Ghostscript

2.1 class GhostScriptMBS

class GhostScriptMBS

class, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 5.0, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: A class to run the open source ghostscript library in a REALbasic application.

2.1.1 Methods

Close

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 5.0, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: The destructor.

Notes:

There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.

(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

GSDeleteInstance

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 5.4, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Destroy an instance of Ghostscript.

Notes: Before you call this, Ghostscript must have finished. If Ghostscript has been initialised, you must call GSExit before GSDeleteInstance.

GSExit as integer

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 5.4, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Exit the interpreter.

Notes: This must be called on shutdown if GSInit() has been called, and just before GSDeleteInstance().

GSInit(parameters() as string) as integer

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 5.4, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Initialise the interpreter.

Notes:

Pass an array of parameter things. String must have the needed encoding (no UTF16).

Error codes for all GS* functions:

0	No errors
e_ Quit	"quit" has been executed. This is not an error. GSExit() must be called next.
e_ NeedInput	More input is needed by GSRunStringContinue(). This is not an error.
e_ Info	"gs -h" has been executed. This is not an error. GSExit() must be called next.
<0	Error
<= -100	Fatal error. GSExit() must be called next.

see ierrors.h from Ghostscript for more details on the error codes.

GSNew as integer

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 5.4, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Create a new instance of Ghostscript.

Notes:

This instance is passed to most other GS* functions.
At this stage, Ghostscript supports only one instance.

Please do not use RunParams together with the GS* functions.
GS* functions work on a lower level.

Handle is set.

GSRunString(data as string, UserErrors as integer, byref ExitCode as integer) as integer

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 5.4, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Runs data through the interpreter.

Notes:

If this function returns ≤ -100 , either quit or a fatal error has occurred. You must call GSExit() next. The only exception is GSRunStringContinue() which will return e_ NeedInput (-106) if all is well.
There is a 64 KB length limit on any buffer submitted to a gsapi_ run_ * function for processing. If you have more than 65535 bytes of input then you must split it into smaller pieces and submit each in a separate GSRunStringContinue() call.

GSRunStringBegin(UserErrors as integer, byref ExitCode as integer) as integer

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 5.4, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Runs data through the interpreter.

Notes:

If this function returns ≤ -100 , either quit or a fatal error has occurred. You must call `GSExit()` next. The only exception is `GSRunStringContinue()` which will return `e_NeedInput (-106)` if all is well.

There is a 64 KB length limit on any buffer submitted to a `gsapi_run_*` function for processing. If you have more than 65535 bytes of input then you must split it into smaller pieces and submit each in a separate `GSRunStringContinue()` call.

GSRunStringContinue(data as string, UserErrors as integer, byref ExitCode as integer) as integer

method from class `GhostScriptMBS`, `Ghostscript`, `MBS REALbasic PDF Plugin (Ghostscript)`, Plugin version: 5.4, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Runs data through the interpreter.

Notes:

If this function returns ≤ -100 , either quit or a fatal error has occurred. You must call `GSExit()` next. The only exception is `GSRunStringContinue()` which will return `e_NeedInput (-106)` if all is well.

There is a 64 KB length limit on any buffer submitted to a `gsapi_run_*` function for processing. If you have more than 65535 bytes of input then you must split it into smaller pieces and submit each in a separate `GSRunStringContinue()` call.

GSRunStringEnd(UserErrors as integer, byref ExitCode as integer) as integer

method from class `GhostScriptMBS`, `Ghostscript`, `MBS REALbasic PDF Plugin (Ghostscript)`, Plugin version: 5.4, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Runs data through the interpreter.

Notes:

If this function returns ≤ -100 , either quit or a fatal error has occurred. You must call `GSExit()` next. The only exception is `GSRunStringContinue()` which will return `e_NeedInput (-106)` if all is well.

There is a 64 KB length limit on any buffer submitted to a `gsapi_run_*` function for processing. If you have more than 65535 bytes of input then you must split it into smaller pieces and submit each in a separate `GSRunStringContinue()` call.

LoadAPIdll(libname as string)

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 8.1, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Loads the shared library.

Notes: Only for Windows DLLs.

LoadAPIframework(libaryfile as folderitem)

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 8.1, Mac OS X: Works, Windows: Does nothing, Linux x86: Does nothing.

Function: Loads the shared library.

Example:

```
dim g as new GhostScriptMBS
g.LoadAPIframework getfolderitem("Ghostscript.framework")
```

Notes: Only for frameworks on Mac OS X.

LoadAPIlibrary(libname as string)

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 8.1, Mac OS X: Works, Windows: Does nothing, Linux x86: Works.

Function: Loads the shared library.

Notes: Only for Linux .so files or Mac OS X .dylib files.

RunParams(parameters() as string, runstring as string) as integer

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 5.0, Mac OS X: Does nothing, Windows: Works, Linux x86: Does nothing.

Function: Runs the ghostscript engine.

Notes:

runstring can be empty.

Returns an error code:

0 - success

1 - error, shared library was not loaded
or one of the Ghostscript error codes.

UnloadAPI

method from class GhostScriptMBS, Ghostscript, MBS REALbasic PDF Plugin (Ghostscript), Plugin version: 6.4, Mac OS X: Works, Windows: Works, Linux x86: Does nothing.

Function: Unloads the shared library.

Notes:

Reverses what LoadAPI does.

So if you loaded a ghostscript dll file, this file will be unloaded and the file closed.

In special cases you may need to force a reset of the ghostscript library by unloading it and loading it later again.
