 10.5 and later. Data in this format can be only be reconsistuted into the equivalent printing manager object with the appropriate CreateWithDataRepresentation function. The data representation produced when using kPMDataFormatXMLMinimal is approximately 3-5 times smaller than kPMDataFormatXMLDefault. This format is a good choice when execution on versions of Mac OS X prior to 10.5 is not necessary and an uncompressed XML representation of the data is needed.

131.3.22  kPMLandscape = 2

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the orientation constants. **Notes:** Landscape

131.3.23  kPMPortrait = 1

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the orientation constants. **Notes:** Portrait

131.3.24  kPMReverseLandscape = 4

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the orientation constants. **Notes:** Reverse Landscape

131.3.25  kPMReversePortrait = 3

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the orientation constants. **Notes:** Reverse Portrait
131.4  class CPMPrinterMBS

131.4.1  class CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a printer.

131.4.2  Methods

131.4.3  Constructor(name as string)

MBS MacCG Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Initializes a new printer object given the printer name.
**Notes:**
Raises exception if lookup fails.
This accepts both CUPS names and the Mac GUI names in printing control panel.

131.4.4  CreateFromPrinterID(PrinterID as String) as CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Create a PMPrinter instance from the supplied printerID.
**Example:**
```vbscript
dim p as CPMPrinterMBS = CPMPrinterMBS.CreateFromPrinterID("Brother DCP 8085DN")
MsgBox p.name
```

131.4.5  CreateGenericPrinter as CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a generic PMPrinter.

131.4.6  CreateLocalPrinterList as CPMPrinterMBS()

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Queries list of local printers.
**Example:**
dim a() as CPMPrinterMBS = CPMPrinterMBS.CreateLocalPrinterList
for each p as CPMPrinterMBS in a
    MsgBox p.Name
next

131.4.7 DescriptionURL as string

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Returns the description URL for this printer.
Example:

dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
dim printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox printer.DescriptionURL

Notes:
Should be the path to a PPD file for a laser printer.
Lasterror is set.

131.4.8 DeviceURI as string

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Hand back the URI of the printer’s device.
Example:

dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
dim printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox printer.DeviceURI

Notes:
On success returns a CFURLMBS object describing the printer’s device.
Lasterror is set.
131.4.9  DriverCreator as String

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a 4 letter code for the creator of the printer.

**Example:**

```vba
    dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
    dim printer as CPMPrinterMBS = session.CurrentPrinter
    MsgBox "DriverCreator: "+str(printer.DriverCreator)
```

**Notes:** Lasterror is set.

131.4.10  DriverReleaseInfo as CPMVersionMBS

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries printer driver version.

131.4.11  HostName as string

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Hand back the host name of the print server hosting the printer’s print queue.

**Example:**

```vba
    dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
    dim printer as CPMPrinterMBS = session.CurrentPrinter
    MsgBox "HostName: "+str(printer.HostName)
```

**Notes:** Lasterror is set.

131.4.12  ID as string

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the string.
131.4.13 IndexedPrinterResolution(index as Integer) as CPMResolutionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a printer resolution.  
**Notes:**  
Lasterror is set.  
Index is from 1 to ResolutionCount.

131.4.14 IsDefault as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this printer is the default printer.  
**Example:**

dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS  
dim printer as CPMPrinterMBS = session.CurrentPrinter  
MsgBox "IsDefault: " + str(printer.IsDefault)

131.4.15 IsFavorite as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Return true if the printer is in the user’s favorite printer list.  
**Example:**

dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS  
dim printer as CPMPrinterMBS = session.CurrentPrinter  
MsgBox "IsFavorite: " + str(printer.IsFavorite)

131.4.16 IsPostScriptCapable as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Can this printer do postscript?  
**Example:**

dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS  
dim printer as CPMPrinterMBS = session.CurrentPrinter  
MsgBox "IsPostScriptCapable: " + str(printer.IsPostScriptCapable)
Notes: Lasterror is set.

131.4.17  **IsPostScriptPrinter as boolean**

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
If the result is true if the printer is a PostScript printer.  
**Example:**
```vbscript
dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
dim printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox "IsPostScriptPrinter: " + str(printer.IsPostScriptPrinter)
```

Notes: A PostScript printer is one whose driver takes PostScript directly.

131.4.18  **IsRemote as boolean**

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Hand back a boolean indicating whether the printer is hosted by remote print server.  
**Example:**
```vbscript
dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
dim printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox "IsRemote: " + str(printer.IsRemote)
```

Notes:
If result is true, the print queue represents a printer hosted and managed by a remote print server.

If result is false, the print queue represents a directly connected printer, a network printer, or a remote printer that is locally managed. Consult the queue’s device URI to determine the type of connection that is used to communicate with the printer.

Whether a printer is remote is derived from the CUPS printer-type attribute for the print queue.
131.4.19  **LanguageInfo as CPMLanguageInfoMBS**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns language information about the printer.  
**Notes:** Lasterror is set.

131.4.20  **Location as string**

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the location of the printer.

131.4.21  **MakeAndModelName as string**

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A string with the name for the model and the maker.  
**Notes:**  
Lasterror is set.  
Returns "" on any error.

131.4.22  **Name as string**

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the string.  
**Example:**
```vbscript
dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
dim printer as CPMPrinterMBS = session.CurrentPrinter
MsgBox printer.name
```

131.4.23  **ResolutionCount as Integer**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns how much resolutions are supported by the printer.  
**Notes:** Lasterror is set.
131.4.24 SetDefault

MBS MacCG Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Set the default printer for the current user.
**Notes:**
It is not typical for an application to set the current default printer for the user; the printing system itself
takes care of managing the default printer.
This function should be used only in rare circumstances.

Requires Mac OS X 10.5.

131.4.25 State as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Queries printer state.
**Example:**
```vba
dim p as CPMPrinterMBS = CPMPrinterMBS.CreateFromPrinterID("Brother DCP 8085DN")
MsgBox str(p.State)
```
**Notes:** Can be kPMPrinterIdle, kPMPrinterProcessing or kPMPrinterStopped.

131.4.26 Properties

131.4.27 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The handle for the printer.
**Notes:**
It’s a PMPrinter which you find in CMTypes.h in the Toolbox.
(Read and Write property)

131.4.28 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The error code from the last command.
**Notes:**
0 if successfull, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
131.4.29 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether the destructor will release the handle. **Notes:** (Read and Write property)

131.4.30 Constants

131.4.31 kPMPrinterIdle = 3

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the printer state constants. **Notes:** Printer is idle.

131.4.32 kPMPrinterProcessing = 4

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the printer state constants. **Notes:** Printer is processing.

131.4.33 kPMPrinterStopped = 5

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the printer state constants. **Notes:** Printer is stopped.
131.5 class CPMPrintSessionMBS

131.5.1 class CPMPrintSessionMBS

Notes: Works only in Carbon Stuff and can only be used with CGContext which works only on Mac OS X.

131.5.2 Methods

131.5.3 BeginDocument(settings as CPMPrintSettingsMBS, pageformat as CPMPageFormatMBS)

Notes: Lasterror is set.

131.5.4 BeginDocumentNoDialog(settings as CPMPrintSettingsMBS, pageformat as CPMPageFormatMBS)

Notes: Doesn’t use the print progress dialog.
Lasterror is set.

131.5.5 BeginPage(pageformat as CPMPageFormatMBS, rect as CPMRectMBS)

Notes: Lasterror is set.

131.5.6 BeginPageNoDialog(pageformat as CPMPageFormatMBS, rect as CPMRectMBS)

Notes:
Doesn’t use the print progress dialog.
LastError is set.

131.5.7 Constructor

MBS MacCG Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new print session object.

131.5.8 CreatePrinterList(list() as string)

MBS MacCG Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a list of all printers.
**Example:**

```vba
dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS

dim list() as string
session.CreatePrinterList(list)
MsgBox join(list, EndOfLine)
```

**Notes:**
List is an array of strings with the names of the printers.
LastError is set.
See also:

- 131.5.9 CreatePrinterList(list() as string, byref index as Integer, byref currentprinter as CPMPrinterMBS)

131.5.9 CreatePrinterList(list() as string, byref index as Integer, byref currentprinter as CPMPrinterMBS)

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a list of all printers.
**Example:**

```vba
dim session as CPMPrintSessionMBS = NewCPMPrintSessionMBS

dim list() as string
dim currentprinter as CPMPrinterMBS
dim index as Integer
```
131.5. **CLASS CPMPRINTSESSIONMBS**

```vbnet
session.CreatePrinterList(list, index, currentprinter)

MsgBox join(list, EndOfLine)
```

**Notes:**
List is an array of strings with the names of the printers.
Index is the index of the current printer inside this list.
CurrentPrinter is the current printer selected.
Lasterror is set.
See also:

- 131.5.8 `CreatePrinterList(list() as string)`

### 131.5.10 **DefaultPageFormat(pageformat as CPMPPageFormatMBS)**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the page format object to the default settings.
**Notes:** Lasterror is set.

### 131.5.11 **DefaultPrintSettings(printsettings as CPMPrintSettingsMBS)**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the settings object to the default settings.
**Notes:** Lasterror is set.

### 131.5.12 **EndDocument**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Ends the current document.
**Notes:** Lasterror is set.

### 131.5.13 **EndDocumentNoDialog**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Ends the current document.
**Notes:** Doesn’t use the print progress dialog.
Lasterror is set.
131.5.14  EndPage

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Ends the current page.
**Notes:** Lasterror is set.

131.5.15  EndPageNoDialog

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Ends the current page.
**Notes:**
Doesn’t use the print progress dialog.
Lasterror is set.

131.5.16  GetDestinationFormat(printsettings as CPMPrintSettingsMBS) as String

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the destination format value.
**Notes:** Lasterror is set.

131.5.17  GetDestinationLocation(printsettings as CPMPrintSettingsMBS) as String

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the destination location value.
**Notes:** Lasterror is set.

131.5.18  GetDestinationType(printsettings as CPMPrintSettingsMBS) as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the destination type value.
**Notes:** Lasterror is set.
131.5. CLASS CPMPRINTSESSIONMBS

131.5.19  kPMDocumentFormatDefault as String

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the document format.

131.5.20  kPMDocumentFormatPDF as String

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the document format.

131.5.21  kPMDocumentFormatPostScript as string

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the document format.

131.5.22  kPMGraphicsContextCoreGraphics as string

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the graphics context.

131.5.23  kPMGraphicsContextDefault as string

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the graphics context.

131.5.24  PageContext as CGContextMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGContext object for the current page. **Notes:** Lasterror is set.

131.5.25  PageSetupDialog(pageformat as CPMPageFormatMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Shows the page setup dialog.
131.5.26  PrintDialog(settings as CPM::PrintSettingsMBS, pageformat as CPM::PageFormatMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Shows the print dialog.
**Notes:** Lasterror is set.

131.5.27  SetDestination(printsettings as CPM::PrintSettingsMBS, desttype as Integer, destformat as String, desturl as String)

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets a new destination.
**Notes:**
Some destinations so you may need to specify a format, else you can pass "" for the default format. Some destinations require a URL to a file.

Destination type codes:

- kPMDestinationInvalid 0
- kPMDestinationPrinter 1
- kPMDestinationFile 2
- kPMDestinationFax 3
- kPMDestinationPreview 4

Destformat strings:

- kPMDocumentFormatPDF application/pdf
- kPMDocumentFormatPICT application/vnd.apple.printing-pict
- kPMDocumentFormatPICTPS application/vnd.apple.printing-pict-ps
- kPMDocumentFormatPostScript application/postscript

Lasterror is set.
131.5.28 **UseSheets**(docWindow as window)

MBS MacCG Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Specifies that a printing dialog should be displayed as a sheet.
**Notes:**
docWindow: The window to which the sheet dialog should be attached.
LastError is set. (-1 for the docWindow parameter being nil)

131.5.29 **ValidatePageFormat**(pageformat as CPMPageFormatMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Validates the page format.
**Notes:** Lasterror is set.

131.5.30 **ValidatePrintSettings**(printsettings as CPMPrintSettingsMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Validates the print settings.
**Notes:** Lasterror is set.

131.5.31 **Properties**

131.5.32 **handle** as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle for the print session.
**Notes:**
It’s a PMPrintSession which you find in CMTypes.h in the Toolbox.
(Read and Write property)

131.5.33 **LastError** as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The error code from the last command.
**Notes:**
0 if successful, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
(Read and Write property)
131.5.34 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** whether the destructor will release the handle. **Notes:** (Read and Write property)

131.5.35 SheetTarget as Window

MBS MacCG Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The window set by UseSheets. **Notes:** This property is to reference the window used for the sheets so REALbasic does not destroy the window too early. (Read and Write property)

131.5.36 CurrentPrinter as CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The current printer for this session. **Notes:** Lasterror is set. Setting this can only be done on Mac OS X. (Read and Write computed property)

131.5.37 CurrentPrinterName as string

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The current printer for this session by name. **Notes:** Lasterror is set. (Read and Write computed property)

131.5.38 Events

131.5.39 SheetDone( WindowHandle as Integer, accepted as boolean)

MBS MacCG Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called for a finished print sheet.
131.5. CLASS CPMPRINTSESSIONMBS

Notes: Accepted is false if the cancel button was used. True if OK was clicked.

131.5.40 Constants

131.5.41 kPMDestinationFax = 3
MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the destination types. **Notes:** Fax

131.5.42 kPMDestinationFile = 2
MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the destination types. **Notes:** File

131.5.43 kPMDestinationInvalid = 0
MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the destination types. **Notes:** Invalid

131.5.44 kPMDestinationPreview = 4
MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the destination types. **Notes:** Preview

131.5.45 kPMDestinationPrinter = 1
MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the destination types. **Notes:** Printer

131.5.46 kPMDestinationProcessPDF = 5
MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the destination types. **Notes:** Process to PDF
131.5.47 kPMDestinationTypeDefault = 1

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the destination types. **Notes:** Default is printer.
131.6. CLASS CPMPRINTSETTINGSMBS

131.6. class CPMPrintSettingsMBS

131.6.1. class CPMPrintSettingsMBS

131.6.2. Methods

131.6.3. Constructor

131.6.4. CopyPrintSettings(dest as CPMPrintSettingsMBS)

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Copes the settings to the other settings.

131.6.5. CreateDataRepresentation(Format as Integer = 0) as String

Example:
```vba
dim p as new CPMPrintSettingsMBS
p.Collate = true
p.Duplex = p.kPMDuplexTumble
dim data as string = p.CreateDataRepresentation
Break // check in debugger
```

131.6.6. CreateWithDataRepresentation(Data as String) as CPMPrintSettingsMBS

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Creates a PMPageFormat object from a data representation created with CreateDataRepresentation.
131.6.7 Dictionary as Dictionary

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Represent these print settings as a dictionary.

131.6.8 GetPageRange(byref minPage as UInt32, byref maxPage as UInt32)

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Queries the page range to print.
**Notes:**
Obtains the valid range of pages that can be printed.
The default page range is 1 - (all pages). The page range is something that is set by the application. It is NOT the first and last page to print. It serves as limits for setting the first and last page.

131.6.9 Keys as String()

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Queries list of keys.
**Example:**
```vbnet
dim p as new CPMPrintSettingsMBS
p.Collate = true
p.Duplex = p.kPMDuplexTumble
dim keys() as string = p.keys
Break // check in debugger
```

131.6.10 SetPageRange(minPage as UInt32, maxPage as UInt32)

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the page range to print.

131.6.11 Properties

131.6.12 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The handle for the print settings.
**Notes:**
131.6. **CLASS CPMPRINTSETTINGSMBS**

It’s a PMPrintSettings which you find in CMTypes.h in the Toolbox.

(Read and Write property)

### 131.6.13 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The error code from the last command.

**Notes:**
0 if successful, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
(Read and Write property)

### 131.6.14 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
whether the destructor will release the handle.

**Notes:** (Read and Write property)

### 131.6.15 Collate as boolean

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The collate setting.

**Notes:** (Read and Write computed property)

### 131.6.16 Copies as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The number of copies that the user requests to be printed.

**Notes:**
Lasterror is set.
(Read and Write computed property)

### 131.6.17 Duplex as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The duplex setting.

**Notes:** (Read and Write computed property)
131.6.18 FirstPage as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The number of the first page to print.
**Notes:**
Lasterror is set.
(Read and Write computed property)

131.6.19 JobName as String

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Specifies the name of a print job.
**Notes:**
Lasterror is set.
(Read and Write computed property)

131.6.20 LastPage as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The number of the last page to print.
**Example:**
'get a print session

// print this PDF
dim pathPrinted as FolderItem=GetFolderItem("test.pdf")

dim thePrintSession as CPMPrintSessionMBS = NewCPMPrintSessionMBS
if thePrintSession = nil then Return

'get default page format and print settings and attach it to the print settings
dim thePageFormat as CPMPageFormatMBS = NewCPMPageFormatMBS
dim thePrintSettings as CPMPrintSettingsMBS = NewCPMPrintSettingsMBS
thePrintSession.DefaultPageFormat thePageFormat
thePrintSession.DefaultPrintSettings thePrintSettings

'show the print dialog
if not thePrintSession.PrintDialog(thePrintSettings,thePageFormat) then return

'open the file which will be printed
dim thePdfDocument as CGPDFDocumentMBS = pathPrinted.OpenAsCGPDFDocumentMBS

' limit page counts to the one we have
dim LastPage as Integer = thePdfDocument.PageCount
if thePrintSettings.LastPage < lastpage then
lastpage = thePrintSettings.LastPage
end if

' you get better progress bar if you tell how many pages will come
thePrintSettings.LastPage = lastpage

' begin the printing
thePrintSession.BeginDocument(thePrintSettings, thePageFormat)

' loop over the number of copies
for currentCopy as Integer = 1 to thePrintSettings.Copies

' loop over the pages
for currentPage as Integer = thePrintSettings.FirstPage to LastPage

' prepage the page
dim PrintRect as CPMRectMBS = thePageFormat.AdjustedPageSize
dim CGRect as CGRectMBS = CGMakeRectMBS(PrintRect.left, PrintRect.top, PrintRect.Width, PrintRect.Height)
thePrintSession.BeginPage(thePageFormat, nil)
dim thePrintContext as CGContextMBS = thePrintSession.PageContext
if thePrintContext = Nil then return

' print the page
thePrintContext.DrawCGPDFDocument thePdfDocument, CGRect, currentPage

' end the page
thePrintContext = nil
thePrintSession.EndPage
next

next

' end the printing
thePrintSession.EndDocument

Notes:
Lasterror is set.
(Read and Write computed property)
131.6.21  **Value(key as String) as Variant**

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The value in settings.

**Example:**

```vba
dim p as new CPMPrintSettingsMBS
p.Collate = true
dim value as Variant = p.value("com.apple.print.PrintSettings.PMCopyCollate")
Break // check in debugger
```

**Notes:** (Read and Write computed property)

131.6.22  **Constants**

131.6.23  **kPMDuplexNone = 1**

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the duplex mode constants.

**Notes:** Duplex off.

131.6.24  **kPMDuplexNoTumble = 2**

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the duplex mode constants.

**Notes:** Duplex with no tumble.

131.6.25  **kPMDuplexTumble = 3**

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the duplex mode constants.

**Notes:** Duplex with tumble.

131.6.26  **kPMSimplexTumble = 4**

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the duplex mode constants.

**Notes:** No duplex.
131.7  CLASS CPMRECTMBS

131.7  class CPMRectMBS

131.7.1  class CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a rectangle.  
**Notes:** Only a data class.

131.7.2  Properties

131.7.3  Bottom as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The bottom distance to the border.  
**Notes:** (Read and Write property)

131.7.4  Height as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The height of the rectangle.  
**Notes:** Setting the height changes the bottom property.  
(Read and Write property)

131.7.5  Left as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The left distance to the border.  
**Notes:** (Read and Write property)

131.7.6  Right as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The right distance to the border.  
**Notes:** (Read and Write property)
131.7.7  Top as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The top distance to the border.  
**Notes:** (Read and Write property)

131.7.8  Width as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The width of the rectangle.  
**Notes:** Setting the height changes the right property.  
(Read and Write property)
131.8. **CLASS CPMRESOLUTIONMBS**

131.8 **class CPMResolutionMBS**

131.8.1 **class CPMResolutionMBS**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a resolution.
**Notes:** Only a data class.

131.8.2 **Properties**

131.8.3 **Horizontal as Double**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The horizontal resolution.
**Notes:** (Read and Write property)

131.8.4 **Vertical as Double**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The vertical resolution.
**Notes:** (Read and Write property)
131.9 class CPMVersionMBS

131.9.1 class CPMVersionMBS

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class for version information.

131.9.2 Properties

131.9.3 CountryCode as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The country code.
**Notes:** (Read and Write property)

131.9.4 LongVersion as String

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The long version string.
**Notes:** (Read and Write property)

131.9.5 ShortVersion as String

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The short version string.
**Notes:** (Read and Write property)

131.9.6 VersionMajor as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The major version number.
**Notes:** (Read and Write property)

131.9.7 VersionMinor as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The minor version number.
131.9. CLASS CPMVERSIONMBS

Notes: (Read and Write property)

131.9.8 VersionRevision as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The reversion number.
**Notes:** (Read and Write property)

131.9.9 VersionStage as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The version stage.
**Notes:** (Read and Write property)
131.10 class WindowsAddPrintJobMBS

131.10.1 class WindowsAddPrintJobMBS

MBS Win Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to send raw data to a printer.

**Example:**

```vbs
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

dim w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
MsgBox "OpenPrinter failed. Is the printer name correct in the source code?"
Return
end if

const DocName = "My Document"

if not w.StartDocPrinter("My Document", w.kDataFormatRAW) then
MsgBox "StartDocPrinter failed."
Return
end if

MsgBox "Print Job ID: " +str(w.JobID)

call w.StartPagePrinter

dim PostScript as string = "% !PS" +EndOfLine.UNIX +".1 setgray" +EndOfLine.UNIX +"0 0 100 100 rect-fill" +EndOfLine.UNIX +"showpage" +EndOfLine.UNIX

dim BytesSent as Integer = w.WritePrinter(PostScript)

MsgBox str(BytesSent) +" bytes of " +str(lenb(PostScript)) +" bytes sent."

call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer
```

**Notes:**

Perfect for printing postscript data to a postscript printer.
You can use this class in several ways:
131.10. CLASS WINDOWSADDPRINTJOBMBS

1. OpenPrinter, AddJob, WriteJob and ScheduleJob.

131.10.2 Methods

131.10.3 AddJob as boolean

MBS Win Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Creates a new print job.
Notes: Returns true on success and false on failure.

131.10.4 ClosePrinter

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Closes printer connection.

131.10.5 EndDocPrinter as boolean

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The EndDocPrinter function ends a print job for the specified printer.
Notes:
If the function succeeds, the return value is a true.

The EndDocPrinter function returns an error if the print job was not started by calling the StartDocPrinter function.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it may fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many
factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

### 131.10.6 EndPagePrinter as boolean

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The EndPagePrinter function notifies the print spooler that the application is at the end of a page in a print job.  
**Notes:**  
If the function succeeds, the return value is a true.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

### 131.10.7 OpenPrinter(PrinterName as string) as boolean

MBS Win Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Opens the printer for printing.  
**Notes:**  
Returns true on success and false on failure.  
PrinterName can be "" for the default printer.

### 131.10.8 ScheduleJob as boolean

MBS Win Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Schedules the printing.  
**Notes:** Returns true on success and false on failure.
131.10. CLASS WINDOWSADDPRINTJOBMBS

131.10.9 StartDocPrinter(DocName as string, Datatype as string) as boolean

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The StartDocPrinter function notifies the print spooler that a document is to be spooled for printing.

**Example:**

```vbnet
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

dim w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
    MsgBox "OpenPrinter failed. Is the printer name correct in the source code?"
    Return
end if

const DocName = "My Document"

if not w.StartDocPrinter("My Document", w.kDataFormatRAW) then
    MsgBox "StartDocPrinter failed."
    Return
end if

MsgBox "Print Job ID: " + str(w.JobID)

call w.StartPagePrinter

dim PostScript as string = "% !PS" + EndOfLine.UNIX + ".1 setgray" + EndOfLine.UNIX + "0 0 100 100 rect-fill" + EndOfLine.UNIX + "showpage" + EndOfLine.UNIX

dim BytesSent as Integer = w.WritePrinter(PostScript)

MsgBox str(BytesSent) + " bytes of " + str(lenb(PostScript)) + " bytes sent."

call w.EndPagePrinter

call w.EndDocPrinter

w = nil // close printer
```

**Notes:**

DocName: A string that specifies the name of the document.

OutputFile: Optional a path string or a folderitem that specifies the name of an output file. To print to a printer, set this to "" or nil or leave away.

Datatype: A string that identifies the type of data used to record the document.
If the function succeeds, the return value is true and the JobID property is set.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

### 131.10.10 StartDocPrinter(DocName as string, OutputFile as folderitem, Datatype as string) as boolean

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**

The StartDocPrinter function notifies the print spooler that a document is to be spooled for printing.

**Example:**

```vbnet
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

dim w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
    MsgBox "OpenPrinter failed. Is the printer name correct in the source code?"
    Return
end if

const DocName = "My Document"

// output to a file
dim file as FolderItem = SpecialFolder.Desktop.Child("test.ps")

if not w.StartDocPrinter("My Document", file, w.kDataFormatRAW) then
```
MsgBox "StartDocPrinter failed."
Return
end if

MsgBox "Print Job ID: " + str(w.JobID)
call w.StartPagePrinter

dim PostScript as string = "% !PS" + EndOfLine.UNIX +".1 setgray" + EndOfLine.UNIX +"0 0 100 100 rect-fill" + EndOfLine.UNIX +"showpage" + EndOfLine.UNIX

dim BytesSent as Integer = w.WritePrinter(PostScript)

MsgBox str(BytesSent) + " bytes of " + str(lenb(PostScript)) + " bytes sent."
call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer

Notes:

DocName: A string that specifies the name of the document.
OutputFile: Optional a path string or a folderitem that specifies the name of an output file. To print to a printer, set this to "" or nil or leave away.
Datatype: A string that identifies the type of data used to record the document.

If the function succeeds, the return value is true and the JobID property is set.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

### 131.10.13 WriteJob(data as string) as Integer

**MBS Win Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.** **Function:** Adds data to the spool file.

**Notes:**

You need to pass raw data for the printer, e.g. postscript data.

Returns the number of bytes written.

So lenb(data) should be equal to the result.

Only available between a call to AddJob and ScheduleJob.

### 131.10.14 WritePrinter(data as string) as Integer

**MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.** **Function:** The WritePrinter function notifies the print spooler that data should be written to the specified printer.

**Notes:**

- data: The data that should be written to the printer.

If the function succeeds, the return value is a true.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a high-level document (such as an Adobe PDF or Microsoft Word file) or other printer data (such as PCL, PS, or HPGL) is sent directly to a printer, the print settings defined in the document take precedent
over Windows print settings.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

131.10.15 Properties

131.10.16 JobID as Integer

MBS Win Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The JobID of this print. **Notes:** For information only. Maybe be useful for the user to find this print job later. (Read and Write property)

131.10.17 JobPath as String

MBS Win Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file name of the temporary file used. **Notes:** Just for information and only available between a call to AddJob and ScheduleJob. (Read and Write property)

131.10.18 lastError as Integer

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code. **Notes:** Zero for no error. -1 if the plugin has a problem like invalid parameter or called on Mac/Linux. others are Windows error codes. (Read and Write property)
131.10.19 lastErrorMessage as String

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The localized text message for LastError property.
**Notes:** (Read and Write property)

131.10.20 PrinterHandle as Integer

MBS Win Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The handle to the printer.
**Notes:** (Read and Write property)

131.10.21 Constants

131.10.22 kDataFormatRAW = ”RAW”

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the data format constants.
**Notes:** Use this constant if you send to both local and networked printers that use GDI-based printer drivers.

131.10.23 kDataFormatXPS_PASS = ”XPS_PASS”

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the data format constants.
**Notes:** Use this constant to send printer control data directly to printers that use XPSDrv printer drivers.
**131.11. class WindowsDeviceModeMBS**

**131.11.1. class WindowsDeviceModeMBS**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for device mode information for a Windows printer.

**Example:**

```vbs
dim d as new WindowsDeviceModeMBS
dim name as string = "My printer"

// here we define which values we want to change
d.Fields = d.DM_ORIENTATION

// and change value
//d.Orientation = d.DMORIENT PORTRAIT

dim w as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
if w.ChangePrinterSettings(d, 2) then
    MsgBox "OK"
else
    MsgBox "Failed"
end if
```

**Notes:**

Basicly this class wraps the Windows DEVMODE structure.

For more information on the DEVMODE structure, visit this website:

**131.11.2. Methods**

**131.11.3. ApplyToSetupString(SetupString as String) as string**

MBS Win Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Applies current device mode to the given setup string.

**Example:**

```vbs
dim p as new PrinterSetup
if p.PageSetupDialog then
    dim w as WindowsDeviceModeMBS = WindowsDeviceModeMBS.FromSetupString(s)
```
w.Copies = 3
w.Fields = BitwiseOr(w.Fields, w.DM_COPIES)

dim s as string = w.SetupString
dim t as string = w.ApplyToSetupString(s)

Break // check
end if

Notes:
The setup string contains a device mode and we replace the one from Xojo with our own.
The other information is kept the same.

131.11.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Creates a new empty device mode.
**Notes:** Size is set for you to default name of the data structure.

131.11.5 FromRawData(data as memoryblock, Unicode as boolean = true) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Creates a new WindowsDeviceModeMBS object with given data.
**Notes:**
The data is expected to the in format of DEVMODEW structure with some extra data and the right values inside.
If Unicode is true, we use DEVMODEW and if Unicode is false, we use DEVMODEA structure.
See also:

- 131.11.6 FromRawData(data as string, Unicode as boolean = true) as WindowsDeviceModeMBS

131.11.6 FromRawData(data as string, Unicode as boolean = true) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Creates a new WindowsDeviceModeMBS object with given data.
**Notes:**
The data is expected to be in the format of DEVMODEW structure with some extra data and the right values inside.
If Unicode is true, we use DEVMODEW and if Unicode is false, we use DEVMODEA structure.
See also:

- 131.11.5 FromRawData(data as memoryblock, Unicode as boolean = true) as WindowsDeviceModeMBS
  17816

131.11.7 FromSetupString(SetupString as String) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Initialized DevMode object from setup string.
**Example:**

dim p as new PrinterSetup

// setup something
call p.PageSetupDialog

// now we have nice setupstring
dim ss as string = p.SetupString

// parse it in device mode
dim d as WindowsDeviceModeMBS = WindowsDeviceModeMBS.FromSetupString(ss)

// duplex is?
MsgBox "Duplex: " +str(d.Duplex)

// change printer
d.DeviceName = "Deskjet 2540 series# :2"

// enable duplex
d.Fields = BitwiseOr(d.Fields, d.DM DUPLEX)
d.Duplex = d.DMDUP HORIZONTAL

// now duplex is?
MsgBox "Duplex: " +str(d.Duplex)

// get back as setup string
dim da as string = d.SetupString

if da = "" then
  MsgBox "failed to create setup string"
  Return
end if

// assign back
p.SetupString = da

// take a look
call p.PageSetupDialog

// and print something
dim g as Graphics = OpenPrinter(p)

g.DrawString "Page 1", 20, 20

g.NextPage

g.DrawString "Page 2", 20, 20

Notes:
You can pass string from PrinterSetup.SetupString.

Supports Xojo 2017r1 with 17.3 plugins.

131.11.8 RawData(Unicode as boolean = true) as memoryblock

Notes:
Returns nil on any error.
If Unicode is true, we use DEVMODEW and if Unicode is false, we use DEVMODEA structure.

131.11.9 SetupString(ActualHorizontalResolution as integer, ActualVerticalResolution as integer, MaxHorizontalResolution as integer, MaxVerticalResolution as integer, MarginLeft as integer = 2500, MarginRight as integer = 2500, MarginTop as integer = 2500, MarginBottom as integer = 2500, MinMarginLeft as integer = 0, MinMarginRight as integer = 0, MinMarginTop as integer = 0, MinMarginBottom as integer = 0, PageSetupFlags as integer = 8) as string

Notes:
This setupstring is empty on error.
If not empty, you can assign to PrinterSetup.SetupString.
Please pass reasonable flags.
Check existing SetupStrings from Xojo for possible values.
Resolution parameters can e.g. be 72.

Supports Xojo 2017r1 with 17.3 plugins.
See also:

- 131.11.10 SetupString(Margin as Integer = 2500) as string

131.11.10  SetupString(Margin as Integer = 2500) as string

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a setup string from devmode.

**Example:**

```pascal
dim p as new PrinterSetup

// setup something
call p.PageSetupDialog

// now we have nice setupstring
dim ss as string = p.SetupString

// parse it in device mode
dim d as WindowsDeviceModeMBS = WindowsDeviceModeMBS.FromSetupString(ss)

// duplex is?
MsgBox "Duplex: " + str(d.Duplex)

// change printer
d.DeviceName = "Deskjet 2540 series# :2"

// enable duplex
d.Fields = BitwiseOr(d.Fields, d.DM_DUPLEX)
d.Duplex = d.DMDUP_HORIZONTAL

// now duplex is?
MsgBox "Duplex: " + str(d.Duplex)

// get back as setup string
dim da as string = d.SetupString

if da = "" then
MsgBox "failed to create setup string"
Return
end if
```
CHAPTER 131. PRINTING

// assign back
p.SetupString = da

// take a look
call p.PageSetupDialog

// and print something
dim g as Graphics = OpenPrinter(p)

  g.DrawString "Page 1", 20, 20
  g.NextPage
  g.DrawString "Page 2", 20, 20

Notes:
This setupstring is empty on error.
If not empty, you can assign to PrinterSetup.SetupString.

Supports Xojo 2017r1 with 17.3 plugins.
See also:

• 131.11.9 SetupString(ActualHorizontalResolution as integer, ActualVerticalResolution as integer, Max-HorizontalResolution as integer, MaxVerticalResolution as integer, MarginLeft as integer = 2500,
  MarginRight as integer = 2500, MarginTop as integer = 2500, MarginBottom as integer = 2500,
  MinMarginLeft as integer = 0, MinMarginRight as integer = 0, MinMarginTop as integer = 0, Min-
  MarginBottom as integer = 0, PageSetupFlags as integer = 8) as string

131.11.11 Properties

131.11.12 Collate as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Specifies whether collation should be used when printing multiple copies.
Notes:
(This member is ignored unless the printer driver indicates support for collation by setting the dmFields
member to DM_COLLATE.) This member can be one of the following values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMCOLLATE_TRUE</td>
<td>Collate when printing multiple copies.</td>
</tr>
<tr>
<td>DMCOLLATE_FALSE</td>
<td>Do not collate when printing multiple copies.</td>
</tr>
</tbody>
</table>

(Read and Write property)
131.11. **CLASS WINDOWSDEVICEMODEMBS**

### 131.11.13 Color as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Switches between color and monochrome on color printers. **Notes:**

The following are the possible values:

- DMCOLOR_COLOR
- DMCOLOR_MONOCHROME

(Read and Write property)

### 131.11.14 Copies as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Selects the number of copies printed if the device supports multiple-page copies. **Notes:** (Read and Write property)

### 131.11.15 Data as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The raw data pointer to the DEVMODEW structure. **Notes:** (Read only property)

### 131.11.16 DefaultSource as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the paper source. **Notes:**

Use the DMBIN_* constants. (Read and Write property)

### 131.11.17 DeviceName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that specifies the "friendly" name of the printer or display; for example, "PCL/HP LaserJet" in the case of PCL/HP LaserJet. **Notes:**

This string is unique among device drivers. Note that this name may be truncated to fit in the dmDeviceName field.
131.11.18  DitherType as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies how dithering is to be done.

**Notes:**

The member can be one of the following predefined values, or a driver-defined value greater than or equal to the value of DMDITHER_USER.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMDITHER_NONE</td>
<td>No dithering.</td>
</tr>
<tr>
<td>DMDITHER_COARSE</td>
<td>Dithering with a coarse brush.</td>
</tr>
<tr>
<td>DMDITHER_FINE</td>
<td>Dithering with a fine brush.</td>
</tr>
<tr>
<td>DMDITHER_LINEART</td>
<td>Line art dithering, a special dithering method that produces well defined borders between black, white, and gray scaling. It is not suitable for images that include continuous graduations in intensity and hue, such as scanned photographs.</td>
</tr>
<tr>
<td>DMDITHER_GraySCALE</td>
<td>Device does gray scaling.</td>
</tr>
</tbody>
</table>

(Read and Write property)

131.11.19  DriverExtra as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Contains the number of bytes of private driver-data that follow this structure. If a device driver does not use device-specific information, set this member to zero.

**Notes:** (Read and Write property)

131.11.20  DriverVersion as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The driver version number assigned by the driver developer.

**Notes:** (Read and Write property)
### 131.11.21 Duplex as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Selects duplex or double-sided printing for printers capable of duplex printing.
**Notes:**
Following are the possible values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMDUP_SIMPLEX</td>
<td>Normal (nonduplex) printing.</td>
</tr>
<tr>
<td>DMDUP_HORIZONTAL</td>
<td>Short-edge binding, that is, the long edge of the page is horizontal.</td>
</tr>
<tr>
<td>DMDUP_VERTICAL</td>
<td>Long-edge binding, that is, the long edge of the page is vertical.</td>
</tr>
</tbody>
</table>

(Read and Write property)

### 131.11.22 Fields as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Specifies whether certain properties have been initialized.
**Notes:**
If a property is initialized, its corresponding bit is set, otherwise the bit is clear. A driver supports only those properties that are appropriate for the printer or display technology.

Use the DM_* constants which match by name their property. So the DM_ORIENTATION bit value is related to the Orientation property.
(Read and Write property)

### 131.11.23 FormName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A string array that specifies the name of the form to use; for example, "Letter" or "Legal".
**Notes:**
A complete set of names can be retrieved by using the GetPrinterFormats function on the WindowsPrinterListMBS class.
(Read and Write property)
131.11.24 ICMIntent as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies which color matching method, or intent, should be used by default.

**Notes:**
This member is primarily for non-ICM applications. ICM applications can establish intents by using the ICM functions. This member can be one of the following predefined values, or a driver defined value greater than or equal to the value of DMICM_USER.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMICM_ABS_COLORIMETRIC</td>
<td>Color matching should optimize to match the exact color requested without white point mapping. This value is most appropriate for use with proofing.</td>
</tr>
<tr>
<td>DMICM_COLORIMETRIC</td>
<td>Color matching should optimize to match the exact color requested. This value is most appropriate for use with business logos or other images when an exact color match is desired.</td>
</tr>
<tr>
<td>DMICM_CONTRAST</td>
<td>Color matching should optimize for color contrast. This value is the most appropriate choice for scanned or photographic images when dithering is desired.</td>
</tr>
<tr>
<td>DMICM_SATURATE</td>
<td>Color matching should optimize for color saturation. This value is the most appropriate choice for business graphs when dithering is not desired.</td>
</tr>
</tbody>
</table>

(Read and Write property)

131.11.25 ICMMethod as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies how ICM is handled.

**Notes:**
For a non-ICM application, this member determines if ICM is enabled or disabled. For ICM applications, the system examines this member to determine how to handle ICM support. This member can be one of the following predefined values, or a driver-defined value greater than or equal to the value of DMICM-METHOD_USER.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMICMMETHOD_NONE</td>
<td>Specifies that ICM is disabled.</td>
</tr>
<tr>
<td>DMICMMETHOD_SYSTEM</td>
<td>Specifies that ICM is handled by Windows.</td>
</tr>
<tr>
<td>DMICMMETHOD_DRIVER</td>
<td>Specifies that ICM is handled by the device driver.</td>
</tr>
<tr>
<td>DMICMMETHODDEVICE</td>
<td>Specifies that ICM is handled by the destination device.</td>
</tr>
</tbody>
</table>

The printer driver must provide a user interface for setting this member. Most printer drivers support only the DMICMMETHOD_SYSTEM or DMICMMETHOD_NONE value. Drivers for PostScript printers support all values.
131.11. CLASS WINDOWSDEVICEMODEMBS

(Read and Write property)

131.11.26 LogPixels as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of pixels per logical inch. **Notes:** Printer drivers do not use this member. (Read and Write property)

131.11.27 MediaType as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the type of media being printed on. **Notes:** The member can be one of the following predefined values, or a driver-defined value greater than or equal to the value of DMMEDIA_USER.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMMEDIA_STANDARD</td>
<td>Plain paper.</td>
</tr>
<tr>
<td>DMMEDIA_GLOSSY</td>
<td>Glossy paper.</td>
</tr>
<tr>
<td>DMMEDIA_TRANSPARENCY</td>
<td>Transparent film.</td>
</tr>
</tbody>
</table>

(Read and Write property)

131.11.28 Nup as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies where the NUP is done. **Notes:** It can be one of the following.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMNUP_SYSTEM</td>
<td>The print spooler does the NUP.</td>
</tr>
<tr>
<td>DMNUP.ONEUP</td>
<td>The application does the NUP.</td>
</tr>
</tbody>
</table>
131.11.29 Orientation as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
For printer devices only, selects the orientation of the paper.

**Example:**

```vbs
' Here we define which values we want to change
Dim d As New WindowsDeviceModeMBS
Dim name As String = "My printer"

// and change value
Dim d As New WindowsDeviceModeMBS
Dim name As String = "My printer"

// here we define which values we want to change
Dim d As New WindowsDeviceModeMBS
Dim name As String = "My printer"

// and change value
Dim d As New WindowsDeviceModeMBS
Dim name As String = "My printer"

Dim w As WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
If w.ChangePrinterSettings(d, 2) Then
    MsgBox "OK"
Else
    MsgBox "Failed"
End If

**Notes:**
This member can be either DMORIENT_PORTRAIT (1) or DMORIENT_LANDSCAPE (2).
(Read and Write property)

131.11.30 PaperLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
For printer devices only, overrides the length of the paper specified by the PaperSize member, either for custom paper sizes or for devices such as dot-matrix printers that can print on a page of arbitrary length.

**Notes:**
These values, along with all other values in this structure that specify a physical length, are in tenths of a millimeter.
(Read and Write property)
131.11. CLASS WINDOWSDEVICEMODEMBS

131.11.31 PaperSize as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
For printer devices only, selects the size of the paper to print on.
**Notes:**
This member can be set to zero if the length and width of the paper are both set by the PaperLength and PaperWidth members. Otherwise, the PaperSize member can be set to a device specific value greater than or equal to DMPAPER_USER or to one of the following predefined values with DMPAPER_* constants.
(Read and Write property)

131.11.32 PaperWidth as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
For printer devices only, overrides the width of the paper specified by the PaperSize member.
**Notes:**
Unit is tenths of a millimeter.
(Read and Write property)

131.11.33 PrintQuality as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Specifies the printer resolution.
**Notes:**
There are four predefined device-independent values:

DMRES_HIGH
DMRES_MEDIUM
DMRES_LOW
DMRES_DRAFT

If a positive value is specified, it specifies the number of dots per inch (DPI) and is therefore device dependent.
(Read and Write property)

131.11.34 Scale as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Specifies the factor by which the printed output is to be scaled.
**Notes:**
The apparent page size is scaled from the physical page size by a factor of Scale \( /100 \). For example, a letter-sized page with a dmScale value of 50 would contain as much data as a page of 17- by 22-inches because the output text and graphics would be half their original height and width.

(Read and Write property)

### 131.11.35 Size as Integer

**Function:** Specifies the size, in bytes, of the DEVMODE structure, not including any private driver-specific data that might follow the structure’s public members.

**Notes:**
You don’t need to set this field normally as the plugin does that for you.
(Read and Write property)

### 131.11.36 SpecVersion as Integer

**Function:** The version number of the initialization data specification on which the structure is based.

**Notes:**
You don’t need to set this field normally as the plugin does that for you.
(Read and Write property)

### 131.11.37 TTOption as Integer

**Function:** Specifies how TrueType fonts should be printed.

**Notes:**
This member can be one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMTT_BITMAP</td>
<td>Prints TrueType fonts as graphics. This is the default action for dot-matrix printers.</td>
</tr>
<tr>
<td>DMTT_DOWNLOAD</td>
<td>Downloads TrueType fonts as soft fonts. This is the default action for Hewlett-Packard printers that use Printer Control Language (PCL).</td>
</tr>
<tr>
<td>DMTT_DOWNLOAD_OUTLINE</td>
<td>Downloads TrueType fonts as outline soft fonts.</td>
</tr>
<tr>
<td>DMTT_SUBDEV</td>
<td>Substitutes device fonts for TrueType fonts. This is the default action for PostScript printers.</td>
</tr>
</tbody>
</table>

(Read and Write property)
131.11.38  YResolution as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the y-resolution, in dots per inch, of the printer.

**Notes:**
If the printer initializes this member, the PrintQuality member specifies the x-resolution, in dots per inch, of the printer.
(Read and Write property)

131.11.39  Constants

131.11.40  DMBIN_AUTO = 7

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.
**Notes:** Auto

131.11.41  DMBIN_CASSETTE = 14

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.
**Notes:** Cassette

131.11.42  DMBIN_ENVELOPE = 5

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.
**Notes:** Envelope

131.11.43  DMBIN_ENVMANUAL = 6

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.
**Notes:** Envelope Manual.
131.11.44  DMBIN_FORMSOURCE = 15
MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.  
**Notes:** Form Source.

131.11.45  DMBIN_LARGECAPACITY = 11
MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.  
**Notes:** Large Capacity

131.11.46  DMBIN_LARGEFMT = 10
MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.  
**Notes:** Large Format

131.11.47  DMBIN_LOWER = 2
MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.  
**Notes:** Lower

131.11.48  DMBIN_MANUAL = 4
MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.  
**Notes:** Manual

131.11.49  DMBIN_MIDDLE = 3
MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.  
**Notes:** Middle

131.11.50  DMBIN_ONLYONE = 1
MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the source bin constants.  
**Notes:** Only One.
131.11.  CLASS WINDOWSDEVICEMODEMBS

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the paper format constants.  
**Notes:** PRC Envelope # 9 Rotated, 324- by 229-millimeters
131.11.203  **DMPAPER_QUARTO = 15**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the paper format constants.  
**Notes:** Quarto, 215- by 275-millimeter paper.

131.11.204  **DMPAPER_RESERVED_48 = 48**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the paper format constants.

131.11.205  **DMPAPER_RESERVED_49 = 49**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the paper format constants.

131.11.206  **DMPAPER_STATEMENT = 6**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the paper format constants.  
**Notes:** Statement, 5 1/2- by 8 1/2-inches.

131.11.207  **DMPAPER_TABLOID = 3**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the paper format constants.  
**Notes:** Tabloid, 11- by 17-inches.

131.11.208  **DMPAPER_TABLOID_EXTRA = 52**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the paper format constants.  
**Notes:** Tabloid, 11.69 x 18-inches.

131.11.209  **DMPAPER_USER = 256**

MBS Win Plugin, Plugin Version: 11.3. **Function:** One of the paper format constants.  
**Notes:** user defined size.  
Set PaperWidth and PaperLength fields.
Use all flags DM_PAPERLENGTH, DM_PAPERWIDTH and DM_PAPERSIZE combined for Fields property.

131.11.210  DMRES_DRAFT = -1

MBS Win Plugin, Plugin Version: 10.4.  Function: One of the print quality constants. Notes: Draft

131.11.211  DMRES_HIGH = -4

MBS Win Plugin, Plugin Version: 10.4.  Function: One of the print quality constants. Notes: High

131.11.212  DMRES_LOW = -2

MBS Win Plugin, Plugin Version: 10.4.  Function: One of the print quality constants. Notes: Low

131.11.213  DMRES_MEDIUM = -3

MBS Win Plugin, Plugin Version: 10.4.  Function: One of the print quality constants. Notes: Medium

131.11.214  DMTT_BITMAP = 1

MBS Win Plugin, Plugin Version: 10.4.  Function: One of the true type option mode constants. Notes: Prints TrueType fonts as graphics. This is the default action for dot-matrix printers.

131.11.215  DMTT_DOWNLOAD = 2

MBS Win Plugin, Plugin Version: 10.4.  Function: One of the true type option mode constants. Notes: Downloads TrueType fonts as soft fonts. This is the default action for Hewlett-Packard printers that use Printer Control Language (PCL).
131.11.216  DMTT_DOWNLOAD_OUTLINE = 4

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the true type option mode constants.  
**Notes:** Downloads TrueType fonts as outline soft fonts.

131.11.217  DMTT_SUBDEV = 3

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the true type option mode constants.  
**Notes:** Substitutes device fonts for TrueType fonts. This is the default action for PostScript printers.

131.11.218  DM_BITSPERPEL = & h00040000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property.  
**Notes:** This value is related to the BitsperPel property.

131.11.219  DM_COLLATE = & h00008000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property.  
**Notes:** This value is related to the Collate property.

131.11.220  DM_COLOR = & h00000800

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property.  
**Notes:** This value is related to the Color property.

131.11.221  DM_COPIES = & h00000100

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property.  
**Notes:** This value is related to the Copies property.

131.11.222  DM_DEFAULTSOURCE = & h00000200

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property.  
**Notes:** This value is related to the DefaultSource property.
131.11. CLASS WINDOWSDEVICEMODEMBS

131.11.223  DM_DISPLAYFLAGS = & h00200000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the DisplayFlags property.

131.11.224  DM_DISPLAYFREQUENCY = & h00400000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the DisplayFrequency property.

131.11.225  DM_DITHERTYPE = & h04000000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the DitherType property.

131.11.226  DM_DUPLEX = & h00001000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Duplex property.

131.11.227  DM_FORMNAME = & h00010000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Formname property.

131.11.228  DM_ICMIINTENT = & h01000000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the ICMIntent property.

131.11.229  DM_ICMMETHOD = & h00800000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the ICMMMethod property.
131.11.230  DM_LOGPIXELS = & h00020000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the LogPixels property.

131.11.231  DM_MEDIATYPE = & h02000000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the MediaType property.

131.11.232  DM_NUP = & h00000040

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the NUP property.

131.11.233  DM_ORIENTATION = & h00000001

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Orientation property.

131.11.234  DM_PANNINGHEIGHT = & h10000000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Panningheight property.

131.11.235  DM_PANNINGWIDTH = & h08000000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Panningwidth property.

131.11.236  DM_PAPERLENGTH = & h00000004

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Paperlength property.
131.11. CLASS WINDOWSDEVICEMODEMBS

131.11.237 DM_PAPERSIZE = &h00000002

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Papersize property.

131.11.238 DM_PAPERWIDTH = &h00000008

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Paperwidth property.

131.11.239 DM_PELSHIGHT = &h00100000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Pelsheight property.

131.11.240 DM_PELSWIDTH = &h00080000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Pelswidth property.

131.11.241 DM_POSITION = &h00000020

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Position property.

131.11.242 DM_PRINTQUALITY = &h00000400

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the PrintQuality property.

131.11.243 DM_SCALE = &h00000010

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the Scale property.
131.11.244  DM_TTOPTION = & h00004000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the TTOption property.

131.11.245  DM_YRESOLUTION = & h00002000

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants to use with the fields property. **Notes:** This value is related to the YResolution property.
131.12.  CLASS WINDOWSGRAPHICSINFOMBS

131.12  class WindowsGraphicsInfoMBS

131.12.1  class WindowsGraphicsInfoMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
This class gives information for Windows Device contexts.

**Example:**

```vbnet
dim g as Graphics = OpenPrinter
dim info as WindowsGraphicsInfoMBS = g.WindowsGraphicsInfoMBS

MsgBox _
"Printer physical page size: " + str(info.PhysicalWidth) + " " + str(info.PhysicalHeight) + _
EndOfLine + _
"Useable paper size: " + str(info.ResolutionX) + " x " + str(info.ResolutionY) + _
EndOfLine + _
"Paper size: " + str(info.SizeX) + " x " + str(info.SizeY) + " mm"
```

**Notes:** Main use currently is to learn about native resolution of a printer graphics object.

131.12.2  Methods

131.12.3  Constructor(g as graphics)

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Initializes properties for this graphics object.

131.12.4  Properties

131.12.5  AspectX as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Relative width of a device pixel used for line drawing.
**Notes:** (Read and Write property)

131.12.6  AspectXY as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Diagonal width of the device pixel used for line drawing.
131.12.7 AspectY as Integer

Notes: (Read and Write property)

131.12.8 BitsPerPixel as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Number of adjacent color bits for each pixel.
Example:
```
dim p as new Picture(200, 200, 32)
dim info as new WindowsGraphicsInfoMBS(p.Graphics)
```

MsgBox ”Color Depth: ”+str(info.BitsPerPixel)

Notes:
As example gives a display device context, the bits per pixel is the screen depth.
(Read and Write property)

131.12.9 BrushesCount as Integer

Notes: (Read and Write property)

131.12.10 ColorCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Number of entries in the device’s color table, if the device has a color depth of no more than 8 bits per pixel.
Notes:
For devices with greater color depths, 1 is returned.
(Read and Write property)
131.12. **CLASS WINDOWSGRAPHICSINFOMBS**

131.12.11 **DesktopResolutionX as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Horizontal width of entire desktop in pixels.

**Example:**

```vba
Dim p As New Picture(200, 200, 32)
Dim info As New WindowsGraphicsInfoMBS(p.Graphics)
MsgBox "Size of Windows Desktop: "+Str(info.DesktopResolutionX)+" x "+Str(info.DesktopResolutionY)
```

**Notes:** (Read and Write property)

131.12.12 **DesktopResolutionY as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Vertical height of entire desktop in pixels.

**Example:**

```vba
Dim p As New Picture(200, 200, 32)
Dim info As New WindowsGraphicsInfoMBS(p.Graphics)
MsgBox "Size of Windows Desktop: "+Str(info.DesktopResolutionX)+" x "+Str(info.DesktopResolutionY)
```

**Notes:** (Read and Write property)

131.12.13 **DriverVersion as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device driver version.

**Notes:** (Read and Write property)

131.12.14 **FontCount as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of device-specific fonts.

**Notes:** (Read and Write property)
131.12.15 LogPixelsX as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of pixels per logical inch along the screen width.

**Example:**

```vba
dim g as Graphics = OpenPrinter
dim info as WindowsGraphicsInfoMBS = g.WindowsGraphicsInfoMBS
MsgBox "Printer resolution: " +str(info.LogPixelsX)+” x ”+str(info.LogPixelsY)
```

**Notes:**

In a system with multiple display monitors, this value is the same for all monitors.
(Read and Write property)

131.12.16 LogPixelsY as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of pixels per logical inch along the screen height.

**Example:**

```vba
dim g as Graphics = OpenPrinter
dim info as WindowsGraphicsInfoMBS = g.WindowsGraphicsInfoMBS
MsgBox "Printer resolution: " +str(info.LogPixelsX)+” x ”+str(info.LogPixelsY)
```

**Notes:**

In a system with multiple display monitors, this value is the same for all monitors.
(Read and Write property)

131.12.17 MakersCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of markers the device has.

**Notes:** (Read and Write property)
131.12. PenCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of device-specific pens.  
**Notes:** (Read and Write property)

131.12. PhysicalHeight as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** For printing devices: the height of the physical page, in device units.  
**Notes:** 
For example, a printer set to print at 600 dpi on 8.5-by-11-inch paper has a physical height value of 6600 device units. Note that the physical page is almost always greater than the printable area of the page, and never smaller.  
(Read and Write property)

131.12. PhysicalOffsetX as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** For printing devices: the distance from the left edge of the physical page to the left edge of the printable area, in device units.  
**Notes:** 
For example, a printer set to print at 600 dpi on 8.5-by-11-inch paper, that cannot print on the leftmost 0.25-inch of paper, has a horizontal physical offset of 150 device units.  
(Read and Write property)

131.12. PhysicalOffsetY as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** For printing devices: the distance from the top edge of the physical page to the top edge of the printable area, in device units.  
**Notes:** 
For example, a printer set to print at 600 dpi on 8.5-by-11-inch paper, that cannot print on the topmost 0.5-inch of paper, has a vertical physical offset of 300 device units.  
(Read and Write property)
131.12.22 PhysicalWidth as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
For printing devices: the width of the physical page, in device units.

**Notes:**
For example, a printer set to print at 600 dpi on 8.5-x11-inch paper has a physical width value of 5100 device units. Note that the physical page is almost always greater than the printable area of the page, and never smaller.

(Read and Write property)

131.12.23 Planes as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Number of color planes.

**Notes:** (Read and Write property)

131.12.24 ResolutionX as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Width, in pixels, of the screen; or for printers, the width, in pixels, of the printable area of the page.

**Notes:** (Read and Write property)

131.12.25 ResolutionY as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Height, in raster lines, of the screen; or for printers, the height, in pixels, of the printable area of the page.

**Notes:** (Read and Write property)

131.12.26 ScalingFactorX as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Scaling factor for the x-axis of the printer.

**Notes:** (Read and Write property)
131.12.27  ScalingFactorY as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Scaling factor for the y-axis of the printer.
**Notes:** (Read and Write property)

131.12.28  SizeX as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Width, in millimeters, of the physical screen.
**Notes:** (Read and Write property)

131.12.29  SizeY as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Height, in millimeters, of the physical screen.
**Notes:** (Read and Write property)

131.12.30  Technology as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Device technology. It can be any one of the kTechnology* constants.
**Notes:** (Read and Write property)

131.12.31  VRefresh as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
For display devices: the current vertical refresh rate of the device, in cycles per second (Hz).
**Notes:** (Read and Write property)

131.12.32  Constants

131.12.33  kTechnologyCharStream = 4

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the technology constants.
**Notes:** Character stream
CHAPTER 131. PRINTING

131.12.34  kTechnologyDisplayFile = 6

MBS Win Plugin, Plugin Version: 12.1. Function: One of the technology constants. Notes: Display file

131.12.35  kTechnologyMetaFile = 5

MBS Win Plugin, Plugin Version: 12.1. Function: One of the technology constants. Notes: Metafile

131.12.36  kTechnologyPlotter = 0

MBS Win Plugin, Plugin Version: 12.1. Function: One of the technology constants. Notes: Vector plotter

131.12.37  kTechnologyRasterCamera = 3

MBS Win Plugin, Plugin Version: 12.1. Function: One of the technology constants. Notes: Raster camera

131.12.38  kTechnologyRasterDisplay = 1

MBS Win Plugin, Plugin Version: 12.1. Function: One of the technology constants. Notes: Raster display

131.12.39  kTechnologyRasterPrinter = 2

MBS Win Plugin, Plugin Version: 12.1. Function: One of the technology constants. Notes: Raster printer
131.13  class WindowsPageFormatMBS

131.13.1  class WindowsPageFormatMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for a page format.

**Example:**

```vba
// change the printer name to your printer's name
dim w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)
dim formats(-1) as WindowsPageFormatMBS = w.GetPrinterFormats

for each p as WindowsPageFormatMBS in formats
    MsgBox p.Name
next
```

**Notes:**
This class wraps the FORM_INFO_1 structure. You can find more information here:

131.13.2  Properties

131.13.3  DisplayName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The form’s display name in the language specified by LangId.

**Notes:**
Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

131.13.4  Flags as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The flags for this page format.

**Notes:**
The following values are defined.

(Read and Write property)
<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORM_USER</td>
<td>If this bit flag is set, the form has been defined by the user. Forms with this flag set are defined in the registry.</td>
</tr>
<tr>
<td>FORM_BUILTIN</td>
<td>If this bit-flag is set, the form is part of the spooler. Form definitions with this flag set do not appear in the registry.</td>
</tr>
<tr>
<td>FORM_PRINTER</td>
<td>If this bit flag is set, the form is associated with a certain printer, and its definition appears in the registry.</td>
</tr>
</tbody>
</table>

131.13.5 **ImageableAreaBottom as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The imageable area, in thousandths of millimeters, of the form.  
**Notes:** (Read and Write property)  

131.13.6 **ImageableAreaHeight as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The imageable area, in thousandths of millimeters, of the form.  
**Notes:** (Read and Write property)  

131.13.7 **ImageableAreaLeft as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The imageable area, in thousandths of millimeters, of the form.  
**Notes:** (Read and Write property)  

131.13.8 **ImageableAreaRight as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The imageable area, in thousandths of millimeters, of the form.  
**Notes:** (Read and Write property)  

131.13.9 **ImageableAreaTop as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The imageable area, in thousandths of millimeters, of the form.  
**Notes:** (Read and Write property)
131.13.10  ImageableAreaWidth as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The imageable area, in thousandths of millimeters, of the form.
**Notes:** (Read and Write property)

131.13.11  Keyword as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A non-localizable string identifier of the form.
**Notes:**
When passed to AddForm or SetForm, this gives the caller a means of identifying the form in all locales.
Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

131.13.12  LangId as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The language of the DisplayName.
**Notes:**
Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

131.13.13  Mode as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The mode.
**Notes:**
Value can be 1 (Windows 2000 and newer) or 2 (Windows Vista and newer).
(Read and Write property)

131.13.14  MuiDll as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Multilingual User Interface localized resource DLL that contains the localized display name.
**Notes:**
Only available in Windows Vista and newer and only valid if mode = 2.
131.13.15 Name as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The name of the form.
**Notes:** (Read and Write property)

131.13.16 ResourceId as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The resource ID of the form’s display name in MuiDll.
**Notes:**
Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

131.13.17 SizeHeight as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The height, in thousandths of millimeters, of the form.
**Notes:** (Read and Write property)

131.13.18 SizeWidth as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The width, in thousandths of millimeters, of the form.
**Notes:** (Read and Write property)

131.13.19 StringType as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Specifies how a localized display name for the form is obtained at runtime.
**Notes:**
The following values are defined. Only one can be set in any given call to AddForm or SetForm. Both STRING_MUIDLL and STRING_LANGPAIR can be set in the WindowsPageFormatMBS (s) returned by GetForm or GetPrinterFormats.
Can be STRING_LANGPAIR, STRING_MUIDLL or STRING_NONE. Only available in Windows Vista and newer and only valid if mode = 2. (Read and Write property)

### 131.13.20 Constants

#### 131.13.21 FORM_BUILTIN = 1

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants.  
**Notes:** If this bit-flag is set, the form is part of the spooler. Form definitions with this flag set do not appear in the registry.

#### 131.13.22 FORM_PRINTER = 2

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants.  
**Notes:** If this bit flag is set, the form is associated with a certain printer, and its definition appears in the registry.

#### 131.13.23 FORM_USER = 0

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the flag constants.  
**Notes:** If this bit flag is set, the form has been defined by the user. Forms with this flag set are defined in the registry.

#### 131.13.24 STRING_LANGPAIR = 4

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the StringType property.  
**Notes:** The display name and language ID are provided directly by DisplayName and the language is specified by LangId.

#### 131.13.25 STRING_MUIDLL = 2

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the StringType property.  
**Notes:** The display name is extracted from the Multilingual User Interface localized resources DLL specified in MuiDll. The ID is in the ResourceId member.
131.13.26 STRING_NONE = 1

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the StringType property. **Notes:** There is no localized display name.
131.14 class WindowsPageSetupDialogMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class to run the Windows Page Setup dialog.

### 131.14.2 Methods

#### 131.14.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor.

#### 131.14.4 GetDevNames(byref DriverName as string, byref DeviceName as string, 
byref OutputName as string, byref flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Queries the strings that identify the driver, device, and output port names for a printer.
**Notes:**
Returns true if values are available and false if not.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

#### 131.14.5 PageSetupDialog as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Creates a Page Setup dialog box that enables the user to specify the attributes of a printed page.
**Notes:**
These attributes include the paper size and source, the page orientation (portrait or landscape), and the width of the page margins.

If the user clicks the OK button, the return value is true. The members of the object indicate the user’s selections. If the user cancels or closes the Page Setup dialog box or an error occurs, the return value is false. To get extended error information, use the lasterror property.

Starting with Windows Vista, the PageSetupDialog does not contain the Printer button. To switch printer selection other functions.

### 131.14.6 `SetDevNames(DriverName as string, DeviceName as string, OutputName as string, flags as Integer) as boolean`

**MBS Win Plugin, Plugin Version:** 12.1, **Console & Web:** Yes, **Mac:** No, **Win:** Yes, **Linux:** No. **Function:** Sets the strings that identify the driver, device, and output port names for a printer.

**Notes:**
Returns true on success and false on failure.

- **DriverName:** The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
- **OutputName:** The device name for the physical output medium (output port).
- **Flags:** Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

### 131.14.7 Properties

### 131.14.8 `DevMode as WindowsDeviceModeMBS`

**MBS Win Plugin, Plugin Version:** 12.1, **Console & Web:** No, **Mac:** No, **Win:** Yes, **Linux:** No. **Function:** The device mode object.

**Notes:**
On input, if an object is specified, the values in the corresponding DEVMODE structure are used to initialize the controls in the dialog box. On output, the dialog box sets DevMode to a new object that contains values specifying the user’s selections. If the user’s selections are not available, the dialog box sets DevMode to nil.
131.14.9 Flags as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** A set of bit flags that you can use to initialize the Page Setup dialog box.

**Notes:**
When the dialog box returns, it sets these flags to indicate the user's input.
See the PSD_* constants for possible values.
(Read and Write property)

131.14.10 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.

**Notes:** (Read and Write property)

131.14.11 MarginBottom as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The widths of the bottom margin.

**Notes:**
If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)

131.14.12 MarginLeft as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The widths of the left margin.

**Notes:**
If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)
131.14.13 MarginRight as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The widths of the right margin.  
**Notes:**  
If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.  
(Read and Write property)

131.14.14 MarginTop as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The widths of the top margin.  
**Notes:**  
If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.  
(Read and Write property)

131.14.15 MinMarginBottom as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The minimum allowable widths for the bottom margin.  
**Notes:**  
The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.  
(Read and Write property)

131.14.16 MinMarginLeft as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The minimum allowable widths for the left margin.  
**Notes:**  
The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
131.14. **CLASS WINDOWSPAGESETUPDIALOGMBS**

(Read and Write property)

131.14.17 **MinMarginRight as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The minimum allowable widths for the right margin.
**Notes:**
The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

131.14.18 **MinMarginTop as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The minimum allowable widths for the top margin.
**Notes:**
The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

131.14.19 **PaperSizeX as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The dimensions of the paper selected by the user.
**Notes:**
The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

131.14.20 **PaperSizeY as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The dimensions of the paper selected by the user.
**Notes:**
The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the
units of measurement.
(Read and Write property)

131.14.21 Parent as Window

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The window that owns the dialog box.

**Notes:**
This member can be any valid window, or it can be nil if the dialog box has no owner.
(Read and Write property)

131.14.22 Constants

131.14.23 DN_DEFAULTPRN = 1

MBS Win Plugin, Plugin Version: 12.1. **Function:** The flag for default printer on the SetDevNames/GetDevNames flag parameter.

131.14.24 PSD_DEFAULTMINMARGINS = & h00000000

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants. **Notes:** Sets the minimum values that the user can specify for the page margins to be the minimum margins allowed by the printer. This is the default. This flag is ignored if the PSD_MARGINS and PSD_MINMARGINS flags are also specified.

131.14.25 PSD_DISABLEMARGINS = & h00000010

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants. **Notes:** Disables the margin controls, preventing the user from setting the margins.

131.14.26 PSD_DISABLEORIENTATION = & h00000100

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants. **Notes:** Disables the orientation controls, preventing the user from setting the page orientation.
131.14.27 PSD_DISABLEPAPER = & h00000200

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants. **Notes:** Disables the paper controls, preventing the user from setting page parameters such as the paper size and source.

131.14.28 PSD_DISABLEPRINTER = & h00000200

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants. **Notes:**

Obsolete.
Windows XP/2000: Disables the Printer button, preventing the user from invoking a dialog box that contains additional printer setup information.

131.14.29 PSD_INHUNDREDTHSOFMILLIMETERS = & h00000008

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants. **Notes:** Indicates that hundredths of millimeters are the unit of measurement for margins and paper size. The values in the Margin, MinMargin, and PaperSize members are in hundredths of millimeters. You can set this flag on input to override the default unit of measurement for the user’s locale. When the function returns, the dialog box sets this flag to indicate the units used.

131.14.30 PSD_INTHOUSANDTHSOFINCHES = & h00000004

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants. **Notes:** Indicates that thousandths of inches are the unit of measurement for margins and paper size. The values in the Margin, MinMargin, and PaperSize members are in thousandths of inches. You can set this flag on input to override the default unit of measurement for the user’s locale. When the function returns, the dialog box sets this flag to indicate the units used.

131.14.31 PSD_MARGINS = & h00000002

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants. **Notes:** Causes the system to use the values specified in the Margin members as the initial widths for the left, top, right, and bottom margins. If PSD_MARGINS is not set, the system sets the initial widths to one inch for all margins.
**131.14.32**  **PSD_MINMARGINS = & h00000001**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants.  
**Notes:** Causes the system to use the values specified in the MinMargin members as the minimum allowable widths for the left, top, right, and bottom margins. The system prevents the user from entering a width that is less than the specified minimum. If PSD_MINMARGINS is not specified, the system sets the minimum allowable widths to those allowed by the printer.

**131.14.33**  **PSD_NONETWORKBUTTON = & h00200000**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants.  
**Notes:** Hides and disables the Network button.

**131.14.34**  **PSD_NOWARNING = & h00000080**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants.  
**Notes:** Prevents the system from displaying a warning message when there is no default printer.

**131.14.35**  **PSD_RETURNDEFAULT = & h00000400**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants.  
**Notes:** PageSetupDialog does not display the dialog box. Instead, it sets the DevNames and DevMode members to objects that are initialized for the system default printer. PageSetupDlg returns an error if either DevNames or DevMode is not nil.

**131.14.36**  **PSD_SHOWHELP = & h00000800**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the flag constants.  
**Notes:** Causes the dialog box to display the Help button. The hwndOwner member must specify the window to receive the HELPMSGSTRING registered messages that the dialog box sends when the user clicks the Help button.
131.15. CLASS WINDOWSPRINTDIALOGMBS

131.15 class WindowsPrintDialogMBS

131.15.1 class WindowsPrintDialogMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for showing the windows print dialog.

131.15.2 Methods

131.15.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor.

131.15.4 GetDevNames(byref DriverName as string, byref DeviceName as string, byref OutputName as string, byref flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Queries the strings that identify the driver, device, and output port names for a printer.
**Notes:**
Returns true if values are available and false if not.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to
determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the
default printer has not changed since the last print operation. If any of the strings do not match, a warning
message is displayed informing the user that the document may need to be reformatted. On output, the
Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button.
The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the
flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for
the Print property sheet or Print dialog box.

131.15.5 getPageSizeRange(index as Integer, byref fromPage as Integer, byref toPage as Integer)

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Queries a page range entry.
131.15.6 PrintDialog as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Displays a Print Dialog Box or a Print Setup dialog box.

**Notes:**

The Print dialog box enables the user to specify the properties of a particular print job.

If the user clicks the OK button, the return value is true. The members of the object indicate the user’s selections.

If the user canceled or closed the Print or Printer Setup dialog box or an error occurred, the return value is zero. To get extended error information, use the lasterror property. If the user canceled or closed the dialog box, lasterror returns zero.

This is the older function. PrintDialogEx is the newer function. see also http://msdn.microsoft.com/en-us/library/windows/desktop/ms646940(v=vs.85).aspx

131.15.7 PrintDialogEx as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Displays a Print property sheet that enables the user to specify the properties of a particular print job.

**Notes:**

A Print property sheet has a General page that contains controls similar to the Print dialog box. The property sheet can also have additional application-specific and driver-specific property pages as well as the General page.

If the function succeeds, the return value is S_OK (0) and the ResultAction member contains one of the following values.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PD_RESULT_APPLY</td>

<td>information specified by the user.</td>
</tr>
</tbody>
</table>

Lasterror is set.

The values of DevMode and DevNames in WindowsPrintDialogMBS may change when they are passed into PrintDialog. This is because these members are filled on both input and output.
131.15. CLASS WINDOWS\PRINTDIALOGMBS

If PD\RETURNDC is set but PD\USEDEVMODECOPIESANDCOLLATE flag is not set, the PrintDialog functions return incorrect number of copies. To get the correct number of copies, ensure that the calling application always uses PD\USEDEVMODECOPIESANDCOLLATE with PD\RETURNDC.

131.15.8 SetDevNames(DriverName as string, DeviceName as string, OutputName as string, flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Sets the strings that identify the driver, device, and output port names for a printer.
Notes:
Returns true on success and false on failure.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

131.15.9 setPageRange(index as Integer, fromPage as Integer, toPage as Integer)

Notes: Index from 0 to 19.

131.15.10 Properties

131.15.11 Copies as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Contains the initial number of copies for the Copies edit control if DevMode is nil; otherwise, the Copies
member of the DEVMODE contains the initial value.

Notes:
When PrintDlgEx returns, nCopies contains the actual number of copies the application must print. This value depends on whether the application or the printer driver is responsible for printing multiple copies. If the PD_USEDEVMODECOPIESANDCOLLATE flag is set in the Flags member, nCopies is always 1 on return, and the printer driver is responsible for printing multiple copies. If the flag is not set, the application is responsible for printing the number of copies specified by nCopies. For more information, see the description of the PD_USEDEVMODECOPIESANDCOLLATE flag.
(Read and Write property)

131.15.12 DC as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: The device context or an information context, depending on whether the Flags member specifies the PD_RETURNDC or PC_RETURNIC flag.

Notes:
If neither flag is specified, the value of this member is undefined. If both flags are specified, PD_RETURNDC has priority.
(Read and Write property)

131.15.13 DevMode as WindowsDeviceModeMBS

Notes:
On input, if an object is specified, the values in the corresponding DEVMODE structure are used to initialize the controls in the dialog box. On output, the dialog box sets DevMode to a new object that contains values specifying the user’s selections. If the user’s selections are not available, the dialog box sets DevMode to nil.
(Read and Write property)

131.15.14 ExclusionFlags as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: A set of bit flags that can exclude items from the printer driver property pages in the Print property sheet.

Notes:
This value is used only if the PD_EXCLUSIONFLAGS flag is set in the Flags member. Exclusion flags should be used only if the item to be excluded will be included on either the General page or on an application-defined page in the Print property sheet. This member can specify the following flag:
PD_EXCL_COPIESANDCOLLATE: Excludes the Copies and Collate controls from the printer driver prop-
131.15. **CLASS WINDOWS\PRINTDIALOGMBS**

Property pages in a Print property sheet. This flag should always be set when the application uses the default Copies and Collate controls provided by the lower portion of the General page of the Print property sheet. (Read and Write property)

### 131.15.15 Flags as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** A set of bit flags that you can use to initialize the Print property sheet.

**Notes:**

When the PrintDialog function returns, it sets these flags to indicate the user’s input. This member can be one or more of the following values.

To ensure that PrintDialog returns the correct values in the Copies and Collate members of the DeviceMode, set PD\_RETURNDC = TRUE and PD\_USEDEVMODECOPIESANDCOLLATE = TRUE. In so doing, the Copies member of the PRINTDLG structure is always 1 and PD\_COLLATE is always false.

To ensure that PrintDialog returns the correct values in nCopies and PD\_COLLATE, set PD\_RETURNDC = TRUE and PD\_USEDEVMODECOPIESANDCOLLATE = FALSE. In so doing, dmCopies is always 1 and dmCollate is always FALSE.

Starting with Windows Vista, when you call PrintDlg or PrintDlgEx with PD\_RETURNDC set to TRUE and PD\_USEDEVMODECOPIESANDCOLLATE set to FALSE, the PrintDlg or PrintDlgEx function sets the number of copies in the nCopies member of the PRINTDLG structure, and it sets the number of copies in the structure represented by the hDC member of the PRINTDLG structure.

When making calls to GDI, you must ignore the value of nCopies, consider the value as 1, and use the returned hDC to avoid printing duplicate copies. (Read and Write property)

### 131.15.16 FromPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The initial value for the starting page edit control.

**Notes:**

When PrintDialog returns, nFromPage is the starting page specified by the user. If the Pages radio button is selected when the user clicks the Okay button, PrintDialog sets the PD\_PAGENUMS flag and does not return until the user enters a starting page value that is within the minimum to maximum page range.

If the input value for either FromPage or nToPage is outside the minimum/maximum range, PrintDlg returns an error only if the PD\_PAGENUMS flag is specified; otherwise, it displays the dialog box but changes the out-of-range value to the minimum or maximum value.

This is only for PrintDialog, not for PrintDialogEx. (Read and Write property)
131.15.17  Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:**
Typical errors:
E_OUTOFMEMORY = & h8007000E // Insufficient memory.
E_INVALIDARG = & h80070057 // One or more arguments are invalid.
E_POINTER = & h80000005 // Invalid pointer.
E_HANDLE = & h80000006 // Invalid handle.
E_FAIL = & h80000008 // Unspecified error.
(Read and Write property)

131.15.18  MaxPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The maximum value for the page ranges specified in the Pages edit control.
**Notes:**
If the PD_NOPAGENUMS flag is specified, this value is not valid.
(Read and Write property)

131.15.19  MaxPageRanges as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The size, in array elements, of the PageRanges buffer.
**Notes:**
This value indicates the maximum number of page ranges that can be stored in the array. If the PD_NOPAGENUMS flag is specified, this value is not valid. If the PD_NOPAGENUMS flag is not specified, this value must be greater than zero.
The plugin supports up to 20 page ranges.
(Read and Write property)

131.15.20  MinPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The minimum value for the page ranges specified in the Pages edit control.
**Notes:**
If the PD_NOPAGENUMS flag is specified, this value is not valid.
(Read and Write property)
131.15.21  **PageRanges as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**

On input, set this member to the initial number of page ranges specified.

**Notes:**

When the PrintDialog function returns, PageRanges indicates the number of user-specified page ranges. If the PD_NOPAGENUMS flag is specified, this value is not valid. Use getPageRange to query page ranges or setPageRange to set them.

(Read and Write property)

131.15.22  **Parent as Window**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**

The window that owns the dialog box.

**Notes:**

The window that owns the property sheet. This member must be a valid window handle; it cannot be nil.

(Read and Write property)

131.15.23  **ResultAction as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**

If the PrintDlgEx function returns S_OK (0), ResultAction contains the outcome of the dialog.

**Notes:**

If PrintDialog returns an error, this member should be ignored. The ResultAction member can be one of the following values:

- **PD_RESULT_APPLY** The user clicked the Apply button and later clicked the Cancel button. This indicates that the user wants to apply the changes made in the property sheet, but does not want to print yet. The PRINTDLGEX structure contains the information specified by the user at the time the Apply button was clicked.

- **PD_RESULT_CANCEL** The user clicked the Cancel button. The information in the PRINTDLGEX structure is unchanged.

- **PD_RESULT_PRINT** The user clicked the Print button. The PRINTDLGEX structure contains the information specified by the user.

(Read and Write property)
131.15.24  **StartPanel** as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The property page that is initially displayed. **Notes:**

To display the General page, specify `START_PAGE_GENERAL`. For consistency, it is recommended that the property sheet always be started on the General page. The plugin sets `START_PAGE_GENERAL` for default value. (Read and Write property)

131.15.25  **ToPage** as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The initial value for the ending page edit control. **Notes:**

When PrintDialog returns, ToPage is the ending page specified by the user. If the Pages radio button is selected when the user clicks the Okay button, PrintDialog sets the PD_PAGENUMS flag and does not return until the user enters an ending page value that is within the minimum to maximum page range. This is only for PrintDialog, not for PrintDialogEx. (Read and Write property)

131.15.26  **Constants**

131.15.27  **PD_ALLPAGES** = 0

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property. **Notes:**

The default flag that indicates that the All radio button is initially selected. This flag is used as a placeholder to indicate that the PD_PAGENUMS, PD_SELECTION, and PD_CURRENTPAGE flags are not specified.

131.15.28  **PD_COLLATE** = &h00000010

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property. **Notes:**

If this flag is set, the Collate check box is selected. If this flag is set when the PrintDlgEx function returns, the application must simulate collation of multiple copies. For more information, see the description of the PD_USEDEVMODECOPIESANDCOLLATE flag.
131.15.29  **PD_CURRENTPAGE** = & h00400000

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:** If this flag is set, the Current Page radio button is selected. If none of the PD_PAGENUMS, PD_SELECTION, or PD_CURRENTPAGE flags is set, the All radio button is selected.

131.15.30  **PD_DISABLEPRINTTOFILE** = & h00080000

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:** Disables the Print to File check box.

131.15.31  **PD_EXCLUSIONFLAGS** = & h01000000

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:** Indicates that the ExclusionFlags member identifies items to be excluded from the printer driver property pages.  
If this flag is not set, items will be excluded by default from the printer driver property pages. The exclusions prevent the duplication of items among the General page, any application-specified pages, and the printer driver pages.

131.15.32  **PD_EXCL_COPIESANDCOLLATE** = & h00008100

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:** Excludes the Copies and Collate controls from the printer driver property pages in a Print property sheet. This flag should always be set when the application uses the default Copies and Collate controls provided by the lower portion of the General page of the Print property sheet.

131.15.33  **PD_HIDEPRINTTOFILE** = & h00100000

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:** Hides the Print to File check box.
131.15.34  PD_NOCURRENTPAGE = & h00800000

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.
**Notes:** Disables the Current Page radio button.

131.15.35  PD_NONETWORKBUTTON = & h00200000

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.
**Notes:** Hides and disables the Network button.

131.15.36  PD_NOPAGENUMS = 8

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.
**Notes:**
Disables the Pages radio button and the associated edit controls.
Also, it causes the Collate check box to appear in the dialog.

131.15.37  PD_NOSELECTION = 4

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.
**Notes:** Disables the Selection radio button.

131.15.38  PD_NOWARNING = & h00000080

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.
**Notes:** Prevents the warning message from being displayed when an error occurs.

131.15.39  PD_PAGENUMS = 2

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.
**Notes:** If this flag is set, the Pages radio button is selected. If none of the PD_PAGENUMS, PD_SELECTION, or PD_CURRENTPAGE flags is set, the All radio button is selected. If this flag is set when the PrintDialog function returns, the PageRanges member indicates the page ranges specified by the user.
131.15. **CLASS WINDOWSPRINTDIALOGMBS**

131.15.40 **PD_PRINTSETUP = & h00000040**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property. **Notes:** Causes the system to display the Print Setup dialog box rather than the Print dialog box.

131.15.41 **PD_PRINTTOFILE = & h00000020**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property. **Notes:**
If this flag is set, the Print to File check box is selected.
If this flag is set when PrintDialog returns, the OutputName of DevNames contains the string "FILE:".
When you call the StartDoc function to start the printing operation, specify this "FILE:" string in the Output parameter member of the DOCINFO structure. Specifying this string causes the print subsystem to query the user for the name of the output file.
StartDoc is available in our plugins through StartDocPrinter in WindowsAddPrintJobMBS class.

131.15.42 **PD_RESULT_APPLY = 2**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the ResultAction value constants. **Notes:** The user clicked the Apply button and later clicked the Cancel button. This indicates that the user wants to apply the changes made in the property sheet, but does not yet want to print. The WindowsPrintDialogMBS contains the information specified by the user at the time the Apply button was clicked.

131.15.43 **PD_RESULTCANCEL = 0**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the ResultAction value constants. **Notes:** The user clicked the Cancel button. The information in the WindowsPrintDialogMBS is unchanged.

131.15.44 **PD_RESULTPRINT = 1**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the ResultAction value constants. **Notes:** The user clicked the Print button. The WindowsPrintDialogMBS contains the information specified by the user.
131.15.45  **PD_RETURNDC = & h00000100**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:**
Causes PrintDialog to return a device context matching the selections the user made in the property sheet. The device context is returned in DC property.

131.15.46  **PD_RETURNDEFAULT = & h00000400**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:**
If this flag is set, the PrintDialog function does not display the property sheet. Instead, it sets the DevNames and DevMode members to the default for the system default printer. Both DevNames and DevMode must be empty, or PrintDialog returns an error.

131.15.47  **PD_RETURNIC = & h00000200**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:**
Similar to the PD_RETURNDC flag, except this flag returns an information context rather than a device context. If neither PD_RETURNDC nor PD_RETURNIC is specified, hDC is undefined on output.

131.15.48  **PD_SELECTION = 1**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:**
If this flag is set, the Selection radio button is selected. If none of the PD_PAGENUMS, PD_SELECTION, or PD_CURRENTPAGE flags is set, the All radio button is selected.

131.15.49  **PD_SHOWHELP = & h00000800**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property.  
**Notes:** Causes the dialog box to display the Help button.
131.15. **CLASS WINDOWSPRINTDIALOĞMBS**

131.15.50 **PD_USEDEVMODECOPIES = & h00040000**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property. **Notes:** Same as PD_USEDEVMODECOPIESANDCOLLATE.

131.15.51 **PD_USEDEVMODECOPIESANDCOLLATE = & h00040000**

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the constants for the flags property. **Notes:**

This flag indicates whether your application supports multiple copies and collation. Set this flag on input to indicate that your application does not support multiple copies and collation. In this case, the Copies member of the class always returns 1, and PD_COLLATE is never set in the Flags member.

If this flag is not set, the application is responsible for printing and collating multiple copies. In this case, the Copies property indicates the number of copies the user wants to print, and the PD_COLLATE flag in the Flags member indicates whether the user wants collation.

Regardless of whether this flag is set, an application can determine from Copies and PD_COLLATE how many copies to render and whether to print them collated.

If this flag is set and the printer driver does not support multiple copies, the Copies edit control is disabled. Similarly, if this flag is set and the printer driver does not support collation, the Collate check box is disabled.

In Windows versions prior to Windows Vista, if this flag is not set by the calling application and the dm-Copies member of the WindowsDeviceModeMBS object is greater than 1, use that value for the number of copies; otherwise, use the value of the Copies member of this class.

131.15.52 **START_PANEL_GENERAL = & hffffffff**

MBS Win Plugin, Plugin Version: 12.1. **Function:** Special value for StartPanel property to select general panel.
131.16  class WindowsPrinterInfoMBS

131.16.1  class WindowsPrinterInfoMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for details on printer information.

**Example:**

dim printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
    MsgBox p.PrinterName
next

**Notes:**
This class wraps the PRINTER_INFO_2 structure on windows which you find documented here:
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

131.16.2  Methods

131.16.3  Constructor

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The private constructor.

131.16.4  LocalPrinters as WindowsPrinterInfoMBS()

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Returns the printers as an array.

**Example:**

dim printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
    MsgBox p.PrinterName
next

**Notes:** On any error the array will be empty.
131.16. **OpenPrinter(admin as boolean = false) as WindowsPrinterMBS**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Opens the printer so you can operate on it.

**Example:**

```vba
dim name as string = WindowsPrinterMBS.GetDefaultPrinter
dim p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
MsgBox p.PrinterName
```

**Notes:**

Admin: whether you want to get permissions to administrate.
Returns nil on any error.

131.16. **Printers(flags as Integer, Name as Variant = nil) as WindowsPrinterInfoMBS()**

MBS Win Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Printers function enumerates available printers, print servers, domains, or print providers.

**Notes:**

If you call this with flags = kPrinterFlagsLocal + kPrinterFlagsConnections and name = nil, you get same as LocalPrinters function.

see also

131.16. **Properties**

131.16. **AttributeFlags as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the printer attributes.

**Notes:**

This member can be one of the following values:

Renamed Attributes parameter to AttributeFlags in plugin version 8.2.

(Read and Write property)
PRINTERS\_ATTRIBUTE\_QUEUED & h00000001
PRINTERS\_ATTRIBUTE\_DIRECT & h00000002
PRINTERS\_ATTRIBUTE\_DEFAULT & h00000004 (Windows 95)
PRINTERS\_ATTRIBUTE\_SHARED & h00000008
PRINTERS\_ATTRIBUTE\_NETWORK & h00000010
PRINTERS\_ATTRIBUTE\_HIDDEN & h00000020
PRINTERS\_ATTRIBUTE\_LOCAL & h00000040
PRINTERS\_ATTRIBUTE\_ENABLE\_DEVQ & h00000080
PRINTERS\_ATTRIBUTE\_KEEP\_PRINTED\_JOBS & h00000100
PRINTERS\_ATTRIBUTE\_DO\_COMPLETE\_FIRST & h00000200
PRINTERS\_ATTRIBUTE\_WORK\_OFFLINE & h00000400 (Windows 95)
PRINTERS\_ATTRIBUTE\_ENABLE\_BIDI & h00000800 (Windows 95)
PRINTERS\_ATTRIBUTE\_RAW\_ONLY & h00001000
PRINTERS\_ATTRIBUTE\_PUBLISHED & h00002000 (Windows 2000) Indicates whether the printer is published in the directory service.

131.16.9 AveragePPM as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the average number of pages per minute that have been printed on the printer. **Notes:** (Read and Write property)

131.16.10 Comment as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that provides a brief description of the printer. **Example:**

dim printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrinterName + "+" + p.Comment
next

**Notes:** (Read and Write property)

131.16.11 CountJobs as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the number of print jobs that have been queued for the printer. **Notes:** (Read and Write property)
131.16.12  Datatype as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that specifies the data type used to record the print job. **Notes:** (Read and Write property)

131.16.13  DefaultPriority as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the default priority value assigned to each print job. **Notes:** (Read and Write property)

131.16.14  DevMode as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The WindowsDeviceModeMBS object that defines default printer data such as the paper orientation and the resolution. **Notes:** (Read and Write property)

131.16.15  DriverName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that specifies the name of the printer driver. **Example:**

```vbs
    dim printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

    for each p as WindowsPrinterInfoMBS in printers
        MsgBox p.PrinterName + " : " + p.DriverName
    next
```

**Notes:** (Read and Write property)

131.16.16  Location as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that specifies the physical location of the printer. 

**Notes:**
for example, "Bldg. 38, Room 1164".
(Read and Write property)

131.16.17 Parameters as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that specifies the default print-processor parameters. **Notes:** (Read and Write property)

131.16.18 PortName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that identifies the port(s) used to transmit data to the printer. **Example:**

```vba
dim printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
    MsgBox p.PrinterName + ": " + p.PortName
next
```

**Notes:**
If a printer is connected to more than one port, the names of each port must be separated by commas (for example, "LPT1:,LPT2:,LPT3:").
(Read and Write property)

131.16.19 PrinterName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that specifies the name of the printer. **Example:**

```vba
dim printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
    MsgBox p.PrinterName
next
```
131.16. CLASS WINDOWSPRINTERINFOMBS

Notes: (Read and Write property)

131.16.20 PrintProcessor as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A string that specifies the name of the print processor used by the printer.

**Example:**
```vba
dim printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters
for each p as WindowsPrinterInfoMBS in printers
    MsgBox p.PrintProcessor
next
```

Notes: (Read and Write property)

131.16.21 Priority as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Specifies a priority value that the spooler uses to route print jobs.

**Notes:**
Possible values:

- NO_PRIORITY 0
- MAX_PRIORITY 99
- MIN_PRIORITY 1
- DEF_PRIORITY 1

(Read and Write property)

131.16.22 SeparatorPageFile as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A string that specifies the name of the file used to create the separator page.

**Notes:**
This page is used to separate print jobs sent to the printer.
(Read and Write property)
131.16.23 ServerName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A string identifying the server that controls the printer.

**Example:**

```vbscript
dim printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters
for each p as WindowsPrinterInfoMBS in printers
    MsgBox p.PrinterName + ": " + p.ServerName
next
```

**Notes:**
If this string is "", the printer is controlled locally.
(Read and Write property)

131.16.24 ShareName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A string that identifies the sharepoint for the printer.

**Example:**

```vbscript
dim printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters
for each p as WindowsPrinterInfoMBS in printers
    MsgBox p.PrinterName + ": " + p.ShareName
next
```

**Notes:**
This string is used only if the PRINTER_ATTRIBUTE_SHARED constant was set for the Attributes mem-
ber.
(Read and Write property)

131.16.25 StartTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Specifies the earliest time at which the printer will print a job.

**Notes:**
This value is expressed as minutes elapsed since 12:00 A.M. GMT (Greenwich Mean Time).
131.16. CLASS WINDOWS.PRINTERINFO.MBS

(Read and Write property)

131.16.26 Status as Integer

Notes: This member can be one of the following values:

<table>
<thead>
<tr>
<th>PRINTER_STATUS_PAUSED</th>
<th>&amp; h00000001</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRINTER_STATUS_ERROR</td>
<td>&amp; h00000002</td>
</tr>
<tr>
<td>PRINTER_STATUS_PENDING_DELETION</td>
<td>&amp; h00000004</td>
</tr>
<tr>
<td>PRINTER_STATUS_PAPER_JAM</td>
<td>&amp; h00000008</td>
</tr>
<tr>
<td>PRINTER_STATUS_PAPER_OUT</td>
<td>&amp; h00000010</td>
</tr>
<tr>
<td>PRINTER_STATUS_MANUAL_FEED</td>
<td>&amp; h00000020</td>
</tr>
<tr>
<td>PRINTER_STATUS_PAPER_PROBLEM</td>
<td>&amp; h00000040</td>
</tr>
<tr>
<td>PRINTER_STATUS_OFFLINE</td>
<td>&amp; h00000080</td>

<td>PRINTER_STATUS_WARMING_UP</td>
<td>&amp; h00010000</td>
</tr>
<tr>
<td>PRINTER_STATUS_TONER_LOW</td>
<td>&amp; h00020000</td>
</tr>
<tr>
<td>PRINTER_STATUS_NO_TONER</td>
<td>&amp; h00040000</td>
</tr>
<tr>
<td>PRINTER_STATUS_PAGE_PUNT</td>
<td>&amp; h00080000</td>
</tr>
<tr>
<td>PRINTER_STATUS_USER_INTERVENTION</td>
<td>&amp; h01000000</td>
</tr>
<tr>
<td>PRINTER_STATUS_OUT_OF_MEMORY</td>
<td>&amp; h02000000</td>
</tr>
<tr>
<td>PRINTER_STATUS_DOOR_OPEN</td>
<td>&amp; h04000000</td>
</tr>
<tr>
<td>PRINTER_STATUS_SERVER_UNKNOWN</td>
<td>&amp; h08000000</td>
</tr>
<tr>
<td>PRINTER_STATUS_POWER_SAVE</td>
<td>&amp; h10000000</td>
</tr>
</tbody>
</table>

Windows 95: The PRINTER_STATUS_PAGE_PUNT value specifies that the page is being ”punted” (that is, not printed) because it is too complex for the printer to print.

(Read and Write property)

131.16.27 UntilTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Specifies the latest time at which the printer will print a job.

Notes: This value is expressed as minutes elapsed since 12:00 A.M. GMT (Greenwich Mean Time).
131.16.28 Constants

131.16.29 kPrinterFlagsConnections = 4

MBS Win Plugin, Plugin Version: 15.2. **Function:** One of the flags for Printer function.
**Notes:** The function enumerates the list of printers to which the user has made previous connections.

131.16.30 kPrinterFlagsDefault = 1

MBS Win Plugin, Plugin Version: 15.2. **Function:** One of the flags for Printer function.
**Notes:** Default printer.

131.16.31 kPrinterFlagsLocal = 2

MBS Win Plugin, Plugin Version: 15.2. **Function:** One of the flags for Printer function.
**Notes:** If the kPrinterFlagsName flag is not also passed, the function ignores the Name parameter, and enumerates the locally installed printers. If kPrinterFlagsName is also passed, the function enumerates the local printers on Name.

131.16.32 kPrinterFlagsName = 8

MBS Win Plugin, Plugin Version: 15.2. **Function:** One of the flags for Printer function.
**Notes:** The function enumerates the printer identified by Name. This can be a server, a domain, or a print provider. If Name is nil, the function enumerates available print providers.

131.16.33 kPrinterFlagsNetwork = 64

MBS Win Plugin, Plugin Version: 15.2. **Function:** One of the flags for Printer function.
**Notes:** Network printers?

131.16.34 kPrinterFlagsRemote = 16

MBS Win Plugin, Plugin Version: 15.2. **Function:** One of the flags for Printer function.
**Notes:** Remote (non Local) printers?
131.16.35  kPrinterFlagsShared = 32

MBS Win Plugin, Plugin Version: 15.2. **Function:** One of the flags for Printer function.  
**Notes:** The function enumerates printers that have the shared attribute. Cannot be used in isolation; use an OR operation to combine with another constants.
131.17 class WindowsPrinterJobMBS

131.17.1 class WindowsPrinterJobMBS

131.17.2 Properties

131.17.3 Datatype as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The type of data used to record the print job.
Notes: (Read and Write property)

131.17.4 DevMode as WindowsDeviceModeMBS

Notes: (Read and Write property)

131.17.5 Document as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The name of the user who owns the print job.
Notes: (Read and Write property)

131.17.6 DriverName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The name of the printer driver that should be used to process the print job.
Notes: (Read and Write property)

131.17.7 JobID as Integer

131.17.8 MachineName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The name of the machine that created the print job.
**Notes:** (Read and Write property)

131.17.9 NotifyName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The name of the user who should be notified when the job has been printed or when an error occurs while
printing the job.
**Notes:** (Read and Write property)

131.17.10 PagesPrinted as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The number of pages that have printed.
**Notes:**
This value may be zero if the print job does not contain page delimiting information.
(Read and Write property)

131.17.11 Parameters as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Print-processor parameters.
**Notes:** (Read and Write property)

131.17.12 Position as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The job's position in the print queue.
**Notes:** (Read and Write property)
131.17.13 PrinterName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the printer for which the job is spooled.
**Notes:** (Read and Write property)

131.17.14 PrintProcessor as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the print processor that should be used to print the job.
**Notes:** (Read and Write property)

131.17.15 Priority as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The job priority.
**Notes:**
This member can be one of the following values or in the range between 1 through 99 (kPriorityMin through kPriorityMax).
(Read and Write property)

131.17.16 Size as Int64

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The size, in bytes, of the job.
**Notes:** (Read and Write property)

131.17.17 StartTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The earliest time that the job can be printed.
**Notes:** (Read and Write property)

131.17.18 Status as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The job status.
Notes:
Check kJobStatus* constants for possible values.
(Read and Write property)

131.17.19 StatusString as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The status of the print job.
Notes:
This member should be checked prior to Status and, if StatusString is "", the status is defined by the contents
of the Status member.
(Read and Write property)

131.17.20 Submitted as Date

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The time when the job was submitted.
Notes:
This time value is in Universal Time Coordinate (UTC) format.
(Read and Write property)

131.17.21 Time as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The total time, in milliseconds, that has elapsed since the job began printing.
Notes: (Read and Write property)

131.17.22 TotalPages as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The number of pages required for the job.
Notes:
This value may be zero if the print job does not contain page delimiting information.
(Read and Write property)
131.17.23 UntilTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The latest time that the job can be printed.  
**Notes:** (Read and Write property)

131.17.24 UserName as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the user who owns the print job.  
**Notes:** (Read and Write property)

131.17.25 Constants

131.17.26 kJobStatusBlockedDeviceQueue = &h200

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** The driver cannot print the job.

131.17.27 kJobStatusComplete = &h1000

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** The job is sent to the printer, but may not be printed yet.  
(Windows XP and later)

131.17.28 kJobStatusDeleted = &h100

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** Job has been deleted.

131.17.29 kJobStatusDeleting = 4

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** Job is being deleted.
131.17.30 kJobStatusError = 2

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** An error is associated with the job.

131.17.31 kJobStatusOffline = & h20

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** Printer is offline.

131.17.32 kJobStatusPaperOut = & h40

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** Printer is out of paper.

131.17.33 kJobStatusPaused = 1

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** Job is paused.

131.17.34 kJobStatusPrinted = & h80

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** Job has printed.

131.17.35 kJobStatusPrinting = & h10

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** Job is printing.

131.17.36 kJobStatusRenderingLocally = & h4000

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the job status constants.  
**Notes:** Rendering.
131.17.37  \texttt{kJobStatusRestart} = \& \texttt{h800}

MBS Win Plugin, Plugin Version: 12.1. \textbf{Function}: One of the job status constants.  
\textbf{Notes}: Job has been restarted.

131.17.38  \texttt{kJobStatusRetained} = \& \texttt{h2000}

MBS Win Plugin, Plugin Version: 12.1. \textbf{Function}: One of the job status constants.  
\textbf{Notes}:  
The job has been retained in the print queue following printing.  
(Windows XP and later)

131.17.39  \texttt{kJobStatusSpooling} = 8

MBS Win Plugin, Plugin Version: 12.1. \textbf{Function}: One of the job status constants.  
\textbf{Notes}: Job is spooling.

131.17.40  \texttt{kJobStatusUserIntervention} = \& \texttt{h400}

MBS Win Plugin, Plugin Version: 12.1. \textbf{Function}: One of the job status constants.  
\textbf{Notes}: Printer has an error that requires the user to do something.

131.17.41  \texttt{kPriorityDefault} = 1

MBS Win Plugin, Plugin Version: 12.1. \textbf{Function}: One of the priority constants.  
\textbf{Notes}: Default priority.

131.17.42  \texttt{kPriorityMax} = 99

MBS Win Plugin, Plugin Version: 12.1. \textbf{Function}: One of the priority constants.  
\textbf{Notes}: Maximum priority.
MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the priority constants. **Notes:** Minimum priority.

131.17.44  kPriorityNo = 0

MBS Win Plugin, Plugin Version: 12.1. **Function:** One of the priority constants. **Notes:** No priority.
131.18 class WindowsPrinterMBS

131.18.1 class WindowsPrinterMBS

MBS Win Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The class for an open connection to a windows printer.

Notes: Objects of this class can operate on printers. Some operations need administrative permissions. If you don’t have them, lasterror is set to 5.

131.18.2 Methods

131.18.3 AddForm(form as WindowsPageFormatMBS) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The AddForm function adds a form to the list of available forms that can be selected for the specified printer.

Example:

// query default printer
dim w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)

dim form as new WindowsPageFormatMBS

form.Mode = 1
form.Name = "MyTest"
form.DisplayName = "MyTest"
form.Flags = 0
form.SizeHeight = 100000
form.SizeWidth = 100000
form.ImageableAreaLeft = 0
form.ImageableAreaTop = 0
form.ImageableAreaRight = 100000
form.ImageableAreaBottom = 100000

if w.AddForm(form) then
    MsgBox "OK"
else
    MsgBox "Failed"
end if

Notes: Form.Mode gives level of the data. Must be either 1 (old version) or 2 (newer version).
Form: The form details.

Returns true if the function succeeds and false if the function fails.

Note: This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

An application can determine which forms are available for a printer by calling the GetPrinterFormats function.
If form points to a Mode 2 form, then AddForm will fail if either a form with the specified name already exists or the Keyword value already exists.

131.18.4 AdvancedDocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, parent as window = nil) as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Displays a printer-configuration dialog box for the specified printer, allowing the user to configure that printer.
**Notes:**
This function is a special case of the DocumentProperties function.

parent: The parent window of the printer-configuration dialog box.

OutputDevMode: The device mode structure that will contain the configuration data specified by the user.
InputDevMode: The device mode structure that contains the configuration data used to initialize the controls of the printer-configuration dialog box.

If the DocumentProperties function with these parameters is successful, the return value of AdvancedDocumentProperties is 1. Otherwise, the return value is zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.
This function can only display the printer-configuration dialog box so a user can configure it. For more control, use DocumentProperties.

### 131.18.5 AllJobs as WindowsPrinterJobMBS()

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries all jobs for the printer.  
**Example:**
```
dim w as new WindowsPrinterMBS( WindowsPrinterMBS.GetDefaultPrinter)
dim jobs() as WindowsPrinterJobMBS = w.AllJobs
MsgBox str(UBound(jobs)+1)+" jobs"
```

**Notes:** PrinterName property must be set, so the function knows which printer.

### 131.18.6 CanPrinterPassThroughPostScript as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this printer can pass through postscript data.  
**Notes:** Returns true for Postscript printers and false for other printers.  
For more information on this function, visit this website:  

### 131.18.7 ChangePrinterSettings(value as WindowsDeviceModeMBS, Mode as Integer=2) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Changes printer settings.  
**Notes:**  
This function opens the printer, queries current settings using GetPrinter, applies all your changes, calls DocumentProperties to verify those settings are valid for the printer and uses SetPrinter to apply the changes. To indicate which fields in the WindowsDeviceModeMBS object are set by you, use the fields integer value with a combination of the DM_* constants.  
Returns true on success and false on failure.  
Mode can be 2 (general printer information), 8 (global settings) or 9 (user settings).
For more information on the GetPrinter function, check this website:

For more information on the SetPrinter function, check this website:

For more information on the DocumentProperties function, check this website:

131.18.8 ConfigurePort(name as string = "", parent as window = nil, PortName as string = "") as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Displays the port-configuration dialog box for a port on the specified server.

**Notes:**
Name: The name of the server on which the specified port exists. If this parameter is "", the port is local.
parent: The parent window of the port-configuration dialog box.
PortName: The name of the port to be configured.

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

Before calling the ConfigurePort function, an application should call the EnumPorts function to determine valid port names.

131.18.9 ConnectToPrinterDialog(parent as window = nil) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Displays a dialog box that lets users browse and connect to printers on a network.

**Notes:**
If the user selects a printer, the function attempts to create a connection to it; if a suitable driver is not installed on the server, the user is given the option of creating a printer locally.
parent: Specifies the parent window of the dialog box.

If the function succeeds and the user selects a printer, this object points to the new printer and return value
is true.
If the function fails, or the user cancels the dialog box without selecting a printer, the return value is true.

This is a blocking or synchronous function and might not return immediately. How quickly this function
returns depends on run-time factors such as network status, print server configuration, and printer driver
implementation factors that are difficult to predict when writing an application. Calling this function from a
thread that manages interaction with the user interface could make the application appear to be unresponsive.

The ConnectToPrinterDialog function attempts to create a connection to the selected printer. However, if
the server on which the printer resides does not have a suitable driver installed, the function offers the user
the option of creating a printer locally.

An application should call DeletePrinter to delete a local printer. An application should call DeletePrinter-
Connection to delete a connection to a printer.

### 131.18.10 Constructor(PrinterName as string, admin as boolean = false)

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Opens the printer so you can operate on it.

**Notes:**
Admin: whether you want to get permissions to administrate.
Raises exception if printer can’t be opened. Use OpenPrinter function to avoid exception.

### 131.18.11 DeleteForm(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The DeleteForm function removes a form name from the list of supported forms.

**Notes:**
name: The form name to be removed.

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function
returns depends on run-time factors such as network status, print server configuration, and printer driver
implementation factors that are difficult to predict when writing an application. Calling this function from a
thread that manages interaction with the user interface could make the application appear to be unresponsive.
DeleteForm can only delete form names that were added by using the AddForm function.

**131.18.12  DeleteJob(JobID as Integer) as boolean**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Delete the print job.
**Notes:** Returns true on success and false on failure.

**131.18.13  DeletePrinter as boolean**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Deletes the specified printer object.
**Notes:**
Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

If there are print jobs remaining to be processed for the specified printer, DeletePrinter marks the printer for pending deletion, and then deletes it when all the print jobs have been printed. No print jobs can be added to a printer that is marked for pending deletion. A printer marked for pending deletion cannot be held, but its print jobs can be held, resumed, and restarted. If the printer is held and there are jobs for the printer, DeletePrinter fails with ERROR_ACCESS_DENIED.

LastError is set.

**131.18.14  DeletePrinterConnection(name as string) as boolean**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Deletes a connection to a printer that was established by a call to AddPrinterConnection or ConnectToPrinterDialog.
**Notes:**
name: The name of the printer connection to delete.
Returns true on success and false on failure.
This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

The DeletePrinterConnection function does not delete any printer driver files that were copied to the server to which the printer is attached.

### 131.18.15 DocumentProperties

**DocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, Prompt as boolean = false, parent as window = nil) as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The DocumentProperties function retrieves or modifies printer initialization information or displays a printer-configuration property sheet for the specified printer.

**Example:**

```plaintext
// get default printer
dim p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(WindowsPrinterMBS.GetDefaultPrinter)

// ask for printer settings
dim s as new WindowsDeviceModeMBS
dim n as Integer = p.DocumentProperties(nil, s, true, window1)
```

**Notes:**

Printername property must be set.

Prompt: Whether to show dialog.

OutputDevMode: Devmode variable that receives the printer configuration data specified by the user.

InputDevMode: Optional input data which the operating system uses to initialize the property sheet controls.

Prompt: Whether the function presents the printer driver’s Print Setup property sheet and then changes the settings in the printer’s DeviceMode data structure to those values specified by the user.

If you provide object for InputDevMode, the function will read settings from there. If you don’t pass an object (nil) or you pass incomplete settings, default settings are used to complete.

If prompt is true, the dialog is shown and user can change settings.

On the end, the current new data is stored in OutputDevMode where you can find it.
If the function displays the property sheet, the return value is either IDOK (1) or IDCANCEL (2), depending on which button the user selects.
If the function does not display the property sheet and is successful, the return value is IDOK (1).
If the function fails, the return value is less than zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation-factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

see also

131.18.16 GetDefaultPrinter as string

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The GetDefaultPrinter function retrieves the printer name of the default printer for the current user on the local computer.
Example:
msgbox WindowsPrinterMBS.GetDefaultPrinter

Notes:
For more details on the GetDefaultPrinter function, check this website:

Returns an empty string on any error.

131.18.17 GetForm(name as string) as WindowsPageFormatMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The GetForm function retrieves information about a specified form.
Example:
    // query default printer
    dim w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)
    
    // get a page format
    dim f as WindowsPageFormatMBS = w.GetForm("Letter")
    
    // and show details
MsgBox f.DisplayName+” ”+str(F.SizeWidth/10000,"0.0")+” x ”+str(f.SizeHeight/10000,"0.0")

Notes:

name: The string that specifies the name of the form. To get the names of the forms supported by the printer, call the GetPrinterFormats function.

On failure returns nil, on success the form details.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

If the caller is remote, and the Form Mode is 2, the StringType value of the returned WindowsPageFormatMBS will always be STRING_LANGPAIR.

131.18.18 GetJob(JobID as Integer) as WindowsPrinterJobMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Query job with given ID from printer.

**Notes:**

Returns nil on any error.
PrinterName property must be set, so the function knows which printer.

131.18.19 GetPrinterFormats as WindowsPageFormatMBS()

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the page formats supported by this printer.

**Notes:**

On failure the array is empty.

This function uses the EnumForms for which you can find more information on this website: http://msdn.microsoft.com/en-us/library/dd162624(v=VS.85).aspx
131.18.20 GetPrinterSettings(Mode as Integer=2) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries printer settings.

**Example:**
```vbs
    dim w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)
    dim dm as WindowsDeviceModeMBS = w.GetPrinterSettings
```

**Notes:**
Mode can be 2 (general printer information), 8 (global settings) or 9 (user settings).

For more information on the GetPrinter function, check this website:

131.18.21 GetPrinterTechnology as string

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the printer technology.

**Example:**
```vbs
    dim w as new WindowsPrinterMBS(“my printer”)
    msgbox w.GetPrinterTechnology
```

**Notes:**
Opens the printer, queries the print technology and returns that string.
For postscript printers the string should contain the word “postscript”.
Returns an empty string on any error.

For details on this function, check the following website:

131.18.22 OpenPrinter(PrinterName as string, admin as boolean = false) as WindowsPrinterMBS

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Opens the printer so you can operate on it.

**Notes:**
Admin: whether you want to get permissions to administrate.
Returns nil on any error.

### 131.18.23  PauseJob(JobID as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Pause the print job.
**Notes:** Returns true on success and false on failure.

### 131.18.24  PausePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Pauses the printer.
**Example:**
```vba
dim name as string = WindowsPrinterMBS.GetDefaultPrinter
dim p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, true)
if p.PausePrinter then
    MsgBox "OK"
else
    MsgBox "Failed: " + p.LasterrorMessage + " " + str(p.Lasterror)
end if
```
**Notes:**
Requires application to be run by administrator and printer opened with admin option. Else you get error 5.
Returns true on success and false on failure.

### 131.18.25  PrinterProperties(parent as window = nil) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The PrinterProperties function displays a printer-properties property sheet for the specified printer.
**Example:**
```vba
// get default printer
dim w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)

// open properties dialog
if w.PrinterProperties(window1) then
```

MsgBox "OK"
else
MsgBox "Failed"
end if

Notes:
Returns true on success (dialog shows) or false on error.
Parent is the parent window for the new dialog. Can be nil.

131.18.26  PurgePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Purges the printer.
**Example:**

```pascal
dim name as string = WindowsPrinterMBS.GetDefaultPrinter
dim p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, true)

if p.PurgePrinter then
    MsgBox "OK"
else
    MsgBox "Failed: " + p.LasterrorMessage + " " + str(p.Lasterror)
end if
```

Notes:
Requires application to be run by administrator and printer opened with admin option. Else you get error 5.
Returns true on success and false on failure.

131.18.27  ResumeJob(JobID as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resume a paused print job.
**Notes:** Returns true on success and false on failure.
131.18.28 ResumePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resumes the printer.

**Example:**

```vba
dim name as string = WindowsPrinterMBS.GetDefaultPrinter
dim p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, true)
if p.ResumePrinter then
    MsgBox "OK"
else
    MsgBox "Failed: " + p.LasterrorMessage + " " + str(p.Lasterror)
end if
```

**Notes:**

Requires application to be run by administrator and printer opened with admin option. Else you get error 5.

Returns true on success and false on failure.

131.18.29 SetDefaultPrinter(PrinterName as string) as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Changes the default printer to the given one.

**Example:**

```vba
call WindowsPrinterMBS.SetDefaultPrinter("My Printer")
```

**Notes:**

Returns a Windows error code. (0 for success)

131.18.30 SetForm(name as string, form as WindowsPageFormatMBS) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The SetForm function sets the form information for the specified printer.

**Notes:**
name: The string that specifies the form name for which the form information is set.
Form: The form data. Mode property must be either 1 (older format) or 2 (newer format).

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function
returns depends on run-time factors such as network status, print server configuration, and printer driver
implementation factors that are difficult to predict when writing an application. Calling this function from a
thread that manages interaction with the user interface could make the application appear to be unresponsive.

SetForm can be called multiple times for an existing WindowsPageFormatMBS, each call adding additional
pairs of DisplayName and LangId values. All languages versions of the form will get the Size and Image-
ableArea values of the WindowsPageFormatMBS in the most recent call to SetForm.
If the caller is remote and the form’s Mode is 2, the StringType value of the WindowsPageFormatMBS
cannot be STRING_MUIDLL.

131.18.31 SetJob(JobID as Integer, job as WindowsPrinterJobMBS) as boolean

MBS Win Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Sets job parameters.
**Example:**
```vbnet
dim w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter, true)
dim jobs() as WindowsPrinterJobMBS = w.AllJobs
MsgBox str(UBound(jobs)+1)+” jobs”

// pick first
dim j as WindowsPrinterJobMBS = jobs(0)
j.Document = ”Hello World”

// write back values
call w.SetJob(j.JobID, j)

// error?
if w.Lasterror<>0 then
MsgBox w.LasterrorMessage
end if
```

**Notes:**
see also
131.18.32 SetPrinterSettings(value as WindowsDeviceModeMBS, Mode as Integer=2) as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets printer settings.  
**Example:**

```vbs
// switch default printer to A5 landscape paper

dim name as string = WindowsPrinterMBS.GetDefaultPrinter
dim p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, false)
dim d as WindowsDeviceModeMBS = p.GetPrinterSettings(9)

if d = nil then
    MsgBox p.LasterrorMessage
else
    d.PaperSize = d.DMPAPER_A5
    d.Fields = BitwiseOr(d.Fields, d.DM_PAPERSIZE)
    d.Orientation = d.DMORIENT_LANDSCAPE
    d.Fields = BitwiseOr(d.Fields, d.DM_ORIENTATION)

    if p.SetPrinterSettings(d, 9) then
        MsgBox "OK"
    else
        MsgBox "Failed: " + p.LasterrorMessage
    end if
end if
```

**Notes:**

Mode can be 2 (general printer information), 8 (global settings) or 9 (user settings).

For more information on the GetPrinter function, check this website:

131.18.33 Properties

131.18.34 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal handle to the printer.  
**Notes:** (Read and Write property)
131.18. CLASS WINDOWSPRINTERMBS

131.18.35  Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last windows error code.
**Notes:** (Read and Write property)

131.18.36  LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The text message for the last error code.
**Notes:** (Read and Write property)

131.18.37  PrinterName as String

MBS Win Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The name of the open printer in this object.
**Example:**
```vba
dim name as string = WindowsPrinterMBS.GetDefaultPrinter
dim p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
MsgBox p.PrinterName
```
**Notes:** (Read and Write property)
Chapter 132

Process

132.1 class Application

132.1.1 class Application

Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Extends the Application class inside Realbasic.

132.1.2 Methods

132.1.3 ApplicationCreatorCodeMBS as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Creator Code of the application.

**Example:**

`msgbox "Hi. This application has the creator code "+app.ApplicationCreatorCodeMBS`

**Notes:**

Only useful on Mac OS.
If you run your app inside the Realbasic IDE it will return "RBv2" which is Realbasic's Creator code in Realbasic 2.0.
132.1.4 ApplicationFileMBS as folderitem

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Gives a folderitem to the applications file.

**Example:**

msgbox "Hi. The file of this application is named " + app.ApplicationFileMBS.name

**Notes:**

Inside Realbasic points to the Realbasic application.

This item may go in the future. Please use app.executablefile in new Realbasic versions.

132.1.5 ApplicationNameMBS as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the application.

**Example:**

msgbox "Hi. This application is named " + app.ApplicationNameMBS

**Notes:**

This may not be the exact same name than the filename.

132.1.6 ArgumentsMBS as String()

MBS Util Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries arguments of process.

**Notes:**

Returns nil in case of any error (low memory).
First entry in result is path to current app.
Other entries are parameters, without any quotes.

132.1.7 BundleFolderMBS as folderitem

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a folderitem to the bundle’s mail folder.
132.1.8 BundleLocalizedStringMBS(key as string) as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the localized string for the given key from the default table.
Notes: A short version for BundleLocalizedString which uses the default table.
See also:

- 132.1.9 BundleLocalizedStringMBS(key as string,fromtable as string) as string

132.1.9 BundleLocalizedStringMBS(key as string,fromtable as string) as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the localized string for the given key and table.
Example:

```vba
// You may make yourself a function to look up for the key and return
// This function was not tested in a real application. May contain a bug.

function Localize(key as string, default as string) as string
    dim s as string
    s=app.BundleLocalizedStringMBS(key)
    if s="" then
        s=default // For Mac OS Classic and Windows
    elseif s=key then // returns key for not localized items
        msgbox "For developer: the key ""+key+"" was not localized for any language."
    end if
    return s
end sub

// use like this
FileOpen.text=Localize("FileOpenLabel", "Open...")
```

Notes:
The table parameter is optional to specify which ".strings"-file to use.
without table or table="" the "Localizable.strings" file is used by Mac OS X.

Returns "" (empty string) on Mac OS Classic or Windows.
See also:

- 132.1.8 BundleLocalizedStringMBS(key as string) as string
132.1.10  BundleResourceFolderItemLocalizedMBS(ResourceName as string, ResourceType as string, SubDirectory as string) as folderitem

MBS Util Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches inside the application bundle for a file.  
**Example:**

```vba
dim f as FolderItem
f=app.BundleResourceFolderItemLocalizedMBS(”logo”,”jpg”,””)
MsgBox f.AbsolutePath
```

**Notes:**  
ResourceName is the filename of the resource file.  
ResourceType is the file extension.  
SubDirectory is the name of the directory.  
This function will take care for localization folders.

132.1.11  BundleResourceFolderMBS as folderitem

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a folderitem to the resource file inside the bundle.

132.1.12  GotoHelpBookPageMBS(bookname as string, path as string, anchor as string) as Integer

MBS Util Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Shows a page of an helpbook.  
**Notes:**  
Delivers a request to load a specific text/html file to the Help Viewer application.

**Bookname:**  
Optionally, the AppleTitle of an installed Help book. If ””, the path parameter must be a full file: URL to the file to be opened.

**Path:**  
Optionally, one of two types of paths:  
1) a URL-style path to a file that is relative to the main folder of the book supplied in the bookname parameter, or  
2) if bookname is ””, a full file: URL to the file to be opened. If this parameter is ””, then bookname must not be NULL, and is used to open the Help Viewer to the main page of Help content for the specified book.
Anchor:
Optionally, the name of anchor tag to scroll to in the newly opened file. Can be "."

Result:
An operating system result code that indicates whether the request was successfully sent to the Help Viewer application.

Possible error values:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>noErr</td>
<td>0 No Error</td>
</tr>
<tr>
<td>paramErr</td>
<td>-50 Wrong parameter</td>
</tr>
<tr>
<td>dirNFErr</td>
<td>-120 Folder not found error</td>
</tr>
<tr>
<td>AHInternalErr</td>
<td>-10790 Apple Help Internal error</td>
</tr>
<tr>
<td>AHInternetConfigPrefErr</td>
<td>-10791 Apple Help Config error</td>
</tr>
<tr>
<td>No</td>
<td>-1 Function not available on this platform.</td>
</tr>
</tbody>
</table>

For Cocoa use NSHelpManagerMBS class.

132.1.13  GotoMainHelpBookTOCMBS(developer as boolean) as Integer

MBS Util Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Shows the main table of contents page.
Notes:
Delivers a request to load the main table of contents of installed help books to the Help Viewer application.

Toctype:
The type of table of contents to be loaded: user or developer.

Result:
An operating system result code that indicates whether the request was successfully sent to the Help Viewer application.

Possible error values:

For Cocoa use NSHelpManagerMBS class.
noErr 0  No Error
paramErr -50 Wrong parameter
dirNFErr -120 Folder not found error
AHInternalErr -10790 Apple Help Internal error
AHInternetConfigPrefErr -10791 Apple Help Config error
No -1  Function not available on this platform.

132.1.14  HideMeMBS as boolean

MBS Util Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Hides the current application.

**Notes:**
- Returns true if the current application was hidden.
- Returns false on Carbon running on Mac OS 9 or Windows.

132.1.15  HideOthersMBS as boolean

MBS Util Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Hides all applications except the current one.

**Notes:**
- Returns true if the other applications were hidden.
- Returns false on Carbon running on Mac OS 9 of Windows.

132.1.16  IsBundleMBS as boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the application is a bundle.

132.1.17  LaunchTimeMBS as Double

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ticks value at launch time.

**Example:**

```plaintext
dim d as date

d=new date
d.totalSeconds=d.totalSeconds-(ticks-app.launchTimeMBS)/60

msgbox d.longdate+” ”+d.longtime
```
Notes:
This value must be converted to the seconds value like in the example.
-1 on Windows.
For Mac OS X see the DarwinResourceUsageMBS class.

132.1.18  LookupHelpBookAnchorMBS(bookname as string, anchor as string) as Integer

MBS Util Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Lookups an anchor in an helpbook.
**Notes:**
Delivers a request to perform an anchor lookup to the Help Viewer application.
Note: anchor lookups will fail unless you have indexed your help content with anchor indexing turned on in
the indexing tool’s preferences panel.

Bookname:
Optionally, the AppleTitle of the Help book to searched. If “”, the anchor lookup is performed using all
installed Help books.

Anchor:
The name of the anchor tag to look up.

Result:
An operating system result code that indicates whether the request was successfully sent to the Help Viewer
application.

Possible error values:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>noErr 0</td>
<td>No Error</td>
</tr>
<tr>
<td>paramErr -50</td>
<td>Wrong parameter</td>
</tr>
<tr>
<td>dirNFErr -120</td>
<td>Folder not found error</td>
</tr>
<tr>
<td>AHInternalErr-10790</td>
<td>Apple Help Internal error</td>
</tr>
<tr>
<td>AHInternetConfigPrefErr -10791</td>
<td>Apple Help Config error</td>
</tr>
<tr>
<td>No -1</td>
<td>Function not available on this platform.</td>
</tr>
</tbody>
</table>

For Cocoa use NSHelpManagerMBS class.
132.1.19 MainBundleMBS as CFBundleMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If your application is a bundle, this function returns your own bundle. **Notes:** Returns nil on any error.

132.1.20 NSApplicationMBS as NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the shared NSApplication object. **Notes:**

This method gives easy access to the NSApplicationMBS class.

The plugin makes sure that there is only one application object by returning the same object each time.

132.1.21 OverlayApplicationDockTileImageMBS(pic as CGImageMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

Adds a picture on top of the application dock title.

**Example:**

```plaintext
static n as Integer // global property
dim p as picture
dim m as picture
dim g as graphics
dim s as string
dim w,h,x as Integer

n=n+1 // add one
s=str(n)
m=newpicture(128,128,32)
p=newpicture(128,128,32)

g=p.graphics
g.textsize=24
w=g.stringwidth(s)
h=g.stringheight(s,0)
x=125-w-10
g.foreColor=rgb(255,0,0)
g.fillRoundRect x,10,10+w,10+h,20,20
g.foreColor=rgb(0,0,0)
g.drawstring s,x+5,15+g.textascent
```
g=m.graphics
g.foreColor=rgb(0,0,0)
g.fillRoundRect x,10,10+w,10+h,20,20

if app.OverlayApplicationDockTileImageMBS(CGCreateImageMBS(p,m)) then
end if

Notes:
Changed in MBS Plugin 2.7 to use CGImages directly.
Added support for 64-bit in plugin version 16.0.

132.1.22 ProcessTimeMBS as Double

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current CPU time for the process.

**Example:**

```plaintext
msgbox "I got "+format(app.ProcessTimeMBS/100,"0.00")+" seconds CPU time till now."
```

Notes:
On Mac OS X, the OS counts how much CPU time in given to the current process.
On Mac OS 9 you can get this information for any process using the ProcessMBS class.
Returns -1 in case of an error.

You can do this function yourself if you like:

```plaintext
dim s as SoftDeclareMBS
s=new SoftDeclareMBS
if s.LoadLibrary("System.Framework") then
if s.LoadFunction("clock") then
if s.Call(0,nil) then
MsgBox "clock: "+str(s.Result)+chr(13)+"app.ProcessTime: "+str(app.ProcessTime)
end if
end if
end if

You may need to add Error Checking code.
```
132.1.23 RegisterHelpBookMBS as Integer

MBS Util Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers a help book which is inside the bundle.

**Notes:**

Registers a book of Help content such that the book will appear in the current user’s main table of contents (Help Center) in the Help Viewer application. To be used when help books reside outside of the known help folders (i.e. help books that are kept inside of application bundles).

**Result:**

An operating system result code that indicates whether all help books contained within the specified bundle were registered.

**Possible error values:**

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>noErr</td>
<td>0      No Error</td>
</tr>
<tr>
<td>paramErr</td>
<td>-50    Wrong parameter</td>
</tr>
<tr>
<td>dirNFErr</td>
<td>-120   Folder not found error</td>
</tr>
<tr>
<td>AHInternalErr</td>
<td>-10790 Apple Help Internal error</td>
</tr>
<tr>
<td>AHInternetConfigPrefErr</td>
<td>-10791 Apple Help Config error</td>
</tr>
<tr>
<td>No</td>
<td>-1     Function not available on this platform.</td>
</tr>
</tbody>
</table>

For Cocoa, please declare your help book in the info.plist.

132.1.24 RestoreApplicationDockTileImageMBS as boolean

MBS MacCG Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Restores the application dock tile image.

**Example:**

```plaintext
if app.RestoreApplicationDockTileImageMBS then
  // ok
end if
```

**Notes:** Added support for 64-bit in plugin version 16.0.

132.1.25 SearchHelpBookMBS(bookname as string, query as string) as Integer

132.1.  CLASS APPLICATION

Notes:
Delivers a request to perform the specified search to the Help Viewer application.

Bookname:
Optionally, the AppleTitle of the Help book to be searched. If "", all installed Help books are searched.

Query:
The query to be made. This string can, if desired, have boolean operators or be a natural language phrase.

Result:
An operating system result code that indicates whether the request was successfully sent to the Help Viewer application.

Possible error values:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>noErr</td>
<td>0</td>
</tr>
<tr>
<td>paramErr</td>
<td>-50</td>
</tr>
<tr>
<td>dirNFErr</td>
<td>-120</td>
</tr>
<tr>
<td>AHInternalErr</td>
<td>-10790</td>
</tr>
<tr>
<td>AHInternetConfigPrefErr</td>
<td>-10791</td>
</tr>
<tr>
<td>No</td>
<td>-1</td>
</tr>
</tbody>
</table>

For Cocoa use NSHelpManagerMBS class.

132.1.26  SetApplicationDockTileImageMBS(pic as CGImageMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Sets the application dock tile image.

Example:

```c
dim p as CGImageMBS = CGImageMBS.CreateImage(LogoMBS(500))

if app.SetApplicationDockTileImageMBS(p) then
  // ok
end if
```

Notes:
Changed in MBS Plugin 2.7 to use CGIimages directly.
Added support for 64-bit in plugin version 16.0.
132.1.27  Properties

132.1.28  DockTileMenuMBS as MenuMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The menu used for the dock tile menu.
**Notes:** (Read and Write computed property)

132.1.29  FrontmostMBS as boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the application is frontmost.
**Example:**

app.frontmostmbs=True 'bring app to front

**Notes:**
This property is for read and write. Writing to it brings the app to front. Setting this property to false does nothing.

If you need to make some other application frontmost, you can use app.HideMeMBS or use the ProcessMBS class.
(Read and Write computed property)
132.2. **CLASS BACKGROUNDTHREADMBS**

## 132.2 class BackgroundThreadMBS

### 132.2.1 class BackgroundThreadMBS

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The thread subclass we use for the CallMethodOnThreadMBS functions.

**Example:**

```vbnet
if CallMethodOnThreadMBS(new BackgroundThreadMBS, window1, "Test") then
    msgbox "OK"
else
    msgbox "Failed"
end if
```

**Notes:** Subclass of the Thread class.
132.3 module CallDelegatesMBS

132.3.1 module CallDelegatesMBS

MBS Util Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The module for the call delegate methods. **Notes:** Only supported on Xojo 2013r1 and newer.

132.3.2 Methods

132.3.3 CallDelegateOnMainThreadMBS(m as _delegateMBS)

MBS Util Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Calls a delegate on the main thread. **Example:**

CallDelegateOnMainThreadMBS AddressOf testString, "Hello"
CallDelegateOnMainThreadMBS AddressOf testNumbers, 5, 6
CallDelegateOnMainThreadMBS AddressOf TestNoParameters
CallDelegateOnMainThreadMBS AddressOf Test, "4th call", 4

**Notes:**

We call the delegate on the main thread later with passing a parameter
Our plugin supports various combinations of up to 2 parameters of type string, variant, boolean, double, integer and object.
If you need more, please contact us.
Only supported on Xojo 2013r1 and newer.

If the method you call has optional parameters, you must pass all values or Xojo will throw a compile error.
132.4.1 CallMethodLaterMBS(target as object, name as string, afterDelay as Double) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object on the main thread after the given delay in seconds.

**Example:**
```vbnet
if CallMethodLaterMBS(window1, "Test", 5.0) then
    msgbox "OK"
else
    msgbox "Failed"
end if
```

**Notes:**
The method must be declared on the given class for the target object with no parameters and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread after the given delay in seconds.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your application is.

See also:
- 132.4.2 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant) as boolean
- 132.4.3 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant) as boolean
- 132.4.4 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

132.4.2 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object on the main thread after the given delay in seconds.

**Example:**
```vbnet
if CallMethodLaterMBS(window1, "Test", 4.0, "Hello") then
    msgbox "OK"
```

else
msgbox "Failed"
end if

Notes:
The method must be declared on the given class for the target object with one variant parameter and no
return values.

The method will be called later (Asynchronous) on the main thread after the given delay in seconds. Useful
for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your
application is.
See also:

- 132.4.1 CallMethodLaterMBS(target as object, name as string, afterDelay as Double) as boolean

  value2 as Variant) as boolean
- 132.4.4 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant,
  value2 as Variant, value3 as Variant) as boolean

132.4.3 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant,
  value2 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object on the main thread after the given delay in seconds.
**Example:**

if CallMethodLaterMBS(window1, "Test", 3.0, "Hello", "World") then
msgbox "OK"
else
msgbox "Failed"
end if

Notes:
The method must be declared on the given class for the target object with two variant parameters and no
return values.
The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread after the given delay in seconds.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your application is.

- 132.4.4 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

### 132.4.4 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object on the main thread after the given delay in seconds. **Example:**

```plaintext
if CallMethodLaterMBS(window1, "Test", 3.0, "Hello", "World", 5) then
    msgbox "OK"
else
    msgbox "Failed"
end if
```

**Notes:**
The method must be declared on the given class for the target object with three variant parameters and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread after the given delay in seconds.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your application is.
See also:

- 132.4.1 CallMethodLaterMBS(target as object, name as string, afterDelay as Double) as boolean
132.4.5 CallMethodMBS(target as object, name as string) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object.

**Example:**

```basic
if CallMethodMBS(window1, "Test") then
  msgbox "OK"
else
  msgbox "Failed"
end if
```

**Notes:**
The method must be declared on the given class for the target object with no parameters and no return values.

Returns true on success and false on failure.

See also:

- 132.4.6 CallMethodMBS(target as object, name as string, value1 as Variant) as boolean

- 132.4.8 CallMethodMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

132.4.6 CallMethodMBS(target as object, name as string, value1 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object.

**Example:**

```basic
if CallMethodMBS(window1, "Test", "Hello") then
  msgbox "OK"
else
  msgbox "Failed"
end if
```
Notes:
The method must be declared on the given class for the target object with one variant parameter and no return values.

Returns true on success and false on failure.
See also:

- 132.4.5 CallMethodMBS(target as object, name as string) as boolean
- 132.4.7 CallMethodMBS(target as object, name as string, value1 as Variant, value2 as Variant) as boolean
- 132.4.8 CallMethodMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

132.4.7 CallMethodMBS(target as object, name as string, value1 as Variant, value2 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object.

**Example:**

```vbnet
if CallMethodMBS(window1, "Test", "Hello", "World") then
    messagebox "OK"
else
    messagebox "Failed"
end if
```

Notes:
The method must be declared on the given class for the target object with two variant parameters and no return values.

Returns true on success and false on failure.
See also:

- 132.4.5 CallMethodMBS(target as object, name as string) as boolean
- 132.4.6 CallMethodMBS(target as object, name as string, value1 as Variant) as boolean
- 132.4.8 CallMethodMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean
132.4.8  CallMethodMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object.

**Example:**

```vbnet
if CallMethodMBS(window1, "Test", "Hello", "World", 5) then
    msgbox "OK"
else
    msgbox "Failed"
end if
```

**Notes:**
The method must be declared on the given class for the target object with three variant parameters and no return values.

Returns true on success and false on failure.

See also:
- 132.4.5 CallMethodMBS(target as object, name as string) as boolean
- 132.4.6 CallMethodMBS(target as object, name as string, value1 as Variant) as boolean
- 132.4.7 CallMethodMBS(target as object, name as string, value1 as Variant, value2 as Variant) as boolean

132.4.9  CallMethodOnMainThreadMBS(target as object, name as string) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object on the main thread.

**Example:**

```vbnet
if CallMethodOnMainThreadMBS(window1, "Test") then
    msgbox "OK"
else
    msgbox "Failed"
end if
```

**Notes:**
The method must be declared on the given class for the target object with no parameters and no return values.
The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure. Deprecated, please use CallDelegatesMBS.CallDelegateOnMainThreadMBS instead.

See also:

- 132.4.10 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant) as boolean
- 132.4.11 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant, value2 as Variant) as boolean
- 132.4.12 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

### 132.4.10 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Calls a method on the target object on the main thread.

**Example:**

```lisp
if CallMethodOnMainThreadMBS(window1, "Test", "Hello") then
    msgbox "OK"
else
    msgbox "Failed"
end if
```

**Notes:**

The method must be declared on the given class for the target object with one variant parameter and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure. Deprecated, please use CallDelegatesMBS.CallDelegateOnMainThreadMBS instead.

See also:

- 132.4.9 CallMethodOnMainThreadMBS(target as object, name as string) as boolean
- 132.4.11 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant, value2 as Variant) as boolean
• 132.4.12 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

132.4.11 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant, value2 as Variant) as boolean

Example:

if CallMethodOnMainThreadMBS(window1, "Test", "Hello", "World") then
msgbox "OK"
else
msgbox "Failed"
end if

Notes:
The method must be declared on the given class for the target object with two variant parameters and no return values.

The method will be called later (Asynchronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure.

Deprecated, please use CallDelegatesMBS.CallDelegateOnMainThreadMBS instead.

See also:

• 132.4.9 CallMethodOnMainThreadMBS(target as object, name as string) as boolean
• 132.4.10 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant) as boolean
• 132.4.12 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

132.4.12 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

Example:

if CallMethodOnMainThreadMBS(window1, "Test", "Hello", "World", 5) then
msgbox "OK"
else
msgbox "Failed"
end if

Notes:
The method must be declared on the given class for the target object with three variant parameters and no return values.

The method will be called later (Asynchronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure.
Deprecated, please use CallDelegatesMBS.CallDelegateOnMainThreadMBS instead.
See also:

- 132.4.9 CallMethodOnMainThreadMBS(target as object, name as string) as boolean
- 132.4.10 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant) as boolean

132.4.13 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string) as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Calls a method on the target object on a new thread.

**Example:**

```vbs
if CallMethodOnThreadMBS(new BackgroundThreadMBS, window1, "Test") then
msgbox "OK"
else
msgbox "Failed"
end if
```

Notes:
The method must be declared on the given class for the target object with no parameters and no return values.

Pass in "new BackgroundThreadMBS" for the thread to use. Execution will be done later (Asynchronously) on that thread. Useful for perform some code in the background without creating a thread yourself.
Returns true on success and false on failure.

See also:

- 132.4.14 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant) as boolean  
- 132.4.15 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant, value2 as Variant) as boolean  
- 132.4.16 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

132.4.14 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant) as boolean

Example:

```plaintext
if CallMethodOnThreadMBS(new BackgroundThreadMBS, window1, "Test", "Hello") then
    msgbox "OK"
else
    msgbox "Failed"
end if
```

Notes:

The method must be declared on the given class for the target object with one variant parameter and no return values.

Pass in "new BackgroundThreadMBS" for the thread to use. Execution will be done later (Asynchronously) on that thread. Useful for perform some code in the background without creating a thread yourself.

Returns true on success and false on failure.

See also:

- 132.4.13 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string) as boolean  
- 132.4.15 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant, value2 as Variant) as boolean  
- 132.4.16 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean
132.4.15 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant, value2 as Variant) as boolean

Example:

```plaintext
if CallMethodOnThreadMBS(new BackgroundThreadMBS, window1, "Test", "Hello", "World") then
    msgbox "OK"
else
    msgbox "Failed"
end if
```

Notes:
The method must be declared on the given class for the target object with two variant parameters and no return values.

Pass in "new BackgroundThreadMBS" for the thread to use. Execution will be done later (Asynchronously) on that thread. Useful for perform some code in the background without creating a thread yourself.

Returns true on success and false on failure.

See also:

- 132.4.13 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string) as boolean
- 132.4.14 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant) as boolean
- 132.4.16 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

132.4.16 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

Example:

```plaintext
if CallMethodOnThreadMBS(new BackgroundThreadMBS, window1, "Test", "Hello", "World", 5) then
    msgbox "OK"
else
    msgbox "Failed"
end if
```
msgbox "Failed"
end if

Notes:
The method must be declared on the given class for the target object with three variant parameters and no
return values.

Pass in "new BackgroundThreadMBS" for the thread to use. Execution will be done later (Asynchronously)
on that thread. Useful for perform some code in the background without creating a thread yourself.

Returns true on success and false on failure.
See also:

- 132.4.13 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object,
    name as string) as boolean
- 132.4.14 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object,
    name as string, value1 as Variant) as boolean
- 132.4.15 CallMethodOnThreadMBS(BackgroundThread as BackgroundThreadMBS, target as object,
    name as string, value1 as Variant, value2 as Variant) as boolean

132.4.17 GetDarwinVMStatisticsMBS as DarwinVMStatisticsMBS

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns information about the current memory status on Mac OS X.
Example:

dim d as DarwinVMStatisticsMBS

d=GetDarwinVMStatisticsMBS

if d=nil then
    msgBox "No Darwin running :-("
    quit
else
    dim lines(-1) as string

    lines.Append format(d.pageins, "0")+" pageins"
    lines.Append format(d.pageouts, "0")+" pageouts"
    lines.Append format(d.pagesize, "0")+" pagesize"
    lines.Append format(d.freepages, "0")+" freepages"
    lines.Append format(d.activepages, "0")+" activepages"
    lines.Append format(d.inactivepages, "0")+" inactivepages"
    lines.Append format(d.wiredpages, "0")+" wiredpages"
lines.Append format(d.zerofillpages,"0") + " zerofillpages"
lines.Append format(d.reactivations,"0") + " reactivations"
lines.Append format(d.faults,"0") + " faults"
lines.Append format(d.cowfaults,"0") + " cowfaults"
lines.Append format(d.lookups,"0") + " lookups"
lines.Append format(d.hits,"0") + " hits"

MsgBox Join(lines,EndOfLine)
end if

### 132.4.18 GetDarwinResourceUsageMBS as DarwinResourceUsageMBS

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get information about resource utilization. **Example:**

```vbs
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.IntegralMaxResidentSetSize)
```

**Notes:**

Returns nil on any error.
For more information type ”man getrusage” in the Mac OS X Terminal.

### 132.4.19 SetThreadNameMBS(name as string)

MBS Util Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the name of current thread. **Example:**

```
SetThreadNameMBS "SQL Query Thread"
```

**Notes:** This is useful to see thread name in crash reports or sample reports.

### 132.4.20 CountProcessesMBS as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts how many processes are running. **Notes:**
Short for this function:

function CountProcesses as Integer
dim n as Integer
dim p as ProcessMBS

p=new ProcessMBS
p.getfirstProcess
n=1
while p.getnextProcess
n=n+1
wend

return n
end if

132.4.21 GetWindowsVMStatisticsMBS as WindowsVMStatisticsMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns information about the current memory status on Windows.

**Example:**

dim w as WindowsVMStatisticsMBS

w=GetWindowsVMStatisticsMBS
if w<>nil then

list.AddRow format(w.pagesize,"0")
list.AddRow format(w.memoryLoad,"0")
list.AddRow format(w.availablePageFileMemory,"0")
list.AddRow format(w.availablePhysicalMemory,"0")
list.AddRow format(w.availableVirtualMemory,"0")
list.AddRow format(w.totalPageFileMemory,"0")
list.AddRow format(w.totalPhysicalMemory,"0")
list.AddRow format(w.totalVirtualMemory,"0")

else

msgBox "No Windows memory statistics..."
quit
end if
132.5  class DarwinGroupListMBS

132.5.1  class DarwinGroupListMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The list of Groups on a Mac OS X system.
**Example:**
```vba
dim l as new DarwinGroupListMBS
MsgBox str(l.Count)+" groups"
```

132.5.2  Methods

132.5.3  CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The effective user ID of the calling process.
**Example:**
```vba
dim l as new DarwinGroupListMBS
MsgBox str(l.CurrentEffectiveUserID)
```

**Notes:** The real user ID is that of the user who has invoked the program. As the effective user ID gives the
process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

132.5.4  CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The real group ID of the calling process.
**Example:**
```vba
dim l as new DarwinGroupListMBS
MsgBox "CurrentGroupID: "+str(l.CurrentGroupID)
```

**Notes:** The real group ID is specified at login time.
132.5.5 CurrentUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The real user ID of the calling process.

**Example:**
```vba
dim l as new DarwinGroupListMBS
MsgBox "CurrentUserID: " + str(l.CurrentUserID)
```

**Notes:** The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

132.5.6 Group(index as Integer) as DarwinGroupMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the Group with the given index.

**Example:**
```vba
dim l as new DarwinGroupListMBS
dim c as Integer = l.Count - 1
dim names(-1) as string
for i as Integer = 0 to c
    dim g as DarwinGroupMBS = l.Group(i)
names.Append g.Name
next
MsgBox Join(names, EndOfLine)
```

132.5.7 Properties

**132.5.8 Count as Integer**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The number of Groups on this Mac OS X system.

**Example:**
```vba
dim l as new DarwinGroupListMBS
MsgBox str(l.Count) + " groups"
```

**Notes:** (Read only property)
132.6  class DarwinGroupMBS

132.6.1  class DarwinGroupMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class with information about a Group on Mac OS X.

**Example:**
```
dim g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MsgBox g.Name
```

132.6.2  Methods

132.6.3  CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The effective user ID of the calling process.

**Example:**
```
dim g as new DarwinGroupMBS
MsgBox "CurrentEffectiveUserID: " +str(G.CurrentEffectiveUserID)
```

**Notes:** The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

132.6.4  CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The real group ID of the calling process.

**Example:**
```
dim g as new DarwinGroupMBS
MsgBox "CurrentGroupID: " +str(G.CurrentGroupID)
```

**Notes:** The real group ID is specified at login time.
132.6. **CLASS DARWINGROUPMBS**

132.6.5 **CurrentUserID as Integer**

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The real user ID of the calling process.  
**Example:**
```vba
dim g as new DarwinGroupMBS  
MsgBox "CurrentUserID: " + str(G.CurrentUserID)
```

**Notes:** The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

132.6.6 **LoadGroupByID(Groupid as Integer)**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fills the properties of this class with the values for the Group with the given ID.  
**Example:**
```vba
dim g as new DarwinGroupMBS  
g.LoadGroupByID g.CurrentGroupID  
MsgBox g.Name
```

132.6.7 **LoadGroupByName(name as string)**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fills the properties of this class with the values for the given Group.  
**Example:**
```vba
dim g as new DarwinGroupMBS  
g.LoadGroupByName "staff"  
MsgBox g.Name
```

132.6.8 **UserName(index as Integer) as string**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Group ID of this Group.  
**Example:**
```vba
```vbnet
dim g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID

dim c as Integer = g.UserCount - 1
for i as Integer = 0 to c
    MsgBox g.UserName(i)
next
```

### 132.6.9 Properties

#### 132.6.10 GroupID as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The group ID of the Group. **Example:**

```vbnet
dim g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MsgBox "GroupID: " + str(G.GroupID)
```

**Notes:** (Read only property)

#### 132.6.11 Name as string

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the Group. **Example:**

```vbnet
dim g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MsgBox "Name: " + g.Name
```

**Notes:** (Read only property)

#### 132.6.12 Password as string

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The password for this group.
132.6. CLASS DARWINGROUPMBS

Notes: (Read only property)

132.6.13 Ready as Boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** whether the values in this class were filled correctly.

Notes: (Read only property)

132.6.14 UserCount as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of users in this group.

Example:

```vbnet
dim g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupId
MsgBox "UserCount: " + str(G.UserCount)
```

Notes: (Read only property)
132.7 class DarwinResourceUsageMBS

132.7.1 class DarwinResourceUsageMBS

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for information about resource utilization.
**Example:**
```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.IntegralMaxResidentSetSize)
```

**Notes:** For more information type "man getrusage" in the Mac OS X Terminal.

132.7.2 Properties

132.7.3 BlockInputOperations as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of block input operations.
**Example:**
```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.BlockInputOperations)
```

**Notes:** (Read only property)

132.7.4 BlockOutputOperations as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of block output operations.
**Example:**
```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.BlockOutputOperations)
```

**Notes:** (Read only property)
132.7. **CLASS DARWINRESOURCEUSAGEMBS**

### 132.7.5 IntegralMaxResidentSetSize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Integral max resident set size.

**Example:**
```
dim u as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
dim t as new DarwinTaskInfoMBS

MsgBox "Application Resident Size: " + str(t.ResidentSize) + vbCrLf + "Application Virtual Size: " + str(t.VirtualSize) + vbCrLf + "Application Integral Max Resident Size: " + str(u.IntegralMaxResidentSetSize)
```

**Notes:** (Read only property)

### 132.7.6 IntegralSharedTextMemorySize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Integral shared text memory size.

**Example:**
```
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.IntegralSharedTextMemorySize)
```

**Notes:** (Read only property)

### 132.7.7 IntegralUnsharedDataSize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Integral unshared data size.

**Example:**
```
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.IntegralUnsharedDataSize)
```

**Notes:** (Read only property)
132.7.8 **IntegralUnsharedStackSize as Int64**

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Integral unshared stack size.

**Example:**
```vba
    dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
    MsgBox str(d.IntegralUnsharedStackSize)
```

**Notes:** (Read only property)

132.7.9 **InvoluntaryContextSwitches as Int64**

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of involuntary context switches.

**Example:**
```vba
    dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
    MsgBox str(d.InvoluntaryContextSwitches)
```

**Notes:** (Read only property)

132.7.10 **MessagesReceived as Int64**

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of messages received.

**Example:**
```vba
    dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
    MsgBox str(d.MessagesReceived)
```

**Notes:** (Read only property)

132.7.11 **MessagesSent as Int64**

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of messages sent.

**Example:**
132.7. CLASS DARWINRESOURCEUSAGEMBS

`dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS`  
`MsgBox str(d.MessagesSent)`

**Notes:** (Read only property)

### 132.7.12 PageFaults as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of page faults.  
**Example:**

```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.PageFaults)
```

**Notes:** (Read only property)

### 132.7.13 PageReclaims as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of page reclaims.  
**Example:**

```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.PageReclaims)
```

**Notes:** (Read only property)

### 132.7.14 SignalsReceived as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of signals received.  
**Example:**

```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.SignalsReceived)
```
132.7.15 Swaps as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of swaps.

**Example:**

```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.Swaps)
```

**Notes:** (Read only property)

132.7.16 SystemTimeUsed as Double

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Seconds of system time used.

**Example:**

```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.SystemTimeUsed)
```

**Notes:** (Read only property)

132.7.17 UserTimeUsed as Double

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Seconds of user time used.

**Example:**

```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.UserTimeUsed)
```

**Notes:** (Read only property)
MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of voluntary context switches.

**Example:**

```vba
dim d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.VoluntaryContextSwitches)
```

**Notes:** (Read only property)
132.8 class DarwinTaskInfoMBS

132.8.1 class DarwinTaskInfoMBS

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for your applications memory/resource usage.  
**Example:**
```vbnet
dim u as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS  
dim t as new DarwinTaskInfoMBS  
MsgBox "Application Resident Size: " + str(t.ResidentSize) + EndOfLine +  
"Application Virtual Size: " + str(t.VirtualSize) + EndOfLine +  
"Application Integral Max Resident Size: " + str(u.IntegralMaxResidentSetSize)
```

132.8.2 Methods

132.8.3 Update as boolean

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the values and returns true on success.  
**Example:**
```vbnet
dim d as new DarwinTaskInfoMBS  
MsgBox str(d.UserTime)  
call d.Update  
MsgBox str(d.UserTime)
```

**Notes:** The constructor updates the values on creation of the object.

132.8.4 Properties

132.8.5 ContextSwitches as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of context switches.  
**Example:**
```vbnet
dim d as new DarwinTaskInfoMBS  
MsgBox str(d.ContextSwitches)
```
132.8. CLASS DARWINTASKINFOMBS

Notes: (Read and Write property)

132.8.6 COWFaults as Double

Example:

```vbnet
dim d as new DarwinTaskInfoMBS
MsgBox str(d.COWFaults)
```

Notes: (Read and Write property)

132.8.7 Faults as Double

Example:

```vbnet
dim d as new DarwinTaskInfoMBS
MsgBox str(d.Faults)
```

Notes: (Read and Write property)

132.8.8 MessagesReceived as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Number of messages received.
Example:

```vbnet
dim d as new DarwinTaskInfoMBS
MsgBox str(d.MessagesReceived)
```

Notes: (Read and Write property)
132.8.9  MessagesSent as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of messages sent.  
**Example:**
```vba
dim d as new DarwinTaskInfoMBS
MsgBox str(d.MessagesSent)
```

**Notes:** (Read and Write property)

132.8.10  PageIns as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of actual pageins.  
**Example:**
```vba
dim d as new DarwinTaskInfoMBS
MsgBox str(d.PageIns)
```

**Notes:** (Read and Write property)

132.8.11  ResidentSize as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of resident pages.  
**Example:**
```vba
dim d as DarwinTaskInfoMBS
d=new DarwinTaskInfoMBS
MsgBox "This application uses " + Format(d.ResidentSize,"0") + " Bytes of physical memory."
```

**Notes:** (Read and Write property)
132.8. CLASS DARWINTASKINFOMBS

132.8.12 SuspendCount as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Suspend count for task.
**Example:**

```vbnet
dim d as new DarwinTaskInfoMBS
MsgBox str(d.SuspendCount)
```

**Notes:** (Read and Write property)

132.8.13 SystemCallsMach as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of mach system calls.
**Example:**

```vbnet
dim d as DarwinTaskInfoMBS
d=new DarwinTaskInfoMBS
MsgBox "This application has done so far " + Format(d.SystemCallsMach,"0") + " system calls using the Mach Interface."
```

**Notes:** (Read and Write property)

132.8.14 SystemCallsUnix as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of unix system calls.
**Example:**

```vbnet
dim d as DarwinTaskInfoMBS
d=new DarwinTaskInfoMBS
MsgBox "This application has done so far " + Format(d.SystemCallsUnix,"0") + " system calls using the Unix Interface."
```

**Notes:** (Read and Write property)
132.8.15 SystemTime as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Total system run time.  
**Example:**
```vba
dim d as DarwinTaskInfoMBS
d=new DarwinTaskInfoMBS
MsgBox "This application has used so far "+Format(d.SystemTime,"0")+" seconds of CPU time."
```

**Notes:** (Read and Write property)

132.8.16 UserTime as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Total user run time.  
**Example:**
```vba
dim d as DarwinTaskInfoMBS
d=new DarwinTaskInfoMBS
MsgBox "This application has used so far "+Format(d.UserTime,"0")+" seconds of CPU time."
```

**Notes:** (Read and Write property)

132.8.17 VirtualSize as Double

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of virtual pages.  
**Example:**
```vba
dim d as DarwinTaskInfoMBS
d=new DarwinTaskInfoMBS
MsgBox "This application uses "+Format(d.VirtualSize,"0")+" Bytes of the 4 GB address space."
```
Notes: (Read and Write property)
132.9 class DarwinUserListMBS

132.9.1 class DarwinUserListMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The list of users on a Mac OS X system.

**Example:**

```vba
// find the short user name
dim d as DarwinUserListMBS
dim u as string
dim p as DarwinUserMBS
dim uid,i,c as Integer

// requires MachO target
declare function getuid lib "System" () as Integer
uid=getuid

d=new DarwinUserListMBS

for i=0 to c
  p=d.User(i)
  if p.UserID=uid then
    MsgBox p.Name
    end if
next
```

132.9.2 Methods

132.9.3 CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The effective user ID of the calling process.

**Example:**

```vba
dim l as new DarwinUserListMBS
MsgBox "CurrentEffectiveUserID: "+str(l.CurrentEffectiveUserID)
```

**Notes:** The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.
132.9.4 **CurrentGroupID as Integer**

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The real group ID of the calling process.

**Example:**

```vba
Dim l As New DarwinUserListMBS
MsgBox "CurrentGroupID: "+Str(l.CurrentGroupID)
```

**Notes:** The real group ID is specified at login time.

132.9.5 **CurrentUserID as Integer**

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The real user ID of the calling process.

**Example:**

```vba
Dim l As New DarwinUserListMBS
MsgBox "CurrentUserID: "+Str(l.CurrentUserID)
```

**Notes:** The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of ‘set-user-ID’ mode processes, getuid() is used to determine the real-user-id of the calling process.

132.9.6 **User(index as Integer) as DarwinUserMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the user with the given index.

**Example:**

```vba
// find short user name
Dim d As DarwinUserListMBS
Dim u As String
Dim p As DarwinUserMBS
Dim uid, i, c As Integer

u=SystemInformationMBS.Username
d=new DarwinUserListMBS
c=d.Count-1
for i=0 to c
p=d.User(i)
if p.LongName=u then
MsgBox p.Name
end if
next

### 132.9.7 Properties

### 132.9.8 Count as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of users on this Mac OS X system.

**Example:**

```vb
dim l as new DarwinUserListMBS
MsgBox "Number of users: " +str(l.Count)
```

**Notes:** (Read only property)
132.10. **CLASS DARWINUSERMBS**

**132.10 class DarwinUserMBS**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class with information about a user on Mac OS X.  
**Example:**
```vbs
Dim l As New DarwinUserMBS
l.LoadUserByID l.CurrentUserID
MsgBox l.Name + ": " + l.LongName
```

**132.10.2 Methods**

**132.10.3 CurrentEffectiveUserID as Integer**

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The effective user ID of the calling process.  
**Example:**
```vbs
Dim l As New DarwinUserMBS
MsgBox Str(l.CurrentEffectiveUserID)
```

**Notes:** The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

**132.10.4 CurrentGroupID as Integer**

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The real group ID of the calling process.  
**Example:**
```vbs
Dim l As New DarwinUserMBS
MsgBox Str(l.CurrentGroupID)
```

**Notes:** The real group ID is specified at login time.
132.10.5 **CurrentUserID as Integer**

MBS MacCF Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The real user ID of the calling process.

**Example:**

```vbs```
    dim l as new DarwinUserMBS
    MsgBox str(l.CurrentUserID)
```

**Notes:** The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

132.10.6 **LoadUserByID(userid as Integer)**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fills the properties of this class with the values for the user with the given ID.

**Example:**

```vbs```
    dim l as new DarwinUserMBS
    l.LoadUserByID l.CurrentUserID
    MsgBox l.Name
```

132.10.7 **LoadUserByName(name as string)**

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fills the properties of this class with the values for the given user.

**Example:**

```vbs```
    dim l as new DarwinUserMBS
    l.LoadUserByName "cs"
    MsgBox l.LongName
```
132.10.8 Properties

132.10.9 AccountExpireTime as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time when the account will expire. **Notes:** (Read only property)

132.10.10 GroupID as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The group ID of the user. **Example:**

```vba
dim l as new DarwinUserMBS
l.LoadUserByID l.CurrentUserID
MsgBox str(l.GroupID)
```

**Notes:** (Read only property)

132.10.11 HomePath as string

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The home path of the user. **Example:**

```vba
dim l as new DarwinUserMBS
l.LoadUserByName "cs"
MsgBox l.HomePath
```

**Notes:** (Read only property)

132.10.12 LastPasswordChangeTime as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last time when the user changed the password.
132.10.13 LongName as string

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The long name of the user.

**Example:**

```vba
dim l as new DarwinUserMBS
l.LoadUserByName "cs"
MsgBox l.LongName
```

**Notes:** (Read only property)

132.10.14 Name as string

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The short name of the user.

**Example:**

```vba
dim l as new DarwinUserListMBS

dim c as Integer = l.Count-1
for i as Integer = 0 to c
  dim u as DarwinUserMBS = l.User(i)
  if u.UserID = l.CurrentUserID then
    MsgBox "our user name: " + u.Name
  end if
next
```

**Notes:** (Read only property)

132.10.15 Ready as Boolean

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
whether the values in this class were filled correctly.

**Notes:** (Read only property)
### 132.10.16 Shell as string

**Function:** The path to the default shell for this user.

**Example:**

```vbnet
dim l as new DarwinUserMBS
l.LoadUserByID l.CurrentUserID
MsgBox l.Shell
```

**Notes:** (Read only property)

### 132.10.17 UserID as Integer

**Function:** The user ID of this user.

**Example:**

```vbnet
dim l as new DarwinUserMBS
l.LoadUserByID l.CurrentUserID
MsgBox str(l.UserID)
```

**Notes:** (Read only property)
132.11 class DarwinVMStatisticsMBS

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Holds information about the current Mac OS X memory status.
**Example:**
```
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.pageins) + " page ins"
```

132.11.2 Properties

132.11.3 ActivePages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The total number of pages currently in use and pageable.
**Example:**
```
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.ActivePages)
```

**Notes:** (Read only property)

132.11.4 CowFaults as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The number of faults that caused a page to be copied (generally caused by copy-on-write faults).
**Example:**
```
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CowFaults)
```

**Notes:** (Read only property)
### 132.11.5 CPUTicksIdle as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of time slices used by the Idle process.

**Example:**
```vbs
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CPUTicksIdle)
```

**Notes:**
Calculate deltas like in the example to see usage of CPU time.
(Read only property)

### 132.11.6 CPUTicksNice as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of time slices used by the task switcher process.

**Example:**
```vbs
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CPUTicksNice)
```

**Notes:**
Calculate deltas like in the example to see usage of CPU time.
(Read only property)

### 132.11.7 CPUTicksSystem as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of time slices used by the system processes.

**Example:**
```vbs
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CPUTicksSystem)
```

**Notes:**
Calculate deltas like in the example to see usage of CPU time.
(Read only property)
132.11.8  CPUITicksUser as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The number of time slices used by the user application processes.
**Example:**
```vba
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CPUITicksUser)
```

**Notes:**
Calculate deltas like in the example to see usage of CPU time.
(Read only property)

132.11.9  Faults as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The number of times the "vm_fault" routine has been called.
**Example:**
```vba
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Faults)
```

**Notes:** (Read only property)

132.11.10  FreePages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The total number of free pages in the system.
**Example:**
```vba
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.FreePages)
```

**Notes:** (Read only property)
132.11.  CLASS DARWINVMSTATISTICSMBS

132.11.11  Hits as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The hit count.
**Example:**

```vbs
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Hits)
```

**Notes:** (Read only property)

132.11.12  InactivePages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The total number of pages on the inactive list.
**Example:**

```vbs
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.InactivePages)
```

**Notes:** (Read only property)

132.11.13  Lookups as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The count of lookups.
**Example:**

```vbs
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Lookups)
```

**Notes:** (Read only property)

132.11.14  PageIns as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of requests for pages from a pager (such as the inode pager).
**Example:**

```vbs
```
132.11.15  **PageOuts as Integer**

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The number of pages that have been paged out.
**Example:**
```vbs
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.PageOuts)
```

**Notes:** (Read only property)

132.11.16  **Pagesize as Integer**

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The size of one memory page in memory.
**Example:**
```vbs
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Pagesize)
```

**Notes:**
On PowerPC CPUs, it should be 4096 Bytes.
(Read only property)

132.11.17  **Reactivations as Integer**

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
the total number of pages that have been moved from the inactive list to the active list (reactivated).
**Example:**
```vbs
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Reactivations)
```
Notes: (Read only property)

132.11.18 WiredPages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The total number of pages wired down. That is, pages that cannot be paged out.

**Example:**

```vbnet
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.WiredPages)
```

Notes: (Read only property)

132.11.19 ZeroFillPages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The total number of pages that have been zero-filled on demand.

**Example:**

```vbnet
dim d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.ZeroFillPages)
```

Notes: (Read only property)
132.12 class EnvironmentMBS

132.12.1 class EnvironmentMBS

MBS Util Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Allows you to access system wide environment properties.

132.12.2 Methods

132.12.3 Add(name as string, value as string) as boolean

MBS Util Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Add a property to the list.

**Example:**

```
dim e as EnvironmentMBS

e = new EnvironmentMBS
if e.add("authorname", "Christian") then
    msgbox "ok"
else
    msgbox "fail"
end if
```

**Notes:** Setting this value to some new value will currently only change this value for your application and all child applications.

132.12.4 Get(name as string) as string

MBS Util Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value for a named property.

**Example:**

```
dim e as EnvironmentMBS

e = new EnvironmentMBS
msgbox e.get("windir") // normally c:\windows
```
132.12.5  Lines as string()

MBS Util Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns array of definition lines of environment variables.  
**Example:**
```
dim e as new EnvironmentMBS
msgbox join(e.lines, endofline)
```

**Notes:** Returned strings are in format "name=value".

132.12.6  Name(Index as Integer) as string

MBS Util Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the environment property number n.

132.12.7  Names as string()

MBS Util Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns array of names of environment variables.  
**Example:**
```
dim e as new EnvironmentMBS
msgbox join(e.lines, endofline)
```

132.12.8  Update

MBS Util Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Updates the object to the current environment properties.  
**Notes:** This method is called by the constructor and the methods which change the environment properties.

132.12.9  Properties

132.12.10  Count as Integer

MBS Util Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the number of environment properties.  
**Example:**
dim e as EnvironmentMBS

e=new EnvironmentMBS
msgbox str(e.count)

Notes: (Read only property)

132.12.11 Value(Index as Integer) as string

MBS Util Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value of the environment property number n. **Notes:** Setting this value to some new value will currently only change this value for your application and all child applications. (Read and Write computed property)
132.13   CLASS MUTEXMBS

132.13 class MutexMBS

132.13.1 class MutexMBS

MBS Util Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A class for a mutex.

**Notes:**
This is the mutex class the threadMBS class is using internally.
A mutex is not locked by default.

132.13.2 Methods

132.13.3 Lock

MBS Util Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Locks the mutex.

**Example:**

```vba
dim m as new MutexMBS

m.Lock
MsgBox "Got mutex."

m.Unlock
MsgBox "Released mutex."
```

**Notes:**
The function returns as soon as it has access to the mutex.

Always use Lock and Unlock in a pair.

132.13.4 TryLock as boolean

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Locks the mutex if possible.

**Example:**

```vba
dim m as new MutexMBS

if m.TryLock then
```

```vba
```

```vba```
MsgBox "Got mutex."

m.Unlock
else
MsgBox "Failed to get mutex."
end if

Notes:
Returns true if we got a lock and false if not. Always use Lock and Unlock in a pair.

132.13.5 Unlock

MBS Util Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unlocks the mutex.
**Example:**

dim m as new MutexMBS
m.Lock
MsgBox "Got mutex."

m.Unlock
MsgBox "Released mutex."

Notes: Always use Lock and Unlock in a pair.

132.13.6 Properties

132.13.7 Handle as Integer

MBS Util Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal used reference to the native mutex object.
**Example:**

dim m as new MutexMBS
MsgBox "Handle: " + hex(m.Handle)

Notes:
132.13. **CLASS MUTEXMBS**

Windows Mutex or PThread Mutex.
(Read and Write property)

### 132.13.8 Tag as Variant

MBS Util Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
An object reference for your use.
**Notes:**
Just for convenience.
This property was added so you can use this property for a reference so you won’t need to subclass this class and add custom properties.
(Read and Write property)
132.14 class NSProcessInfoActivityMBS

132.14.1 class NSProcessInfoActivityMBS

Function: The class for an activity.
Example:

dim Activity as NSProcessInfoActivityMBS // property in your window, control, thread, app
dim AllowAppNap as boolean // allow or not?

dim ProcessInfo as NSProcessInfoMBS = NSProcessInfoMBS.processInfo
if AllowAppNap then
    Activity = nil
else
    // disable sleep to let us make something...
    Activity = ProcessInfo.beginActivity(NSProcessInfoMBS.NSActivityBackground, "Backup running")
end if

Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

132.14.2 Methods

132.14.3 Constructor

Function: Private constructor.

132.14.4 Destructor

Function: The destructor.
Notes: If you missed to call endActivity, the destructor will do it.
132.14.5 Properties

132.14.6 Handle as Integer

132.14.7 Options as Integer

MBS MacCocoa Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The options used to create activity. Notes: (Read and Write property)

132.14.8 Reason as String

MBS MacCocoa Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The reason used to create the activity. Notes: (Read and Write property)
132.15 class NSProcessInfoMBS

132.15.1 class NSProcessInfoMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSProcessInfo class provides methods to access information about the current process. **Notes:**

Each process has a single, shared NSProcessInfo object, known as process information agent.

The process information agent can return such information as the arguments, environment variables, host name, or process name. The processInfo class method returns the shared agent for the current process that is, the process whose object sent the message. For example, the following line returns the NSProcessInfo object, which then provides the name of the current process:

```dim processInfo as new NSProcessInfoMBS
dim processName as string = processInfo.processName```

The NSProcessInfo class also includes the operatingSystem method, which returns an enum constant identifying the operating system on which the process is executing.

NSProcessInfo objects attempt to interpret environment variables and command-line arguments in the user’s default C string encoding if they cannot be converted to Unicode as UTF-8 strings. If neither conversion works, these values are ignored by the NSProcessInfo object.

132.15.2 Methods

132.15.3 argument(index as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the command-line argument for the process with the given index. **Example:**

```dim p as new NSProcessInfoMBS
dim i,c as Integer
c=p.argumentCount-1
for i=0 to c
    MsgBox p.argument(i)
next```
132.15. **CLASS NSPROCESSINFOMBS**

132.15.4 **arguments as string()**

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the command-line arguments for the process. **Notes:** Returns array of strings with the process’s command-line arguments.

132.15.5 **beginActivity(options as Integer, reason as string) as NSProcessInfoActivityMBS**

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begin an activity using the given options and reason. **Example:**

```lisp
dim Activity as NSProcessInfoActivityMBS // property in your window, control, thread, app
dim AllowAppNap as boolean // allow or not?

dim ProcessInfo as NSProcessInfoMBS = NSProcessInfoMBS.processInfo
if AllowAppNap then
    Activity = nil
else
    // disable sleep to let us make something...
    Activity = ProcessInfo.beginActivity(NSProcessInfoMBS.NSActivityBackground, "Backup running")
end if
```

**Notes:**

- options: Options for the activity. See constants for possible values.
- reason: A string used in debugging to indicate the reason the activity began.

Returns an object token representing the activity.

Indicate completion of the activity by calling endActivity passing the returned object as the argument. Available in OS X v10.9 and later.

132.15.6 **Constructor**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.
132.15.7 disableAutomaticTermination(Reason as string)

Function: Decrement the counter tracking the number of automatic quit opt-out requests.

Notes:
When this counter is greater than zero, the app will be considered 'active' and ineligible for automatic termination.
An example of using this would be disabling autoquitting when the user of an instant messaging application signs on, due to it requiring a background connection to be maintained even if the app is otherwise inactive.
Each pair of calls should have a matching "reason" argument, which can be used to easily track why an application is or is not automatically terminable.
A given reason can be used more than once at the same time (for example: two files are transferring over the network, each one disables automatic termination with the reason "file transfer in progress")

132.15.8 disableSuddenTermination

Function: Disables the application for quickly killing using sudden termination.

Notes:
This method increments the sudden termination counter. When the termination counter reaches 0 the application allows sudden termination.

By default the sudden termination counter is set to 1. This can be overridden in your application Info.plist. See "Sudden Termination" for more information and debugging suggestions.

Available in Mac OS X v10.6 and later.

132.15.9 enableAutomaticTermination(Reason as string)

Function: Increment the counter tracking the number of automatic quit opt-out requests.

Notes:
When this counter is greater than zero, the app will be considered 'active' and ineligible for automatic termination.
An example of using this would be disabling autoquitting when the user of an instant messaging application signs on, due to it requiring a background connection to be maintained even if the app is otherwise inactive.
Each pair of calls should have a matching "reason" argument, which can be used to easily track why an application is or is not automatically terminable.
A given reason can be used more than once at the same time (for example: two files are transferring over the network, each one disables automatic termination with the reason "file transfer in progress")
132.15. **CLASS NSPROCESSINFOMBS**

132.15.10 **enableSuddenTermination**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables the application for quick killing using sudden termination. **Notes:**

This method decrements the sudden termination counter. When the termination counter reaches 0 the application allows sudden termination.

By default the sudden termination counter is set to 1. This can be overridden in your application Info.plist. See "Sudden Termination" for more information and debugging suggestions.

Available in Mac OS X v10.6 and later.

132.15.11 **endActivity(activity as NSProcessInfoActivityMBS)**

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Ends the given activity. **Notes:**

activity: An activity object returned by beginActivity. Available in OS X v10.9 and later.

132.15.12 **NSActivityLatencyCritical as UInt64**

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the activity option constants. **Notes:**

Flag to indicate the activity requires the highest amount of timer and I/O precision available. Important: Very few applications should need to use this constant. Available in OS X v10.9 and later. Value is &hFF00000000.

132.15.13 **NSProcessInfoThermalStateChangedNotification as String**

MBS MacCocoa Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The notification name to use with NSNotificationObserverMBS. **Notes:**

This notification is posted once the thermal state of the system has changed. Once the notification is posted, use the thermalState property to retrieve the current thermal state of the system.
You can use this opportunity to take corrective action in your application to help cool the system down. Work that could be done in the background or at opportunistic times should be using the Quality of Service levels in NSOperation or the NSBackgroundActivityScheduler API.

This notification is posted on the global dispatch queue. Register for it using the default notification center. The object associated with the notification is NSProcessInfoMBS:processInfo.

### 132.15.14 processInfo as NSProcessInfoMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the process information agent for the process.

### 132.15.15 Properties

#### 132.15.16 activeProcessorCount as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the number of active processing cores available on the computer.  
**Example:**
```vba
dim p as new NSProcessInfoMBS
MsgBox str(p.activeProcessorCount)
```

**Notes:**
Available in Mac OS X v10.5 and later.  
(Read only property)

#### 132.15.17 argumentsCount as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of the command-line arguments.  
**Example:**
```vba
dim p as new NSProcessInfoMBS
dim i,c as Integer
```
c=p.argumentCount-1
for i=0 to c
MsgBox p.argument(i)
next

Notes: (Read only property)

132.15.18 automaticTerminationSupportEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Marks the calling app as supporting automatic termination. Notes:
Without calling this or setting the equivalent Info.plist key (NSSupportsAutomaticTermination), the above methods (disableAutomaticTermination/enableAutomaticTermination) have no effect, although the counter tracking automatic termination opt-outs is still kept up to date to ensure correctness if this is called later. Currently, passing false has no effect. This should be called during applicationDidFinishLaunching or earlier.
(Read and Write property)

132.15.19 environment as dictionary

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the variable names and their values in the environment from which the process was launched. Example:

dim p as new NSProcessInfoMBS
dim d as Dictionary = p.environment
MsgBox str(d.Count)

Notes: (Read only property)

132.15.20 globallyUniqueString as string

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a global unique identifier for the process. Example:

dim p as new NSProcessInfoMBS
CHAPTER 132. PROCESS

MsgBox p.globallyUniqueString // shows for example "072EC09A-4825-11DD-BDC0-001D4F46F5E0-18405-00000CA853EB5B46"

Notes:
Returns the Global ID for the process. The ID includes the host name, process ID, and a time stamp, which ensures that the ID is unique for the network.

This method generates a new string each time it is invoked, so it also uses a counter to guarantee that strings created from the same process are unique.
(Read only property)

132.15.21 Handle as Integer

Notes: (Read and Write property)

132.15.22 hostName as string

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the name of the host computer.
Example:

dim p as new NSProcessInfoMBS

MsgBox p.hostName // for example "iMac.local"

Notes: (Read only property)

132.15.23 operatingSystem as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a constant to indicate the operating system on which the process is executing.
Example:

dim p as new NSProcessInfoMBS

MsgBox str(p.operatingSystem) // shows 5 = NSMACHOperatingSystem
Notes:
Operating system identifier. See "Constants" for a list of possible values. In Mac OS X, it’s NSMACHOOperatingSystem.
(Read only property)

132.15.24 operatingSystemName as string

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a string containing the name of the operating system on which the process is executing.
Example:

dim p as new NSProcessInfoMBS

MsgBox p.operatingSystemName // shows "NSMACHOOperatingSystem"

Notes:
Operating system name. In Mac OS X, it’s "NSMACHOOperatingSystem"
(Read only property)

132.15.25 operatingSystemVersionString as string

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a string containing the version of the operating system on which the process is executing.
Example:

dim p as new NSProcessInfoMBS

MsgBox p.operatingSystemVersionString // "Version 10.5.4 (Build 9E17)"

Notes:
Returns the Operating system version. This string is human readable, localized, and is appropriate for displaying to the user. This string is not appropriate for parsing.
(Read only property)
132.15.26  physicalMemory as UInt64

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the amount of physical memory on the computer.  
**Example:**  
```vba
dim p as new NSProcessInfoMBS

MsgBox str(p.physicalMemory)
```

**Notes:**  
Available in Mac OS X v10.5 and later.  
*(Read only property)*

132.15.27  processIdentifier as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the identifier of the process.  
**Example:**  
```vba
dim p as new NSProcessInfoMBS

MsgBox str(p.processIdentifier)
```

**Notes:**  
*(Read only property)*

132.15.28  processName as string

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the process.  
**Example:**  
```vba
dim p as new NSProcessInfoMBS

MsgBox p.processName
```

**Notes:**  
The process name is used to register application defaults and is used in error messages. It does not uniquely identify the process.
You can assign a new value, but:
User defaults and other aspects of the environment might depend on the process name, so be very careful if you change it. Setting the process name in this manner is not thread safe.
(Read and Write property)

**132.15.29 processorCount as Integer**

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Provides the number of processing cores available on the computer.

**Example**:

```vba
dim p as new NSProcessInfoMBS

MsgBox str(p.processorCount)
```

**Notes**:
Available in Mac OS X v10.5 and later.
(Read only property)

**132.15.30 systemUptime as Double**

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Returns the how long it has been since the computer has been restarted.

**Notes**:
Returns an NSTimeInterval indicating how long system the computer has been restarted.
Available in Mac OS X v10.6 and later.
(Read only property)

**132.15.31 thermalState as Integer**

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Retrieve the current thermal state of the system.

**Example**:

```vba
dim n as NSProcessInfoMBS = NSProcessInfoMBS.processInfo

Select case n.thermalState
case n.NSProcessInfoThermalStateNominal
```
MsgBox "Thermal State: Nominal"
case n.NSProcessInfoThermalStateFair
MsgBox "Thermal State: Fair"
case n.NSProcessInfoThermalStateSerious
MsgBox "Thermal State: Serious"
case n.NSProcessInfoThermalStateCritical
MsgBox "Thermal State: Critical"
else
MsgBox "Thermal State: Unknown"
end Select

Notes:
On systems where thermal state is unknown or unsupported, the value returned from the thermalState property is always NSProcessInfoThermalStateNominal.

Available in Mac OS X 10.10.3 and newer.
Returns -1 if function is called on older Mac OS X versions, Linux or Windows.
(Read only property)

132.15.32 Constants

132.15.33 NSActivityAutomaticTerminationDisabled = & h8000

Notes:
Flag to prevent automatic termination.
Available in OS X v10.9 and later.

132.15.34 NSActivityBackground = & h000000FF

Notes:
Flag to indicate the app has initiated some kind of work, but not as the direct result of user request.
Available in OS X v10.9 and later.
132.15.35  **NSActivityIdleDisplaySleepDisabled = & h10000000000**

MBS MacCocoa Plugin, Plugin Version: 13.5. **Function:** One of the activity option constants. **Notes:**

Flag to require the screen to stay powered on.
Available in OS X v10.9 and later.

132.15.36  **NSActivityIdleSystemSleepDisabled = & h100000**

MBS MacCocoa Plugin, Plugin Version: 13.5. **Function:** One of the activity option constants. **Notes:**

Flag to prevent idle sleep.
This is included in NSActivityUserInitiatedAllowingIdleSystemSleep.
Available in OS X v10.9 and later.

132.15.37  **NSActivitySuddenTerminationDisabled = & h4000**

MBS MacCocoa Plugin, Plugin Version: 13.5. **Function:** One of the activity option constants. **Notes:**

Flag to prevent sudden termination.
This is included in NSActivityUserInitiatedAllowingIdleSystemSleep.
Available in OS X v10.9 and later.

132.15.38  **NSActivityUserInitiated = & h00FFFFFF**

MBS MacCocoa Plugin, Plugin Version: 13.5. **Function:** One of the activity option constants. **Notes:**

Flag to indicate the app is performing a user-requested action.
Available in OS X v10.9 and later.

132.15.39  **NSActivityUserInitiatedAllowingIdleSystemSleep = & h00EFFFFF**

MBS MacCocoa Plugin, Plugin Version: 13.5. **Function:** One of the activity option constants. **Notes:**

Flag to indicate the app is performing a user-requested action, but that the system can sleep on idle.
Available in OS X v10.9 and later.
132.15.40  NSHPUXOperatingSystem=4

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem.
**Notes:** Indicates the HP UX operating system.

132.15.41  NSMACHOperatingSystem=5

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem.
**Example:**
```dim p as new NSProcessInfoMBS
MsgBox str(p.operatingSystem) // shows 5 = NSMACHOperatingSystem```
**Notes:** Indicates the Mac OS X operating system.

132.15.42  NSOSF1OperatingSystem=7

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem.
**Notes:** Indicates the OSF/1 operating system.

132.15.43  NSProcessInfoThermalStateCritical = 3

MBS MacCocoa Plugin, Plugin Version: 15.1. **Function:** One of the constants describing the current thermal state of the system.
**Notes:** System performance is significantly impacted and the Mac needs to cool down. Recommendation: reduce application’s usage of CPU, GPU, and I/O to the minimum level needed to respond to user actions. Consider stopping use of camera and other peripherals if your application is using them.

132.15.44  NSProcessInfoThermalStateFair = 1

MBS MacCocoa Plugin, Plugin Version: 15.1. **Function:** One of the constants describing the current thermal state of the system.
**Notes:** The system has reached a state where fans may become audible.
132.15. CLASS NSPROCESSINFOMBS

132.15.45  NSProcessInfoThermalStateNominal = 0

MBS MacCocoa Plugin, Plugin Version: 15.1. **Function:** One of the constants describing the current thermal state of the system.  
**Notes:** No corrective action is needed.

132.15.46  NSProcessInfoThermalStateSerious = 2

MBS MacCocoa Plugin, Plugin Version: 15.1. **Function:** One of the constants describing the current thermal state of the system.  
**Notes:** Fans are running at maximum speed, system performance maybe impacted. Recommendation: reduce application’s usage of CPU, GPU and I/O, if possible. Switch to lower quality visual effects, reduce frame rates.

132.15.47  NSSolarisOperatingSystem=3

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem.  
**Notes:** Indicates the Solaris operating system.

132.15.48  NSSunOSOperatingSystem=6

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem.  
**Notes:** Indicates the Sun OS operating system.

132.15.49  NSWindows95OperatingSystem=2

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem.  
**Notes:** Indicates the Windows 95 operating system.

132.15.50  NSWindowsNTOperatingSystem=1

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem.  
**Notes:** Indicates the Windows NT operating system.
132.16 class NSRunningApplicationMBS

132.16.1 class NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: NSRunningApplication is a class to manipulate and provide information for a single instance of an application.

Example:

```plaintext
dim n as new NSRunningApplicationMBS

MsgBox n.localizedNome
```

Notes:

Only user applications are tracked; this does not provide information about every process on the system. Some properties of an application are fixed, such as the bundle identifier. Other properties may vary over time, such as whether the app is hidden. Properties that vary can be observed with key-value observing, in which case the description comment for the method notes this capability.

Properties that vary over time are inherently race-prone. For example, a hidden app may unhide itself at any time. To ameliorate this, properties persist until the next turn of the main run loop in a common mode. For example, if you repeatedly poll an unhidden app for its hidden property without allowing the run loop to run, it will continue to return false, even if the app hides, until the next turn of the run loop.

NSRunningApplication is thread safe, in that its properties are returned atomically. However, it is still subject to the main run loop policy described above. If you access an instance of NSRunningApplication from a background thread, be aware that its time-varying properties may change from under you as the main run loop runs (or not).

An NSRunningApplication instance remains valid after the application exits. However, most properties lose their significance, and some properties may not be available on a terminated application.

Requires Mac OS X 10.6.

132.16.2 Methods

132.16.3 activateWithOptions(options as Integer) as boolean

Notes:

options: The options to use when activating the application. See "NSApplicationActivationOptions" for the possible values.
Returns true if the application was activated successfully, otherwise false.

This method will return false if the application has quit, or is not a type of application than can be activated.

Available in Mac OS X v10.6 and later.

**132.16.4 Constructor**

**Example:**

```dim n as new NSRunningApplicationMBS
MsgBox n.localized Name```

**Notes:**

Initializes the object with the current application.
Available in Mac OS X v10.6 and later.

**132.16.5 currentApplication as NSRunningApplicationMBS**

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSRunningApplication representing this application.

**Example:**

```dim n as NSRunningApplicationMBS = NSRunningApplicationMBS.currentApplication
MsgBox n.localized Name```

**Notes:** Available in Mac OS X v10.6 and later.

**132.16.6 forceTerminate as boolean**

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to force the receiver to quit.

**Notes:**
Returns true if the application successfully terminated, otherwise false.

This method will return false if the application is no longer running when the forceTerminate message is sent to the receiver.

This method may return before the receiver exits; you should observe the terminated property to determine when the application terminates.

Available in Mac OS X v10.6 and later.

132.16.7 hide as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to hide or the application.

**Example:**

```vbnet
dim n as NSRunningApplicationMBS = NSRunningApplicationMBS.currentApplication
MsgBox str(n.hide) // hide me
```

**Notes:**

The property of this value will be false if the application has already quit, or if of a type that is unable to be hidden.

Available in Mac OS X v10.6 and later.

132.16.8 runningApplications as NSRunningApplicationMBS()

**Example:**

```vbnet
dim n(-1) as NSRunningApplicationMBS = NSRunningApplicationMBS.runningApplications
dim s(-1) as string
for each r as NSRunningApplicationMBS in n
    s.Append r.localizedName
next
MsgBox Join(s,EndOfLine)
```
132.16. **CLASS NSRUNNINGAPPLICATIONMBS**  

**Notes:**  
Returns an array of NSRunningApplication instances.

The order of the array is unspecified, but it is stable, meaning that the relative order of particular applications will not change across multiple calls to runningApplications. See NSRunningApplication Class Reference for more information on NSRunningApplication.  
Similar to the NSRunningApplication classes's properties, this property will only change when the main run loop is run in a common mode. Instead of polling, use key-value observing to be notified of changes to this array property.  
This property is thread safe, in that it may be called from background threads and the result is returned atomically.  

This list is not updated in a tight loop. For receiving updates, you need to have the runloop run (e.g. check regularly in a timer).

### 132.16.9 `runningApplicationsWithBundleIdentifier(bundleID as string) as NSRunningApplicationMBS()`  

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of currently running applications with the specified bundle identifier.  
**Example:**

```vba  
dim n(-1) as NSRunningApplicationMBS = NSRunningApplicationMBS.runningApplicationsWithBundleIdentifier("com.apple.iTunes")  
if UBound(n)>0 then  
    MsgBox n(0).localizedName  
else  
    MsgBox "iTunes is not running?"  
end if  
```

**Notes:**  
An array of NSRunningApplications, or an empty array if no applications match the bundle identifier.  
Available in Mac OS X v10.6 and later.

### 132.16.10 `runningApplicationWithProcessIdentifier(pid as Integer) as NSRunningApplicationMBS`  

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the running application with the given process identifier, or nil if no application has that pid.
Example:

```swift
dim n as NSRunningApplicationMBS
dim pid as Integer

while n=nil
pid=pid+1
n=NSRunningApplicationMBS.runningApplicationWithProcessIdentifier(pid)
wend

MsgBox n.localizedName+" has PID "+str(pid)
```

Notes:

pid: The process identifier.

Returns an instance of NSRunningApplication for the specified pid, or nil if the application has no process identifier.

Applications that do not have PIDs cannot be returned from this method.

Available in Mac OS X v10.6 and later.

132.16.11 terminate as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to quit the receiver normally.

**Notes:**

Returns true if the application successfully terminated, otherwise false.

This method will return false if the application is no longer running when the terminate message is sent to the receiver.

This method may return before the receiver exits; you should observe the terminated property to determine when the application terminates.

Available in Mac OS X v10.6 and later.

132.16.12 unhide as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to unhide or the application.
Notes:

Returns true if the application was successfully shown, otherwise false.

The property of this value will be false if the application has already quit, or if of a type that is unable to be hidden.

Available in Mac OS X v10.6 and later.

132.16.13 Properties

132.16.14 activationPolicy as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Indicates the activation policy of the application. (read-only)

Notes:

The value returned by this property is usually fixed, but it may change through a call to activateWithOptions.

Available in Mac OS X v10.6 and later.

(Read only property)

132.16.15 active as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Indicates whether the application is currently frontmost. (read-only)

Example:

```dim n as new NSRunningApplicationMBS
MsgBox str(n.active)`

Notes:

Available in Mac OS X v10.6 and later.

(Read only property)
132.16.16  bundleIdentifier as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates the CFBundleIdentifier of the application. (read-only)

**Example:**

```vbscript
dim n as new NSRunningApplicationMBS
MsgBox n.bundleIdentifier
```

**Notes:**
The value of this property will be nil if the application does not have an Info.plist.
(Read only property)

132.16.17  bundleURL as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates the URL to the application’s bundle. (read-only)

**Example:**

```vbscript
dim n as new NSRunningApplicationMBS
MsgBox n.bundleURL
```

**Notes:**
Available in Mac OS X v10.6 and later.
(Read only property)

132.16.18  executableArchitecture as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates the URL to the application’s executable. (read-only)

**Example:**

```vbscript
dim n as new NSRunningApplicationMBS
MsgBox str(n.executableArchitecture) // shows 7
```

**Notes:**
Available in Mac OS X v10.6 and later.
(Read only property)

132.16.19 executableURL as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates the URL to the application’s executable. (read-only)

**Example:**

```plaintext
dim n as new NSRunningApplicationMBS

MsgBox n.executableURL
```

**Notes:**

Available in Mac OS X v10.6 and later.
(Read only property)

132.16.20 finishedLaunching as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver’s process has finished launching, (read-only)

**Notes:**

The value of this property corresponds to the running application having received an NSApplicationDidFinishLaunchingNotification notification internally. Some applications do not post this notification (applications that do not rely on NSApplication) and so are never reported as finished launching.

Available in Mac OS X v10.6 and later.
(Read only property)

132.16.21 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSRunningApplication object.

**Notes:** (Read and Write property)
132.16.22  hidden as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the application is currently hidden. (read-only)

**Example:**

```vbs
Dim n As New NSRunningApplicationMBS
MsgBox Str(n.hidden)
```

**Notes:**

Available in Mac OS X v10.6 and later.
(Read only property)

132.16.23  icon as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the icon for the receiver’s application. (read-only)

**Example:**

```vbs
Dim n As New NSRunningApplicationMBS
Dim i As NSImageMBS = n.icon

// without this call the size is 32x32 Pixel
i.setSize 512,512
Backdrop = i.CopyPictureWithMask
```

**Notes:**

Available in Mac OS X v10.6 and later.
(Read only property)

132.16.24  launchDate as date

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates the date when the application was launched. (read-only)

**Example:**
132.16. CLASS NSRUNNINGAPPLICATIONMBS

dim n as new NSRunningApplicationMBS

MsgBox n.launchDate.ShortTime

Notes:
This property is not available for all applications. Specifically, it is not available for applications that were launched not launched by LaunchServices. Available in Mac OS X v10.6 and later. (Read only property)

132.16.25  localizedName as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Indicates the localized name of the application. (read-only)

Example:

dim n as new NSRunningApplicationMBS

MsgBox n.localizedDescription

Notes:
The value of this property is dependent on the current localization of the application and is suitable for presentation to the user. Available in Mac OS X v10.6 and later. (Read only property)

132.16.26  ownsMenuBar as boolean

Example:

// put in a timer...
dim r as NSRunningApplicationMBS = NSRunningApplicationMBS.currentApplication
window1.Title = str(r.ownsMenuBar)

Notes:
Available in Mac OS X v10.7 and later.
132.16.27  processIdentifier as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates the process identifier (pid) of the application. (read-only)

**Example:**

```dim n as new NSRunningApplicationMBS
MsgBox str(n.processIdentifier)`
```

**Notes:**

Not all applications have a pid. Applications without a return a value of -1. Do not rely on this for comparing processes, instead compare NSRunningApplication instances using isEqual:

Available in Mac OS X v10.6 and later.

(Read only property)

132.16.28  terminated as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates that the receiver’s application has terminated. (read-only)

**Notes:**

The value of terminated is true if the receiver’s application has terminated, otherwise false. This property is observable using key-value observing.

Available in Mac OS X v10.6 and later.

(Read only property)

132.16.29  Constants

132.16.30  NSApplicationActivateAllWindows = 1

MBS MacCocoa Plugin, Plugin Version: 9.7. **Function:** One of the flag constants for activateWithOptions.

**Notes:**

By default, activation brings only the main and key windows forward. If you specify NSApplicationActivateAllWindows, all of the application’s windows are brought forward.

Available in Mac OS X v10.6 and later.
132.16.31  NSApplicationActivateIgnoringOtherApps = 2

MBS MacCocoa Plugin, Plugin Version: 9.7. **Function:** One of the flag constants for activateWithOptions. **Notes:**
By default, activation deactivates the calling app (assuming it was active), and then the new app is activated only if there is no currently active application. This prevents the new app from stealing focus from the user, if the app is slow to activate and the user has switched to a different app in the interim. However, if you specify NSApplicationActivateIgnoringOtherApps, the application is activated regardless of the currently active app, potentially stealing focus from the user. You should rarely pass this flag because stealing key focus produces a very bad user experience. Available in Mac OS X v10.6 and later.

132.16.32  NSApplicationActivationPolicyAccessory = 1

MBS MacCocoa Plugin, Plugin Version: 9.7. **Function:** One of the constants used for following activation policies. **Notes:**
The application does not appear in the Dock and does not have a menu bar, but it may be activated programmatically or by clicking on one of its windows. This corresponds to value of the LSUIElement key in the application’s Info.plist being 1. Available in Mac OS X v10.6 and later.

132.16.33  NSApplicationActivationPolicyProhibited = 2

MBS MacCocoa Plugin, Plugin Version: 9.7. **Function:** One of the constants used for following activation policies. **Notes:**
The application does not appear in the Dock and may not create windows or be activated. This corresponds to the value of the LSBackgroundOnly key in the application’s Info.plist being 1. This is also the default for unbundled executables that do not have Info.plists. Available in Mac OS X v10.6 and later.

132.16.34  NSApplicationActivationPolicyRegular = 0

MBS MacCocoa Plugin, Plugin Version: 9.7. **Function:** One of the constants used for following activation policies. **Notes:**
The application is an ordinary app that appears in the Dock and may have a user interface. This is the default for bundled apps, unless overridden in the Info.plist.
Available in Mac OS X v10.6 and later.
132.17. CLASS NSXPCCONNECTIONMBS

132.17 class NSXPCConnectionMBS

132.17.1 class NSXPCConnectionMBS

Notes:
This class is the primary means of creating and configuring the communication mechanism between two processes. Each process has one instance of this class to represent the endpoint in the communication channel.

Requires a setup with info.plist entries, correct permissions and code signing.

132.17.2 Methods

132.17.3 Available as boolean

132.17.4 CallMethod(name as string, tag as Variant, params() as Variant)

Notes: Returns array of variant.

132.17.5 Close

132.17.6 Constructor(endpoint as NSXPCListenrEndpointMBS)

Notes:
endpoint: The desired listener endpoint for the service. Available in OS X v10.8 and later.

See also:

- 132.17.7 Constructor(MachOServiceName as string, flags as Integer)
- 132.17.8 Constructor(ServiceName as string)

### 132.17.7 Constructor(MachOServiceName as string, flags as Integer)

**Function:** Initializes an NSXPCConnection object to connect to a LaunchAgent or LaunchDaemon with a name advertised in a launchd.plist.

**Notes:**
For example, if an agent is managed with launchd and has a launchd.plist in textasciitilde /Library/LaunchAgents, this method would create a connection to that agent. The agent should use NSXPCListener to wait for new connections.

If the connection is being made to a process that is running in a privileged Mach bootstrap context (for example, a daemon started by a launchd property list in /Library/LaunchDaemons), then pass the NSXPCConnectionPrivileged option.

Available in OS X v10.8 and later.

See also:

- 132.17.6 Constructor(endpoint as NSXPCListenerEndpointMBS)
- 132.17.8 Constructor(ServiceName as string)

### 132.17.8 Constructor(ServiceName as string)

**Function:** Initializes an NSXPCConnection object to connect to an NSXPCListener object in an XPC service, identified by a service name.

**Notes:**
XPC services are helper processes that are usually part of your application bundle. The service should use NSXPCListener to wait for new connections.

Available in OS X v10.8 and later.

See also:

- 132.17.6 Constructor(endpoint as NSXPCListenerEndpointMBS)
- 132.17.7 Constructor(MachOServiceName as string, flags as Integer)
132.17.9 Destructor

Function: The destructor.

132.17.10 invalidate

Function: Invalidates the connection.
Notes: When you call this method, all outstanding reply blocks, error handling blocks, and invalidation blocks are called on the message handling queue. The connection must be invalidated before it is deallocated. After a connection is invalidated, no more messages may be sent or received.

132.17.11 resume

Function: Starts or resumes handling of messages on a connection.
Notes: All connections start suspended. You must resume them before they start processing received messages or sending messages through the remoteObjectProxy object.
Available in OS X v10.8 and later.

132.17.12 suspend

Function: Suspends the connection.
Notes: Suspend and resumes must be balanced before the connection may be invalidated.
Available in OS X v10.8 and later.

132.17.13 Properties

132.17.14 auditSessionIdentifier as Integer

Function: The BSM audit session identifier for the connecting process.
Notes:
This attribute may be used by the listener delegate to accept or reject connections.  
(Read only property)

132.17.15 effectiveGroupIdentifier as Integer

Function: The effective group ID (EGID) of the connecting process.  
Notes:  
This attribute may be used by the listener delegate to accept or reject connections.  
(Read only property)

132.17.16 effectiveUserIdentifier as Integer

Function: The effective user ID (EUID) of the connecting process.  
Notes:  
This attribute may be used by the listener delegate to accept or reject connections.  
(Read only property)

132.17.17 endpoint as NSXPCListenerEndpointMBS

Function: If the connection was created with an NSXPCListenerEndpoint object, returns the endpoint object used.  
Notes: (Read only property)

132.17.18 Handle as Integer

Function: The internal object reference.  
Notes: (Read and Write property)

132.17.19 processIdentifier as Integer

Function: The process ID (PID) of the connecting process.  
Notes:
This attribute may be used by the listener delegate to accept or reject connections. Available in OS X v10.8 and later. (Read only property)

**132.17.20**  
**serviceName as String**

**Function:** The name of the XPC service that this connection was configured to connect to.  
**Notes:** (Read only property)

**132.17.21**  
**Events**

**132.17.22**  
**CallMethodReturned(name as string, tag as Variant, Parameters() as Variant, Results() as Variant)**

**Function:** The event called when method returns.

**132.17.23**  
**ErrorHandler(error as NSErrorMBS)**

**Function:** The error event for errors happening when calling method.

**132.17.24**  
**InterruptionHandler**

**Function:** The event is called if the remote process exits or crashes.  
**Notes:** It may be possible to re-establish the connection by simply sending another message. The handler is invoked on the same queue as reply messages and other handlers, and it is always executed after any other messages or reply block handlers (except for the invalidation handler).

**132.17.25**  
**InvalidationHandler**

**Function:** This event is invoked on the same queue as reply messages and other handlers, and is always executed last (after the interruption handler, if required).
Notes: You may not send messages over the connection from within an invalidation handler block.

132.17.26 Constants

132.17.27 NSXPCConnectionPrivileged = 1

MBS MacFrameworks Plugin, Plugin Version: 14.2. **Function:** One of the options that you can pass to a connection.

**Notes:**

Use this option if connecting to a service in the privileged Mach bootstrap (for example, a daemon with a launchd.plist in /Library/LaunchDaemons).
Available in OS X v10.8 and later.
132.18. class NSXPCLISTENERENDPOINTMBS

132.18.1 class NSXPCLISTENERENDPOINTMBS

**Function:** Class that "names" a specific NSXPCLISTENER object.
**Notes:**
An instance may be retrieved from an NSXPCLISTENER and sent over existing NSXPCCONNECTIONS. A process may then use it to create a new NSXPCCONNECTION to the original NSXPCLISTENER.

This pattern is useful if you have a service which multiplexes work to other services. The service can act as an intermediate helper. The requesting application does not need to know specifically which service it is connecting to, just that it implements a known NSXPInterface.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

132.18.2 Methods

132.18.3 Available as boolean

**Function:** Whether this class is available.

132.18.4 Constructor

**Function:** The private constructor.

132.18.5 Properties

132.18.6 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)
class NSXPCListenerMBS

class NSXPCListenerMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSXPCListener class and its delegate are responsible for waiting for new incoming connections, configuring them, and accepting or rejecting them.

**Notes:**

Each XPC service, launchd agent, or launchd daemon typically has at least one NSXPCListener object that listens for connections to a specified service name.

When the listener receives a new connection request, it creates a new NSXPCConnection object, then asks the delegate to inspect, configure, and resume the connection object by calling the delegate's shouldAcceptNewConnection event.

Methods

Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.

Close

Constructor(Anonymous as boolean = false)

**Notes:**

If Anonymous is true: Initializes with a new anonymous listener connection.

If false: Initializes with the singleton listener used to listen for incoming connections in an XPC service.

see also:

See also:

- 132.19.6 Constructor(Name as string)
132.19. **CLASS NSXPCLISTENERMBS**

132.19.6 **Constructor(Name as string)**

**Function:** Initializes a listener in a LaunchAgent or LaunchDaemon which has a name advertised in a launchd.plist file.

**Notes:**
For example, you might use this in an agent launched by launchd with a launchd.plist contained in textasciitilde /Library/LaunchAgents, or a daemon launched by launchd with a launchd.plist contained in /Library/LaunchDaemons.

Available in OS X v10.8 and later.
See also:
- 132.19.5 Constructor(Anonymous as boolean = false)

132.19.7 **Destructor**

**Function:** The destructor.

132.19.8 **invalidate**

**Function:** Invalidates the listener.

**Notes:**
After calling this method, no more connections are created. Once a listener is invalidated it may not be resumed or suspended.
Available in OS X v10.8 and later.

132.19.9 **resume**

**Function:** Starts processing of incoming requests.

**Notes:**
All listeners start suspended and must be resumed before they begin processing incoming requests.

If called on the serviceListener object, this method never returns. Therefore, you should call it as the last step inside the XPC service’s main function after setting up any desired initial state and configuring the listener itself.
If called on any other NSXPCListener, the connection is resumed, and the method returns immediately.
Available in OS X v10.8 and later.

132.19.10 suspend

Function: Suspends the listener.
Notes:
Suspends and resumes must be balanced before the listener may be invalided.
Available in OS X v10.8 and later.

132.19.11 Properties

132.19.12 endpoint as NSXPCListenerEndpointMBS

Function: Returns an endpoint object that may be sent over an existing connection.
Notes:
The receiver of the endpoint can use this object to create a new connection to this NSXPCListener object.
The resulting NSXPCListenerEndpoint object uniquely names this listener object across connections.
(Read only property)

132.19.13 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

132.19.14 Events

132.19.15 CallMethod(Name as string, Parameters() as Variant) as Variant()

Function: Called on the listener side when a method was called on the connection.
Notes: Return array of variant for the results.
132.19.16   shouldAcceptNewConnection(newConnection as NSXPCConnectionMBS) as boolean

Function: Accepts or rejects a new connection to the listener.

Notes:
To accept the connection, first configure the connection if desired, then call resume on the new connection, then return true.
To reject the connect, return a value of false. This causes the connection object to be invalidated.
In this method, you can also set up properties on the connection object, such as its exported object and interfaces. Be sure to call resume when you are finished configuring the connection object and are ready for it to receive messages.
132.20 class ProcessMBS

132.20.1 class ProcessMBS

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Adds the class ProcessMBS to Realbasic to get details about all running applications.

**Example:**

```
// Shows how to use the processInformationCFDictionary function to
// decide on Mac OS X whether an application is a background only one.

dim myProcess as ProcessMBS
dim myCFDictionary as CFDictionaryMBS
dim myCFBoolean as CFBooleanMBS
dim myCFObject as CFObjectMBS

myProcess = new ProcessMBS
myProcess.GetCurrentProcess
myCFDictionary = CFDictionaryMBS(myProcess.processInformationCFDictionary)
myCFObject = myCFDictionary.Value(newcfstringmbs("LSBackgroundOnly"))
myCFBoolean = CFBooleanMBS(myCFObject)

if myCFBoolean.Value then
    MsgBox "is background"
else
    MsgBox "is not background"
end if
```

**Notes:**

Requires Windows 95 or Windows 2000 to run on Windows.

To find all windows on Windows, use the WindowsListMBS class.
To find all windows on Mac OS X, use the CGSWindowListMBS class.

132.20.2 Methods

132.20.3 Bundle as folderitem

MBS Util Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bundle path.

**Notes:**

Maybe nil if not available.
132.20. **CLASS PROCESSMBS**

Returns on Mac OS X the path to the main bundle of the process.

### 132.20.4 BundleID as string

MBS Util Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bundle identifier.  
**Notes:**  
Maybe "" if not available.  
Returns on Mac OS X the identifier to the main bundle of the process.

### 132.20.5 CurrentProcessID as Integer

MBS Util Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the process ID of the application.  
**Example:**  
MsgBox str(ProcessMBS.CurrentProcessID)

### 132.20.6 GetCurrentProcess

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Load the current Process' information into the class.  
**Notes:** This should always be your Realbasic application.

### 132.20.7 GetfirstProcess

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Load the first Process into the class.  
**Example:**  
```vbs
    dim p as ProcessMBS
    p=new ProcessMBS
    p.GetfirstProcess ' get first
    do
        MsgBox p.name
    loop until not p.GetNextProcess ' get next till no more
```
132.20.8 GetFrontProcess

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Load the frontmost Process’ information into the class.

132.20.9 GetNextProcess as boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Load the next Process into the class.

**Example:**

```plaintext
dim p as ProcessMBS
p=new ProcessMBS
p.GetfirstProcess ' get first
do
msgBox p.name
loop until not p.GetNextProcess ' get next till no more
```

**Notes:** Returns true if successfull.

132.20.10 GetProcess(serial as memoryblock)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Load the process information for the process with the given serial.

132.20.11 KillProcess as Integer

MBS Util Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Kills a Process on Mac OS X or Windows.

**Example:**

```plaintext
dim p as ProcessMBS
p=new ProcessMBS
p.getCurrentprocess
msgbox str(p.killprocess)
```

**Notes:**

Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error".
132.20. CLASS PROCESSMBS

Sets the lasterror property.

Lasterror codes on Windows:
0 - failed
1 - normal exit
2 - forced exit

If you kill the main process of a task, this can kill the sub processes, too.
See also:

- 132.20.12 KillProcess(ProcessID as Integer, timeout as Integer) as Integer
- 132.20.13 KillProcess(timeoutms as Integer) as Integer

132.20.12 KillProcess(ProcessID as Integer, timeout as Integer) as Integer

**Example:**
```plaintext
cost pid = 12345 // put the PID here
call ProcessMBS.KillProcess pid, 100
```

**Notes:**
Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error".

Returns on Windows:
0 - failed
1 - normal exit
2 - forced exit

The timeout is in milliseconds.
If you kill the main process of a task, this can kill the sub processes, too.
See also:

- 132.20.11 KillProcess as Integer
- 132.20.13 KillProcess(timeoutms as Integer) as Integer

132.20.13 KillProcess(timeoutms as Integer) as Integer

MBS Util Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Kills a Process on Mac OS X or Windows.
Example:

dim p as ProcessMBS
p=new ProcessMBS
p.getcurrentprocess
msgbox str(p.killprocess)

Notes:
Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error".

Sets the lasterror property.

Lasterror codes on Windows:
0 - failed
1 - normal exit
2 - forced exit

The timeout is in milliseconds. If you don’t specify a timeout, 1000 ms are used.
If you kill the main process of a task, this can kill the sub processes, too.
See also:

- 132.20.11 KillProcess as Integer 18040
- 132.20.12 KillProcess(ProcessID as Integer, timeout as Integer) as Integer 18041

132.20.14 MacProcessSerial as memoryblock

MBS Util Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the serial number for this process as a memoryblock with binary content.
Notes:
On Mac OS every process as its own unique ID. (If you launch one application two times, they may have everything equal except the process serial.)

The serial itself is a 8byte long memoryblock (two integer).

Returns nil on any error.
132.20.15  Priority(ProcessID as Integer) as Integer

MBS Util Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: Yes. **Function:** Sets or gets priority for a process on Mac and Linux.

**Notes:**
Value is in the range -20 to 20. The default priority is 0; lower priorities cause more favorable scheduling.
For Windows, please use WinSetPriorityClass and WinGetPriorityClass.
(Read and Write computed property)

See also:
- 132.20.44 Priority as Integer

132.20.16  ProcessInformationCFDictionary as object

MBS Util Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFDictionaryMBS object with the properties of the process.

**Example:**
```vbs
dim p as ProcessMBS
dim d as CFDictionaryMBS

p=new ProcessMBS
p.GetCurrentProcess

d=CFDictionaryMBS(p.ProcessInformationCFDictionary)

if d=nil then
    MsgBox "This example works only on Mac OS X 10.2!"
else
    // use information in dictionary
end if
```

**Notes:**
Only available on Mac OS X 10.2 or newer.
(And in Mac OS X 10.2 is a bug which may lead into a crash by using this function. Fixed in Mac OS X 10.3)
The function returns a CFDictionaryMBS, but to avoid plugin dependencies, the function is declared as Object, so RB 4.5 don’t crash when an application uses the process plugin and dosn’t use the CF Plugin.

**Result:**
An immutable CFDictionary containing these keys and their values. Keys marked with an '*' are optional. Over time more keys may be added.
Key Name          Type
"PSN"             CFNumber, kCFNumberLongLongType
"Flavor"          CFNumber, kCFNumberSInt32
"Attributes"      CFNumber, kCFNumberSInt32
"ParentPSN"       CFNumber, kCFNumberLongLong
"FileType"        CFString, file type
"FileCreator"     CFString, file creator
"pid"             CFNumber, kCFNumberLongType
"LSBackgroundOnly" CFBoolean
"LSUIElement"     CFBoolean
"IsHiddenAttr"    CFBoolean
"IsCheckedInAttr" CFBoolean
"RequiresClassic" CFBoolean
"RequiresCarbon"  CFBoolean
"LSUserQuitOnly"  CFBoolean
"LSUIPresentationMode" CFNumber, kCFNumberShortType
"BundlePath"      CFString
kIOBundleExecutableKey CFString
kIOBundleNameKey   CFString
kIOBundleIdentifierKey CFString

132.20.17  QuitProcess as Integer

MBS Util Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Quits a Process on Mac OS.

**Example:**

```dim p as ProcessMBS
p=new ProcessMBS
p.getcurrentprocess
msgbox str(p.QuitProcess)```

**Notes:**

Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error". Sets the lasterror property.

132.20.18  SameAs(other as ProcessMBS) as boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if two ProcessMBS objects have the same Process.
132.20.19 SetFrontProcessWithOptions(options as Integer)

MBS Util Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the current process to the front.

**Example:**

```vba
dim p as ProcessMBS

// move my front window to the front
p=new ProcessMBS
p.GetCurrentProcess
p.SetFrontProcessWithOptions 1
```

**Notes:**

If you pass 0 in the options parameter, the process is activated and all process windows are brought forward.

If you pass kSetFrontProcessFrontWindowOnly (value 1), the process is activated and the frontmost non-floating window is brought forward. (Mac OS X only)

132.20.20 SetServiceMode(ismode as boolean) as boolean

MBS Util Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** If an application is a service, it is not listed inside the Windows force quit window.

**Notes:** Works only on Windows 95, 98 and ME.

132.20.21 TransformProcessType(mode as Integer) as Integer

MBS Util Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the 'type' of the process specified in the psn parameter.

**Notes:**

Given a psn for an application, this call transforms that application into the given type. Foreground applications have a menu bar and appear in the Dock. Background applications do not appear in the Dock, do not have a menu bar (and should not have windows or other user interface). UIElement applications do not have a menu bar, do not appear in the dock, but may in limited circumstances present windows and user interface. If a foreground application is frontmost when transformed into a background application, it is first hidden and another application is made frontmost. A UIElement or background-only application which is transformed into a foreground application is not brought to the front (use SetFrontProcess() after the transform if this is required) nor will it be shown if it is hidden (even if hidden automatically by being transformed into a background-only application), so the caller should use ShowHideProcess() to show the application after it is transformed into a foreground application. Applications can only transform themselves;
this call cannot change the type of another application.

Returns error code (0 for success).

### 132.20.22 TransformToForegroundApplication as Integer

MBS Util Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Transforms a background application to a foreground application.

**Notes:**

Returns a Mac OS error code. Returns -1 if the function is not available. You need to select a process first with Get*Process functions.

Requires Mac OS X 10.3.

You can use this call to transform a background-only application into a foreground application. A foreground application appears in the Dock (and in the Force Quit dialog) and contains a menu bar. This function does not cause the application to be brought to the front; you must set FrontProcess=true to do so.

While available starting in 10.3 "Panther," calling TransformProcessType on a UIElement application in 10.3 or 10.4 will return paramErr (-50), rendering it only usable on a full BackgroundOnly application. Leopard supports foregrounding both UIElement and BackgroundOnly applications.

### 132.20.23 Update

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the classes information.

**Notes:** Use it if you want the current CPUtiltime value after some time.

### 132.20.24 WinFullProcessImagePath as string

MBS Util Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the full name of the executable image for the specified process.

**Notes:**

Returns empty string on any error like missing permissions.

The path is in the device style "Device\Harddisk0\Partition1\WINNT\System32\test.exe".

Requires Windows Vista or Windows Server 2008 or newer.
WinGetPriorityClass(ProcessID as Integer) as Integer

MBS Util Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the priority class for the specified process.

**Notes:**

You can pass ProcessID -1 to get the current process. This value, together with the priority value of each thread of the process, determines each thread’s base priority level.

If the function succeeds, the return value is the priority class of the specified process.

The process’s priority class is one of the following values:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABOVE_NORMAL_PRIORITY_CLASS</td>
<td>&amp; h00008000</td>
<td>Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.</td>
</tr>
<tr>
<td>BELOW_NORMAL_PRIORITY_CLASS</td>
<td>&amp; h00004000</td>
<td>Process that has priority above IDLE_PRIORITY_CLASS but below NORMAL_PRIORITY_CLASS.</td>
</tr>
<tr>
<td>HIGH_PRIORITY_CLASS</td>
<td>&amp; h00000800</td>
<td>Process that performs time-critical tasks that must be executed immediately for it to run correctly. The threads of a high-priority class process preempt the threads of normal or idle priority class processes. An example is the Task List, which must respond quickly when called by the user, regardless of the load on the operating system. Use extreme care when using the high-priority class, because a high-priority class CPU-bound application can use nearly all available cycles.</td>
</tr>
<tr>
<td>IDLE_PRIORITY_CLASS</td>
<td>&amp; h00000400</td>
<td>Process whose threads run only when the system is idle and are preempted by the threads of any process running in a higher priority class. An example is a screen saver. The idle priority class is inherited by child processes.</td>
</tr>
<tr>
<td>NORMAL_PRIORITY_CLASS</td>
<td>&amp; h00000200</td>
<td>Process with no special scheduling needs.</td>
</tr>
<tr>
<td>REALTIME_PRIORITY_CLASS</td>
<td>&amp; h00000100</td>
<td>Process that has the highest possible priority. The threads of a real-time priority class process preempt the threads of all other processes, including operating system processes performing important tasks. For example, a real-time process that executes for more than a very brief interval can cause disk caches not to flush or cause the mouse to be unresponsive.</td>
</tr>
</tbody>
</table>

Every thread has a base priority level determined by the thread’s priority value and the priority class of its process. The operating system uses the base priority level of all executable threads to determine which thread gets the next slice of CPU time. Threads are scheduled in a round-robin fashion at each priority level, and only when there are no executable threads at a higher level will scheduling of threads at a lower level take place.

For a table that shows the base priority levels for each combination of priority class and thread priority value, see Scheduling Priorities.

Priority class is maintained by the executive, so all processes have a priority class that can be queried.

For Mac and Linux, please use Priority.
132.20.26 WinModulePath as string

MBS Util Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Returns the path the first code file in this process.
Notes:
Returns empty string on any error like missing permissions.
The path is in the typical style "C:\path\name.exe".

132.20.27 WinProcessImagePath as string

MBS Util Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Retrieves the name of the executable file for the specified process.
Notes:
Returns empty string on any error like missing permissions.
The path is in the device style "Device\Harddisk0\Partition1\WINNT\System32\test.exe".
Requires Windows XP or Windows Server 2003 or newer.

132.20.28 WinSetPriorityClass(ProcessID as Integer, PriorityClass as Integer) as Integer

MBS Util Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Sets the priority class for the specified process.
Notes:
You can pass ProcessID -1 to get the current process.
This value together with the priority value of each thread of the process determines each thread’s base priority level.

The process’s priority class is one of the following values:

Every thread has a base priority level determined by the thread’s priority value and the priority class of its process. The operating system uses the base priority level of all executable threads to determine which thread gets the next slice of CPU time. Threads are scheduled in a round-robin fashion at each priority level, and only when there are no executable threads at a higher level will scheduling of threads at a lower level take place.
For a table that shows the base priority levels for each combination of priority class and thread priority value, see Scheduling Priorities.
Priority class is maintained by the executive, so all processes have a priority class that can be queried.
<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABOVE_NORMAL_PRIORITY_CLASS</td>
<td>&amp; h00008000</td>
<td>Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.</td>
</tr>
<tr>
<td>BELOW_NORMAL_PRIORITY_CLASS</td>
<td>&amp; h00004000</td>
<td>Process that has priority above IDLE_PRIORITY_CLASS but below NORMAL_PRIORITY_CLASS.</td>
</tr>
<tr>
<td>HIGH_PRIORITY_CLASS</td>
<td>&amp; h00000080</td>
<td>Process that performs time-critical tasks that must be executed immediately for it to run correctly. The threads of a high-priority class process preempt the threads of normal or idle priority class processes. An example is the Task List, which must respond quickly when called by the user, regardless of the load on the operating system. Use extreme care when using the high-priority class, because a high-priority class CPU-bound application can use nearly all available cycles.</td>
</tr>
<tr>
<td>IDLE_PRIORITY_CLASS</td>
<td>&amp; h00000040</td>
<td>Process whose threads run only when the system is idle and are preempted by the threads of any process running in a higher priority class. An example is a screen saver. The idle priority class is inherited by child processes.</td>
</tr>
<tr>
<td>NORMAL_PRIORITY_CLASS</td>
<td>&amp; h00000020</td>
<td>Process with no special scheduling needs.</td>
</tr>
<tr>
<td>REALTIME_PRIORITY_CLASS</td>
<td>&amp; h00000100</td>
<td>Process that has the highest possible priority. The threads of a real-time priority class process preempt the threads of all other processes, including operating system processes performing important tasks. For example, a real-time process that executes for more than a very brief interval can cause disk caches not to flush or cause the mouse to be unresponsive.</td>
</tr>
</tbody>
</table>

Every thread has a base priority level determined by the thread’s priority value and the priority class of its process. The system uses the base priority level of all executable threads to determine which thread gets the next slice of CPU time. The SetThreadPriority function enables setting the base priority level of a thread relative to the priority class of its process. For more information, see Scheduling Priorities.

The *_PRIORITY_CLASS values affect the CPU scheduling priority of the process. For processes that perform background work such as file I/O, network I/O, or data processing, it is not sufficient to adjust the CPU scheduling priority; even an idle CPU priority process can easily interfere with system responsiveness when it uses the disk and memory. Processes that perform background work should use the PROCESS_MODE_BACKGROUND_BEGIN and PROCESS_MODE_BACKGROUND_END values to adjust their resource scheduling priorities; processes that interact with the user should not use PROCESS_MODE_BACKGROUND_BEGIN.

If a process is in background processing mode, the new threads it creates will also be in background processing mode. When a thread is in background processing mode, it should minimize sharing resources such as critical sections, heaps, and handles with other threads in the process, otherwise priority inversions can occur. If there are threads executing at high priority, a thread in background processing mode may not be scheduled promptly, but it will never be starved.

Each thread can enter background processing mode independently using SetThreadPriority. Do not call SetPriorityClass to enter background processing mode after a thread in the process has called SetThreadPriority to enter background processing mode. After a process ends background processing mode, it resets all threads in the process; however, it is not possible for the process to know which threads were already in background processing mode.

On any error the value is zero.

For Mac and Linux, please use Priority.
132.20.29 Properties

132.20.30 CPUTime as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of ticks this Process did get to calculate.

**Notes:**

Unit is 1/60 of a second.
On Mac OS X this value is not available and normally 0.
(Read only property)

132.20.31 CurrentProcess as boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the application is in the current Process.

**Notes:**

This should always be true because you are running Realbasic as the current ProcessMBS while you ask for this.
(Read only property)

132.20.32 flags as Integer

MBS Util Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The flags for this process on Mac OS.

**Example:**

```vbnet
Sub Open()
    // List all visible processes

    dim s as string
    dim p as ProcessMBS
    dim d As CFDictionaryMBS
    dim LSBackgroundOnly, LSUIElement As CFStringMBS
    dim b As CFBooleanMBS
    dim obj As CObjectMBS
    dim visible as Boolean

    const modeOnlyBackground=& h00000400

    LSUIElement=NewCFStringMBS("LSUIElement")
    LSBackgroundOnly = NewCFStringMBS("LSBackgroundOnly")

    p = new ProcessMBS
```

p.getfirstProcess

do
visible=True

// Mac OS X
d = CFDictionaryMBS(p.ProcessInformationCFDictionary)

if d <> nil Then
    obj = d.Value(LSBackgroundOnly)
    if obj isa CFBooleanMBS then
        b=CFBooleanMBS(obj)

        if b.value Then
            visible=false
        end
    end if

    obj= d.Value(LSUIElement)
    if obj isa CFBooleanMBS then
        b=CFBooleanMBS(obj)

        if b.value Then
            visible=false
        end
    end if

// Mac OS 9

if BitwiseAnd(p.Flags,modeOnlyBackground)<>0 then
    visible=False
end if

if visible then
    ListBox1.AddRow p.Name
end if

loop until not p.GetNextProcess
End Sub

Notes:

Returns 0 on any error.

Process mode flags. These flags indicate whether the process is an application or desk accessory. For appli-
cations, this field also returns information specified in the application’s 'SIZE' resource. This information is returned as flags. You can refer to these flags by using these constants:

- `modeDeskAccessory` & h00020000
- `modeMultiLaunch` & h00010000
- `modeNeedSuspendResume` & h00004000
- `modeCanBackground` & h00001000
- `modeDoesActivateOnFGSwitch` & h00000800
- `modeOnlyBackground` & h00000400
- `modeGetFrontClicks` & h00000200
- `modeGetAppDiedMsg` & h00000100
- `mode32BitCompatible` & h00000080
- `modeHighLevelEventAware` & h00000040
- `modeLocalAndRemoteHLEvents` & h00000020
- `modeStationeryAware` & h00000010
- `modeUseTextEditServices` & h00000008

(Read only property)

132.20.33 FrontProcess as boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the application is in the front of all others.

**Example:**

```vba
dim p as new ProcessMBS
p.GetCurrentProcess
p.FrontProcess=true "bring app to front"
```

**Notes:**

This property is for read and write. Writing to it brings the Process to front.

(Read and Write property)

132.20.34 lasterror as Integer

MBS Util Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code.

**Notes:**

As this property is introduced with MBS Plugin 3.1, only a few functions set it. 0 means no error, -1 means not available and anything else is a Mac OS error code.
132.20. CLASS PROCESSMBS

(Read and Write property)

132.20.35 LaunchProcess as ProcessMBS

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the application which launched the current one.

**Notes:**

For some applications like the ”loginwindow” it is nil, because there was no app to launch it other than the system itself.

(Read only property)

132.20.36 MacCreator as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Mac Creator code for the application.

**Notes:** (Read only property)

132.20.37 MacType as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Mac Type code for the application.

**Notes:**

Possible values:

"APPL" normal application
"appe" background application (Classic)
"APPC" Control panel application (Classic)
"APPD" Desktop Accessory (Classic)
"FNDR" Finder

others may be possible.

(Read only property)
132.20.38 MemoryFree as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the size of the free space in the Process’ memory partition.

**Notes:**

On Mac OS X normally 0.

(Read only property)

132.20.39 MemorySize as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns size of the Process’ memory partition.

**Notes:**

On Mac OS X normally 0.

(Read only property)

132.20.40 Name as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Returns the name of this application.

**Notes:**

Added Windows support in MBS Plugin 2.7 for this property.

(Read only property)

132.20.41 Path as folderitem

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the path of the Process’ executable file.

**Notes:**

Maybe nil if not available.

Use this folderitem to get an icon for the Process.

(and this icon may be nil!)

(Read only property)
132.20.42  ProcessID as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Returns the PID of the process for use in unix command line tools.

**Example:**

```plaintext
Function LoginWindowPID() as Integer
// returns Process ID of Loginwindow on Mac OS X.
// or 0 on error

dim p as ProcessMBS

p=new ProcessMBS
p.GetFirstProcess

do
if p.Name="loginwindow" then
Return p.ProcessID
end if
loop until not p.GetNextProcess
End Function
```

**Notes:**

Works only on Mac OS X.
See the "CPU Focus" application for an example.

Note that this call does not make sense for Classic applications, since they all share a single UNIX process ID.
(Read only property)

132.20.43  Visible as boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the application is visible.

**Example:**

```plaintext
// hide iTunes

dim p as new ProcessMBS

p.GetFirstProcess
do
if p.BundleID="com.apple.iTunes" then
p.Visible=false
```

exit
end if
loop until not p.GetNextProcess

Notes:
Works only on Mac OS X.
Returns false if not supported.
Sets the lasterror property.
(Read and Write property)

132.20.44 Priority as Integer

Example:

dim p as new ProcessMBS

p.GetCurrentProcess

MsgBox str(p.priority) // shows 0

p.priority = 5

MsgBox str(p.priority) // shows 5

Notes:
20 (least) to -20 (max). Setting the value may be limited due to permissions.
(Read and Write computed property)
See also:

* 132.20.15 Priority(ProcessID as Integer) as Integer

18043

132.20.45 Constants

132.20.46 kProcessTransformToBackgroundApplication = 2

MBS Util Plugin, Plugin Version: 15.2. Function: One of the process transformation types.
Notes:
Turn application in a background application.
functional in Mac OS X 10.7 and later

**132.20.47 kProcessTransformToForegroundApplication = 1**

MBS Util Plugin, Plugin Version: 15.2. **Function:** One of the process transformation types. **Notes:** Turn application in a foreground application.

**132.20.48 kProcessTransformToUIElementApplication = 4**

MBS Util Plugin, Plugin Version: 15.2. **Function:** One of the process transformation types. **Notes:**
Turn application in a user interface element application.
functional in Mac OS X 10.7 and later
132.21 class WindowsProcessMemoryInfoMBS

132.21.1 class WindowsProcessMemoryInfoMBS

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to get information about the memory usage of a process on Windows.

132.21.2 Methods

132.21.3 Constructor

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor which fills the values into the properties.
**Example:**
```
dim w as new WindowsProcessMemoryInfoMBS
msgbox "This application uses currently " + str(w.WorkingSetSize) + " Bytes of memory."
```

**Notes:** Queries the current process memory information.
See also:

- 132.21.4 Constructor(ProcessID as Integer)

132.21.4 Constructor(ProcessID as Integer)

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor which fills the values into the properties.
**Notes:** Queries the process memory information of the process with the given ID.
See also:

- 132.21.3 Constructor

132.21.5 Properties

132.21.6 PageFaultCount as Integer

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of page faults.
**Notes:** (Read only property)
132.21.7  PagefileUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current space allocated for the pagefile, in bytes. Those pages may or may not be in memory. **Notes:** (Read only property)

132.21.8  PeakPagefileUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The peak space allocated for the pagefile, in bytes. **Notes:** (Read only property)

132.21.9  PeakWorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The peak working set size, in bytes. **Notes:** (Read only property)

132.21.10  ProcessID as Integer

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The process ID of the process queried. **Notes:** Value is 0 if the query failed. (Read only property)

132.21.11  QuotaNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The peak nonpaged pool usage, in bytes. **Notes:** (Read only property)

132.21.12  QuotaPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current paged pool usage, in bytes.
132.21.13 QuotaPeakNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current nonpaged pool usage, in bytes. **Notes:** (Read only property)

132.21.14 QuotaPeakPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The peak paged pool usage, in bytes. **Notes:** (Read only property)

132.21.15 WorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current working set size, in bytes. **Notes:** This is the memory your application uses. (Read only property)
132.22. CLASS WINDOWSPROCESSSTATISTICSMBS

132.22 class WindowsProcessStatisticsMBS

132.22.1 class WindowsProcessStatisticsMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
A class to get information about process statistics on Windows.
Example:

dim c as new WindowsProcessStatisticsMBS
MsgBox str(C.PeakWorkingSetSize)

132.22.2 Methods

132.22.3 Constructor(ProcessID as Integer = -1, Mode as Integer = 255)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Creates a new object for given process and with given mode.
Example:

dim pid as Integer = -1
dim c as new WindowsProcessStatisticsMBS(pid, WindowsProcessStatisticsMBS.ModeMemoryCounters)
MsgBox str(C.PeakWorkingSetSize)

Notes:
If ProcessID is -1, the current process is queried.
Mode can be a combination of the Mode* constants you want to query. The Mode property will later contain
the Mode* constants combination of the values which are valid.

132.22.4 Properties

132.22.5 CreationTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
A file time that receives the creation time of the process.
Notes:
Property is valid if Mode contains ModeTimes.
(Read only property)
132.22.6 CycleTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The sum of the cycle time of all threads of the specified process.

**Notes:**
Property is valid if Mode contains ModeTimes.
This value can only be queried on Windows Vista or newer.
(Read only property)

132.22.7 ExitTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A file time that receives the exit time of the process. If the process has not exited, the content of this structure is undefined.

**Notes:**
Property is valid if Mode contains ModeTimes.
(Read only property)

132.22.8 HandleCount as Integer

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of handles in use by the process.

**Example:**
```vbnet
dim w as new WindowsProcessStatisticsMBS
dim n1 as Integer = w.HandleCount

dim x as new window1 // make a new window

w = new WindowsProcessStatisticsMBS
dim n2 as Integer = w.HandleCount

MsgBox str(n2)+" handles in used, "+str(n2-n1)+" used by second window"
```

**Notes:**
Value is -1 on an error.
(Read only property)
132.22.9  **KernelTime as UInt64**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A file time structure that receives the amount of time that the process has executed in kernel mode.
**Notes:**
The time that each of the threads of the process has executed in kernel mode is determined, and then all of
those times are summed together to obtain this value.
Property is valid if Mode contains ModeTimes.
(Read only property)

132.22.10  **Mode as Integer**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Which values have been queried.
**Notes:**
This value is a combination of the Mode* constants.
(Read only property)

132.22.11  **OtherOperationCount as UInt64**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The number of I/O operations performed, other than read and write operations.
**Notes:**
Property is valid if Mode contains ModeIOCounters.
(Read only property)

132.22.12  **OtherTransferCount as UInt64**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The number of bytes transferred during operations other than read and write operations.
**Notes:**
Property is valid if Mode contains ModeIOCounters.
(Read only property)
132.22.13  PageFaultCount as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The number of page faults.
**Notes:**
Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

132.22.14  PagefileUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The current space allocated for the pagefile, in bytes. Those pages may or may not be in memory.
**Notes:**
Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

132.22.15  PeakPagefileUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The peak space allocated for the pagefile, in bytes.
**Notes:**
Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

132.22.16  PeakWorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The peak working set size, in bytes.
**Notes:**
Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

132.22.17  ProcessID as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The process ID of the process queried.
132.22. **CLASS WINDOWS
PROCESSSTATISTICSMBS**

**Notes:** (Read only property)

### 132.22.18 QuotaNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The peak nonpaged pool usage, in bytes. **Notes:** Property is valid if Mode contains ModeMemoryCounters. (Read only property)

### 132.22.19 QuotaPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current paged pool usage, in bytes. **Notes:** Property is valid if Mode contains ModeMemoryCounters. (Read only property)

### 132.22.20 QuotaPeakNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current nonpaged pool usage, in bytes. **Notes:** Property is valid if Mode contains ModeMemoryCounters. (Read only property)

### 132.22.21 QuotaPeakPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The peak paged pool usage, in bytes. **Notes:** Property is valid if Mode contains ModeMemoryCounters. (Read only property)
132.22.22  ReadOperationCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of read operations performed.

**Notes:**
Property is valid if Mode contains ModelIOCounters.
(Read only property)

132.22.23  ReadTransferCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of bytes read.

**Notes:**
Property is valid if Mode contains ModelIOCounters.
(Read only property)

132.22.24  TotalIdleTime as UInt64

MBS Win Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The amount of time that the system has been idle.

**Notes:** (Read only property)

132.22.25  TotalKernelTime as UInt64

MBS Win Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The amount of time that the system has spent executing in Kernel mode (including all threads in all processes, on all processors).

**Notes:**
This time value also includes the amount of time the system has been idle. So you may want to subtract idle time to get real kernel time.
(Read only property)

132.22.26  TotalUserTime as UInt64

MBS Win Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The amount of time that the system has spent executing in User mode (including all threads in all processes, on all processors).

**Notes:**
If you need to know what is the percentage of the CPU time spent for user applications, you need to read this value two times and calculate the delta.

(Read only property)

132.22.27  **UserTime as UInt64**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A file time structure that receives the amount of time that the process has executed in user mode.

**Notes:**

The time that each of the threads of the process has executed in user mode is determined, and then all of those times are summed together to obtain this value. 
Property is valid if Mode contains ModeMemoryCounters.

(Read only property)

132.22.28  **WorkingSetSize as Int64**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current working set size, in bytes.

**Notes:**

This is the memory your application uses. 
Property is valid if Mode contains ModeMemoryCounters.

(Read only property)

132.22.29  **WriteOperationCount as UInt64**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of write operations performed.

**Notes:**

Property is valid if Mode contains ModeIOCounters.

(Read only property)

132.22.30  **WriteTransferCount as UInt64**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of bytes written.

**Notes:**

Property is valid if Mode contains ModeIOCounters.
132.22.31 Constants

132.22.32 ModeCycleTime = 8

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants. **Notes:** Whether to query the cycle time.

132.22.33 ModeHandles = 32

MBS Win Plugin, Plugin Version: 12.5. **Function:** One of the mode constants. **Notes:** Whether to query the handle count.

132.22.34 ModeIOCounters = 2

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants. **Notes:** Whether to query the IOCounters.

132.22.35 ModeMemoryCounters = 1

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants. **Notes:** Whether to query the memory counters.

132.22.36 ModeTimes = 4

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants. **Notes:** Whether to query the time values.

132.22.37 ModeTotalTime = 16

MBS Win Plugin, Plugin Version: 11.2. **Function:** One of the mode constants. **Notes:**
Whether to query the total CPU time values.
Requires Windows XP with SP1.
132.23 class WindowsVMStatisticsMBS

132.23.1 class WindowsVMStatisticsMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Holds information about the current Windows memory status.

132.23.2 Methods

132.23.3 Constructor

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new statistics object with current values.

**Example:**

```vbscript
// show values in a listbox:
dim w as new WindowsVMStatisticsMBS
list.AddRow "Pagesize: " + format(w.Pagesize,"0")
list.AddRow "MemoryLoad: " + format(w.MemoryLoad,"0")
list.AddRow "AvailablePageFileMemory: " + format(w.AvailablePageFileMemory,"0")
list.AddRow "AvailablePhysicalMemory: " + format(w.AvailablePhysicalMemory,"0")
list.AddRow "AvailableVirtualMemory: " + format(w.AvailableVirtualMemory,"0")
list.AddRow "TotalPageFileMemory: " + format(w.TotalPageFileMemory,"0")
list.AddRow "TotalPhysicalMemory: " + format(w.TotalPhysicalMemory,"0")
list.AddRow "TotalVirtualMemory: " + format(w.TotalVirtualMemory,"0")
```

132.23.4 Properties

132.23.5 AllocationGranularity as Integer

MBS Win Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The granularity for the starting address at which virtual memory can be allocated.

**Notes:**

Typically 64 KB.

(Read only property)
132.23.6 AvailablePageFileMemory as Int64

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the number of bytes available in the paging file.
**Notes:** (Read only property)

132.23.7 AvailablePhysicalMemory as Int64

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the number of bytes of physical memory available.
**Notes:** (Read only property)

132.23.8 AvailableVirtualMemory as Int64

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the number of bytes of unreserved and uncommitted memory in the user mode portion of the virtual address space of the calling process.
**Notes:** (Read only property)

132.23.9 Memoryload as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies a number between 0 and 100 that gives a general idea of current memory utilization, in which 0 indicates no memory use and 100 indicates full memory use.
**Notes:** (Read only property)

132.23.10 Pagesize as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The size of one memory page in memory.
**Notes:**
On Intel 80386 or newer CPUs, it should be 4096 Bytes.
(Read only property)
132.23.11  TotalPageFileMemory as Int64

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the total number of bytes that can be stored in the paging file. Note that this number does not represent the actual physical size of the paging file on disk.  
**Notes:** (Read only property)

132.23.12  TotalPhysicalMemory as Int64

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the total number of bytes of physical memory.  
**Notes:** (Read only property)

132.23.13  TotalVirtualMemory as Int64

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the total number of bytes that can be described in the user mode portion of the virtual address space of the calling process.  
**Notes:**  
Value is 0 on any error.  
(Read only property)
Chapter 133

Quartz Composer

133.1 class QCCompositionMBS

133.1.1 class QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The composition class.
Notes:
The QCComposition class represents a Quartz Composer composition that either:

- comes from the system-wide composition repository (/Library/Compositions and
  ~ /Library/Compositions) where it can be accessed by any application through the methods
  of the QCCompositionRepository class
- is created from an arbitrary source (typically a file on disk) using one of its methods

This class cannot be subclassed.

A QCComposition object has the following information associated with it and that you can obtain by using
the appropriate method of the QCComposition class:

- Attributes include the name and description of the composition, copyright information, and whether
  or not its provided by OS X (built-in).
- The protocols that the composition conforms to. A composition protocol defines a set of required and
  optional input parameters and output results.

Many methods of the QCRenderer, QCCompositionLayer, and QCView classes take a QCComposition object as a parameter.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

133.1.2 Methods

133.1.3 compositionWithData(data as MemoryBlock) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a composition object initialized with the contents of a Quartz Composer composition file.
Example:

```qcode
dim data as MemoryBlock // composition file content in MemoryBlock variable
dim q as QCCompositionMBS = QCCompositionMBS.compositionWithData(data)
```

Notes:

data: The contents of a file created with the Quartz Composer developer tool.

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 133.1.4 compositionWithData(data as string) as QCCompositionMBS

133.1.4 compositionWithData(data as string) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a composition object initialized with the contents of a Quartz Composer composition file.
Example:

```qcode
dim data as string // composition file content in string variable
dim q as QCCompositionMBS = QCCompositionMBS.compositionWithData(data)
```

Notes:

data: The contents of a file created with the Quartz Composer developer tool.

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 133.1.3 compositionWithData(data as MemoryBlock) as QCCompositionMBS
133.1.5 compositionWithFile(file as folderitem) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a composition object initialized with a Quartz Composer composition file.
Example:

dim file as folderitem // your folderitem
dim q as QCCompositionMBS = QCCompositionMBS.compositionWithFile(file)

Notes:

file: A path to a file created with the Quartz Composer developer tool (.qtz extension).

Returns a Quartz Composer composition object or nil if there is an error.
See also:

• 133.1.6 compositionWithFile(path as string) as QCCompositionMBS

133.1.6 compositionWithFile(path as string) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a composition object initialized with a Quartz Composer composition file.
Example:

dim path as string = ""/System/Library/Compositions/Rollercoaster.qtz"" // your path
dim q as QCCompositionMBS = QCCompositionMBS.compositionWithFile(path)

Notes:

file: A path to a file created with the Quartz Composer developer tool (.qtz extension).

Returns a Quartz Composer composition object or nil if there is an error.
See also:

• 133.1.5 compositionWithFile(file as folderitem) as QCCompositionMBS

133.1.7 Constructor

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
133.1.8 copy as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Creates a copy of the composition.

133.1.9 getAttributes as dictionary

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Returns the attributes of the composition.

133.1.10 inputKeys as string()

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Returns an array listing the keys that identify the input ports of the root patch of the composition.

133.1.11 outputKeys as string()

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Returns an array listing the keys that identify the output ports of the root patch of the composition.

133.1.12 protocols as string()

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Returns the list of protocols to which the composition conforms.

133.1.13 QCCompositionAttributeBuiltInKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** One of the standard attribute names.
**Example:**
```vba
dim c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
dim d as Dictionary = c.getattributes
dim b as Boolean = d.Value(c.QCCompositionAttributeBuiltInKey)
MsgBox str(b)
```
Notes:
The key for the composition origin. The associated value is a Boolean value. True indicates the composition is built-in (provided by OS X).

133.1.14 QCCompositionAttributeCategoryKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard attribute names.
Example:
```vba
dim c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
dim d as Dictionary = c.getattributes
dim b as string = d.Lookup(c.QCCompositionAttributeCategoryKey, "?")
MsgBox b
```

Notes: The composition category. The associated value is a category constant. See Categories.

133.1.15 QCCompositionAttributeCopyrightKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard attribute names.
Example:
```vba
dim c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
dim d as Dictionary = c.getattributes
dim b as string = d.Value(c.QCCompositionAttributeCopyrightKey)
MsgBox b
```

Notes:
The key for composition copyright information. The associated value is a string.
133.1.16 QCCompositionAttributeDescriptionKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard attribute names.
Notes:
The key for the composition description.
The associated value is a string.

133.1.17 QCCompositionAttributeHasConsumersKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard attribute names.
Notes:
The key for a composition that has consumer patches. The associated value is a Boolean value.
True indicates that the composition has consumers.

133.1.18 QCCompositionAttributeIsTimeDependentKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard attribute names.
Notes: The key for the composition time dependency. The associated value is a Boolean value. True indicates that the composition is time dependent.

133.1.19 QCCompositionAttributeNameKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard attribute names.
Example:

dim c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
dim d as Dictionary = c.getattributes
MsgBox d.Value(c.QCCompositionAttributeNameKey)

Notes:
The key for the composition name.
The associated value is a string.
133.1.20 QCCompositionCategoryDistortion as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the category names.
Notes: A composition that produces a distortion effect.

133.1.21 QCCompositionCategoryStylize as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the category names.
Notes: A composition that produces a stylize effect.

133.1.22 QCCompositionCategoryUtility as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the category names.
Notes: A utility composition.

133.1.23 QCCompositionInputAudioPeakKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A number input port whose key is inputAudioPeak. The value must be in the \([0,1]\) range as a mono signal with no decay applied.

133.1.24 QCCompositionInputAudioSpectrumKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A structure input port whose key is inputAudioSpectrum. The structure must contain 16 values in the \([0,1]\) range representing 16 spectrum bands of the mono signal from low to high frequencies with no decay applied.

133.1.25 QCCompositionInputDestinationImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: An image input port whose key is inputDestinationImage.

133.1.26 QCCompositionInputImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: An image input port whose key is inputImage.

133.1.27 QCCompositionInputPaceKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A number input port whose key is inputPace. The value must be in the [0,1] range.

133.1.28 QCCompositionInputPreviewModeKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A Boolean input port whose key is inputPreviewMode. When the value of this input port is set to TRUE, the composition that provides this port must be able to run in a low-quality mode that produces a preview of the composition.

133.1.29 QCCompositionInputPrimaryColorKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A color input port whose key is inputPrimaryColor.

133.1.30 QCCompositionInputRSSArticleDurationKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A number input port whose key is inputRSSArticleDuration. The value must be expressed in seconds.
133.1.31 QCCompositionInputRSSFeedURLKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A string input port whose key is inputRSSFeedURL. This port must be passed an http or feed scheme URL.

133.1.32 QCCompositionInputScreenImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: An image input port whose key is inputScreenImage.

133.1.33 QCCompositionInputSecondaryColorKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A color input port whose key is inputSecondaryColor.

133.1.34 QCCompositionInputSourceImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: An image input port whose key is inputSourceImage.

133.1.35 QCCompositionInputTrackInfoKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A structure input port whose key is inputTrackInfo. The structure contains optional entries, such as "name", "artist", "album", "duration", "artwork", and so on.

133.1.36 QCCompositionInputTrackPositionKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A number input port whose key is inputTrackPosition. The value must be expressed in seconds.
133.1.37 QCCompositionInputTrackSignalKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A Boolean input port whose key is inputTrackSignal.

133.1.38 QCCompositionInputXKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A number input port whose key is inputX. The value must be normalized to the image width with the origin on the left.

133.1.39 QCCompositionInputYKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard input key names.
Notes: A number input port whose key is inputY. The value must be normalized to the image height with the origin at the bottom.

133.1.40 QCCompositionOutputImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard output key names.
Notes: An image output port whose key is outputImage.

133.1.41 QCCompositionOutputWebPageURLKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard output key names.
Notes: A string output port whose key is outputWebPageURL.

133.1.42 QCCompositionProtocolGraphicAnimation as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard protocol names.
Notes:
A composition that renders a generic graphical animation. It has the option to use QCCompositionInputPrimaryColorKey for the primary color of the animation, QCCompositionInputSecondaryColorKey for the secondary color of the animation, QCCompositionInputPaceKey for the global pace of the animation, and QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes.

Available in OS X v10.5 and later.

133.1.43 QCCompositionProtocolGraphicTransition as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: One of the standard protocol names.

Notes: A composition that performs a transition between two images, using a transition time in range of 0 to 1. A conforming composition must use the input keys QCCompositionInputSourceImageKey for the starting image and QCCompositionInputDestinationImageKey for the image to transition to. The composition can optionally use QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes.

133.1.44 QCCompositionProtocolImageFilter as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: One of the standard protocol names.

Notes: A composition that applies an effect to a source image. A conforming composition must use the input key QCCompositionInputImageKey for the source image and QCCompositionOutputImageKey for the output image. The composition can optionally use QCCompositionInputXKey to specify the X position of the center point of the effect, QCCompositionInputYKey to specify the Y position of the center point of the effect, and QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes.

133.1.45 QCCompositionProtocolMusicVisualizer as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: One of the standard protocol names.

Notes:

A composition that acts as a visualizer for music. A conforming composition must use the input key QCCompositionInputAudioPeakKey for the instantaneous audio peak and the QCCompositionInputAudioSpectrumKey for the instantaneous audio spectrum. It can optionally use the QCCompositionInputTrackInfoKey to indicate it receives information about the current track and the QCCompositionInputTrackSignalKey to indicate the start of a new track.
CHAPTER 133. QUARTZ COMPOSER

Available in OS X v10.5 and later.

133.1.46 QCCompositionProtocolRSSVisualizer as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard protocol names.
Notes:
A composition that acts as a visualizer for an RSS feed. A conforming composition must use the input key QCCompositionInputRSSFeedURLKey for the URL to use for the RSS feed. It can optionally use QCCompositionInputRSSArticleDurationKey to specify the duration of each feed article.

Available in OS X v10.5 and later.

133.1.47 QCCompositionProtocolScreenSaver as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the standard protocol names.
Notes:
A composition that can be used as a screen saver. The composition has the option to use QCCompositionInputScreenImageKey for a screenshot image of the screen that the screen saver runs on, QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes, and QCCompositionOutputWebPageURLKey for a URL to open in the default web browser when screen saver exits (only allowed if screen saver password is disabled).

Available in OS X v10.5 and later.

133.1.48 Properties

133.1.49 Description as String

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The description for the composition.
Notes: (Read only property)
133.1. CLASS QCCOMPOSITIONMBS

133.1.50 Handle as Integer

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

133.1.51 identifier as String

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The identifier for the composition.
Example:
```vbnet
dim r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
dim a() As QCCompositionMBS = r.allCompositions
MsgBox a(0).identifier
```
Notes: The unique identifier for the composition if it comes from the composition repository; "" otherwise.
(Read only property)

133.1.52 Name as String

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The name for the composition.
Example:
```vbnet
dim c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
MsgBox c.name
```
Notes: (Read only property)
133.2 class QCCompositionRepositoryMBS

133.2.1 class QCCompositionRepositoryMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
Function: The system-wide Quartz Composer composition repository.  
Example:

dim r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository  
dim a() As QCCompositionMBS = r.allCompositions  
MsgBox str(a.Ubound+1)+” compositions installed”

Notes:  
The QCCompositionRepository class represents a system-wide centralized repository of built-in and installed  
Quartz Composer compositions (/Library/Compositions and  
textasciitilde /Library/Compositions). The QCCompositionRepository class cannot be subclassed.  
Compositions in the repository are represented by the QCComposition class. You can use the methods of  
the QCCompositionRepository class to fetch all compositions or only those that meet specific criteria.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

133.2.2 Methods

133.2.3 allCompositions as QCCompositionMBS()

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
Function: Returns an array that contains all compositions currently in the composition repository.  
Example:

dim r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository  
dim a() As QCCompositionMBS = r.allCompositions  
MsgBox str(a.Ubound+1)+” compositions installed”

133.2.4 Compositions(protocols() as String = nil, attributes as Dictionary = nil) as QCCompositionMBS()

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
Function: Returns an array of compositions that match a set of criteria.  
Example:
133.2. **CLASS QCCompositionRepositoryMBS**

```vbs
dim r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
dim a() As QCCompositionMBS = r.Compositions( array( QCCompositionMBS.QCCompositionProtocolImageFilter))
MsgBox str(a.Ubound+1)+" compositions found"
```

**Notes:**

**Protocols:** The protocols that you want compositions to conform to. Pass nil if you don’t want to filter based on the protocol. You can pass any of these protocols: QCCompositionProtocolAnimation, QCCompositionProtocolImageProducer, QCCompositionProtocolImageFilter, QCCompositionProtocolImageComposer, QCCompositionProtocolImageTransition, and QCCompositionProtocolScreenSaverRSS.

**Attributes:** A dictionary that contains the attributes, and their associated values, that you want compositions to match. Pass nil if you don’t want to filter based on the attributes. For example, you can pass any of these attributes: QCCompositionAttributeNameKey, QCCompositionAttributeDescriptionKey, QCCompositionAttributeCopyrightKey, QCCompositionAttributeBuiltInKey, and QCCompositionAttributeTimeDependentKey.

Returns an array of QCComposition objects that meet the supplied criteria.

### 133.2.5 compositionWithIdentifier(identifier as string) as QCCompositionMBS

**MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the composition that corresponds to the identifier.

**Example:**

```vbs
dim r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
dim c as QCCompositionMBS = r.compositionWithIdentifier("/swing")
MsgBox c.Name
```

**Notes:**

**Identifier:** A string that uniquely identifies the composition to retrieve.

Returns the composition identified by the provided string, or nil if there is no composition with that identifier in the composition repository.

### 133.2.6 Constructor

**MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The private constructor.
133.2.7 loadPlugIn(file as folderitem) as Boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Attempts to load a Quartz Composer plug-in from a .plugin bundle at the specified path and returns true on success.
Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.plugin")
dim r as Boolean = QCCompositionRepositoryMBS.loadPlugIn(f)
if r then
    MsgBox "OK"
else
    MsgBox "Failed"
end if
```

Notes: This method will do nothing if the plug-in was already loaded.
See also:

• 133.2.8 loadPlugIn(path as string) as Boolean

133.2.8 loadPlugIn(path as string) as Boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Attempts to load a Quartz Composer plug-in from a .plugin bundle at the specified path and returns true on success.
Notes: This method will do nothing if the plug-in was already loaded.
See also:

• 133.2.7 loadPlugIn(file as folderitem) as Boolean

133.2.9 QCCompositionRepositoryDidUpdateNotification as string

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The new of the notification which is posted whenever the list of compositions in the composition repository is updated.

133.2.10 sharedCompositionRepository as QCCompositionRepositoryMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the shared instance of the composition repository.
133.2.11 Properties

133.2.12 Handle as Integer

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)
133.3 control QCViewControlMBS

133.3.1 control QCViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 
**Function:** The control to host a QCView properly.

133.3.2 Properties

133.3.3 View as QCViewMBS

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 
**Function:** The QCView in use by this control. 
**Notes:** Please use this property to access the actual view and make your settings and load the data to render. (Read only property)

133.3.4 Events

133.3.5 BoundsChanged

**Function:** The event called when the bounds, but not the frame, changed.

133.3.6 DidStartRendering

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 
**Function:** Rendering did start notification.

133.3.7 DidStopRendering

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 
**Function:** Rendering did stop notification.
133.3. **CONTROL QCVIEWCONTROLMBS**

133.3.8 **EnableMenuItems**

Function: The event where you can enable menu items.

133.3.9 **FrameChanged**

Function: The event called when the frame changed.

133.3.10 **GotFocus**

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

133.3.11 **LostFocus**

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

133.3.12 **MenuAction(HitItem as MenuItem) As Boolean**

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

133.3.13 **MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean**

Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

133.3.14 MouseDrag(x as Integer, y as Integer)

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

133.3.15 MouseUp(x as Integer, y as Integer)

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

133.3.16 ScaleFactorChanged(NewFactor as Double)

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.
133.4. class QCViewMBS

133.4.1 class QCViewMBS

**Function:** The QCView class is a custom NSView class that loads, plays, and controls Quartz Composer compositions.

**Notes:**

It is an autonomous view that is driven by an internal timer running on the main thread.

The view can be set to render a composition automatically when it is placed onscreen. The view stops rendering when it is placed offscreen. When not rendering, the view is filled with the current erase color. The rendered composition automatically synchronizes to the vertical retrace of the monitor.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

133.4.2 Methods

133.4.3 Constructor

**Function:** Creates a new Quartz composer view with size 100/100 and position 0/0

**Example:**

```
    dim t as new QCViewMBS
```

**Notes:** On success the handle property is not zero.

See also:

- 133.4.4 Constructor(Handle as Integer) 18093
- 133.4.5 Constructor(left as Double, top as Double, width as Double, height as Double) 18094

133.4.4 Constructor(Handle as Integer)

**Function:** Creates an object based on the given QCView handle.

**Example:**

```
    dim t as new QCViewMBS(0, 0, 100, 100)
    dim v as new QCViewMBS(t.handle)
```
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)

Notes: The handle is casted to a QCView and the plugin retains this handle.
See also:

- 133.4.3 Constructor
- 133.4.5 Constructor(left as Double, top as Double, width as Double, height as Double)

133.4.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new Quartz composer view with the given size and position.
Example:

```vbnet
dim x as new QCViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 133.4.3 Constructor
- 133.4.4 Constructor(Handle as Integer)

133.4.6 erase

Function: Clears the view using the current erase color.

133.4.7 getAttributes as dictionary

Function: Returns the attributes of the composition associated with the renderer.
Notes:

Returns a dictionary that contains the attributes that describe the composition, including the input and output ports of the root patch.
The dictionary can define any of the attributes that are specified by the composition attribute keys. See QCCompositionAttributeNameKey, QCCompositionAttributeDescriptionKey, and QCCompositionAttributeCopyrightKey.

The dictionary can also contain dictionaries that correspond to the keys that identify the input and output ports of the root patch of the composition. See QCPortAttributeTypeKey, QCPortAttributeNameKey, QCPortAttributeMinimumValueKey, QCPortAttributeMaximumValueKey, and QCPortAttributeMenuItemsKey.

Available in Mac OS X v10.4 and later.

133.4.8 `inputKeys as string()`

Function: Returns an array that contains the keys that identify the input ports of the root patch of the composition.

133.4.9 `loadComposition(composition as QCCompositionMBS) as boolean`

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Loads a QCComposition object into the view.
Notes:
Returns true if successful; otherwise false.
If unsuccessful, any composition that’s already loaded in the view remains loaded.

133.4.10 `loadCompositionFromData(data as MemoryBlock) as boolean`

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Loads the composition from memoryblock.
Notes:
If unsuccessful, returns false; any composition that’s already loaded in the view remains loaded.
Available in Mac OS X v10.4 and later.
See also:

- 133.4.11 `loadCompositionFromData(data as string) as boolean`
133.4.11 loadCompositionFromData(data as string) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Loads the composition from data string.
Notes:
If unsuccessful, returns false; any composition that’s already loaded in the view remains loaded.
Available in Mac OS X v10.4 and later.
See also:
• 133.4.10 loadCompositionFromData(data as MemoryBlock) as boolean

133.4.12 loadCompositionFromFile(file as folderitem) as boolean

Function: Loads the composition file located at the specified path.
Notes:
file: A folderitem that specifies the location of a Quartz Composer composition file.
If unsuccessful, returns false; any composition that’s already loaded in the view remains loaded.
Available in Mac OS X v10.4 and later.
See also:
• 133.4.13 loadCompositionFromFile(filepath as string) as boolean

133.4.13 loadCompositionFromFile(filepath as string) as boolean

Function: Loads the composition file located at the specified path.
Notes:
filepath: A string that specifies the location of a Quartz Composer composition file.
If unsuccessful, returns false; any composition that’s already loaded in the view remains loaded.
Available in Mac OS X v10.4 and later.
See also:
• 133.4.12 loadCompositionFromFile(file as folderitem) as boolean
133.4.14 outputKeys as string()

Function: Returns an array that contains the keys that identify the output ports of the root patch of the composition.

133.4.15 pauseRendering

Function: Pauses rendering in the view.
Notes:
You can nest calls to this method.
Available in Mac OS X v10.5 and later.

133.4.16 resumeRendering

Function: Resumes rendering a paused composition.
Notes:
You can nest calls to this method.
Available in Mac OS X v10.5 and later.

133.4.17 setValueForInputKey(value as Variant, key as string) as boolean

Function: Sets the value for an input port of a composition.
Notes:
value: The value to set for the input port. The input port must be at the root patch of the composition. The data type of the value argument must match the input port.
key: The key associated with the input port of the composition. This method throws an exception if key is invalid.

Returns false if it cannot set the value.
Available in Mac OS X v10.4 and later.
133.4.18  startRendering as boolean

Function: Starts rendering the composition that is in the view.
Notes: Returns false if the composition fails to start rendering; true otherwise.
Available in Mac OS X v10.4 and later.

133.4.19  stopRendering

Function: Stops rendering the composition that is in the view.
Notes: Available in Mac OS X v10.4 and later.

133.4.20  unloadComposition

Function: Unloads the composition from the view.
Notes: If necessary, this method calls stopRendering prior to unloading the composition.
Available in Mac OS X v10.5 and later.

133.4.21  valueForInputKey(key as string) as Variant

Function: Returns the value for an input port of a composition.
Notes: key: The key associated with an input port for the root patch of a composition. This method throws an exception if key is invalid.
Returns the value. The data type of returned value depends on the type of the input port.
Available in Mac OS X v10.4 and later.

133.4.22  valueForOutputKey(key as string) as Variant

Function: Returns the value for an output port of a composition.
key
The key associated with an output port for the root patch of a composition. This method throws an exception if key is invalid.

Returns the value as REALbasic variant. The data type of returned value depends on the type of the output port.

133.4.23 Properties

133.4.24 autostartsRendering as boolean

Function: Whether the composition that is in the view starts rendering automatically when the view is put on the screen.
Notes:
Available in Mac OS X v10.4 and later.
(Read and Write property)

133.4.25 eraseColor as NSColorMBS

Function: The color used to erase the view.
Notes:
Available in Mac OS X v10.4 and later.
(Read and Write property)

133.4.26 eventForwardingMask as Integer

Function: The mask used to filter which types of events are forwarded from the view to the composition during rendering.
Notes:
mask: An event filtering mask. The mask can be a combination of any of the mask constants listed in Table below (defined in NSEventMBS) or the constant NSAnyEventMask.

(Read and Write property)
### Constant Description

- **NSLeftMouseDownMask**: The user pressed the left button.
- **NSLeftMouseDraggedMask**: The user moved the mouse with the left button down.
- **NSLeftMouseUpMask**: The user released the left button.
- **NSRightMouseDownMask**: The user pressed the right button.
- **NSRightMouseDraggedMask**: The user moved the mouse with the right button down.
- **NSRightMouseUpMask**: The user released the right button.
- **NSOtherMouseDownMask**: The user pressed the middle button, or some button other than the left or right button.
- **NSOtherMouseDraggedMask**: The user moved the mouse with the middle button down, or some button other than the left or right button.
- **NSOtherMouseUpMask**: The user released the middle button, or some button other than the left or right button.
- **NSMouseMovedMask**: The user moved the mouse without holding down a mouse button.
- **NSScrollWheelMask**: The user moved the mouse scroll wheel.
- **NSKeyDownMask**: The user generated a character or characters by pressing a key.
- **NSKeyUpMask**: The user released a key.
- **NSFlagsChangedMask**: The user pressed or released a modifier key, or toggled the Caps Lock key.

### 133.4.27 isPausedRendering as boolean

**MBS MacControls Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns whether or not the rendering in the view is paused.

**Notes:**

- True if the rendering is paused; otherwise false.
- Available in Mac OS X v10.5 and later.
  *(Read only property)*

### 133.4.28 isRendering as boolean

**MBS MacControls Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Checks whether a composition is rendering in the view.

**Notes:**

- Returns true if a composition is rendering in the view; false otherwise.
- Available in Mac OS X v10.5 and later.
  *(Read only property)*

### 133.4.29 loadedComposition as QCCompositionMBS

**MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the composition loaded in the view.

**Notes:** *(Read only property)*
133.4.30  \texttt{maxRenderingFrameRate} as \texttt{Double}

\textbf{Function:} The maximum rendering frame rate.
\textbf{Notes:}
- Pass 0.0 to specify that there is no limit.
- Available in Mac OS X v10.4 and later.
  (Read and Write property)

133.4.31  \texttt{snapshotImage} as \texttt{NSImageMBS}

\textbf{Function:} Returns an \texttt{NSImage} object of the current image in the view.
\textbf{Notes:}
- Available in Mac OS X v10.5 and later.
  (Read only property)
Chapter 134

QuickLook

134.1 class QLPreviewPanelMBS

134.1.1 class QLPreviewPanelMBS

Function: The QLPreviewPanel class implements the Preview Panel - a user interface object that displays
the preview of a list of items.
Notes:
Every application only has an instance of QLPreviewPanel.
Subclass of the NSPanelMBS class.

134.1.2 Methods

134.1.3 Available as boolean

Function: Whether this panel is available.
Notes: Returns true on Snow Leopard.

134.1.4 Constructor

Function: The constructor for a new panel.
CHAPTER 134. QUICKLOOK

134.1.5 currentPreviewItem as folderitem

Function: The currently previewed item in the preview panel or nil if there is none.

134.1.6 enterFullScreenMode(screen as NSScreenMBS)

Function: Enters full screen mode.
Notes: If panel is not on-screen, the panel will go directly to full screen mode.

134.1.7 exitFullScreenMode

Function: Exits full screen mode.

134.1.8 refreshCurrentPreviewItem

Function: Asks the Preview Panel to recompute the preview of the currently previewed item.

134.1.9 reloadData

Function: Asks the Preview Panel to reload its data from its data source.
Notes: This method does not refresh the visible item if it has not changed.

134.1.10 updateController

Function: Asks the Preview Panel to update its current controller.
Notes: The Preview Panel automatically updates its controller (by searching the responder chain) whenever
the main or key window changes. Invoke updateController if the responder chain changes without explicit
notice.
134.1.11 Properties

**134.1.12 currentPreviewItemIndex as Integer**

**Function:** The index of the currently previewed item in the preview panel or NSNotFound (-1) if there is none.  
**Notes:** (Read and Write property)

**134.1.13 inFullScreenMode as boolean**

**Function:** True if the panel is currently open and in full screen mode.  
**Notes:** (Read only property)

**134.1.14 PreviewView as QLPreviewViewMBS**

**Function:** Returns the preview view in the panel.  
**Notes:** (Read only property)

**134.1.15 Events**

**134.1.16 didLoadPreviewItem(file as folderitem)**

**Function:** This event is called after an item has been loaded.

**134.1.17 handleEvent(e as NSEventMBS) as boolean**

**Function:** Invoked by the preview panel when it receives an event it doesn’t handle.  
**Notes:** Returns true if you did not handle this event.
134.1.18  **numberOfPreviewItems as Integer**

**Function:** The event called to ask you for the number of items that the preview panel should preview.

134.1.19  **previewItemAtIndex(index as Integer) as folderitem**

**Function:** The event is called to ask you for the item with the given index.

134.1.20  **sourceFrameOnScreenForPreviewItem(file as folderitem) as NSRectMBS**

**Function:** Invoked when the preview panel opens or closes to provide a zoom effect.
**Notes:** Return a zero rect if there is no origin point, this will produce a fade of the panel. The coordinates are screen based.

134.1.21  **transitionImageForPreviewItem(file as folderitem, byref contentRect as NSRectMBS) as NSImageMBS**

**Function:** Called to ask you for the transition image for a given preview item.
**Notes:**
Invoked when the preview panel opens or closes to provide a smooth transition when zooming.

contentRect: The rect within the image that actually represents the content of the document. For example, for icons the actual rect is generally smaller than the icon itself.

Return an image the panel will crossfade with when opening or closing. You can specify the actual "document" content rect in the image in contentRect.

134.1.22  **willLoadPreviewItem(file as folderitem)**

**Function:** This event is called before an item is loaded.
134.2. CONTROL QLPreviewViewControlMBS

134.2 control QLPreviewViewControlMBS

MBS MacFrameworks Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The Xojo control for a QLPreviewViewMBS.

134.2.2 Properties

134.2.3 View as QLPreviewViewMBS

MBS MacFrameworks Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view this control shows.
Notes: (Read only property)

134.2.4 Events

134.2.5 BoundsChanged

Function: The event called when the bounds, but not the frame, changed.

134.2.6 EnableMenuItems

Function: The event where you can enable menu items.

134.2.7 FrameChanged

Function: The event called when the frame changed.

134.2.8 GotFocus

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

134.2.9 LostFocus

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

134.2.10 MenuAction(HitItem as MenuItem) As Boolean

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

134.2.11 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

134.2.12 MouseDrag(x as Integer, y as Integer)

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the
Mouse has really moved.

134.2.13  **MouseUp(x as Integer, y as Integer)**

**Function:** The mouse button was released.
**Notes:** Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

134.2.14  **ScaleFactorChanged(NewFactor as Double)**

**Function:** The backing store scale factor has changed.
**Notes:** Please invalidate any cached bitmaps or other relevant state.
134.3 class QLPreviewViewMBS

134.3.1 class QLPreviewViewMBS

**Function:** The class for using a preview view from QuickLook in Real Studio. 
**Notes:** 
If you want to show previews of files in your application, use this view. For example if you not just want to show previews of pictures, but also from Movies, PDF, Office and iWork files. Requires Mac OS X 10.6 or newer. 

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

134.3.2 Methods

134.3.3 Available as boolean

**Function:** Whether this class is available. 
**Notes:** Returns true on Mac OS X 10.6 or newer. 

134.3.4 close

**Function:** Closes the receiver, releasing the current preview item. 
**Notes:** 
The application is required to call close when the receiver is no longer needed if shouldCloseWithWindow is false. The close method will be called automatically when the window closes if shouldCloseWithWindow is true. 

134.3.5 Constructor

**Function:** Creates a new quicklook preview view with size 100/100 and position 0/0 
**Example:**
134.3. CLASS QLPreviewViewMBS

```
dim t as new QLPreviewViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 134.3.6 Constructor(Handle as Integer)
- 134.3.7 Constructor(left as Double, top as Double, width as Double, height as Double)
- 134.3.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer)

### 134.3.6 Constructor(Handle as Integer)

**Function:** Creates an object based on the given QLPreviewView handle.

**Example:**

```
dim t as new QLPreviewViewMBS(0, 0, 100, 100)
dim v as new QLPreviewViewMBS(t.handle)
```

Notes: The handle is casted to a QLPreviewView and the plugin retains this handle.
See also:

- 134.3.5 Constructor
- 134.3.7 Constructor(left as Double, top as Double, width as Double, height as Double)
- 134.3.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer)

### 134.3.7 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new QuickLook preview view with the given size and position.

**Example:**

```
dim x as new QLPreviewViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:
CHAPTER 134. QUICKLOOK

- 134.3.5 Constructor
- 134.3.6 Constructor(Handle as Integer)
- 134.3.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer)

134.3.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer)

Function: Creates a new QuickLook preview view with the given size and position.
Example:

```vba
dim view as new QLPreviewViewMBS(0, 0, 200, 200, QLPreviewViewMBS.StyleCompact)
```

Notes:
On success the handle property is not zero.

On Mac OS X 10.7 or later we use the new style parameter to create a Preview view with the given style.
See also:

- 134.3.5 Constructor
- 134.3.6 Constructor(Handle as Integer)
- 134.3.7 Constructor(left as Double, top as Double, width as Double, height as Double)

134.3.9 refreshPreviewItem

Function: Asks the Preview view to recompute the preview of the currently previewed item.

134.3.10 Properties

134.3.11 autostarts as boolean

Function: Whether playback of audio/video files automatically starts.
Notes: (Read and Write computed property)
134.3. **CLASS QLPREVIEWVIEWMBS**

### 134.3.12 previewItem as folderitem

**Function:** The current visible item in the view.
**Notes:** (Read and Write computed property)

### 134.3.13 shouldCloseWithWindow as boolean

**Function:** Set whether the receiver closes when its window closes.
**Notes:**
See close method.
(Read and Write computed property)

### 134.3.14 Constants

#### 134.3.15 StyleCompact = 1

MBS MacFrameworks Plugin, Plugin Version: 11.2. **Function:** One of the style constants.
**Notes:** Use in inspectors.

#### 134.3.16 StyleNormal = 0

MBS MacFrameworks Plugin, Plugin Version: 11.2. **Function:** One of the style constants.
**Notes:** Use in full previews.
Chapter 135

QuickTime

135.1 class QTAudioChannelDescriptionMBS

135.1.1 class QTAudioChannelDescriptionMBS

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The description for an audio channel.

135.1.2 Properties

135.1.3 ChannelFlags as UInt32

MBS Main Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Flags that control the interpretation of Coordinates. **Notes:** (Read and Write property)

135.1.4 ChannelLabel as UInt32

MBS Main Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The AudioChannelLabel that describes the channel. **Notes:** (Read and Write property)
135.1.5 Coordinates(index as Integer) as Double

MBS Main Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** An ordered triple that specifies a precise speaker location.  
**Notes:**  
Index from 0 to 2.  
(Read and Write computed property)

135.1.6 Constants

135.1.7 kAudioChannelCoordinates_Azimuth = 0

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for indexing the Coordinates array.  
**Notes:** For spherical coordinates, 0 is front center, positive is right, negative is left. This is measured in degrees.

135.1.8 kAudioChannelCoordinates_BackFront = 1

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for indexing the Coordinates array.  
**Notes:** For rectangulare coordinates, negative is back and positive is front.

135.1.9 kAudioChannelCoordinates_Distance = 2

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for indexing the Coordinates array.  
**Notes:** For spherical coordinates, the units are described by flags.

135.1.10 kAudioChannelCoordinates_DownUp = 2

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for indexing the Coordinates array.  
**Notes:** For rectangulare coordinates, negative is below ground level, 0 is ground level, and positive is above ground level.
135.1.11 kAudioChannelCoordinates_Elevation = 1

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for indexing the Coordinates array.  
**Notes:** For spherical coordinates, +90 is zenith, 0 is horizontal, -90 is nadir. This is measured in degrees.

135.1.12 kAudioChannelCoordinates_LeftRight = 0

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for indexing the Coordinates array.  
**Notes:** For rectangular coordinates, negative is left and positive is right.

135.1.13 kAudioChannelFlags_AllOff = 0

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for the ChannelFlags property.  
**Notes:** All flags off.

135.1.14 kAudioChannelFlags_Meters = 4

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for the ChannelFlags property.  
**Notes:** Set to indicate the units are in meters, clear to indicate the units are relative to the unit cube or unit sphere.

135.1.15 kAudioChannelFlags_RectangularCoordinates = 1

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for the ChannelFlags property.  
**Notes:** The channel is specified by the cartesian coordinates of the speaker position. This flag is mutually exclusive with kAudioChannelFlags_SphericalCoordinates.

135.1.16 kAudioChannelFlags_SphericalCoordinates = 2

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the constants for the ChannelFlags property.  
**Notes:** The channel is specified by the spherical coordinates of the speaker position. This flag is mutually exclusive with kAudioChannelFlags_RectangularCoordinates.
135.1.17 \texttt{kAudioChannelLabel\_Ambisonic\_W = 200}

MBS Main Plugin, Plugin Version: 11.3. \textbf{Function:} One of the channel label constants.

135.1.18 \texttt{kAudioChannelLabel\_Ambisonic\_X = 201}

MBS Main Plugin, Plugin Version: 11.3. \textbf{Function:} One of the channel label constants.

135.1.19 \texttt{kAudioChannelLabel\_Ambisonic\_Y = 202}

MBS Main Plugin, Plugin Version: 11.3. \textbf{Function:} One of the channel label constants.

135.1.20 \texttt{kAudioChannelLabel\_Ambisonic\_Z = 203}

MBS Main Plugin, Plugin Version: 11.3. \textbf{Function:} One of the channel label constants.

135.1.21 \texttt{kAudioChannelLabel\_Center = 3}

MBS Main Plugin, Plugin Version: 11.3. \textbf{Function:} One of the channel label constants.

135.1.22 \texttt{kAudioChannelLabel\_CenterSurround = 9}

MBS Main Plugin, Plugin Version: 11.3. \textbf{Function:} One of the channel label constants. \textbf{Notes:} WAVE: "Back Center" or plain "Rear Surround"

135.1.23 \texttt{kAudioChannelLabel\_CenterSurroundDirect = 44}

MBS Main Plugin, Plugin Version: 11.3. \textbf{Function:} One of the channel label constants. \textbf{Notes:} back center, non diffuse

135.1.24 \texttt{kAudioChannelLabel\_ClickTrack = 304}

MBS Main Plugin, Plugin Version: 11.3. \textbf{Function:} One of the channel label constants.
135.1.25  kAudioChannelLabel_DialogCentricMix = 43

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.1.26  kAudioChannelLabel_Discrete = 400

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.1.27  kAudioChannelLabel_Discrete_0 = & h10000

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.1.28  kAudioChannelLabel_Discrete_1 = & h10001

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.1.29  kAudioChannelLabel_Discrete_10 = & h1000A

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.1.30  kAudioChannelLabel_Discrete_11 = & h1000B

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.1.31  kAudioChannelLabel_Discrete_12 = & h1000C

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.1.32  kAudioChannelLabel_Discrete_13 = & h1000D

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.
135.1.33  kAudioChannelLabel_Discrete_14 = & h1000E

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.1.34  kAudioChannelLabel_Discrete_15 = & h1000F

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.1.35  kAudioChannelLabel_Discrete_2 = & h10002

MBS Main Plugin, Plugin Version: 11.3. **Function:** One of the channel label constants.

135.2. **CLASS QTAUDIOCHANNELLAYOUTMBS**

135.2 class QTAudioChannelLayoutMBS

135.2.1 class QTAudioChannelLayoutMBS

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
The class is used to specify channel layouts in files and hardware.

**Notes:**
This class does not use QuickTime functions as it only wraps data structures. And it can be used with Mac App Store and AVFoundation.

Some channel abbreviations used for the constants:

- L - left
- R - right
- C - center
- Ls - left surround
- Rs - right surround
- Cs - center surround
- Rls - rear left surround
- Rrs - rear right surround
- Lw - left wide
- Rw - right wide
- Lsd - left surround direct
- Rs - right surround direct
- Lc - left center
- Rc - right center
- Ts - top surround
- Vhl - vertical height left
- Vhc - vertical height center
- Vhr - vertical height right
- Lt - left matrix total. for matrix encoded stereo.
- Rt - right matrix total. for matrix encoded stereo.
135.2.2 Methods

135.2.3 GetNumberOfChannels(layoutTag as UInt32) as UInt32

MBS Main Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Function to get the number of channels out of an AudioChannelLayoutTag. **Notes:** The low 16 bits of an AudioChannelLayoutTag gives the number of channels except for kAudioChannelLayoutTag.UseChannelDescriptions and kAudioChannelLayoutTag.UseChannelBitmap.

135.2.4 Memory as Memoryblock

MBS Main Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Returns the audio channel layout as memoryblock, so you can pass it for declares.

135.2.5 Properties

135.2.6 ChannelBitmap as UInt32

MBS Main Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** If ChannelLayoutTag is set to kAudioChannelLayoutTag.UseChannelBitmap, this field is the channel usage bitmap. **Notes:** (Read and Write property)

135.2.7 ChannelLayoutTag as UInt32

MBS Main Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The AudioChannelLayoutTag that indicates the layout. **Notes:** (Read and Write property)

135.2.8 NumberChannelDescriptions as UInt32

MBS Main Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The number of items in the ChannelDescriptions array. **Notes:** (Read and Write property)
135.2.9 ChannelDescriptions(index as Integer) as QTAudioChannelDescription-MBS

MBS Main Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** An array of AudioChannelDescriptions that describe the layout.  
**Notes:** Index from 0 to NumberChannelDescriptions-1.  
(Read and Write computed property)

class QTSoundStreamMBS

Chapter 135. QuickTime

135.3 class QTSoundStreamMBS

135.3.1 class QTSoundStreamMBS

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A class for the QTSoundOutput component which outputs sound using a given AudioUnit. Notes: Not supported for 64 bit targets.

135.3.2 Methods

135.3.3 AttachToAudioUnitComponent(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Attaches the Sound Output component to a given Audio Unit component. Notes: Returns the error code. (0 for success) You may call AudioUnitInitialize and AudioOutputUnitStart after this to start the output unit. See also:

- 135.3.4 AttachToAudioUnitComponent(componenthandle as Integer, element as Integer) as Integer

135.3.4 AttachToAudioUnitComponent(componenthandle as Integer, element as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Attaches the Sound Output component to a given Audio Unit component. Notes: Returns the error code. (0 for success) You may call AudioUnitInitialize and AudioOutputUnitStart after this to start the output unit. See also:

- 135.3.3 AttachToAudioUnitComponent(componenthandle as Integer) as Integer

135.3.5 AudioOutputUnitStart(componenthandle as Integer) as Integer

135.3.6 AudioUnitInitialize(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the output unit. **Notes:** Returns a Mac OS error code (0 for success).

135.3.7 closeComponent

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the Sound Output component.

135.3.8 InitComponent

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the sound output component. **Notes:** Allocates memory for example.

135.3.9 OpenComponent

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the SoundOutput component.

135.3.10 OpenDefaultAudioUnitOutputComponent as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the default audio unit component and returns the handle. **Notes:** Returns 0 on any error. The component is only available on Mac OS X, so this function will return 0 on all other platforms.

135.3.11 Properties

135.3.12 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The component handle.
135.3.13  IsOpen as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the sound output component has been opened yet.
Notes:
Returns false on any error.
(Read only property)

135.3.14  IsStreamActive as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: True in case the stream is active.
Notes:
Returns false on any error.
(Read only property)

135.3.15  PostsStatusNotifications as Boolean

Notes: (Read and Write property)

135.3.16  Release as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the constructor should release the handle.
Notes: (Read and Write property)

135.3.17  SoundOutputComponentHandle as Integer

Notes: (Read only property)
Chapter 136

RAMStream

136.1 class RAMStreamMBS

136.1.1 class RAMStreamMBS

Notes:
If you need to concat lot’s of streams, just make a RAMstream and write to it.

In the example folder is a project called "test ramstream speed" which tests the speed on concating 10000 strings which each 1000 bytes in length.

On my G4 Dual 1000 Mhz, I get this result:
String only: 22063 ticks
RAMStream: 18 ticks

136.1.2 Methods

136.1.3 close

Notes:
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)
136.1.4 Constructor(InitialSize as Integer=0)

**Example:**
```vbnet
dim r as RAMStreamMBS
r=new RAMStreamMBS(1000000)
r.write "Hello"
```

**Notes:**
To avoid memory fragmentation the memory grows in 32 KByte chunks.

The parameter you give is the size for the first allocation. So if you only need 2 KByte, you just pass 2048. If you don’t know the size, you can pass 0 or a negative number to get the default initial size which is 32 KByte.

You can change the GrowSize property to use a different growing size.
Performance is better if resizing the memory buffer is minimized.

The stream can grow to around 2 GB.
On low memory, the initial resize will fail and length will be 0.

136.1.5 Look(count as Integer) as string

MBS Util Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads bytes, but does not move the current position.

**Example:**
```vbnet
dim r as RamStreamMBS // your stream
dim s as string
s=r.look(100)
```

**Notes:** Like the lookahead property in a socket.
136.1. CLASS RAMSTREAMMBS

136.1.6 LookBlock(count as Integer) as memoryblock

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads bytes into a memoryblock, but leaves the current position untouched.

**Example:**

```plaintext
dim b as RAMStreamMBS
dim s as memoryblock
'...
s=b.LookBlock(5)
```

136.1.7 LookByte as Integer

MBS Util Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a byte, but leaves the current position untouched.

136.1.8 LookLong as Integer

MBS Util Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads an integer, but leaves the current position untouched.

136.1.9 LookShort as Integer

MBS Util Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a short, but leaves the current position untouched.

136.1.10 Read(count as Integer) as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads bytes into a string.

**Example:**

```plaintext
dim b as RAMStreamMBS
dim s as string
'...
s=b.read(5)
```
136.1.11  ReadBlock(count as Integer) as memoryblock

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads bytes into a memoryblock.

**Example:**

```vbnet
dim b as RAMStreamMBS
dim s as memoryblock
'...
s=b.ReadBlock(5)
```

136.1.12  Readbyte as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads an 8bit Byte from the stream.

**Example:**

```vbnet
dim b as RAMStreamMBS
dim i as Integer
'...
i=B.readbyte
```

136.1.13  ReadLong as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a signed 32bit Integer from the stream.

**Example:**

```vbnet
dim b as RAMStreamMBS
dim i as Integer
'...
i=B.readlong
```

**Notes:** This function is affected by the LittleEndian Setting.

136.1.14  ReadShort as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a signed 16bit Integer from the stream.
Example:

```vbs
dim b as RAMStreamMBS
dim i as integer
...
i = B.readlong
```

**Notes:** This function is affected by the LittleEndian Setting.

### 136.1.15 Write(data as string)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes bytes from a string to file.

### 136.1.16 WriteBlock(data as memoryblock, count as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes count bytes from a memoryblock to file.

Example:

```vbs
dim b as RAMStreamMBS
dim m as memoryblock
...
b.writeblock m, m.size
```

### 136.1.17 WriteByte(data as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a byte to file.

### 136.1.18 WriteLong(data as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes an 32bit integer to file.

**Notes:** This method is affected by the LittleEndian Setting.
136.1.19 WriteShort(data as Integer)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes an 16bit integer to file.
**Notes:** This method is affected by the LittleEndian Setting.

136.1.20 Properties

136.1.21 EOF as boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if you are at the end of the stream.
**Notes:** (Read only property)

136.1.22 GrowSize as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The size in bytes used to grow the ramstream backbuffer.
**Notes:**
Default is 32 Kilobytes.
If the value is bigger than zero, it will be used as the allocation increase. Else the default value is used.
(Read and Write property)

136.1.23 Length as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the current length of the stream.
**Notes:**
You can truncate the stream by setting this property.
(Read and Write property)

136.1.24 LittleEndian as boolean

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decides whether to convert integers read or wrote to the file.
**Notes:**
See Realbasics binarystream for more details.
For native platform you may set "littleendian=targetwin32".
136.1. CLASS RAMSTREAMMBS

(Read and Write property)

136.1.25 MemoryUsed as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** How much memory is currently used for this Stream.  
**Notes:** (Read and Write property)

136.1.26 Position as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns current position.  
**Notes:**

You can set the current file stream position using this property. 
(Read and Write property)
136.2Globals

136.2.1 CreateRamStreamMBS(InitialSize as Integer = 0) as RamStreamMBS

Example:

```vbnet
dim r as RAMStreamMBS
r=CreateRamStreamMBS(1000000)
r.write "Hello"
```

Notes:

To avoid memory fragmentation the memory grows in 32 KByte chunks.

The parameter you give is the size for the first allocation. So if you only need 2 KByte, you just pass 2048. If you don’t know the size, you can pass 0 or a negative number to get the default initial size which is 32 KByte.

You can change the GrowSize property to use a different growing size.
Performance is better if resizing the memory buffer is minimized.

The stream can grow to around 2 GB.
Returns nil on low memory.
Chapter 137

RaspberryPiCamera

137.1 class RaspberryPiCameraFormatDescriptionMBS

137.1.1 class RaspberryPiCameraFormatDescriptionMBS

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The class for a format description.
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

137.1.2 Methods

137.1.3 Constructor

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The private constructor.

137.1.4 Properties

137.1.5 Description as String

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The format description.
**Notes:** (Read only property)
137.1.6 Flags as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The flags.  
**Notes:** Currently can be 1 for compressed and 2 for emulated. (Read only property)

137.1.7 Index as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Format number.  
**Notes:** (Read only property)

137.1.8 Pixelformat as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The pixel format.  
**Notes:** (Read only property)

137.1.9 PixelformatString as String

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The pixel format as text.  
**Notes:** (Read only property)

137.1.10 Type as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The buffer type.  
**Notes:** Usually 1 for video capture. (Read only property)
137.2. class RaspberryPiCameraFormatMBS

137.2.1 class RaspberryPiCameraFormatMBS

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The class for format settings.

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

137.2.2 Methods

137.2.3 Constructor

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The private constructor.

137.2.4 Properties

137.2.5 BytesPerRow as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The number of bytes per row.

**Notes:**
For padding, zero if unused.
(Read and Write property)

137.2.6 ColorSpace as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The colorspace.

**Example:**

// ITU-R 601 – broadcast NTSC/PAL
const V4L2_COLORSPACE_SMPTE170M = 1

// 1125-Line (US) HDTV
const V4L2_COLORSPACE_SMPTE240M = 2

// HD and modern captures.
const V4L2_COLORSPACE_REC709 = 3
// broken BT878 extents (601, luma range 16-253 instead of 16-235)
const V4L2.COLORSPACE_BT878 = 4

// These should be useful. Assume 601 extents.
const V4L2.COLORSPACE_470_SYSTEM_M = 5
const V4L2.COLORSPACE_470_SYSTEM_BG = 6

// I know there will be cameras that send this. So, this is
// unspecified chromaticities and full 0-255 on each of the
// Y’CbCr components
const V4L2.COLORSPACE_JPEG = 7

// For RGB colourspaces, this is probably a good start.
const V4L2.COLORSPACE_SRGB = 8

Notes:
Normally zero for default.
(Read and Write property)

137.2.7 Field as Integer

Example:

const V4L2.FIELD_ANY = 0
// driver can choose from none, top, bottom, interlaced
// depending on whatever it thinks is approximate ... 
const V4L2.FIELD_NONE = 1
// this device has no fields ...
const V4L2.FIELD_TOP = 2
// top field only
const V4L2.FIELD_BOTTOM = 3
// bottom field only
const V4L2.FIELD_INTERLACED = 4
// both fields interlaced
const V4L2.FIELD_SEQ_TB = 5
// both fields sequential into one
// buffer, top-bottom order
const V4L2.FIELD_SEQ_BT = 6
// same as above + bottom-top order
const V4L2.FIELD_ALTERNATE = 7
// both fields alternating into separate buffers
137.2. CLASS RASPBERRYPICAMERAFORMATMBS

```c
const V4L2_FIELD_INTERLACED_TB = 8
// both fields interlaced, top field
// first and the top field is transmitted first
const V4L2_FIELD_INTERLACED_BT = 9
// both fields interlaced, top field
// first and the bottom field is transmitted first
```

**Notes:** (Read and Write property)

### 137.2.8 Height as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The height of image in pixels.  
**Notes:** (Read and Write property)

### 137.2.9 Pixelformat as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The pixel format.  
**Notes:** (Read and Write property)

### 137.2.10 PixelformatString as String

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The pixel format as text.  
**Notes:** (Read only property)

### 137.2.11 SizeImage as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The size of image.  
**Notes:** (Read and Write property)
137.2.12 Type as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The type of data stream.

**Notes:**
With plugin we always use 1 for video capture (V4L2_BUF_TYPE_VIDEO_CAPTURE).
(Read and Write property)

137.2.13 Width as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The width of image in pixels.
**Notes:** (Read and Write property)
137.3  class RaspberryPiCameraMBS

137.3.1  class RaspberryPiCameraMBS

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The class to get pictures from Raspberry Pi camera and similar Linux cameras.

137.3.2  Methods

137.3.3  AvailableFormats as RaspberryPiCameraFormatDescriptionMBS()

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Queries available formats.
**Notes:**
Lasterror and ErrorMessage are set.
Can return nil in case of error.

137.3.4  Capture(WithPicture as boolean = true) as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Captures a new picture.
**Notes:**
If WithPicture is true and pixel format is compatible (RGB 24 or 32bit), we set the picture property.
If capturing JPEG, we copy the JPEG data into the JPEG property.
Returns true on success.
Lasterror and ErrorMessage are set.

137.3.5  Close

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Closes camera device.
**Notes:** Lasterror and ErrorMessage are set.
137.3.6 Constructor

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The constructor.

137.3.7 CurrentFormat as RaspberryPiCameraFormatMBS

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Queries current format. **Notes:**

Returns nil in case of error. Lasterror and ErrorMessage are set.

137.3.8 InitBuffer as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Initializes buffer. **Notes:**

This is done automatically if you capture. Returns true on success. Lasterror and ErrorMessage are set.

137.3.9 Open(Device as string = "/dev/video0") as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Opens the camera device. **Notes:**

You need

- a Raspberry Pi computer
- to attach the camera module
- to enable the video camera
- run a command: sudo modprobe bcm2835-v4l2
- to check if you see /dev/video0 in file system.
137.3. CLASS RASPBERYPICAMERAMBS

Returns true on success.
Lasterror and ErrorMessage are set.

137.3.10 SetCurrentFormat(format as RaspberryPiCameraFormatMBS) as boolean

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Sets current format.
**Notes:**
This allows to use any format, even if we can’t transform it to picture for you.

Returns true on success.
Lasterror and ErrorMessage are set.

137.3.11 SetJPEGSize(Width as Integer, Height as Integer) as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Sets size and format to capture.
**Notes:**
Sets JPEG format with given size.

Returns true on success.
Lasterror and ErrorMessage are set.

137.3.12 SetSize(Width as Integer, Height as Integer) as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Sets size and format to capture.
**Notes:**
Sets to capture RGB picture with given size.

Returns true on success.
Lasterror and ErrorMessage are set.
137.3.13 Properties

137.3.14 AutoExposureBias as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
Lasterror is set.
e.g. 12.
(Read and Write property)

137.3.15 AutoFocusRange as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
See kAutoFocusRange* constants
(Read and Write property)

137.3.16 AutoFocusStart as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
Lasterror is set.
(Read and Write property)

137.3.17 AutoFocusStatus as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
See kAutoFocusStatus* constants
(Read and Write property)
137.3. CLASS RASPERRYPICAMERAMBS

137.3.18  AutoFocusStop as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
Lasterror is set.  
(Read and Write property)

137.3.19  AutoNPresetWhiteBalance as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
See kWhiteBalance* constants.  
e.g. value is 1 for kWhiteBalanceAuto.  
(Read and Write property)

137.3.20  Buffer as Ptr

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The pointer to the buffer.  
**Notes:**
For the case you want to convert yourself pixel values to a picture.  
(Read only property)

137.3.21  BufferLength as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The length of the buffer.  
**Notes:**  
(Read only property)

137.3.22  BusInfo as String

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The device bus info.  
**Notes:**
e.g. ”PCI:1”
137.3.23 BytesPerRow as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The bytes per row for current image.
**Notes:** (Read only property)

137.3.24 CanCapture as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Whether the device can capture video.
**Notes:**
This is queried by checking if bitwiseAnd(capabilities,1) = 1.
(Read only property)

137.3.25 Capabilities as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Device capabilities bitmap.
**Notes:** (Read only property)

137.3.26 Card as String

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The name of the card.
**Notes:**
e.g. "Hauppauge WinTV"
(Read only property)

137.3.27 Driver as String

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The name of the driver.
**Notes:**
137.3. CLASS RASPBERRYPICAMERAMBS

e.g. "bttv"
(Read only property)

137.3.28 ErrorMessage as String

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The error message for lasterror property.
**Notes:** (Read only property)

137.3.29 ExposureAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
Lasterror is set.
e.g. 1000
(Read and Write property)

137.3.30 ExposureAuto as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
See kExposure* constants.
Value is e.g. 0 for kExposureAuto.
(Read and Write property)

137.3.31 ExposureAutoPriority as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
Lasterror is set.
(Read and Write property)
137.3.32 ExposureMetering as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:**
See kExposureMetering* constants (Read and Write property)

137.3.33 FocusAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:**
Lasterror is set.
May not work if you don’t have a controllable focus on the camera. (Read and Write property)

137.3.34 FocusAuto as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:**
Lasterror is set.
May not work if you don’t have a controllable focus on the camera. (Read and Write property)

137.3.35 FocusRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:**
Lasterror is set.
May not work if you don’t have a controllable focus on the camera. (Read and Write property)
137.3. **CLASS RASPBERRYPICAMERAMBS**

---

### 137.3.36 Handle as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The internal file handle. **Notes:** (Read only property)

---

### 137.3.37 Height as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The height in pixel used for capture. **Notes:** (Read only property)

---

### 137.3.38 ImageStabilization as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:**

Lasterror is set. (Read and Write property)

---

### 137.3.39 IrisAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:**

Lasterror is set. May not work if you don’t have a controllable iris on the camera. (Read and Write property)

---

### 137.3.40 IrisRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:**

Lasterror is set. May not work if you don’t have a controllable iris on the camera. (Read and Write property)
137.3.41 **IsoSensitivity as Integer**

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:** Lasterror is set. (Read and Write property)

137.3.42 **IsoSensitivityAuto as Integer**

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:** See kISOSensitivity* constants. Usually set to kISOSensitivityAuto for auto mode (1). (Read and Write property)

137.3.43 **JPEG as String**

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The last JPEG image data block. **Notes:** (Read only property)

137.3.44 **LastError as Integer**

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The last error code. **Notes:** (Read only property)

137.3.45 **Lock3A as Integer**

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:** See kLock* constants. (Read and Write property)
137.3. CLASS RASPBERRYPICAMERAMBS

137.3.46 Opened as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Whether device is opened. **Notes:** (Read only property)

137.3.47 PanAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:** Lasterror is set. (Read and Write property)

137.3.48 PanRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:** Lasterror is set. (Read and Write property)

137.3.49 PanReset as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:** Lasterror is set. (Read and Write property)

137.3.50 PanSpeed as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. **Notes:** Lasterror is set. (Read and Write property)
137.3.51 Picture as Picture

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The last captured picture. 
**Notes:** (Read only property)

137.3.52 PixelFormat as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The pixel format. 
**Notes:** (Read only property)

137.3.53 PixelformatString as String

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The pixel format as text. 
**Notes:** (Read only property)

137.3.54 Privacy as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties. 
**Notes:**
Lasterror is set.
(Read and Write property)

137.3.55 Recording as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Whether we are recording currently. 
**Notes:** (Read only property)
137.3. **CLASS RASPBERRYPICAMERAMBS**

137.3.56 **SceneMode as Integer**

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties.

**Notes:**

See kSceneMode* constants

(Read and Write property)

137.3.57 **TiltAbsolute as Integer**

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties.

**Notes:**

Lasterror is set.

(Read and Write property)

137.3.58 **TiltRelative as Integer**

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties.

**Notes:**

Lasterror is set.

(Read and Write property)

137.3.59 **TiltReset as Integer**

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties.

**Notes:**

Lasterror is set.

(Read and Write property)

137.3.60 **TiltSpeed as Integer**

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** One of the camera configuration properties.

**Notes:**
Lasterror is set.
(Read and Write property)

137.3.61 Version as String

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The version of the driver.
**Notes:** (Read only property)

137.3.62 WideDynamicRange as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.
**Notes:**
Lasterror is set.
(Read and Write property)

137.3.63 Width as Integer

MBS Linux Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The width in pixel used for capture.
**Notes:** (Read only property)

137.3.64 ZoomAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
One of the camera configuration properties.

CHAPTER 137. RASPBERRYPICAMERA
Chapter 138

Registration

138.1 module MBS

138.1.1 module MBS

MBS Main Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The module with version details.

138.1.2 Methods

138.1.3 Target as string

MBS Main Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the target where the plugin was compiled for.

**Example:**

MsgBox mbs.Target

**Notes:** Can be Win32, Linux, Carbon, Carbon-PPC or Cocoa.
138.1.4 Constants

138.1.5 BuildNumber = 19645

MBS Main Plugin, Plugin Version: 9.5. **Function:** The build number of the plugins.

**Example:**

```
# if mbs.BuildNumber>15000 then

// use some new MBS feature

MsgBox "OK"

# endif
```

**Notes:** The constant value is not in this documentation as it changes too often.

138.1.6 CompileDate = ”May 20 2018”

MBS Main Plugin, Plugin Version: 9.5. **Function:** The compilation date of the plugin.

**Notes:** The constant value is not in this documentation as it changes too often.

138.1.7 CompileTime = ”16:56:54”

MBS Main Plugin, Plugin Version: 9.5. **Function:** The compilation time of the plugin.

**Example:**

```
MsgBox mbs.CompileTime
```

**Notes:** The constant value is not in this documentation as it changes too often.

138.1.8 ComputerName = ”MyMac”

MBS Main Plugin, Plugin Version: 14.0. **Function:** The computer the IDE was launched on for building an app.

**Example:**

```
MsgBox mbs.ComputerName
```
Notes:

Using this constant allows you to include details on who build the app in the application itself, e.g. for documentation.
The constant value is not in this documentation as it changes too often.

138.1.9 Copyright = " 2017 by Monkeybread Software"

MBS Main Plugin, Plugin Version: 9.5. Function: The plugin copyright string.
Example:
MsgBox mbs.Copyright

138.1.10 HasAudioPlugin = true

MBS Main Plugin, Plugin Version: 16.4. Function: Whether the Audio plugin is installed.
Example:

```plaintext
# if MBS.HasAudioPlugin then
MsgBox "Audio Plugin is installed."
# endif
```
